Law Relating to the Signing of Patents.

AN ACT to amend section four thousand eight hundred and eighty-three of the Revised Statutes to enable the Assistant Secretary of the Interior to sign patents.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That section four thousand eight hundred and eighty-three of the Revised Statutes is hereby amended by inserting after the words "Secretary of the Interior," where they occur therein, the following words: "or under his direction by one of the Assistant Secretaries of the Interior," so that the said section as amended will read as follows:

"SECTION 4883. All patents shall be issued in the name of the United States of America, under the seal of the Patent Office, and shall be signed by the Secretary of the Interior or under his direction by one of the Assistant Secretaries of the Interior, and countersigned by the Commissioner of Patents, and they shall be recorded, together with the specifications, in the Patent Office, in books to be kept for that purpose."

Approved February 18, 1888.

Fraudulent Practices by Attorneys.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., April 18, 1888.

The attention of this Office having frequently been called to circulars and communications of persons pretending to have access to the records of this Bureau, and claiming to possess information of the pendency of applications for patents, notice is hereby given the public that all such persons in so advertising themselves are acting under false representations and are guilty of unprofessional conduct, and should not be entitled to credit.

The Office has also received information that certain attorneys disbarred from practice under section 487 of the Revised Statutes are continuing to prosecute applications for patents under the names of other persons.

Hereafter a list will be published in the OFFICIAL GAZETTE containing the names and addresses of all such persons, and the public warned against employing them or intrusting applications or interests to their charge.

BENTON J. HALL, *Commissioner.*

The Office has information that *Messrs. Horn & Son, No. 606 Eleventh street, Northwest, Washington, D. C.*, have been guilty of the practices set forth in the first paragraph of the above notice, and that *Isaac S. McGehan, No. 135 Broadway, New York*, a disbarred attorney, has been practicing under the name of *Alexander Melhado.*

Notice.—Models in Rejected or Abandoned Cases.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., March 9, 1888.

Notice is hereby given to inventors and the public that a large number of models in the custody of this Office, which were received between the years 1870 and 1880, many of which have never become a part of the records of this Office. All such models and all models belonging to rejected or abandoned applications will be sold or otherwise disposed of under the provisions of section 486 of the Revised Statutes unless removed in sixty days from the date hereof.

Institutions of learning in good standing may, after the expiration of the time above limited, on written application, make selection before the day of public sale of models remaining unclaimed. The expense of removal or transportation of these models must be borne by the applicants or institutions of learning.

BENTON J. HALL,
Commissioner.

Notice.

UNITED STATES PATENT OFFICE,
Washington, D. C., April 13, 1888.

To expedite the distribution of the mail in this Office, and to insure the prompt and certain delivery of communications to the divisions and officials having charge of the matters to which they relate, attorneys and correspondents are respectfully requested to enter upon the upper left-hand corner of amendments and other communications, if known to them, the number of the room and the name of the examiner or designation of the division to which the communication should be sent.

BENTON J. HALL,
Commissioner of Patents.

Issue of May 1, 1888.

DESIGNS.

18,282 and 18,283.—CLOCK-DIAL.—*Otto Bartel*, New York, N. Y. Applications filed March 21, 1888. Serial Nos. 268,016 and 268,017. Term of patents 3½ years.

18,284.—LADY'S COSTUME.—*Henrietta F. Duke*, New York, N. Y., assignor to *The Butterick Publishing Company*, (*Limited*,) same place. Application filed April 2, 1888. Serial No. 269,861. Term of patent 3½ years.

18,285.—FONT OF COMBINATION TYPE ORNAMENTS.—*Charles E. Heyer*, Chicago, Ill., assignor to *Bernhard Bros. & Spindler*, same place. Application filed February 20, 1888. Serial No. 264,699. Term of patent 14 years.

18,286.—SIDEWALK DEAD-LIGHT FRAME.—*Peter H. Jackson*, San Francisco, Cal. Application filed December 22, 1887. Serial No. 258,770. Term of patent 14 years.

18,287.—GIRL'S STREET-COSTUME.—*Etta L. Jenkins*, New York, N. Y., assignor to *The Butterick Publishing Company*, (*Limited*,) same place. Application filed April 2, 1888. Serial No. 269,864. Term of patent 3½ years.

18,288.—INFANT'S CLOAK.—*Etta L. Jenkins*, New York, N. Y., assignor to *The Butterick Publishing Company*, (*Limited*,) same place. Application filed April 2, 1888. Serial No. 269,865. Term of patent 3½ years.

18,289.—LADY'S COSTUME.—*Minnie B. Kent*, New York, N. Y., assignor to *The Butterick Publishing Company*, (*Limited*,) same place. Application filed April 2, 1888. Serial No. 269,890. Term of patent 3½ years.

18,290.—SPOON.—*Garry I. Mix*, Yalesville, Conn. Application filed November 30, 1887. Serial No. 256,571. Term of patent 14 years.

18,291.—LADY'S PRINCESS COSTUME.—*Ellen Moran*, New York, N. Y., assignor to *The Butterick Publishing Company*, (*Limited*,) same place. Application filed April 2, 1888. Serial No. 269,892. Term of patent 3½ years.

18,292.—LADY'S WRAP.—*Ellen Moran*, New York, N. Y., assignor to *The Butterick Publishing Company*, (*Limited*,) same place. Application filed April 2, 1888. Serial No. 269,893. Term of patent 3½ years.

18,293.—WINDOW-GUARD.—*John Pirkl*, Brooklyn, N. Y. Application filed December 16, 1887. Serial No. 258,139. Term of patent 7 years.

18,294.—CARPET.—*Edward Poole*, Brooklyn, N. Y., assignor to *The Lowell Manufacturing Company*, Lowell, Mass. Application filed March 31, 1888. Serial No. 269,165. Term of patent 3½ years.

18,295.—LADY'S WRAPPER.—*Lizzie Roys*, New York, N. Y., assignor to *The Butterick Publishing Company*, (*Limited*,) same place. Application filed April 2, 1888. Serial No. 269,876. Term of patent 3½ years.

18,296 and 18,297.—CARPET.—*Emil G. Sauer*, Brooklyn, N. Y., assignor to *The Lowell Manufacturing Company*, Lowell, Mass. Applications filed March 31, 1888. Serial Nos. 269,159 and 269,162. Term of patents 3½ years.

18,298.—BOOK-COVER PROTECTOR.—*Charles W. Stiff* and *Joseph Watrous*, Foxborough, Mass. Application filed November 18, 1886. Serial No. 218,770. Term of patent 7 years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 6,191 and upward are registered under the act of March 3, 1881.]

15,399.—ANTI-FRICTION METAL.—*American Improved Anti-Friction Metal Company*, Mobile, Ala.; Bremen, Germany, and Paris, France. Application filed January 25, 1888. Used since April 15, 1887.

"A representation of the globe of the world, showing the Western hemisphere with its axis prolonged and resting on metallic boxes or bearings, associated with the words 'IMPROVED ANTI-FRICTION METAL.'"

15,400.—PHOTOGRAPHIC PAPER FOR MAKING PRINTS.—*E. & H. T. Anthony & Company*, New York, N. Y. Application filed March 22, 1888. Used since 1877.

"The letters 'N. P. A.'"

15,401.—PLUG OR TWIST TOBACCO, OR TOBACCO IN ROLL.—*Arnold & Bell*, Baltimore, Md. Application filed March 29, 1888. Used since August 22, 1887.

"The words 'CITY STOCK.'"

15,402.—ULTRAMARINES.—*Deschamps Frères, Vieux-Jouef-Hours*, Mouse, France. Application filed March 12, 1888. Used since September 10, 1878.

"The letters 'D. F.'"

15,403.—SMOKING AND CHEWING TOBACCO.—*Fishburne Bros.*, Roanoke City, Va. Application filed February 20, 1888. Used since May 1, 1874.

"The words 'ROMAN EAGLE' and the representation of an eagle."

15,404.—RADIATORS.—*A. A. Griffing Iron Company*, Jersey City, N. J., and Chicago, Ill. Application filed March 19, 1888. Used since September, 1874.

"The word 'BUNDY.'"

15,405.—PLUG-TOBACCO FOR CHEWING.—*J. H. Hargrove & Son*, Chatham, Va. Application filed April 6, 1888. Used since April, 1869.

"The picture of a blanketed horse, together with the words 'DARK HORSE.'"

15,406.—COMPOUND FOR PREVENTING INCRUSTATION AND FOR REMOVING SCALE IN BOILERS.—*Lewis Manufacturing Company*, Sioux City, Iowa. Application filed February 13, 1888. Used since January 15, 1888.

"The word 'EUREKA.'"

15,407.—FLOUR.—*Marshall, Kennedy & Co.*, (*Limited*,) Pittsburg, Pa. Application filed April 6, 1888. Used since January 1, 1881.

"The words 'BAYARD AMBER' in connection with the representation of a roller-mill."

15,408.—RIBBONS AND PIECE SILKS.—*Murphy, Grant & Co.*, San Francisco, Cal., and New York, N. Y. Application filed March 7, 1888. Used since December, 1851.

"The letters 'AA.'"

15,409.—ANTHRACITE AND BITUMINOUS COAL.—*North River Coal and Wharf Company*, Jersey City, N. J. Application filed February 27, 1888. Used since October, 1887.

"The word-symbol 'PORT LIBERTY.'"

15,410.—STEAM AND HOT-WATER BOILERS.—*Pierce, Butler & Pierce Manufacturing Company*, Syracuse, N. Y. Application filed March 31, 1888. Used since December 5, 1882.

"The word 'FLORIDA.'"

15,411.—VENTILATORS.—*John H. Reynolds*, Troy, N. Y. Application filed March 3, 1888. Used since February 15, 1877.

"The word 'GLOBE.'"

15,412.—HOSIERY.—*Edward Scheiflin & Co.*, New York, N. Y. Application filed March 9, 1888. Used since November 15, 1887.

"The word 'ELECTRIC.'"

15,413.—STOCKINGS.—*William Stirker*, New York, N. Y. Application filed February 14, 1888. Used since November 1, 1887.

"The words 'THE DARBY.'"

15,414.—RADIATORS.—*Thomas H. Williams* and *Samuel D. Tompkins*, Jersey City, N. J., and Chicago, Ill. Application filed March 29, 1888. Used since March 1, 1888.

"The word 'TRIUMPH.'"

15,415.—COTTON UNDERWEAR.—*Andrew Zerban*, New York, N. Y. Application filed June 22, 1887. Used since May 20, 1887.

"The symbol of a star within two quadrangles covering each other, the corners of each quadrangle projecting beyond the sides of the other."

15,416.—WOOLEN UNDERWEAR.—*Andrew Zerban*, New York, N. Y. Application filed June 22, 1887. Used since May 20, 1887.

"The words 'AFTER DR. JAEGER'S SANITARY WOOLEN SYSTEM' arranged around the symbol of a star within two squares or quadrangles covering each other in such a manner that the corners of each project beyond the sides of the other, the symbol of a star occupying a central position within the two squares."

LABELS.

5,571.—Title: "GLYCERINE BAY RUM."—*Samuel M. Binder*, Boyertown, Pa. Application filed February 20, 1888.

5,572.—Title: "BOWHAM'S CALENDULA OIL COMPOUND."—*John C. Bowham*, Sutherland, Iowa. Application filed March 6, 1888.

5,573.—Title: "SPECIAL." (FOR OINTMENT.)—*Elwood B. Bunting*, Burlington, N. J. Application filed April 7, 1888.

5,574.—Title: "WEST INDIA HAIR TONIC AND DANDRUFFOS."—*I. W. Earnest*, San Antonio, Tex. Application filed April 3, 1888.

5,575.—Title: "WEST INDIA LIVER ELIXIR."—*I. W. Earnest*, San Antonio, Tex. Application filed April 3, 1888.

5,576.—Title: "WEST INDIA TONIC ELIXIR OF SARSAPARILLA."—*I. W. Earnest*, San Antonio, Tex. Application filed April 3, 1888.

5,577.—Title: "WEST INDIA BALSAM OF HOREHOUND AND COLTSFOOT."—*I. W. Earnest*, San Antonio, Tex. Application filed April 3, 1888.

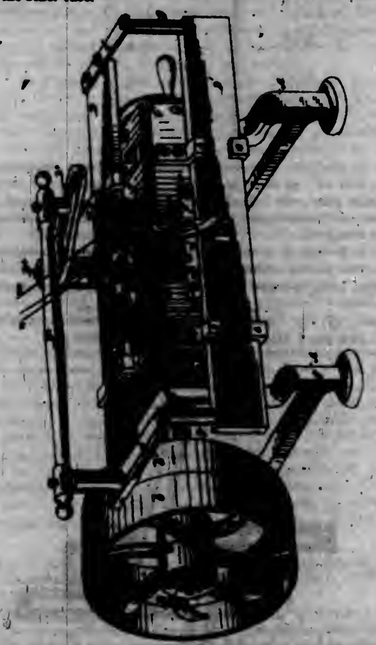
5,578.—Title: "THE BALM OF ZANTHORIZA." (FOR A MEDICINE.)—*Frederick Ives*, Ogdensburg, N. Y. Application filed April 7, 1888.

5,579.—Title: "LOCHER'S RENOWNED RHEUMATIC REMEDY."—*Charles A. Locher*, Lancaster, Pa. Application filed April 9, 1888.

5,580.—Title: "CHEMICO CORN SALVE."—*George L. Mansfield*, New Haven, Conn. Application filed April 6, 1888.

5,581.—Title: "GOLDEN SEAL AND SANDAL WOOD COMBINATION." (FOR A MEDICINE.)—*Millbern & Williamson*, Detroit, Mich. Application filed April 9, 1888.

5,582.—Title: "BEST COUGH SYRUP."—*Millbern & Williamson*, Detroit, Mich. Application filed April 9, 1888.



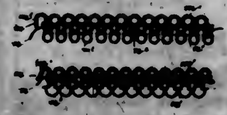
5,583.—Title: "STANDARD STOCK LINIMENT."—*F. E. Sanborn*, Omaha, Nebr. Application filed March 5, 1888.

PATENTS

GRANTED MAY 1, 1888.

381,898. STRAIGHT-KNITTING MACHINE. CHARLES J. APPLEGATE, Elizabeth, N. J., assignor to Ludwig Stehr, New York, N. Y. Filed July 16, 1887. Serial No. 244,446. (No model.)

Brief.—The improved machine includes a set of horizontal and a set of vertical needles, with a yarn-guide for each, and cams for operating the same, which are so constructed and arranged as to cause the needles of each set to form the yarn supplied to them into rows of plain loops and to interlock each loops with the corresponding loops formed by the other set, the loops of one yarn lying wholly upon one face of the fabric and the loops of the other yarn wholly upon the other face.

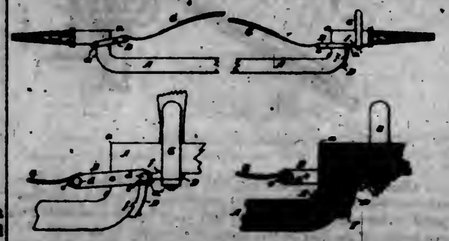


Claim:—1. The combination, substantially as hereinbefore set forth, with two sets of needles of a straight-knitting machine, arranged at an angle to each other, and cams for reciprocating said needles, depend with their spines in different vertical planes, whereby the needles of each set are alternately caused to follow in their movements the needles of the other set and set at distance for them, of independent yarn-supplying devices for each set of needles, devices for throwing back the latches of the needles when such needles are advanced, and mechanism for operating said cams.

2. The combination, as hereinbefore set forth, with a set of vertical and a set of horizontal needles of a straight-knitting machine, independent yarn-supplying devices for each set thereof, and a web-carrier, of a cam for reciprocating each set of needles, arranged with their spines in different vertical planes, and mechanism for operating said cams and web-carrier.

3. The combination, substantially as hereinbefore set forth, with the needle-bars O O, arranged at an angle to each other, the needles *d d*, provided with the butts *d'*, and the cam-bars D D', provided with the needle-actuating grooves E, which have the spines of their V-shaped portions disposed in different vertical planes, whereby the needles carried by each bar are caused alternately to follow in their movements the needles of the other bar and set at distance for them, of yarn-carriers P P', having the eyes *l l* formed in their outer ends, the latch-opener *f*, the take-up H H, and mechanism for reciprocating said cam-bars.

381,899. KNITTED FABRIC. CHARLES J. APPLEGATE, Elizabeth, N. J., assignor to Ludwig Stehr, New York, N. Y. Filed July 16, 1887. Serial No. 244,448. (Specimen.)



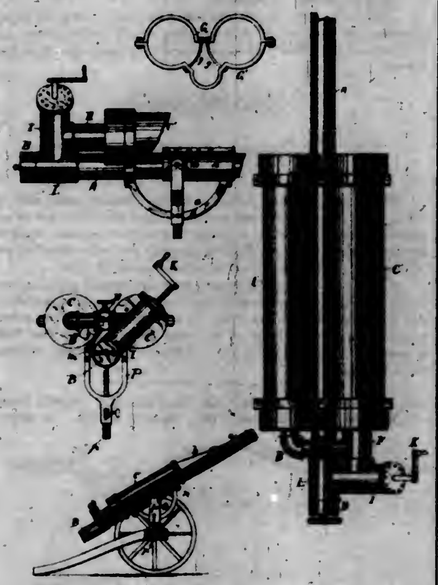
Brief.—The fabric, which is formed of two yarns, is firm and homogeneous, with the loops of one yarn lying wholly upon one face and the loops of the other yarn appearing wholly upon the other face thereof.

Claim.—1. A fabric formed from two distinct yarns, each of which is interlooped with itself and interlocked with the other by extending around each other at points intermediate adjacent loops of the same, substantially as described, whereby the loops composing one face thereof never appear upon the other face, as set forth.

2. A double-faced fabric formed from two distinct yarns, each of which is interlooped with itself to form its respective side of the fabric, and is interlocked with the other by extending around it at points intermediate adjacent loops of the same, substantially as described, whereby the loops composing one face thereof never appear upon the other face, as set forth.

381,900. SPRING-COUPLER FOR VEHICLES. FRANCIS BACON, Waterloo, N. Y. Filed Oct. 1, 1887. Serial No. 251,202. (No model.)

Claim.—1. The combination of the bevel or crank-shaped vehicle-wheel axle, the shackle or link supports or bearings *d' d'*, arranged at the lower or outer angles formed at the junction of the upper horizontal parts of the axle with the vertical parts of the same, the shackle or links having their outer ends extending across said supports at those portions thereof which are along or within said angles, and the vehicle-spring connected at its ends to the inner ends of the said shackles or links, substantially as and for the purposes specified.



2. The combination of the bevel or crank-shaped vehicle-wheel axle, the detachable shackle or link supports or bearings *d' d'*, arranged in the lower outer angles formed by the upper horizontal parts of the axle and the vertical parts thereof, the shackles or link supports having their outer ends bearing on the said parts *d' d'*, and the vehicle-spring connected at its ends to the inner ends of the said shackles or links, substantially as and for the purposes specified.

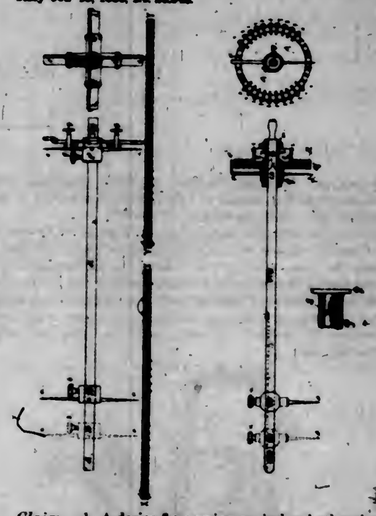
3. The combination, with the axle A, of shackle or link supports consisting of detachable angle-shaped irons arranged in the lower outer angles formed by the upper horizontal parts of the axle and its vertical parts, links or shackles having their outer ends supported by the said irons at the angles thereof, and the spring C, connected at its ends to the inner ends of the said links or shackles, substantially as and for the purposes specified.

4. The combination, with the axle A, of the detachable supports or bearings *a' a'*, having one or more lateral arms or extensions and arranged in the angles formed by the upper horizontal parts of the said axle and its vertical portions, vertically-vibrating shackles or links having their outer ends arranged between the said axle and the said supports or bearings, of the spring C, attached at its ends to the inner ends of the said shackles or links, and clips connecting the said supports or bearings detachably to the axle, substantially as and for the purposes specified.

5. The combination of the crank-axle A, the detachable link-supports *a' a'*, arranged underneath the horizontal parts or shanks of the said axle and at or near the outward sides of its vertical parts, the spring C, and the links or couplings connected to the ends of the said spring and having their outer bolts between the said shanks and the said supports, substantially as and for the purposes specified.

381,901. PNEUMATIC CANNON. WALLACE A. BARTLETT, Washington, D. C., assignor to Washington G. Bouldin, Boston, Mass. Filed Sept. 24, 1884. Renewed Sept. 20, 1887. Serial No. 251,088. (No model.)

Claim.—1. The combination, with the gun-tube and its supporting mechanism, of a sectional flask secured to said tube, a valve interposed between the sections of said flask, and a flexible connection from one section of the flask to the source of air-supply, as set forth.

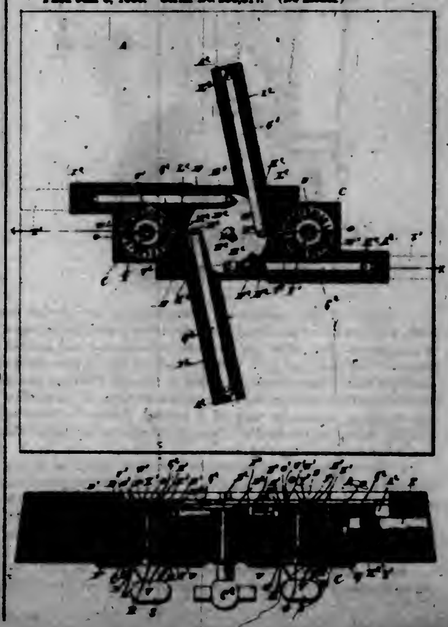


2. The combination, with a sectional flask of a gun-tube, of a single operating-valve, a plurality of supply-pipes leading from the separate compartments of the flask to the valve, and a closing-valve in one of the supply-pipes, substantially as set forth.

3. The combination, with the gun-tube, of a sectional flask secured thereto, a plurality of supply-pipes leading from said sections to the operating-valve, and an operating-valve placed in a vertical plane drawn through the axis of the gun, as set forth.

4. The combination, with the gun-tube, a trunnioned sleeve thereon, and the supporting-yoke, of an arc bar attached to the tube, and a clamp to secure said arc bar against the yoke.

5. The combination, with the gun-tube, of a sectional flask secured thereto, valves between the sections, by which each section may be separated from and rendered independent of the others, a supply-pipe leading from each section to the operating-valve, and a closing-valve in at least one of the supply-pipes.



381,902. DEVICE FOR PRINTING MUSICAL AND OTHER CHARACTERS. GUSTAVE BOREL, Lancy, near Geneva, and DAVID MONNIER, Geneva, Canton of Geneva, Switzerland. Filed Nov. 15, 1886. Serial No. 218,942. (No model.) Patented in France Apr. 22, 1886, No. 173,676; in Belgium June 12, 1886, No. 72,686; in England Aug. 12, 1886, No. 10,886; in Austria-Hungary Oct. 9, 1886, No. 17,754, and in Italy Oct. 12, 1886, No. 20,542.

Claim.—1. A device for copying musical and other characters, provided with pointers for resting on the characters to be copied, another pointer for indicating the corresponding positions on another sheet, and a type-carrier which will print the characters on the points thus designated.

2. A shaft, in combination with a type-carrier mounted thereon, and two sleeves adjustable backward and forward thereon, these sleeves being provided with arms carrying pointers, substantially as set forth.

381,903. COMBINATION-LOCK. JOHN BRESNAN, Galveston, Tex. Filed Jan. 6, 1888. Serial No. 260,817. (No model.)

Claim.—1. The combination of the knob-spindle, the inner sleeve secured thereto and having the spindle movable longitudinally thereon, the sign disk or dial loose on the outer end of the spindle and adjustably secured to the knob, the loose tumblers and ring, and the sign-tumbler rigid with the inner end of the inner sleeve and adjustably secured to the ring, substantially as described.

2. The combination of the door, the bolts, the central disk, the arms connecting the bolts thereto, the pivoted detent-arms, the links connecting the same to the central disk, and the knob-spindles on opposite sides of the central disk and having the tumblers provided with notches adapted to be engaged by the detent-arms to lock the central disk, substantially as described.

3. The combination of the door having the rigid outer sleeve, the inner sleeve therein, the knob-spindle secured to the inner sleeve and movable longitudinally therein, the sign-disk loose on the outer end of the spindle and having the series of openings, the knob having the stud to engage one of said openings, the tumblers and ring loose on the outer sleeve, and the sign-tumbler rigid on the inner end of the inner sleeve and adjustably secured to the ring, substantially as described.

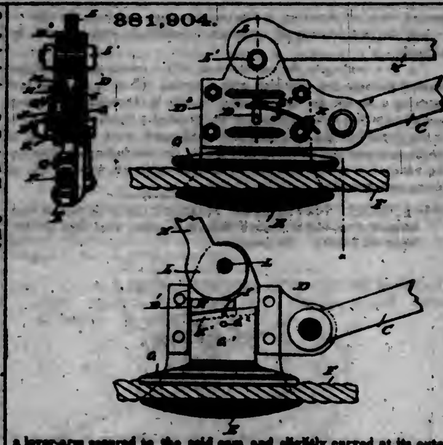
4. The combination of the door having the rigid outer sleeve, the knob-spindle, the tumblers loose on the rigid sleeve, the washers between the tumblers and rigid with the said sleeve, the ring loose on the sleeve, and the sign-tumbler revolubly with the spindle, said tumblers and ring having the studs adapted to engage each other, and thereby cause the tumblers to turn when the spindle is rotated, substantially as described.

5. The combination of the bolts X', the disk D', the arms connecting the bolts to the disk, the detents L', having lugs M', the links N', connecting said detents to the disk, and the combination-locks having the notched tumblers adapted to be engaged by the lugs M', for the purposes set forth, substantially as described.

6. In combination with the rigid sleeve D, the inner sleeve, H, swiveled thereto, the knob-spindle movable longitudinally in the sleeve H and independent thereof, but also having a connection with the inner sleeve, whereby said inner sleeve is rotated, the sign-tumbler U', revolubly with the sleeve H, and the tumblers mounted on the outer sleeve, D, and adapted to be turned by the sign-tumblers U', as set forth.

7. In combination with the rigid sleeve D, the inner sleeve, H, swiveled thereto, the knob-spindle movable longitudinally in the sleeve H and independent thereof, but also having a connection with the inner sleeve, whereby said inner sleeve is rotated, the sign-tumblers U', revolubly with the sleeve H, and the tumblers mounted on the outer sleeve, D, and adapted to be turned by the sign-tumblers U', and the sign disk or dial U, loose on the spindle and adjustably secured to the knob, the sign-disk being adjusted to correspond with the sign-tumbler.

8. In combination with the outer rigid sleeve, D, the tumblers and washers thereon, said washers being rigidly fitted to the sleeve, and the tumblers being in engagement with one another, the ring E', in engagement with the tumblers, the inner swiveled sleeve, H, the sign-tumbler U', rigidly fixed to the sleeve H, the adjustable connection between the tumbler U and the ring E', the knob-spindle movable longitudinally within the inner sleeve, and also adapted to turn the latter, and the sign-disk U, loose on the knob-spindle and having an adjustable connection therewith, the adjustable connection between the disk U and the knob-spindle corresponding with the adjustable connection between the ring E' and the sign-tumbler U', as set forth.



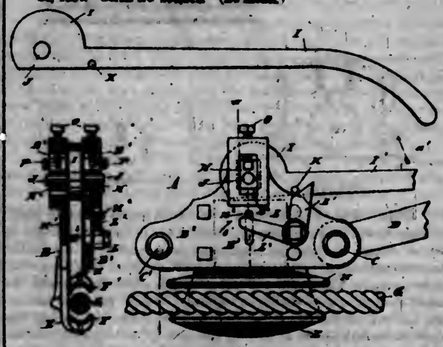
381,904. CABLE-GRIP. WILLIAM J. R. GAGE, Leavenworth, Kans., assignor to himself and John Rathgeber Carr, same place. Filed Apr. 6, 1887. Serial No. 233,733. (No model.)

Claim.—1. In a cable-grip, the combination, with a casing and a fixed jaw formed thereon, of a movable jaw adapted to slide in the said casing, a wedge held on the upper inclined end of the said movable jaw, and a cam pivoted on the said casing and operating on the said wedge, substantially as shown and described.

2. In a cable-grip, the combination, with a casing and a fixed clamp held thereon, of a movable clamp adapted to slide in the said casing, a wedge held adjustable on the upper inclined edge of the said movable jaw, a cam pivoted on the said casing and operating on the said wedge, and a spring operating on the said movable jaw, substantially as shown and described.

3. In a cable-grip, the combination, with a slotted casing carrying a fixed jaw, of a movable jaw fitted in a recess of the casing and provided with a pin projecting through the slot of the casing, a spring secured to the casing and bearing its free end resting under the said pin, and a cam for operating the movable jaw, substantially as herein shown and described.

4. In a cable-grip, the combination, with a casing, a fixed jaw formed thereon, and a movable jaw sliding in the said casing, of a cam pivoted on the said casing and operating on the said movable jaw, and



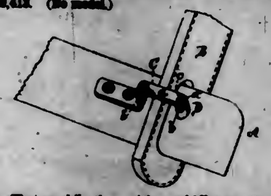
a lever-arm secured to the said cam and slightly curved at its outer end, substantially as shown and described.

5. In a cable-grip, the combination, with the movable jaw G and the plate G', formed on the said jaw G and having an inclined and grooved upper end, of a wedge, H, held on the said inclined end of the plate G' and provided with a tongue, H', fitting into the groove on the plate G', said means for fastening the said wedge H to the said plate G', substantially as shown and described.

6. In a cable-grip, the combination, with the cam L, of the adjustable wedge H, on which operates the said cam L, the plate G', on which the said wedge H is held adjustably, and the jaw G, fixed on the said plate G', substantially as shown and described.

381,905. CABLE-GRIP. WILLIAM J. R. GAGE, Leavenworth, Kans., assignor to himself and Joseph Rathgeber Carr, same place. Filed Dec. 28, 1887. Serial No. 259,312. (No model.)

Claim.—1. In a cable-grip, the combination, with a slotted casing carrying a fixed jaw, of a movable jaw fitted in a recess of the said casing and provided with a pin projecting through the slot of the casing, a cam for pressing the said movable jaw downward, and a bell-crank lever pivoted on the said casing and operating with one arm on the pin of the movable jaw, said bell-crank lever being operated by a pin on the said cam, substantially as shown and described.

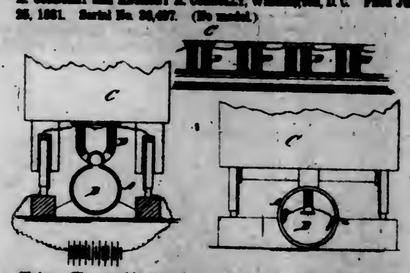


2. In a cable-grip, the combination, with a slotted casing carrying a fixed jaw, of a movable jaw fitted in a recess of the casing and provided with a pin projecting through the said slot of the casing, a cam pivoted in vertically-adjustable bearings and operating on the said movable jaw, a pin or lug secured on the said cam, and a bell-crank lever pivoted on the said casing and provided on one of its arms with an inclined edge on which operates said pin of the cam, while the other arm of the bell-crank lever operates on the said pin of the movable jaw, substantially as shown and described.

3. In a cable-grip, a casing carrying a fixed jaw and a movable jaw fitted in a recess of the said casing, in combination with a cam operating on the said movable jaw and provided with trunnions, bearings carrying the said trunnions and mounted to slide vertically in the recesses formed in the said casing, a set-screw screwing in the said casing, its rounded end passing into a recess of the said bearings, and a

second set-screw screwing in the said bearings and into the said recess of the said first-named set-screw, substantially as shown and described.

4. In a cable-grip, the combination, with a casing and a fixed jaw formed thereon and provided with a curved die, of a movable jaw carrying a similar die and adapted to slide in the said casing, a cam operating on the said movable jaw and pivoted in the said casing, a pin or lug formed on the said cam, and a bell-crank lever, on one arm of which operates said pin, the other arm of the said bell-crank lever being adapted to act on a pin of the said movable jaw, substantially as shown and described.



381,906. TUG-FASTENER. FRANKLIN P. CHILD, Springfield, Ohio, assignor of one-half to Albert K. Hahn, same place. Filed Sept. 12, 1887. Serial No. 249,613. (No model.)

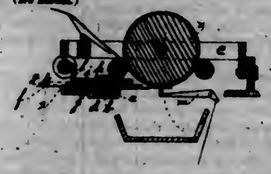
Claim.—1. The combination, with a whiffletree, A, a trace, B, slotted and slipped on the end thereof, a bent arm attached to said whiffletree, and a latch pivoted to said arm and allowing the trace to be slipped on the whiffletree, but preventing its removal therefrom, substantially as set forth.

2. The bent arm *c*, having its end bent down and slotted, as shown, in combination with the latch D, pivoted in said slot, the whiffletree to which said arm is attached and the trace slipped on the body of said whiffletree, substantially as set forth.

381,907. PNEUMATIC RAILWAY AND CONVEYER. THOMAS A. CHISHOLM and ANTHONY A. CHISHOLM, Washington, D. C. Filed June 20, 1881. Serial No. 34,497. (No model.)

Claim.—The combination, in a railway or transit system or plant, of a pneumatic tube containing a piston, a car or carrier arranged to travel outside said tube, an electro-magnetic coupling or connection between said car or carrier and said piston, the same consisting of an electro-magnet and armature located the one within the tube and the other upon the car or carrier, a stationary electric generator outside the car, and an electric-current conductor or conductors leading the current through sliding or moving contacts to said magnet, substantially as and for the purpose described.

381,908. DISK HARROW. ADAMS CHEEVER, Jr., Cooperstown, N. Y. Filed Feb. 24, 1888. Serial No. 265,127. (No model.)

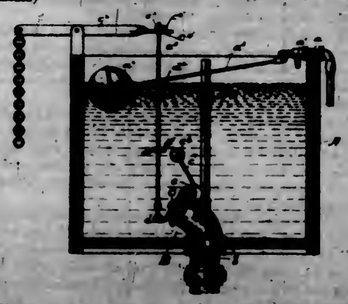


Claim.—The combination, with the concave-convex disk, of the arm G², situated upon the convex side of the disk and adjacent to the edge, the sliding socket G, the depending shank, and the scraper supported upon the shank, substantially as described.

381,909. REVERSIBLE PLOW. ROBERT A. CRAIG, Hale Ward, N. C. Filed Nov. 28, 1887. Serial No. 256,253. (No model.)

Claim.—1. The combination, with a plow-standard having the longitudinal recess T, the double-beveled shoulder D, and the laterally-extended portion, of the wedge-shaped concave casting having the central bolt-rest and the seats P Q, the pivot-bolt, the double-pointed plow-point, the lever fulcrumed in the recess T and provided with the toe for engaging the seats in the toe-plate, the lever-arm provided with a knife-edge, and the rack-plate secured to the plow-beam, substantially as specified.

2. The combination, in a plow, with the recessed plow-standard having the double-beveled shoulders and the laterally-extended enlargement below the same, of the casting I, having seats P Q, the double-pointed plow-point secured to said casting, the lever fulcrumed in a recess in the rear face of the plow-standard and provided with a toe at its lower end and a knife-edge near its upper end, and the rack and guard secured to the plow-beam above the plow-standard, substantially as specified.



381,910. INKING DEVICE FOR TYPE-WRITING MACHINES. LOUIS S. CRANDALL, Syracuse, N. Y. Filed Dec. 20, 1886. Serial No. 188,511. (No model.)

Claim.—1. In a type-writer, a rotating inking-disk composed of cloth, felt, or other fibrous material interposed between and in combination with the platen and type system of said type-writer, presenting unused or fresh portions of an annular section of said disk between said platen and said type system after each and every impression of said type, substantially as set forth, and an annular ink-containing trough superimposed upon and communicating with said disk for the purpose of supplying ink thereto and moving axially therewith, substantially as described.

2. The combination of means substantially such as the disk *f*, the supporting-flange *e*, the retaining-flange *g*, the ink-supplying trough *i*, and the movable supporting-stud *d*, for the purpose of providing an inking device for a type-writer, substantially as set forth.

381,911. SERVICE-BOX FOR WATER-CLOSETS. JAMES CRAWFORD, Cambridge, Mass. Filed Apr. 26, 1887. Serial No. 236,022. (No model.)

Claim.—1. In a service-box for water-closets, the combination, with the outlet-passage valve G, having the inclined upwardly-extending arm provided with the counter-balancing-weight arranged above the pivot of the valve to hold the latter open or closed, of the operating-lever *e*, a rod which connects the said lever with the said valve and which is provided with a stop, an arm which controls the inlet-cock and which is arranged to engage the said stop, and a float for operating said arm, whereby when the operating-lever is actuated the discharge-valve will be opened and held open by its counter-balancing-weight until the float-arm falls far enough to engage the stop on the connecting-rod, when the said valve will be automatically closed, substantially as set forth.

2. In a service-box for water-closets, the combination, with the valve C, for controlling the outlet-passage from the box, the said valve having the arm *c*², provided with the counter-balancing-weight *c*³, of the operating-lever *e*², the connecting-rod *e*³, having a loose connection with the said lever *e*² and provided with the adjustable stop *d*, the arm *a*² for controlling the inlet-cock, having the loop *a*³ to engage said stop, and the float *a*⁴, attached to said arm, to operate substantially as set forth.

381,912. VIBRATING MECHANISM FOR SEWING-MACHINES. JAMES GIBBONS, Boston, Mass. Filed May 30, 1887. Serial No. 239,716. (No model.)

Claim.—In a thread-tension mechanism, the combination, substantially as described, of the grooved and flanged tension-wheel A, the friction brake or check *n*, the bracket C, the dial E, fixed to such bracket, the spindle F, provided with the screw and nut, and the grooved wheel *b* and revoluble in a bearing, *b*, projecting from the bracket, the disk *c*, fixed on the spindle and provided with the index-pointer or hand D, the washers *d e* and disk *f*, applied to the spindle, and the spiral spring *h*, applied to the bracket, and grooved wheel A, all being arranged and to operate essentially and for use as set forth.

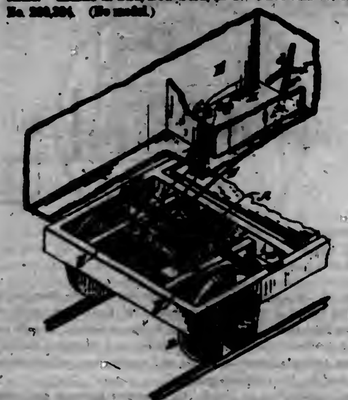
381,913. PIPE-COUPLING. JOHN BOYD, Allegheny, Pa. Filed June 20, 1887. Serial No. 242,202. (No model.)

Claim.—1. In a pipe-coupling, the spigot end of a pipe having a screw-thread thereon, movable metallic rings curved in cross-section on their outer surfaces, an elastic and internally-compressible packing, and a field-chamber between said rings and an aperture communicating with said chamber, in combination with the bell of an adjacent pipe having a curved surface at the inner end of the bell, whereby the packing is expanded by lateral compression and the pressure of the fluid in the pipe and deviations in the alignment provided for, substantially as described.

2. In a pipe-coupling, the spigot end of a pipe having detachable metallic rings curved in cross-section on their outer surfaces, an elastic packing, a spring and a field-chamber between said rings, and an aperture in the pipe communicating with said chamber, in combination with the bell end of an adjacent pipe, the inner wall of which is composed of curved and parallel surfaces, substantially as described.

381,914. CAR-COUPLING. WILLIAM DE GEX, Aylmer, Ontario, Canada. Filed Oct. 31, 1887. Serial No. 253,553. (No model.)

Claim.—1. The pivoted coupling-pin B, pivotal coupling-hook D, and bearing C, in combination with the draw-bar A, formed with a hooked end, *a*², rod F, and spring E, for the purpose specified.



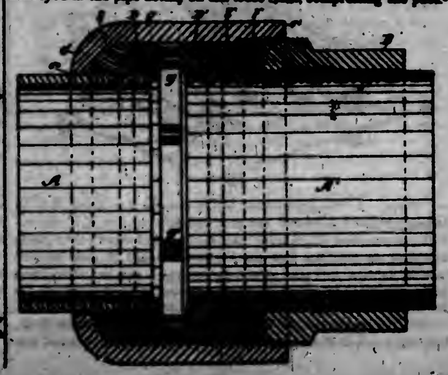
2. The locking-lever H and plate formed with notches or notches K, in combination with the pivotal coupling-pin B, pivotal coupling-hook D, and draw-bar A, formed with a hooked end, *a*², for the purpose specified.

3. A draw-bar, A, moving longitudinally under the frame of the car, in combination with the retracting lever J, for the purpose specified.

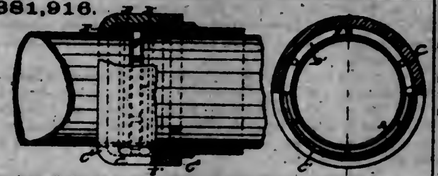
4. The pivotal coupling-pin B, pivotal coupling-hook D, bearing C, and forked bearing or guide G, in combination with a draw-bar, A, having a hooked end, *a*², formed round at *a*², rod F, and spring E, for the purpose specified.

5. The pivotal coupling-pin B, pivotal coupling-hook D, bearing C, and forked bearing or guide G, in combination with a draw-bar, A, having hooked end *a*², rod F, spring E, levers H I J, and rod H², formed with elevations H' and H², and a plate formed with notches or notches K, for the purpose specified.

381,915. SIGNING-LIGHTING APPARATUS FOR RAILROAD-CARS. HARRY H. DAY, New York, N. Y. Filed Jan. 10, 1888. Serial No. 260,264. (No model.)



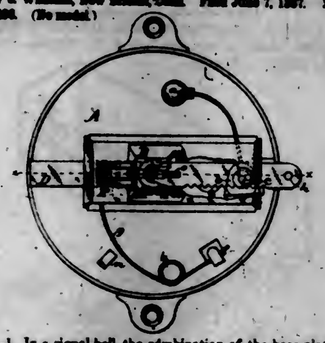
Claim.—1. In combination, the dynamo A, provided with friction-pulleys *a*' *a*² for direct engagement with the car-wheels, the said dynamo being mounted to slide in grooves arranged on the car-trunk, the lever D², provided with pawl and notched bar for retaining the dynamo out of engagement with the car-wheels, and the rod D' and post D, for connecting the lever D² and dynamo-support, and a spring, F, acting in conjunction with the lever D², for retaining the dynamo in engagement with the car-wheels, substantially as described.



2. In combination, the dynamo A, mounted to slide in grooves arranged on the car-trunk and having its armature provided with friction-wheels for engagement with the car-wheels, the lever D²; provided with pawl and notched bar for retaining the dynamo in or out of engagement with the car-wheels, and the rod D' and post D, as described.

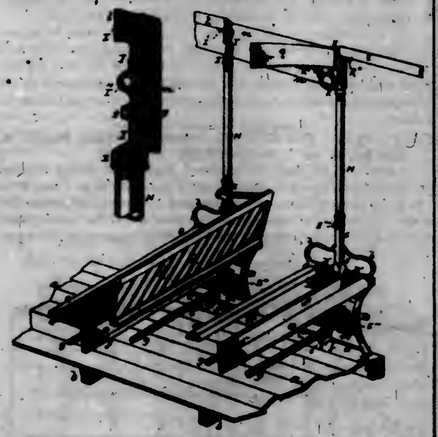
381,916. PIPE-COUPLING. SAMUEL B. DARLING, Bedford, Pa. Filed Feb. 25, 1887. Serial No. 228,858. (No model.)

Claim.—A coupling for plain-end pipes, made in two sections, recessed to put in packing-rings B and B' and brass rings D and D', in which the packing is not only compressed by mechanical means, but is also still further compressed by the pressure of the gas or liquid conveyed in the pipe acting on the brass rings, compressing the pack-



881,916.

ing into all the apertures of the coupling, substantially as shown and set forth.

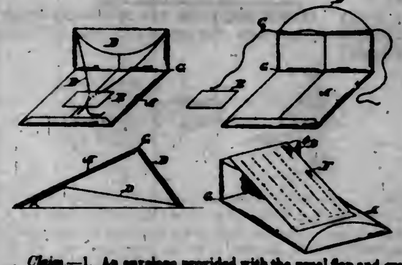


881,917. SIGNAL-BELL. GEORGE W. HART, New London, assignor to Henry C. Williams, New Britain, Conn. Filed June 7, 1887. Serial No. 240,488. (No model.)

Claim.—1. In a signal-bell, the combination of the base-plate A, the vibrating hammer and pallets mounted thereon, the straight rack moving over said base-plate, the frame B, also mounted on said base-plate, the angle-lever mounted on said frame and engaging said slide, and a spring acting against said slide and angle-lever, substantially as described, and for the purpose specified.

2. The combination of a bell, the vibratory hammer and pallets, the slide bearing a straight rack, with the teeth in engagement with said pallets, the spring for moving said slide in one direction, the angle-lever, connecting-rod, and handle for moving said slide in the opposite direction, substantially as described, and for the purpose specified.

881,918. STREET-CAR. JOSEPH W. EVANS, Newburyport, Mass. Filed Nov. 19, 1887. Serial No. 255,572. (No model.)



Claim.—1. The combination of the metallic side pieces, B B, internally grooved, as shown, and provided with the feet B' B', the metallic bottom piece, C, provided with the vertical flange C', the metallic top piece, D, provided with the horizontal flange D', and the non-metallic panel A, said side pieces, bottom piece, and top piece being each separate and distinct and bolted together, so as to constitute the frame, substantially as and for the purpose described.

2. The combination of the panel A, side pieces, B B, bottom piece, C C, top piece, D D', and metallic post E, of the shape shown and provided with the groove F', foot F, contact-arms F'', and pivot F''', all made integral and conforming in shape to the shape of the panel, substantially as and for the purpose set forth.

3. The combination of the lower section, E, of substantially the shape described, the central section, H, and the upper section, I, provided with the flange F, said sections being all of metal and rigidly secured together, substantially as and for the purpose set forth.

4. The combination of the lower section, E, of substantially the shape described, the central section, H, and the upper end section, K, provided with the arms K' and K'' and the contacts K''' and K''', said sections being all of metal and rigidly secured together, substantially as and for the purpose described.

881,919. MAKING FOLDING DISPLAY-ENVELOPE. HENRY P. BRINKMAN, Delphos, Ohio. Filed Feb. 15, 1887. Renewed Dec. 22, 1887. Serial No. 258,073. (No model.)

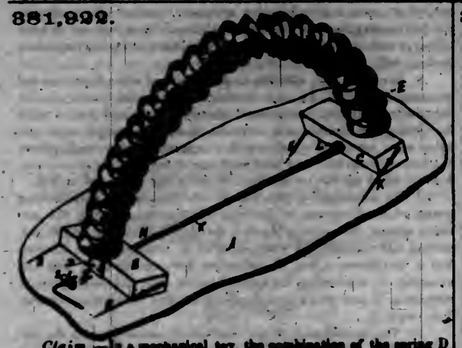
Claim.—1. An envelope provided with the usual flap and creased from side to side and combined with a string or strip secured at the flap end of the envelope and a retaining device for the string or strip upon the body of the envelope, whereby when said envelope is folded at the crease it can be retained in that bent shape, substantially as described.

2. An envelope, A, creased at one end and provided with a cord for opening the end and extending forward and attached to the body of the envelope, so that the envelope may be opened out at any angle for displaying, the whole arranged as and for the purpose substantially as herein set forth and described.

881,920. BUNG-FASTENER. GEORGE A. GRISTMORE and ARTHUR F. GARTSIDE, Savannah, Ga. Filed Aug. 16, 1887. Serial No. 247,048. (No model.)

Claim.—As an appliance to be used with a package and a bung, and as a seal for the latter, the ring B, having the groove *a'*, combined with the disks *b* and *c*, and guard *d*, adapted to be driven into the groove, so as to rest upon the disk *c*, substantially as set forth.

881,921. ADJUSTABLE NIPPLE FOR INCANDESCENT HANGING LAMPS. HIRAM P. GOODRICH, Brooklyn, N. Y. Filed Dec. 2, 1887. Serial No. 256,726. (No model.)

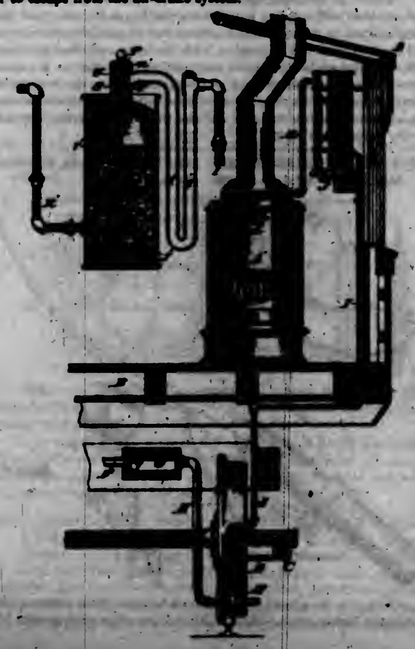


Claim.—1. In lamp appliances for electric lighting, an adjustably-jointed lamp-holder consisting of the combination of a hollow body-bar and a hollow nipple adjustably pivoted together, the hollow of the one communicating with the hollow of the other, and constituting a pivoted joint, having an open way through its interior for free passage of electric conducting-wires, substantially as described.

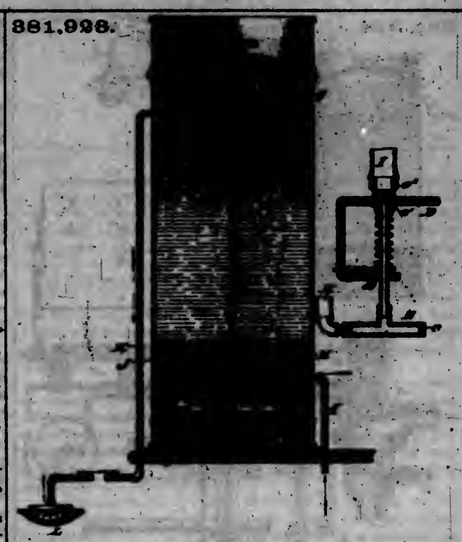
2. In lamp appliances for electric lighting, the combination of a yoke adapted to embrace a rod or pipe, a body-bar provided with suitable means for the pivoted articulation of a pivot, and a hollow nipple adjustably pivoted to the said body-bar, the hollow of said nipple extending through the pivotal articulation and communicating with the hollow of the body-bar, forming an open way through the interior of the joint for the free passage of electric conducting-wires, substantially as described.

881,922. MECHANICAL TOY. JAMES W. HALL, Newburyport, Mass. Filed Dec. 1, 1887. Serial No. 256,203. (No model.)

881,922.



Claim.—In a mechanical toy, the combination of the spring D and foot-pieces C and B, having engaging open, with the cord N, said cord being secured at one end to the rear foot-piece, B, thence passing freely through a loop or eyelet secured to the forward foot-piece, C, and thence back under the foot-piece B, substantially as described, and for the purpose set forth.



881,923. DEVICE FOR EXTINGUISHING FIRES IN RAILWAY-CARS. SAMUEL H. HARMEYER and EDWARD GRAFTEMEN, Columbus, Ohio. Filed Mar. 12, 1887. Serial No. 230,927. (No model.)

Claim.—1. In combination with a reservoir for storing pneumatic force, a conduit leading therefrom and closed by a valve, a derailment-trip arranged so as to open the valve when actuated, a conduit arranged to connect with the first conduit when the valve is opened by the movement of the trip, an extinguisher-tank provided with inlet and outlet passages, and a receptacle for acid interposed between the conduit opened by the movement of the valve and the inlet-passage of the extinguisher-tank, so that the air or gas from the reservoir when released by the tripping of the valve will pass from the first through the second conduit and force the acid into the extinguisher-tank.

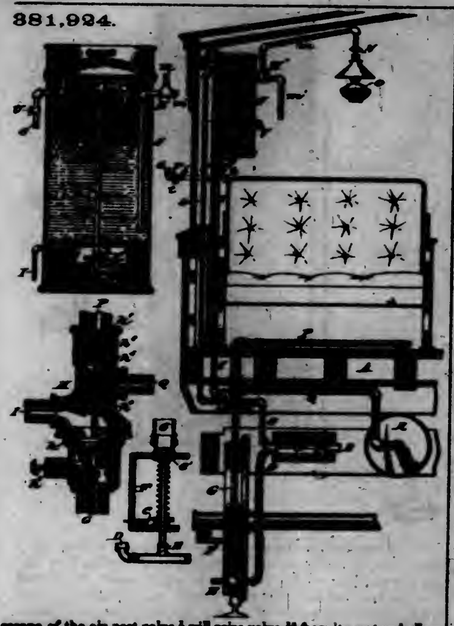
2. In combination with the air-brake system of a railway-car, a conduit leading therefrom and closed by a valve, a derailment-trip arranged to open said valve when actuated, an extinguisher-tank, and a receptacle for acid situated between the tank and conduit, substantially as shown and described, so that the air or gas escaping into the conduit will force the acid into the tank and simultaneously allow the air to escape from the air-brake system.

881,928.

3. In combination with the air-brake system of a railway-car, a storage-tank, G, having a valve, *g*, a conduit, H, leading from said tank and closed by a valve, a derailment-trip arranged to open said valve when actuated, a conduit, I, arranged to connect with conduit H when the valve is opened by the trip, an extinguisher-tank, and an acid-receptacle interposed between the tank and conduit I, substantially as shown and described, so that the escape of air into conduit I will force the acid into the extinguisher-tank.

4. In combination with the air-brake system of a railway-car and a fire-extinguishing tank having inlet and outlet passages, the derailment-trip E, consisting of hollow communicating tubes having the openings *d'* at their upper vertical end, a bracket, D, having a tube, *d''*, a conduit, I, leading from tube *d''* to the extinguisher-tank, and a conduit, H, leading from the brake system into the horizontal arm of trip E, so that when the trip is raised the air from conduit H will pass through the hollow trip into conduit I and thence into the extinguishing-tank.

5. In combination with the air-brake system of a railway-car, a fire-extinguishing tank having inlet and outlet passages and an acid-receptacle interposed in the said inlet-passage, the hollow derailment-trip E, having openings *d'*, the bracket D, having tube *d''*, a conduit, I, leading from tube *d''* to the acid-receptacle, and a conduit, H, leading from the brake system into the horizontal arm of the hollow trip E, all substantially as and for the purpose specified.



6. In combination with the air-brake system of a railway-car, a fire-extinguishing tank, a conduit leading from the brake system to the tank, and an acid-receptacle interposed in said conduit, the cylinder U, opening into the extinguisher-tank, the open air, and the conduit leading from the acid-receptacle, the weighted rod K, having a large valve, R, at its lower end and a smaller valve, T, at its upper end, all substantially as and for the purpose specified.

881,924. DEVICE FOR EXTINGUISHING FIRES AND PREVENTING THE ESCAPE OF STEAM IN RAILWAY-CARS. SAMUEL H. HARMEYER, Columbus, Ohio. Filed Mar. 17, 1887. Serial No. 231,260. (No model.)

Claim.—1. In combination with the air-brake system and steam-heating system of a railway-car, a conduit leading from the brake system and closed by a valve, a derailment-trip connected with this valve so as to open it when actuated, and a valve-chamber, H, connected by one passage with the steam-pipes and by another with the conduit leading from the air-brake system, said chamber having valves A and A^1, a rod, B^1, uniting said valves, and a discharge-orifice between said valves, so that the escape of the air past valve A will raise valve A^1 from its seat and allow the steam to escape.

2. In combination with the air-brake system and steam-heating system of a railway-car, a conduit leading from the brake system and closed by a valve, a derailment-trip connected with this valve so as to open it when actuated, and a valve-chamber, H, connected by one passage with the steam-pipes and by another with the conduit leading from the air-brake system, said chamber having valves A and A^1, a rod, B^1, uniting said valves, a spring-detent, F^1, to prevent the valves from closing, and a discharge-orifice between said valves, so that the

381,924.

escape of the air past valve A will raise valve A^2 from its seat and allow the steam to escape.

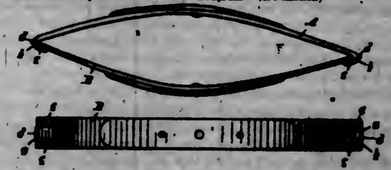
3. In combination with the air-brake system and steam-heating system of a railway-car, a conduit leading from the brake system and closed by a valve, a derailment-trip connected with this valve so as to open it when actuated, and a valve-chamber, H, connected by one passage with the steam-pipes and by another with the conduit leading from the air-brake system, said chamber having valves A and A^2, a rod, A^3, uniting said valves, a tight packing-disk, A^4, separating the air from the steam-passages, a spring-detent, A^5, to prevent the valves from closing, an air-escape passage, I, and a steam-escape passage, Q.

4. In combination with the air-brake system and steam-heating system of a railway-car, a conduit leading from the brake system and closed by a valve, a derailment-trip connected with this valve so as to open it when actuated, and a valve-chamber, H, connected by one passage with the steam-pipes and by another with the conduit leading from the air-brake system, said chamber having valves A and A^2, a rod, A^3, uniting said valves, a tight packing-disk, A^4, separating the air from the steam-passages, a spring-detent, A^5, to prevent the valves from closing, an air-escape passage, I, and a steam-escape passage, Q, and a vessel, R, connected with said steam-passage and filled with absorbent material.

5. In combination with the air-brake system and steam-heating system of a railway-car, a conduit leading from the brake system and closed by a valve, a derailment-trip connected with this valve so as to open it when actuated, and a valve-chamber, H, connected by one passage with the steam-pipes and by another with the conduit leading from the air-brake system, said chamber having valves A and A^2, a rod, A^3, uniting said valves, a tight packing-disk, A^4, separating the air and steam passages, escape-pipes I and Q for air and steam, respectively, and a fire-extinguisher, J, secured to the air-exit pipe I, so that the air, after passing chamber H and releasing the steam, will escape into and actuate the extinguisher.

6. In combination with the air-brake system and steam-heating system of a railway-car, a conduit leading from the brake system and closed by a valve, a derailment-trip connected with this valve so as to open it when actuated, and a valve-chamber, H, connected by one passage with the steam-pipes and by another with the conduit leading from the air-brake system, said chamber having valves A and A^2, a rod, A^3, uniting said valves, a tight packing-disk, A^4, separating the air and steam passages, escape-pipes I and Q for air and steam, respectively, a fire-extinguisher, J, and an cold-receptacle interposed between the extinguisher and air-escape pipe, so that the air after passing chamber H and releasing the steam will force the cold into the extinguisher-tank.

7. In combination with the air-brake system of a railway-car and an extinguisher-tank, a conduit leading from the brake system to the said tank, a valve for closing said conduit, and a derailment-trip arranged to open said valve when actuated, together with a separate conduit leading from the brake system into said tank, and one or more valves in said conduit by which air can be admitted to the extinguisher-tank at will.



8. In combination with the air-brake system of a railway-car and an extinguisher-tank, a conduit leading from the brake system, an anti-receptacle interposed between said conduit and the said tank, a valve for closing said conduit, and a derailment-trip arranged to open said valve when actuated, together with a separate conduit leading from the brake system into said tank, and one or more valves in said conduit by which air can be admitted to the extinguisher-tank at will.

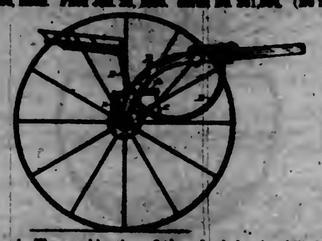
9. The combination, with the air-brake system and steam-heating system of a railway-car, of the reservoir C, connected with the air-brake system, the conduits D and G, the hollow derailment-trip E, connecting said conduits, the valve-chamber H, connected with the conduit G, and having a rod, A^3, and valves A A^2, secured upon said rod, a conduit, F, connecting the valve-chamber with the steam-pipes, a receptacle, R, and steam-escape pipe Q, leading from valve-chamber H to vessel R.

10. The combination of the reservoir C, connected with the air-brake system, the conduits D G, having the derailment-trip E as a connection, the valve-chamber H, having valves A A^2, tight disk A^4, and conduit I, connecting the pipe G with an extinguisher when valve A is opened, all substantially as and for the purpose specified.

11. The combination of the reservoir C, connected with the air-brake system, the conduits D G, having the derailment-trip E as a connection, the valve-chamber H, having valves A A^2 and tight disk A^4, the steam system F, opening into chamber H when valves A A^2 are raised, the conduit I, connecting pipe G with an extinguisher when valve A is opened, and the conduit S, leading direct to extinguisher and having valves t and U, whereby air can be admitted to the extinguisher at will.

381,925. ELLIPTIC SPRING. WILLIAM G. HARRIS, Detroit, Mich., assignor of one-half to the Detroit Steel and Spring Works, same place. Filed Nov. 10, 1887. Serial No. 255,512. (No model.)

Claim.—In an elliptic spring, the combination of the upper main leaf provided with recesses and downturned lips at its ends, said lips being adapted to embrace the shoulders formed upon the main lower leaf and hold such leaf in position, with the lower main leaf provided with shoulders and tongues at its ends, said tongues being on the same curve with the body of the leaf and adapted to enter the recesses in the upper main leaf for the purpose of holding the leaves against lateral displacement, and free to move endwise therein, substantially as and for the purposes set forth.



381,926. BAND-CUTTER. JAMES L. HAMM, Oberlin, Pa. Filed Sept. 3, 1888. Serial No. 283,953. (No model.)

Claim.—1. In a band-cutter, the combination of the cutter-blade having the floating cutting-edges A' A^2 and the stable cutting-edge A^3, adapting it to a thrust and draw cut, with the fork-handle F, the clasp E, the levers C C', and the upper flat securing said clasp and levers to the cutter-blade, whereby the cutter-blade is secured to the fork-handle and prevented from longitudinal and lateral displacement, substantially as and for the purposes set forth.

2. A band-cutter blade formed of two segmental parts united at a common point, a, and provided with cutting-edges upon its upper and lower segmental parts, the interior of said blade being cut away, substantially as and for the purposes set forth.

381,927. TWO-WHEELED VEHICLE. HENRY C. H. HOWARD, Kalamazoo, Mich. Filed Jan. 23, 1888. Serial No. 261,894. (No model.)

Claim.—1. The combination of the wheeled axle, thills having the slots with fulcrum-pins therein, the levers passed through the slot of the thills, a vehicle-body or seat-bars, and the hangers and springs, substantially as set forth.

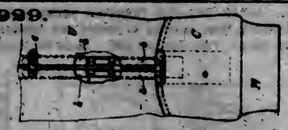
2. The combination of the wheeled axle, body, the fulcrumed levers, the hangers attached at one end to the end of the levers and at the other end to the body, and the spiral springs attached to some suitable connection at one end and to the end of the fulcrumed levers at the other end, substantially as set forth.

3. The combination of a vehicle-body, wheeled axle, thills, the levers having the series of notches and fulcrumed in the slots through the thills, the hangers, and springs, substantially as set forth.

4. The combination of the wheeled axle, thills having the fulcrum-slots, the notched levers in said slots, the fulcrumed body or seat-bars, hangers attached to the body and to the front end of the levers, and spiral springs attached to a projection from the axle at the lower end and to the rear end of the levers at the upper end, substantially as set forth.

5. In a vehicle, the combination of the body fulcrumed at the forward end, the levers transversely to the axle and resting across a suitable fulcrum, said levers being jointedly attached to the body at their forward ends, and springs exerting a resistance against the rise of the rear end of the levers when their forward ends are borne downward, substantially as set forth.

6. In a vehicle, the combination of the body, thills, the fulcrumed levers, the hangers, and springs exerting a resistance against the movement of the levers at each end when the body is borne down, substantially as set forth.



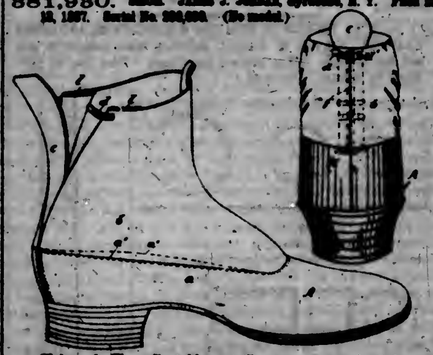
381,928. BIRD-CAGE. WILLIAM HOOF, Baltimore, Md., and HANNA W. HOOF, Philadelphia, Pa. Filed Nov. 22, 1887. Serial No. 255,833. (No model.)

Claim.—1. In egg and fruit carriers, the strips forming the coils suspended from the sides and ends by means of flexible metal strips, constructed as described.

2. In egg and fruit carriers, the sectional trays having two radial sides and the curved sides made conformable to a barrel or any cylindrical package, substantially as described, in combination with coils suspended from the ends and sides by means of metal strips.

381,929. CAN-OPENER. JAMES J. JOHNSON, New York, N. Y. Filed Dec. 6, 1886. Serial No. 220,631. (No model.)

Claim.—In a can-opener provided with a vertical opening, two flexible metal stays, each composed of two parts adapted to slide one upon the other, said stays being pivoted at their lower ends to the plate a and provided at their upper ends with suitable fastening devices, said stays being jointed or otherwise secured within the limits of the sheet at said opening, substantially as described and shown, for the purpose set forth.

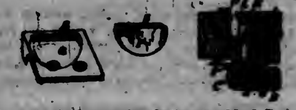


2. In a shoe-fastening device, the attaching-plate a, to which is pivoted the lower ends of the two-part flat metal stays, the parts of both of which are adapted to slide upon each other to compensate for the bending of the shoe in walking, when used in combination with a shoe provided with a vertical opening in the rear of said shoe, and a tongue, T, for the double purpose of assisting in closing said opening and in drawing on the shoe, substantially as described and shown.

3. In a shoe of the class described, the combination of the two-part flexible stays b b and b' b', adapted to slide freely upon each other, pivoted at their lower ends to the plate a and provided at their upper ends with the multiple take-up plate c and spring-stud d, substantially as described.

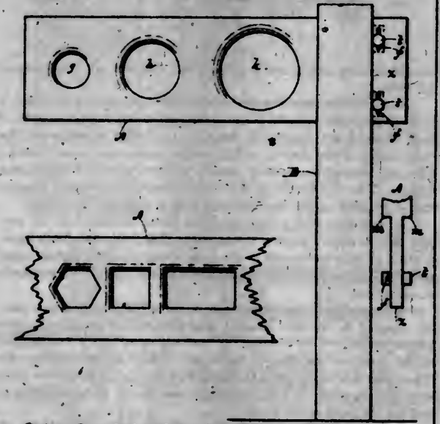
4. In a shoe of the class herein described, provided with a vertical opening in the rear thereof, the combination of stays secured within the folds of the meeting edges of said opening, adapted to yield to the motion of the foot of the wearer, one of said stays being provided with side extensions adapted to fold over and envelop the other stay, the projection b^2, take-up plate c, and stud d, all substantially as and for the purpose set forth.

5. The combination of the flat metal stays b b', provided with extension b^2, projection b^3, said stays being pivoted to the plate a, and provided with clasp c and spring-stud d, substantially as described and shown.



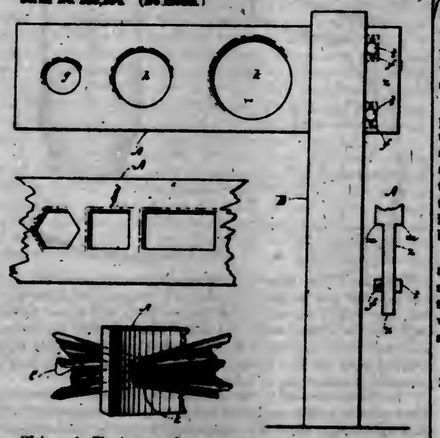
381,930. SHOE. JAMES T. JORMAN, Syracuse, N. Y. Filed May 13, 1887. Serial No. 238,093. (No model.)

Claim.—1. The adjustable metallic stay composed of the parts g g', provided with integral extensions A A, projecting from the lower and upper edges, respectively, of the two parts, and lapped around each other to slide vertically one on the other, whereby the vertical movement of the stay-pieces is determined by the overlapping edges coming when the stay-pieces are extended to the extreme limit of movement, substantially as and for the purpose set forth.



2. The combination of the two stays of adjustable metallic stay-pieces pivoted to the connection N and provided, respectively, with the hinged clasp f and stud e, substantially as and for the purpose set forth.

381,931. PLATFORM-SCALE. WILLIAM G. KELLY, Saratoga, Mich., assignor, by direct and mesne assignments, to Henry Gould, Edward T. Wilcox, and Wickham G. Jackson, same place. Filed Aug. 4, 1887. Serial No. 246,162. (No model.)

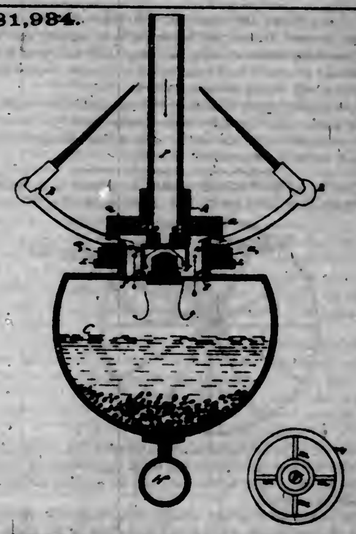


Claim.—In platform-scales, the bearing-block P, the casting Q, attached to the platform and provided with the recess R, to form a bearing for the upper face of block P, in combination with the knife-edge O, which is connected with and operates the scale-beam, the lower face of block P bearing upon the knife-edge O, substantially as described.

881,982. APPARATUS FOR TREATING SKINS. CHARLES M. KENDALL, Haverhill, Mass., assignor to himself and Benjamin Milton Kimball, same place. Filed Dec. 20, 1887. Serial No. 258,352. (No model.)

Claim.—In a device of the character described, the die A, provided with one or more holes and having the tenon *x*, in combination with the standard B, provided with a mortise for receiving said tenon, the keys *f*, passing through said tenon adjacent the outer edge of the standard, and the cross-pins *f'*, passing through said keys, substantially as described.

881,983. PROCESS OF TREATING MOROCCO-SKINS AND OTHER LEATHERS. CHARLES M. KENDALL, Haverhill, Mass., assignor to himself and Benjamin Milton Kimball, same place. Filed Dec. 20, 1887. Serial No. 258,354. (No model.)



Claim.—1. The improved process of treating morocco and other finished skins herein described, the same consisting, essentially, in forcibly drawing the skin successively through two or more holes in a die, said holes being of different sizes, substantially as described.

2. That improvement in the art of treating morocco and other finished skins which consists, essentially, in forcibly drawing the skin through a hole in a die until the grain is broken or disintegrated, substantially as specified.

3. That improvement in the art of treating morocco and other finished skins which consists, essentially, in forcibly and repeatedly drawing the skin through a hole in a die until the grain is broken or disintegrated, the skin being turned or folded differently between the drawings to present it in different positions to the die, substantially as described.

881,984. CARBURETING GAS-LAMP. ARTHUR EISER, Philadelphia, Pa. Filed Oct. 15, 1887. Serial No. 252,425. (No model.)

Claim.—1. In a carbureting gas-lamp, the combination, with the carbureting-vessel, of a supply-pipe having passage-ways in its sides, and a burner-support attached to said pipe and adapted to open and close said passage-ways.

2. In a carbureting gas-lamp, the combination, with a carbureting-vessel, gas-burners, and burner-support, of a valve situated at or near the burner-support and adapted to open and close simultaneously all of the burner passage-ways leading to the carbureting-vessel and to the gas-supply, substantially as described.

3. In a carbureting gas-lamp, the combination, with a carbureting-vessel, a gas-burner, and a burner-support, of a gas-supply pipe terminating in the neck or mouth of the carbureting-vessel, and a valve placed at the termination of said pipe adapted to admit and shut off the gas from said pipe to the gas-burners and carbureting-vessel, substantially as described.

4. In a carbureting gas-lamp, the combination of a gas-supply pipe, a gas-burner, a burner-support internally grooved and screw-threaded, and an asbestus washer placed at end of said groove, with a carbureting-vessel detachably connected to said burner-support by an elongated screw-threaded neck, which engages the similar screw-threads in said groove, and arranged to make a gas-tight joint with the said washer, and a packed joint or stuffing-box attached to the lower end of burner-support, substantially as and for the purpose herein described.

5. In a carbureting gas-lamp, the combination, with a gas-burner and burner-support, of a carbureting-vessel detachably connected to said burner-support by a neck, said neck forming, with its connection to the burner-support, a valve adapted to open and close the passage-ways leading from the burners to the carbureting-vessel, substantially as described.

881,985. FASTENER FOR GLOVES, &c. EDWIN J. ERASMUS, Boston, Mass., assignor to the International Fastening Company, Portland, Me. Filed Nov. 26, 1887. Serial No. 256,203. (No model.)

Claim.—1. A button member consisting of a flexible struck-up flanged stud, A, having two spring-arms, *b b*, and a flat cabochon base, in combination with a collet, B, embracing said base, and a flanged eyelet, C, whereby the eyelet is rounded out against the base of the stud and under the rounded-in edge of the collet, all arranged as and for the purposes substantially as described.

2. An indestructible socket consisting of the combination of a flaring bell-shaped cup, F, and a flanged lip, G, whose upper portion is pressed around the flaring mouth of said cup, substantially as and for the purposes described.

3. In a fastener, an indestructible button-hole member consisting of a dome-shaped cover, E, having a central opening, a flaring bell-shaped cup, F, having an upwardly-projecting tubular portion, *c*, and a flanged lip, G, whose upper portion is pressed around the flaring mouth of said cup, substantially as described.

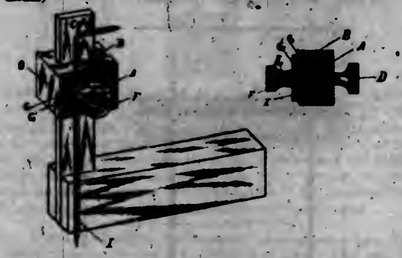
881,986. BOWING FOR HOLDING WATCHES. EDWARD JOHN LOUDON, London, County of Middlesex, England, assignor of one-half to A. J. Loudon & Co., New York, N. Y. Filed Sept. 14, 1887. Serial No. 249,659. (No model.)

Claim.—1. As a new article of manufacture, a strap or band provided with a watch-holder having an opening to permit observation of the time, substantially as set forth.

2. A strap or band provided with a watch-holder having an opening to permit observation of the time, and a fastening for securing said holder in place upon the strap or band, substantially as set forth.

3. A strap or band provided with a watch-holder and a loop, as 12, said watch-holder having an opening to permit observation of the time, and a supplemental strap for engagement with said loop, substantially as set forth.

4. A strap or band provided with a watch-holder having an opening to permit observation of the time, and apertures, as 14 and 15, for the passage of the stem and chain-ring of the watch, substantially as set forth.

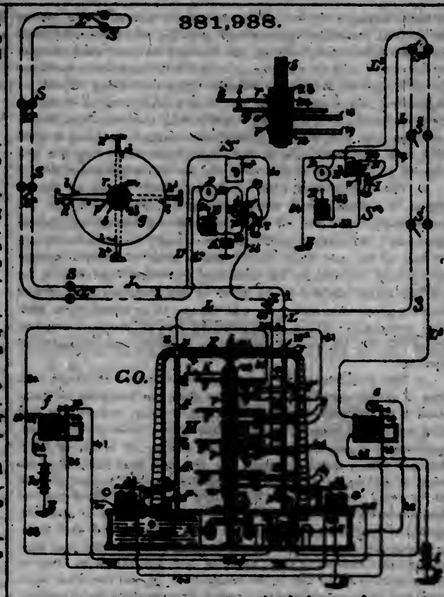


5. A strap or band provided with a watch-holder consisting of a ring tapering from its outer to its inner edge, substantially as set forth.

6. The combination, with a strap or band, of a watch-holder hinged thereto and a fastening device for said watch-holder, substantially as set forth.

7. The combination of the strap 2, perforated, as at 3, at one end and provided with a buckle and loop at the other end, with a watch-holder, 6, provided with a strap, 9, adapted to engage with said loop and buckle, substantially as set forth.

8. The combination of the strap 2 and the watch-holder, the latter provided with a strap, 9, having an extension, 11, substantially as set forth.



881,987. SURFACE-GAGE. EDWIN LESLEY and CHARLES H. PERRY, Prospect, Ill. Filed Mar. 5, 1887. Serial No. 229,794. (No model.)

Claim.—1. The plane-faced block A, provided with the plane-faced slot B and set-screw D, adapting it to be secured upon a flat bar, in combination with a gage-rod adjustably clamped upon one side of said block and movable only in a plane parallel to said slot, whereby the implement may be readily secured upon a try-square blade or may be used alone with either of its faces serving as the base or working-face.

2. In an implement of the class described, the combination, with a block having a plane face and a slot or groove whose sides and bottom are all plane perpendicular to said face, of a set-screw adapted to secure a flat bar in said slot, and a gage-rod adjustably clamped upon one side of said block, substantially as and for the purpose set forth.

881,988. SYSTEM OF TELEPHONIC INTERCOMMUNICATION. JOHN A. HOYT, Hartford, Mass. Filed July 6, 1887. Serial No. 243,208. (No model.)

Claim.—1. The hereinabove-described improvement in connecting apparatus for automatic telephone-exchanges, comprising a series of disks, one for each line, carried upon a single rotating shaft, a series of rotating arms normally engaged by the said disks and rotating therewith, each of the said arms constituting the terminal of a telephone-line, a series of lifting-rods, one for each line and connected by branch circuits with said lines, disposed around the central shaft and provided with projecting arms equal in number to the number of disks, and a single electro-magnet controlling each of the said lifting-rods and adapted, when energized, to move the said rod longitudinally, whereby the rotating line terminal at the time opposite any one of the projecting arms of the said rod may be engaged, lifted from its disk engagement, and electrically connected with the line represented by said lifting-rod, substantially as and for the purpose described.

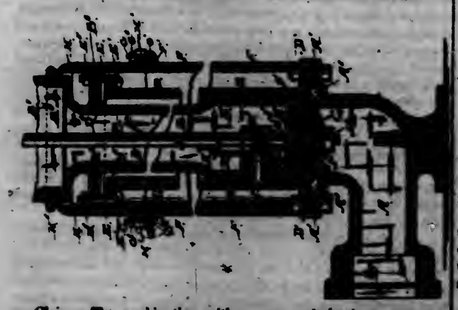
2. The combination, in an automatic telephone-exchange system, with a series of telephone-lines centering at a common station, a relay included in the circuit of each line, and a single electro-magnet for each line in a local circuit controlled by said relay, of an automatic connecting apparatus comprising the following instrumentalities: a shaft constantly revolved by a suitable motor, a series of disks mounted thereon rigidly, but insulated therefrom, a series of rotating conducting-arms, each constituting a line terminal mounted loosely upon the said shaft at different points of the periphery thereof and normally participating in the movement thereof by engagement with the said disks, each line being provided normally with a continuation through one of the said disks, and a series of lifting-rods arranged parallel to the said shaft, (one for each line and each connected by a branch circuit with its own line,) provided with projecting arms, one opposite each revolving disk and capable of longitudinal motion, the said rods being each controlled by the local magnet of its own line and adapted, when actuated thereby, to move longitudinally in its bearings and to engage by means of its projecting arms any predetermined terminal arm, thus disconnecting the main line, represented by said arm, from its normal continuation and connecting it through the said lifting-rod to the circuit represented by said rod, substantially as specified.

3. The combination, in an automatic telephone-exchange system, of a series of telephone-lines centering at a common station and radiating therefrom each to one or more sub-stations, and an indicating-dial and circuit-changer at each sub-station, as described herein, with an automatic connecting apparatus at the central station comprising the following instrumentalities: a relay in the main circuit of each line adapted to respond to the operation of the sub-station circuit-changer, a single electro-magnet in a local circuit for each of the said relays and controlled thereby, the longitudinally-movable lifting-rods 15, each connected by a branch with one of the lines actuated by said magnets and each having a series of projecting arms equal in number to the lines of the system, the vertical shaft 5, carrying the disks *g*, and the rotating arms 4, each constituting the terminal of a line and normally rotating with the said disks and shaft, but mounted at different points of the periphery of the latter and adapted to be engaged by one of the projecting arms of the said lifting-rods when actuated by the electro-magnet, whereby the line terminated by said rotating arm may be disconnected from its normal continuation through the disk and connected with the line represented by the lifting-rod, as described.

4. The hereinabove-described appliance for the automatic interconnection of electric lines at a central exchange, consisting of the vertical shaft 5, covered with the insulating-sleeve 22, and maintained in motion by the motor M, the disk *g*, rigidly mounted thereon but insulated therefrom, and each forming the terminal of a normal continuation of one of the main circuits, the rotating arms 4, loosely mounted on the said shaft on different horizontal planes and at different points of the periphery of said shaft and insulated therefrom, each arm forming the terminal of one of the main lines, the said arms being each

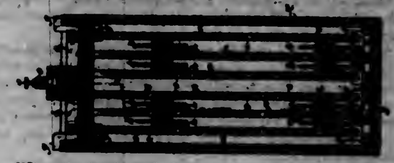
normally engaged by one of the said disks, maintained in motion thereby and connected therethrough with the said circuit combination, the vertical lifting-rods 15, one for each line, and each electrically connected with its own line, provided with the arms *a*, one opposite each disk of the series, the said lifting-rods being capable of longitudinal movement, and the said arms *a* being adapted to engage any predetermined rotating arm *k* and to raise the same from its normal connection with the disk *g*, the electro-magnets actuating the said lifting-rods, and relays, one in each loop-circuit, controlling the said magnets, all combined as described, and for the purposes specified.

5. The combination, with a relay in a main circuit, an electro-magnet in a local circuit controlled thereby, and an armature and armature-lever therefor, of a vertical rod capable of longitudinal movement in its bearings and forming a normally-disconnected branch terminal of the said main circuit, and a series of terminal springs representing, respectively, and connected with other main circuits, the said rod being adapted to be lifted by the armature-lever of said electro-magnet when energized, and thereby to be brought into electrical connection with a predetermined one of the said terminal springs for the purpose of establishing through communication, as described.



6. The combination, in an automatic telephone-exchange, of a series of spring-arms forming telephone main-line terminals, all maintained in rotary motion, so as to pass a given point successively, and being maintained normally in connection with a series of circuit continuations by engagement with an equal number of revolving disks, combined with a series of relays, one for each line, included in the circuit of said main lines, a series of electro-magnets in local circuits, one for each line, controlled by the said relays, and armatures and armature-levers therefor, and a series of vertical rods, one for each line, capable of longitudinal movement in their bearings, and each forming a normally-disconnected branch terminal of one of the said main lines, the said rods being each actuated and adapted to be lifted by the armature-lever of the electro-magnets of its own line when energized, and being provided with a series of projecting arms extending, when the rod is lifted, into the path of the rotating spring-arms, whereby the said rods may be caused to connect with any of the said spring-terminals (each in its own time) and to disconnect the same from its normal continuation for the purpose of establishing through connection, substantially as described.

381,939. TIES-SHEARER. JOSEPH D. MCGEE, Quigley, Ga. Filed Sept. 17, 1887. Serial No. 249,982. (No model.)

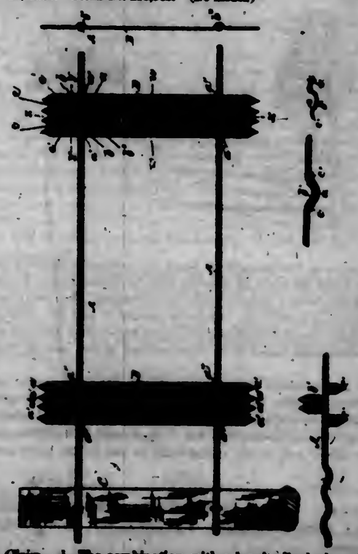


Claim.—The base C, having upright A, in combination with the grasping-arms D, the actuating-lever E, the pin E, and the slotted plate G, the whole co-operating as herein shown and described.

381,940. FIRE-HYDRANT. ALBERT H. HILLIER, Reading, Pa., assignor to the Hilliers Foundry and Machine Company, (Limited), same place. Filed July 15, 1885. Serial No. 172,324. (No model.)

Claim.—The combination, with a goose-neck having a recess on its upper face, a flange, A', and a foot-joint dowel in said recess, of a stand-pipe bolted to the goose-neck and overlapping the foot-joint, a hydrant located in the stand-pipe and having a flange, B', a flange, B'', on the upper end of the stand-pipe, bolt-and-nut connections between the flanges, said hydrant having an abutment, B''', a valve-seat fitting against said abutment, a fitting to hold the valve-seat in place, a valve, and a front-case of two sections removably secured together and inclosing the stand-pipe and hydrant, substantially as set forth.

381,941. SECONDARY BATTERY. ABRAHAM V. HEDGES, New York, N. Y. Filed Nov. 23, 1887. Serial No. 255,677. (No model.)



Claim.—1. An electrode for secondary batteries, consisting of a plurality of plates of lead or other suitable material placed face to face in close contact, each plate being provided with funnel-shaped perforations which flare in opposite directions, substantially as described.

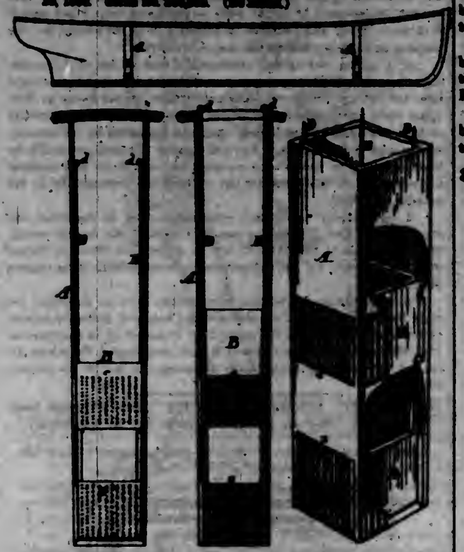
2. In a battery-cell, the combination, with a plurality of plates forming the positive electrode, of an insulating-prop, *f*, for grasping and supporting the edges of said plates, and cut away so as to be out of contact with the plates of the other electrode, substantially as described.

3. A battery-cell provided with independent insulating-props *f*, for grasping and supporting the edges of the plates forming the two electrodes, the prop for each electrode being cut away so as to be out of contact with the other electrode, substantially as described.

4. The combination, with the plates *a*, forming the positive and negative electrodes, of the feeders A, provided with the disks *k*, of insulating material, substantially as described.

381,942. FENCE. FRANCIS MEEK, Brooklyn, N. Y. Filed May 27, 1887. Serial No. 239,512. (No model.)

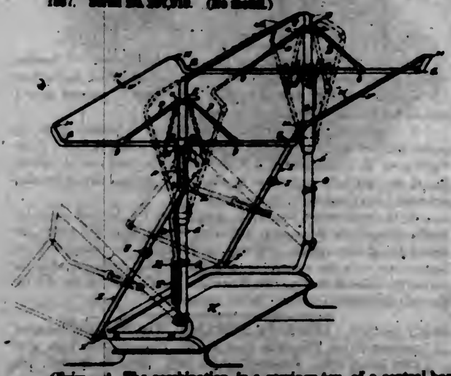
Claim.—1. The combination, with a longitudinal wire, of pickets having slits *a*, perforations *b*, and grooves *a' b'*, for the passage and attachment of the wire, substantially as and for the purposes herein set forth.



2. A fence composed of longitudinal wires and sheet-metal pales, the latter having three or more terminal fingers, each formed with a cross crimp or groove on alternate sides, and a wire or wires laid between said fingers and bound within the groove of each finger, substantially as described, for the purposes specified.

3. A fence composed of sheet-metal pales and longitudinal wires, the said pales corrugated transversely, having three or more terminal fingers and a cross groove or crimp formed on alternate sides of said fingers, and the said wires having curves *a*, conforming with the corrugations of the pickets and bound alternately between the said fingers

within the cross-grooves, substantially as described, for the purposes specified.



4. A cross-metal pickets for fences, having staples or wires terminal fingers, each formed of or many their bars with a cross groove or crimp, the outer fingers having the grooves or crimp on the same side and the intermediate finger or fingers having the groove or crimp on the opposite side, as shown, and for the purposes stated.

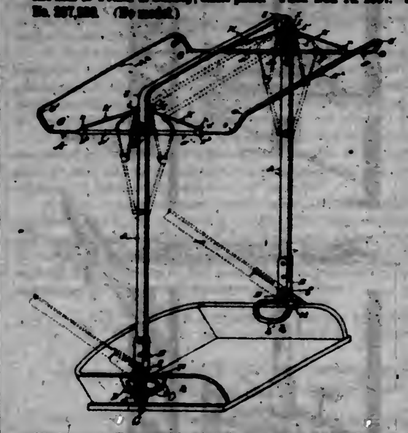
381,943. BOAT. JAMES HOGGAN, Cleveland, Ohio. Filed Feb. 28, 1888. Serial No. 265,956. (No model.)

Claim.—The improvement in ships, consisting in the combination of the casing A, secured between the deck and the bottom of the hold, said casing having the slotted or grated openings *b c* in its sides at and near the bottom, and provided with the valve B, playing inside of the casing for closing the said slots when down, and having the middle openings, whereby when raised by the rods D from openings are made through the slots or gratings, communicating with the interior of the vessel, substantially as described, and for the purpose specified.

381,944. FOLDING CARRIAGE-TOP. JAMES HOGAN, Corry, Pa., assignor of one-half to Frank S. Bentley, same place. Filed Dec. 14, 1887. Serial No. 257,910. (No model.)

Claim.—1. The combination, in a carriage-top, of a central bow hinged to a rabbet, having side-bows secured thereto by means of sliding sleeves and braces, and braces hinged to the back of the rabbet-seat and to said sliding sleeves, substantially as and for the purposes set forth.

2. The combination, in a carriage-top, of a central bow hinged to the front of the seat, with front and back horizontal bows hinged to sleeves adapted to slide up and down on said central bow, and braces hinged to the central and front and back bows above said sliding sleeves, with hinged angle-braces extending from said sliding sleeves to stud-pins on the back of the rabbet-seat, said braces hinged to said angle-braces and to stud-pins in the central bow, A, substantially as and for the purposes set forth.

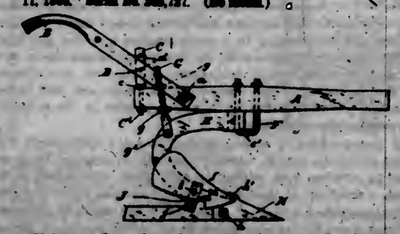


3. The combination, in a carriage-top, of the upright central bow, A, hinged to the seat E, with the horizontal bows F and F' hinged to the sliding sleeves E, and the braces D D and braces I and O, substantially as and for the purposes set forth.

4. In a carriage-top, the combination of the upright bow A with bows F F, having curves G and H thereto, so as to conform to the contour of the top, substantially as and for the purposes set forth.

5. The combination, in a carriage-top, of the upright bow A, the bows F F, hinged to the sleeves E, and the braces D, the braces I, and the slotted braces O with the hooks S and stud-pins T on the sleeves E, substantially as and for the purposes set forth.

6. The combination, in a carriage-top, of the braces I with the braces O for folding together and lowering a carriage-top, substantially as set forth.

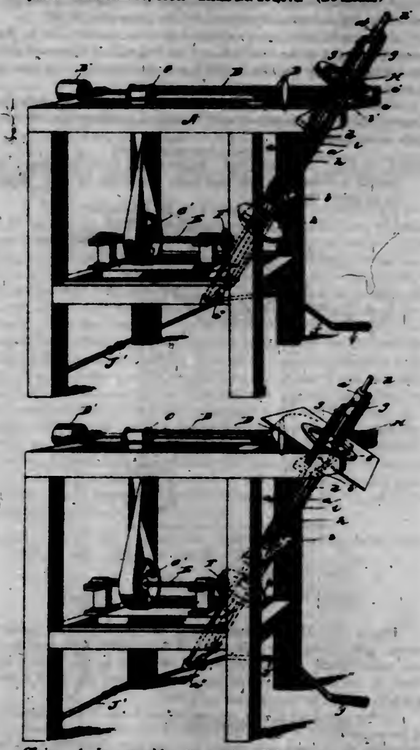


381,945. CARRIAGE-TOP. JAMES HOGAN, Corry, Pa., assignor of one-half to Frank S. Bentley, same place. Filed Dec. 14, 1887. Serial No. 257,911. (No model.)

Claim.—1. The combination, in a carriage-top, of the upright central bow, A, with the side bows, N N, provided with sockets *n*, and connected by a hinge, M, sliding vertically on the bow A, the braces K, the rods N', screwed into sockets *n*, and the hook *l*, substantially as and for the purposes set forth.

2. The combination, in a support for the bows of a carriage-top, of the segments of a circle, D, secured to the vehicle by means of a projection, H, thereon, and having the bearings F therein, and the serrations *d*, with bow-sockets B, having the slots C, the pins E, and an opening on one side for the passage of said projection H, and the set-screws G, substantially as and for the purposes set forth.

381,946. PLOW. FRANZ RUDOLPHAM, Fintonia, Tex. Filed Feb. 11, 1888. Serial No. 263,727. (No model.)

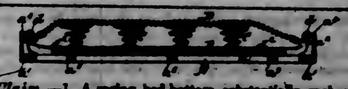


Claim.—1. In a plow, the combination, with the plow-beam, of the staple F, secured to the plow-beam, the curved shank B, provided at its upper front end with the triangular loop *c*, having notches *f* on the lower edge, which engage with the said staple, the bolt G, pivoted in the said plow-beam and connected to the rear portion of the shank under the handles, and the blades secured to the lower front end of shank under the staple, substantially as and for the purpose set forth.

2. In a plow, the combination, with the plow-beam, of the staple F, secured to the plow-beam, the curved shank B, provided at its upper front end with the triangular loop *c*, having notches *f* on its

lower edge, which engage with the said staple, the screw-threaded bolt G, pivoted in the said plow-beam and provided with the adjusting-nuts g, the pin g', pivoting the lower end of said bolt to the rear portion of the shank under the handles, and the blade secured to the lower front end of the shank under the staple, substantially as and for the purpose set forth.

881,947. MACHINE FOR CUTTING DISKS FROM WOOD. CHAS. H. PHELPS, Chicago, Ill., assignor to Gibson, Parish & Company, same place. Filed Feb. 28, 1888. Serial No. 264,972. (No model.)



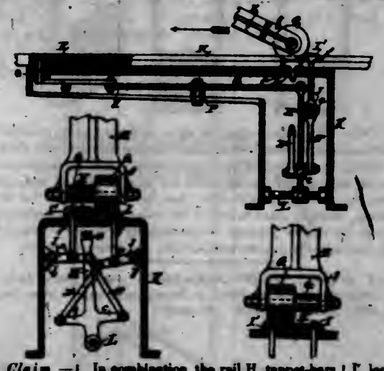
Claim.—1. In a machine for cutting disks from wood, the combination, with a rotatable shaft carrying a concave saw, and a second rotatable shaft carrying a bevel-gear, the position of the saw and bevel-gear with relation to each other being such that a line joining them will form an acute angle with the shaft carrying the saw, of a rotatable and longitudinally-movable shaft parallel to said line and opposite the ends of the shafts, actuated in one direction by spring-pressure and provided with a clamp-plate and beveled gear, a frame longitudinally movable co-operating by a spring-pressure with the said shaft and carrying a shaft in line with the first-named longitudinally-movable shaft, provided with a clamp-plate contiguous to and coacting with the clamp-plate of the other shaft, said frame and shaft having mechanism provided for forcing them in opposition to the spring action, substantially as set forth.

2. In a machine for cutting wooden disks, the combination, with the saw D and the gear F, rotatably mounted on separate shafts and occupying positions with relation to each other, substantially as described, of the frame H, shaft *d* within said frame, having thereon gear *h* and clamp-plate *c*, a shaft, *d'*, supported in the frame in alignment with shaft *d* and having provided at its end the clamp-plate *c'*, springs for actuating the frame and shaft in one direction, and a treadle, J *j*, for operating the frame and shaft in opposition to the spring.

3. In a disk-cutting machine, the combination of shaft B, concave saw D, shaft E, beveled gear F, inclined frame H, shafts *d* and *d'*, clamp-plates *c* and *c'*, respectively, on said shafts, beveled gear *h* on shaft *d*, springs *g g* and J, and treadle J, substantially as set forth.

881,948. BED-BOTTOM. WILLIAM I. PHELPS, Brooklyn, N. Y., assignor to Charles F. Phillips, same place. Filed June 22, 1886. Serial No. 206,267. (No model.)

881,948



Claim.—1. A spring bed-bottom substantially such as herein designated, consisting of a series of spiral springs secured at their lower ends to a rigid base and having free lateral movement within proper limits at their upper ends, and a covering or mat resting loosely upon and supported by but not connected with the said springs, but held against displacement bodily by loose couplings or links which permit it to move freely and conform to pressure in all directions, for the purpose and substantially in the manner described.

2. A spring bed-bottom substantially such as described, consisting of a series of spiral springs secured at their lower ends to a rigid base and having free lateral movement within proper limits at their upper ends, and a covering or mat of woven-wire cloth, substantially such as described, resting loosely upon and supported by but not connected with the said springs, but held against displacement bodily by loose couplings or links which permit it to move freely and conform to pressure in all directions, for the purpose and substantially in the manner described.

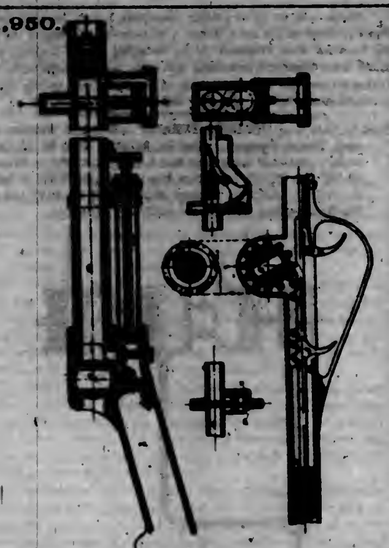
3. In a spring bed-bottom substantially such as described, the combination, with the rigid woven-wire base B, the loosely-resting series of springs C, and cover or mat D, of the rigid frame A, formed with the supports *a a*, for the purpose and substantially in the manner described.

4. In a spring bed-bottom substantially such as described, the rigid frame A, formed of the side and end bars, *a a'*, united by corner-pieces a^2 a^2, formed with the supports a^3 a^3 and a^4 a^4, in combination with the base B, springs C, cover D, and couplings *d*, the whole arranged and operating substantially in the manner and for the purpose described.

881,949. AUTOMATIC CAR-SWITCH. JAMES R. PETTEE, Providence, R. I. Filed Oct. 14, 1887. Serial No. 252,302. (No model.)

Claim.—1. In combination, the rail H, tappet-bars I I', located upon opposite sides of the rail, levers J J, pivoted to the tappet-bars I I', upright lever M, connecting-rods N N, lever O, pivoted arm Q, and switch-bar R, substantially as described.

2. In combination, the rail H, tappet-bars I I', located upon opposite sides of the rail, levers J J, pivoted to the tappet-bars I I', upright lever M, connecting-rods N N, lever O, pivoted arm Q, switch-bar R, and the bell-crank lever E, adapted to depress one of the tappet-bars I I', substantially as described.



3. In combination, the rail H, tappet-bars I I', located upon opposite sides of the track, one extending higher than the other, the switch-bar R, the system of levers, as described, for connecting the tappet-bars with the switch-bar, and the lever E, provided with the reversible roller G, having two diameters, substantially as and for the purpose specified.

881,950. PNEUMATIC ORDNANCE. HAZ. W. PRATT, Brooklyn, assignor to the Pneumatic Dynamite Gun Company, New York, N. Y. Filed Jan. 4, 1886. Renewed Sept. 29, 1887. Serial No. 251,082. (No model.)

Claim.—1. A gun-barrel provided with a valve for closing the bore situated forward of the charge-chamber thereof and actuated by the passage of the projectile past a predetermined point in the barrel beyond the valve.

2. The combination, in a gun, of the barrel provided with a firing mechanism, and a valve for closing the bore situated forward of the charge-chamber thereof and actuated by the passage of the projectile past a predetermined point in the barrel beyond the valve.

881,950.

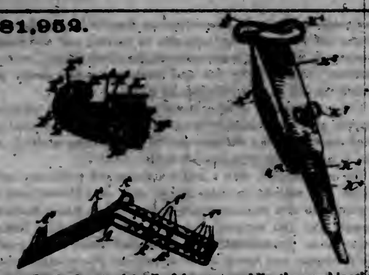
3. A pneumatic gun containing the following elements: a pressure-reservoir communicating with a barrel by means of an interposed firing-valve, a cut-off valve situated in the barrel forward of the charge, and a pump communicating with the barrel and pressure-reservoir.

4. In a pneumatic gun, and in combination with the firing-valve thereof, having a gear-wheel upon its shaft, a reciprocating interrupted toothed rack-bar intermittently acting on such gear-wheel when moved in either direction, substantially as described.

5. A pneumatic gun provided with a pressure-reservoir communicating directly with the barrel, and with a pump or compressor and the barrel through a separate passage fitted with suitable check or stop valves.

881,951. FIRE-KINDLER. JAMES RANDALL, San Francisco, Cal. Filed May 12, 1888. Serial No. 273,515. (No model.)

Claim.—The combination, with a series of parallel laths arranged in tiers and leaving spaces between them, of the parallel laths C, arranged diagonally with relation to the laths A B, plait F, passing through the several tiers, the binding-strips E E' between each tier of laths, and the inflammable strips G G', secured between each tier of laths by the plait F, as set forth.



881,952. HARNESS-SADDLE. GEORGE RAST, Salem, Ohio. Filed Oct. 24, 1887. Serial No. 253,327. (No model.)

Claim.—1. In the herein-described harness-saddle tree, the combination of the upwardly-projecting flanges running the full length of the tree, with a series of cross-bars or bridges at the lower ends thereof, substantially as shown and described.

2. The herein-described harness-saddle tree, provided with the projecting flanges running the whole length of the tree, the series of cross-bars or bridges forming the ended ends, and the square central hole between the flanges, substantially as shown and set forth.

3. In the herein-described harness-saddle, the interchangeable or convertible climbing flexible point-piece B, constructed as hereinbefore described, for the purpose of forming two different grades of harness-saddles, as set forth.

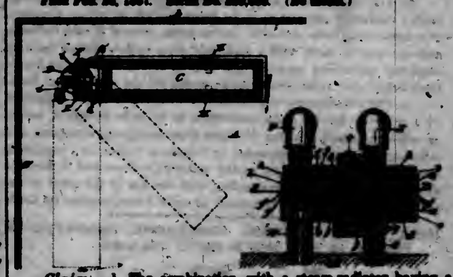
881,952.

4. In the herein-described harness-saddle, the combination of the pad-leather casing, the hame-leather for the hay or bead, and the bead-casing, all sewed together and rolled upwardly and inwardly to form the hay bead or welt, substantially as shown and described.

5. In the herein-described harness-saddle, the combination of the cast-metal tree A, the convertible climbing flexible point-piece B, the pad-leather E, the hame-leather E', and the bead-casing F, substantially as shown and described.

6. In the herein-described harness-saddle, the combination of the cast-metal tree A, the convertible climbing flexible point-piece B, the pad-leather E, the hame-leather E', the bead-casing F', the rattan bead F², the skirt K^6, the jockey K', the looking-loop K^5, and the shaft-bearer K^3, substantially as shown and described.

7. In the herein-described harness-saddle, the combination of the cast-metal tree A, the convertible climbing flexible point-piece B, the skirt K^6, with its tongue-piece K^{10}, the shaft-bearer K^3, and the looking-loop K^5, substantially as shown and described.



8. In the herein-described harness-saddle, the combination of the cast-metal tree A, the convertible climbing flexible point-piece B, the pad-leather E, the hame-leather E', the bead-casing F', the rattan bead F², the skirt K^6, with its tongue-piece K^{10}, the shaft-bearer K^3, the looking-loop K^5, the jockey K', the terrets K^7, the pad-stops K^8, and the saddle-cast K^9, substantially as shown and described.

881,953. ELECTRIC FISH-BOLSTER. CHARLES W. BRITTAIN, Bedford, Ohio. Filed July 13, 1887. Serial No. 244,093. (No model.)

Claim.—The herein-described improved therapeutic pen-holder, consisting of a shaft having the electrodes or plates *a* and *a* arranged and secured on opposite sides thereof, and an insulating material interposed between the plates and the pen-holder, as set forth.

881,954. STEAM-RADIATOR. STEPHEN B. BROWN, Saratoga Springs, N. Y., assignor of one-half to Edmund S. Brown, same place. Filed Feb. 20, 1887. Serial No. 228,020. (No model.)

Claim.—1. The combination, with a steam-radiator having a steam delivery or supply pipe and an exhaust or water-return pipe, and the stationary steam-supply pipe and stationary exhaust or water-escape pipe, of a swivel-joint connection composed of a stationary piece and a rotary piece which are connected by a pivot-bolt, one of said pieces containing a circular or ring-form steam-chamber and a circular or ring-form water-chamber, which are so arranged as to communicate, respectively, with the said two sets of steam-delivery and water-return pipes, whereby the said swivel-connection will adapt the radiator to be turned horizontally at will in either direction and permit the delivery of live steam to the radiator and a discharge from the latter of the exhaust or water from the condensation of the steam, substantially as and for the purpose set forth.

2. The combination, with a stationary steam-supply pipe and a stationary exhaust or water-escape pipe, and a steam-radiator which has one of its ends free to be moved horizontally in either direction,

of the swivel-joint device D, constructed as described, and adapted to support the end of the radiator opposite its moving end and connect its steam-supply pipe and water-escape pipe, respectively, with the said stationary steam-supply pipe and stationary water-escape pipe, substantially as and for the purposes set forth.

3. The combination, with a steam-radiator and the stationary steam-supply pipe and stationary water-pipe, of the swivel-joint connection at one end of the radiator and the supporting-wheel H, substantially as and for the purposes set forth.

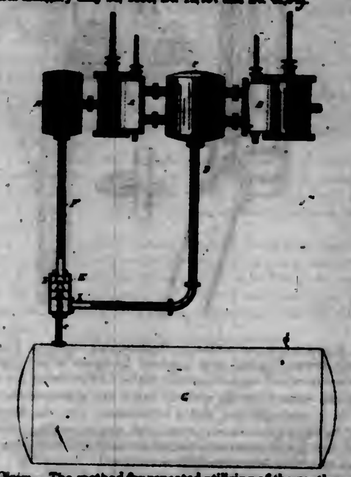
4. The combination, with a steam-radiator and stationary steam-supply pipe and exhaust or water-escape pipe, of a swivel-joint connection composed of a stationary piece connected with said stationary steam-supply pipe and exhaust or water-return pipe, and a horizontally-rotary piece pivoted with said stationary piece, and connected with the live-steam and return-water or exhaust pipe of said radiator, whereby the radiator can be turned at will from one situation to another without uncoupling the said steam-supply and exhaust pipes from the corresponding pipes in the radiator, substantially as and for the purposes set forth.

381,955. RADIATOR. STEPHEN H. REMSEN, Saratoga Springs, N. Y., assignor of one-half to Edmund G. Remsen, same place. Filed Oct. 13, 1887. Serial No. 252,703. (No model.)

Claim.—1. The combination, with a steam-radiator and a stationary pipe for communicating with said radiator, of a swivel-joint connection at or near one end of the radiator and between it and said pipe, so as to support one end of said radiator and allow the body of the latter to be turned horizontally in either direction, and a support to the opposite end of the same, substantially as and for the purposes set forth.

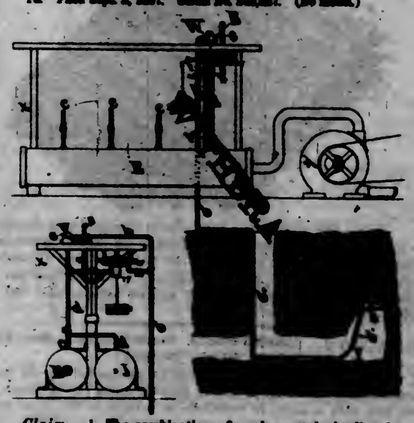
2. The combination, with a swivel or flexible joint connection, of a radiator which will support one end of the same and allow it to be moved horizontally in either direction, and a supporting wheel or roller, one or more, secured to the free end portion of said radiator, of a segmental way of hard or unyielding material and having a uniformly even roller-track surface, and secured to the floor in line corresponding with the line of track of said wheel or roller, substantially as and for the purposes set forth.

3. The combination, with a radiator which is pivoted or jointed with a stationary pipe, so as to be turned at will in either direction, of a supporting roller or wheel, one or more, secured to said radiator, and the way G, made with a uniformly even surface and of hard or relatively unyielding material, and secured to the floor in the line of the track of said roller, substantially as and for the purposes set forth.



4. The combination, with a radiator which has one end supported by a swivel or flexible joint connection, so as to be turned or moved at will horizontally in either direction from said joint-connection, and which has its free end supported by wheels or rollers, of a segmental way made of a relatively unyielding material, and secured to the floor of the room on a line corresponding with the line of the track of the said supporting-wheels, substantially as and for the purposes set forth.

381,956. VELOCIPEDE. JULIUS SCHMIDT, Chippewa Falls, Wis. Filed Sept. 14, 1887. Serial No. 249,711. (No model.)



Claim.—In an ice-or similar velocipede, a main frame, a swinging frame pivoted to the main frame, a traction-wheel hung in the swinging frame, a lever attached to the swinging frame, a spring secured to the main frame and extending upwardly, and an adjustable tension device secured to the upper ends of the lever and spring, the parts in combination, for the purposes substantially as set forth.

381,957. UTILIZING EXHAUST. WERNER SIEMENS, Halske-stadt, Prussia, Germany. Filed Oct. 6, 1887. Serial No. 251,893. (No model.) Patented in Germany May 6, 1885, No. 34,393; in France May 16, 1885, No. 167,616; in Belgium May 19, 1885, No. 68,899; in Italy May 31, 1885, No. 18,372; in England May 20, 1885, No. 6,197, and in Austria-Hungary May 30, 1885, No. 19,127 and No. 41,045.

Claim.—The method for repeated utilizing of the partly-expanded exhaust-steam of a compound or receiver steam-engine, consisting in first leading the exhaust-steam of the high-pressure cylinder or cylinders into a receiver-vessel, from whence it is partly guided off into the low-pressure cylinder of the compound or receiver steam-engine, and partly it is driven by the steam of a generator, by means of an injector, back into the high-pressure cylinder for working in the same, substantially for the purpose as described.

381,958. SIGNALING APPARATUS. THOMAS SHAW, Philadelphia, Pa. Filed Sept. 2, 1887. Serial No. 248,627. (No model.)

Claim.—1. The combination of a mine, a tube leading from a chamber thereof to a terminal station, an air-exhauster and air-pressure device at such station, and a valve controlling the communication between said tube and the exhauster and pressure devices, substantially as described.

2. The combination, with a pipe leading to a mine-chamber and with an exhauster communicating therewith, of an alarm communicating with the inner end of said pipe, a second alarm near the outer end communicating with an air-tank through a pipe provided with a valve, and a valve-shifter connected with said valve and in line with the communication between the mine-pipe and exhauster, substantially as described.

3. The combination, with the mine-pipe *b*, alarms B C at the terminal station and in the mine, respectively, and air-pressure and exhaust-pumps with connections with the pipe *b*, of a valve controlling the flow of air between the exhaust-pump and said pipe and between the pressure-pump and the alarm B, substantially as described.

4. The combination, with the mine-pipe *b*, alarms B C at the terminal station and in the mine, respectively, an air-pressure and exhaust-pumps, of reservoirs or tanks connected with said pumps, and a valve controlling the communication between the exhaust-tank and mine-pipe and between the pressure-tank and pipe and also with the alarm B, substantially as described.

5. The combination, with the mine-pipe and pump connected therewith and with the alarm at the station end of the pipe, of a chamber communicating with the pipe and provided with a diaphragm, and connections between the diaphragm and the alarm whereby the latter is sounded on the movement of the diaphragm under the variation of pressure in the pipe, substantially as described.

6. The combination, with a tube leading to a mine, exhaust-pump connected with said tube and with a chamber covered by a diaphragm, a whistle, a valve controlling the passage to the whistle from a reservoir, of air under pressure, and a connection between the valve and the diaphragm, and means for interrupting the flow of air through the mine-tube, substantially as described.

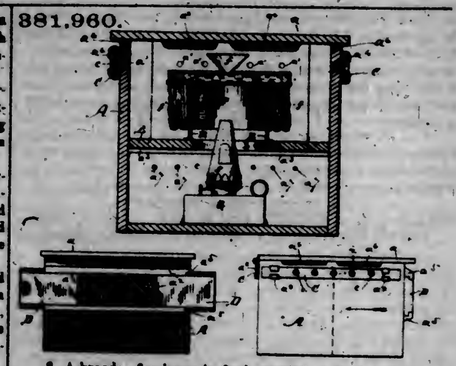
7. The combination of the whistle above ground, a whistle in a mine-chamber, connecting tubes and pump for controlling the flow of air through the mine-tube, a valve for controlling the flow of air to the whistle above ground, a diaphragm in a chamber communicating with the mine-tube and connected to said valve, and a hand-valve constructed to open and close the communication between the exhaust-pump and the mine-tube and also between the exhaust-pump and the chamber covered by the diaphragm, substantially as described.

8. The combination, with a tube leading from a mine-chamber to an outer station and with a pump controlling the flow of air through said tube, of a valve at the inner end of the pipe and a signal at the outer end, and a chamber communicating with the tube and having a movable diaphragm connected to operate said signal, substantially as described.

381,959. PAPER-FILE. ALEXANDER B. SHERWOOD, Chicago, Ill. Filed Feb. 23, 1887. Serial No. 228,670. (No model.)

Claim.—1. In a paper-file, the combination, with the base A and receiving-wire C, of an arched removable transfer-wire, G, and a socket, D, to receive the lower portion of the transfer-wire, and provided with a set-screw, E, substantially as and for the purpose set forth.

2. In a paper-file, the combination, with the base A and receiving-wire C, of an arched removable transfer-wire G, flattened toward its lower end, and a socket, D, to receive the lower portion of the transfer-wire, and provided with a set-screw, E, substantially as and for the purpose set forth.



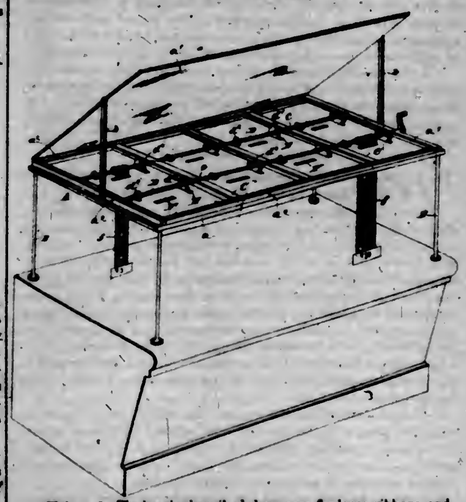
3. In a paper-file, the combination, with the base A and a receiving-wire, C, of an arched removable transfer-wire, G, square toward its lower end, and a socket, D, corresponding internally with the shape of the square portion of the transfer-wire, and provided with a set-screw, E, substantially as and for the purpose set forth.

4. In a paper-file, the combination, with the base A and receiving-wire C, of an arched removable transfer-wire, G, and a socket, D, to receive the lower portion of the transfer-wire, and provided with a lateral leg, *g*, having a screw-threaded opening containing a set-screw, E, substantially as and for the purpose set forth.

381,960. POULTRY-BROODER. GEORGE S. STRONG, Darlington, Ohio. Filed Feb. 9, 1888. Serial No. 263,553. (No model.)

Claim.—1. A brooder for domestic fowls, consisting of a box, A, having lid *a*, exit-orifices a^2, air-orifices a^7, a platform, B, having orifice *b*, slides D, a cylinder, E, a boiler, F, having funnel *f*, and a lamp, G, having flue *g*, the whole constructed and arranged as hereinbefore described, for the purposes set forth.

381,960.



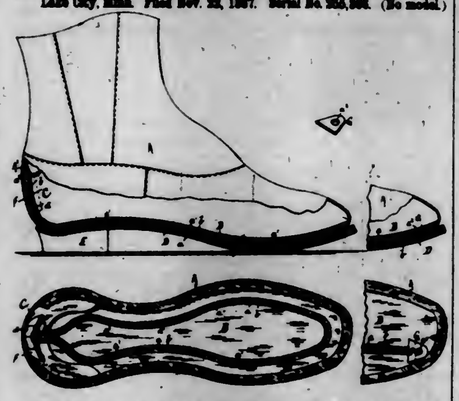
2. A brooder for domestic fowls, consisting of a box, A, having lid *a*, perforations a', exit-orifices a^2, air-orifices a^7, the platform B, having orifice *b*, slides D, a cylinder, E, a boiler, F, having funnel *f*, and a lamp, G, having flue *g*, the whole constructed and arranged as hereinbefore described, for the purposes set forth.

3. A brooder for domestic fowls, consisting of a box, A, having lid *a*, ventilating perforations a', exit-orifices a^2, brackets a^4, clasps a^5, orifices a^7, slides C, having perforations *c*, slides D, a platform, B, having orifice *b*, a cylinder, E, a boiler, F, having funnel *f*, and a lamp, G, having flue *g*, the whole constructed and arranged as hereinbefore described, for the purposes set forth.

4. A brooder for domestic fowls, consisting of a box, A, having lid *a*, exit-orifices a^2, recesses a^3, air-orifices a^7, a platform, B, having orifice *b*, slides D, a cylinder, E, a boiler, F, having funnel *f*, and a lamp, G, having flue *g*, the whole constructed and arranged as hereinbefore described, for the purposes set forth.

381,961. SHOW-CASE. HENRY STERN, Shelbyville, Ky. Filed Jan. 3, 1888. Serial No. 259,669. (No model.)

Claim.—1. The herein-described show-case for laces, ribbons, and fringes, and other goods that are wound on spools, which case comprises a shallow box having a bottom provided with suitable slots for the passage of the goods therethrough, narrow glass sides rising from the edge of the bottom, and a hinged glass lid, spools journaled in bearings made in the bottom, and suitable legs or rods secured to the bottom to support the box a proper distance above the counter or other rest, substantially as specified.



2. In a show-case for laces, fringes, &c., the combination, with the shallow box or casing A, provided with the bottom *a*, having the slots E F, the narrow sides a^2, the legs B B, the strips C C, having the bearing-recesses *c c*, and the spools D, consisting of the spindles *d*, journals d^2, and end pieces, d' d^3, each having the straight portion d^3 on its periphery, substantially as specified.

3. In a show-case for laces, fringes, &c., the combination, with

the legs B B and the shallow box provided with the wooden bottom *d*, having the slots E F, the narrow glass sides d^2, and the hinged glass lid d', of the parallel transverse bearing-strips C, having the bearing-recesses *c*, the coiled bearing-springs G in said recesses, and the spools D, each composed of the spindle *d*, the journals d^3, and the end pieces, d' d^3, each having the straight part d^5 on the periphery, substantially as specified.

4. A show-case comprising a shallow box provided with longitudinal and transverse slots in its bottom, and a spool journaled in the sides of the box and extending over said slots and provided with enlarged end pieces working in the transverse slots, as set forth.

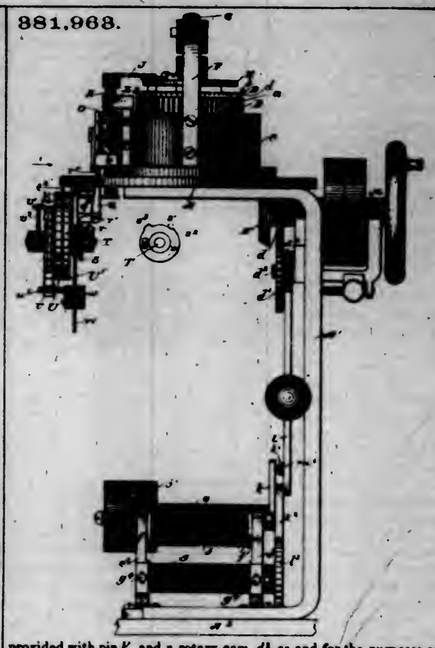
381,962. VENTILATED BOOT OR SHOE. HENRY A. STEVENS, Lake City, Minn. Filed Nov. 23, 1887. Serial No. 255,266. (No model.)

Claim.—1. A boot or shoe having channel *a* formed in its sole and adapted to support a tube, *b*, connecting the interior of said boot or shoe with the open air, in combination with a plate, F, having one or more sockets, *d*, for the reception of the end of said tube and adapted to be held between the counter and heel portion of the upper of said boot or shoe, substantially as and for the purpose set forth.

2. The combination, with a boot or shoe having a channel, *a*, formed in the insole and having communication with the exterior air, of the plate G in the toe of the shoe, and a spiral wire tube, *b*, connecting with the said plate and inserted in the said channel, all substantially as and for the purpose set forth.

381,963. KNITTING-MACHINE. WALTER H. STEWART, Franklin, N. H. Filed June 6, 1887. Serial No. 240,577. (No model.)

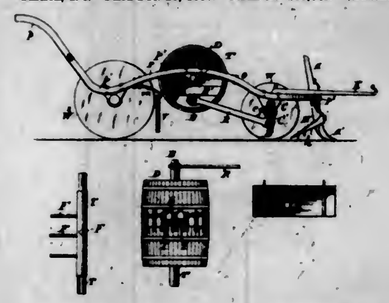
Claim.—1. The combination, with the dial, dial-needles, and cam-disk, of the push-out and drawing-in cams pivoted to the cam-disk and provided with studs extending through slots formed in the cam-disk, a lever pivoted on the cam-dial and provided with slots to receive the studs of said push-out and drawing-in cams, the slot in said lever for the reception of the stud from the drawing-in cam being constructed to permit the lever to have a limited movement without acting on said stud, while the slot for the reception of the stud from the push-out cam is constructed to permit of no movement of the lever without operating the last-mentioned cam, and mechanism, substantially as set forth, for intermittingly operating said lever, as and for the purposes set forth.



2. The combination, with the dial, dial-needles, cam-disk, and its cams 2 3, pivoted to the cam-dial and provided with studs or pins d' d^3, of lever I, provided with slots *i i'*, levers J and N, arbor K, path-cam O, and mechanism, substantially as set forth, for intermittingly rotating said cam, as and for the purposes set forth.

3. The combination, with the stationary base and rotary cam-cylinder, of the path-cam O, journaled on a stud secured to said cam-cylinder, a ratchet-wheel secured to said path-cam, lever *p*, provided with a pawl to engage said ratchet-wheel, lever R and its support, and rotary cam S, as and for the purposes set forth.

4. The combination, with the needle-cylinder, cylinder-needles, and rotary cam-cylinder, of the stitch-cam *c*, slide *c'*, journal-stud c^3, ratchet-wheel c^4, provided with the cam c^5, block c^6, lever c^8, provided with pawl c^9, and means for intermittingly operating said lever, as set forth.

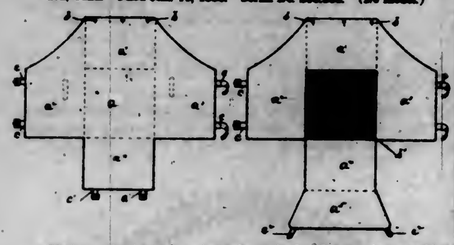


5. The combination, with machine-frame or support, of the fluted take-up rollers, uprights c^3, shaft *d'*, journaled therein, and roller *e*, adapted to turn thereon, arms *f'*, secured by one end to said shaft, roller *f*, journaled in the other end of said arms, weighted arm *j*, lever *l*, pawl P, ratchet-wheel P, weighted arm P, notched lever m^2, arm *k*,

381,968.

provided with pin *k'*, and a rotary cam, d^2, as and for the purposes set forth.

381,964. COTTON-PLANTER. FREDERICK W. STEBBS, George's Station, S. C. Filed Dec. 23, 1887. Serial No. 258,849. (No model.)



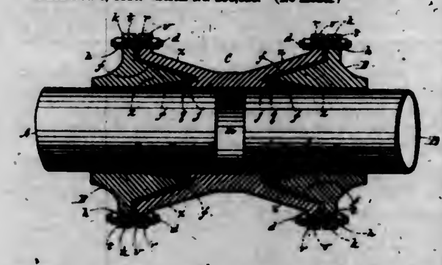
Claim.—1. In a planter, the combination, with a ground-wheel and the furrow-opening shovel, of the oscillating substantially cylindrical or barrel-shaped seed-receptacle having a row of seed-apertures through its periphery on one side of the central vertical line and a row of apertures on the other side of said line, the adjustable slides for the seed-apertures, respectively, and adapted to be made stationary when in operation, the agitator inclosed within the seed-receptacle, and the pitman connecting the receptacle with the said ground-wheel, substantially as set forth.

2. In a cotton-planter, the combination, with the ground-wheel and the furrow-opening shovel, of the oscillating substantially-cylindrical seed-receptacle having seed-apertures situated on arcs of circles transverse to the axis of oscillation, the slides L L, the pitman R, the slotted crank C, adjustably secured to the shaft or wheel W, and the stirring-arms F F, substantially as set forth.

3. In a planter, the combination of an oscillating substantially cylindrical or barrel-shaped seed-receptacle having closed heads and a peripheral wall formed of wooden sections bound together and to said end walls and provided with exit-apertures in the bottom on each side of the central vertical line, the upper part of the periphery being imperforate and the shaft engaging with and supporting said end walls, and the pitman for imparting oscillation to the seed-receptacle, substantially as set forth.

4. The combination, with the front and rear ground-wheels and the furrow-opening shovels, of the main frame formed, substantially as described, of the metal bar bent to provide the handle parts *p*, the depressed parts *p'*, for supporting the rear wheel, the relatively-elevated parts p^2, for supporting the seed-receptacle, and the forward depressed parts, p^3, for supporting the ground-wheel and shovel, the depending bearings secured to the under side of the said frame for supporting the seed-receptacle and ground-wheels, the scraper-bars m, secured to said frame, and the swinging scraper or coverer V between the seed-receptacle and the rear wheel, substantially as set forth.

381,965. BOOT FOR CARRIAGES. JOSEPH W. STORER, New London, Conn. Filed Jan. 16, 1888. Serial No. 260,802. (No model.)



Claim.—1. A carriage-boot formed of a foot-section provided with a flap adapted to pass rearward under the cushion, side flaps with fastenings, as set forth, and a top flap adapted to fold rearward over said side flaps, as herein described, and for the object specified.

2. A carriage-boot formed of a foot-section re-enforced by felt or similar material, a fastening-flap projecting rearward therefrom, as set forth, side flaps, a^2 a^3, top flap, a^4, and straps with fastenings for securing said side and top flaps in their folded positions, substantially as herein described, and for the object specified.

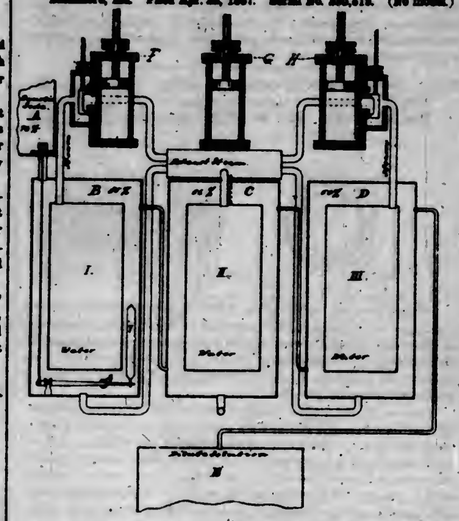
3. A combined cold-weather and storm boot formed of the foot-section *a*, having secured thereto a flap, *a'*, for attaching the said boot to the vehicle, side flaps, a^2 a^3, top flap, a^4, devices, as set forth, for securing said side and top flaps in their folded positions, and an extensible flap, a^5, with straps for securing the same to the vehicle, all being substantially as and for the purpose specified.

4. In combination with a vehicle, a boot having a flap secured to the seat thereof, said boot being formed with foot-section *a*, side flaps, a^3 a^3, top flap, a^4, and with strap-fastenings for securing said side and top flaps in their folded positions, as described, and for the object specified.

381,966. PIPE-COUPLING. JOHN STORY, Castle Shannon, Pa. Filed Dec. 1, 1887. Serial No. 256,632. (No model.)

Claim.—1. In a pipe-coupling, the combination of the following instrumentalities, to wit: a flaring or conical socket containing a packing, a pipe passing longitudinally through said socket and packing into a chamber which connects with a companion pipe, a follower provided with an annular wedge at its inner end and fitted to slide on the pipe which passes through said socket, an annular flange projecting outwardly at the bottom of said socket adjacent to said pipe, and means for advancing said wedge into the packing within said socket to compress the same, and retaining it in its advanced position, said flange being provided on its outer side with an annular bead adjacent to the walls of said socket, substantially as described.

2. In a pipe-coupling, a sleeve provided with a flaring socket and with an outwardly-projecting annular flange at the bottom of said socket integral with the sleeve, in combination with a follower provided with an annular wedge, packing, and bolts for clamping said sleeve and follower, substantially as described.



3. In a pipe-coupling, a sleeve provided with a flaring socket and with an outwardly-projecting annular flange at the bottom of said socket integral with said sleeve, said flange having an annular bead, in combination with a follower, a packing, and means for clamping said follower to said sleeve, substantially as described.

4. A pipe-coupling comprising a sleeve having a central chamber and provided with flaring sockets at its opposite ends for receiving packing, and with integral outwardly-projecting annular flanges at the bottoms of said sockets, followers having inwardly-projecting annular wedges, and means for clamping said followers to said sleeve, substantially as described.

5. A pipe-coupling comprising a sleeve having a central chamber and provided with flaring sockets at its opposite ends for receiving packing, and at the bottoms of said sockets with integral outwardly-projecting annular flanges having annular beads, followers having inwardly-projecting annular wedges, and means for clamping said followers to said sleeve, substantially as described.

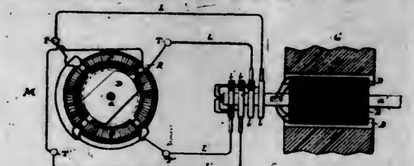
6. The combination of a sleeve having a central chamber and provided with flaring sockets at its opposite ends and with integral outwardly-projecting annular flanges at the bottoms of said sockets, pipes extending through said sockets into said central chamber, packing inserted in said sockets around said pipes, followers having inwardly-projecting annular wedges for compressing said packing in the sockets against the pipes, and means for clamping said followers to said sleeve substantially as described.

381,967. CAUSTIC-SODA STEAM-ENGINE. ANDREW H. BROWN, Baltimore, Md. Filed Apr. 23, 1887. Serial No. 235,819. (No model.)

Claim.—1. In a caustic-soda steam-generator, the combination of a reservoir, a caustic-soda tank, and a dilute-solution tank, the caustic-soda tank being connected with the reservoir by one pipe and with the dilute-solution tank by another pipe, whereby the stronger solution in the reservoir may flow into the caustic-soda tank, there counteracting the absorption of the spent steam, and at the same time causing an overflow into the dilute-solution tank, as described.

2. In a caustic-soda steam-generator, the combination of a reservoir, two or more caustic-soda tanks, and a dilute-solution tank so arranged and connected together in series by one or more pipes that the solution in each caustic-soda tank may be renewed by the inflowing of a stronger solution, and an equal share of the spent steam being absorbed by the solution in each caustic-soda tank, whereby a concentrated solution of caustic soda in generating steam will undergo a progressive dilution, as described.

3. In a caustic-soda steam-generator, the combination of a reservoir, one or more caustic-soda tanks, and a dilute-solution tank, all so arranged and connected together by pipes that the absorption of spent steam may be counteracted by the inflowing of a stronger solution, all essentially as described.



4. In a caustic-soda steam-generator, the combination of a reservoir, one or more caustic-soda tanks, and a dilute-solution tank, a first pipe connecting the reservoir with the first caustic-soda tank; a second pipe connecting the first tank with the second, and so on, if there are more, until all are so connected, a last pipe connecting the last caustic-soda tank with the dilute-solution tank, whereby the absorption of spent steam may be counteracted by the inflowing of a stronger solution, all substantially as set forth.

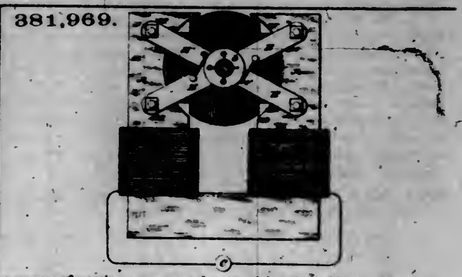
5. In a caustic-soda steam-generator, the combination of a reservoir for the concentrated solution, one or more caustic-soda tanks, and a tank for the diluted solution, a first pipe connecting the reservoir with the first tank, a second pipe connecting the first tank with the second, and so on until all are so connected, a last pipe connecting the last caustic-soda tank with the dilute-solution tank, whereby the absorption of all the spent steam in the one caustic-soda tank, or of an equal share in each, may be counteracted by the inflowing of a stronger solution, and a constant percentage of caustic soda being automatically maintained in one tank, preferably the last if there are more than one, whereby the pressure of the steam in the single immersed boiler or in each boiler may remain constant, all substantially as described.

6. In a caustic-soda steam-generator, the combination of a reservoir, one or more caustic-soda tanks, and a dilute-solution tank, all so arranged and connected together by pipes that the absorption of all the spent steam in the one caustic-soda tank, or of an equal share in each, may be counteracted by the inflowing of a stronger solution, and a constant percentage of caustic soda being automatically maintained in one tank, preferably the last if there are more than one, whereby the pressure of the steam in the single immersed boiler or in each boiler may remain constant, all substantially as set forth.

7. In a caustic-soda steam-generator, the combination of two or more caustic-soda tanks so arranged and connected together in series by one or more pipes that the solution in each tank may be renewed by the inflowing of a stronger solution, and an equal share of the spent steam being absorbed by the solution in each tank, whereby a concentrated solution of caustic soda in generating steam may undergo a progressive dilution, all as set forth.

381,968. ELECTRO-MAGNETIC MOTOR. NIKOLA TESLA, New York, N. Y., assignor of one-half to Charles F. Peck, Englewood, N. J. Filed Oct. 12, 1887. Serial No. 252,132. (No model.)

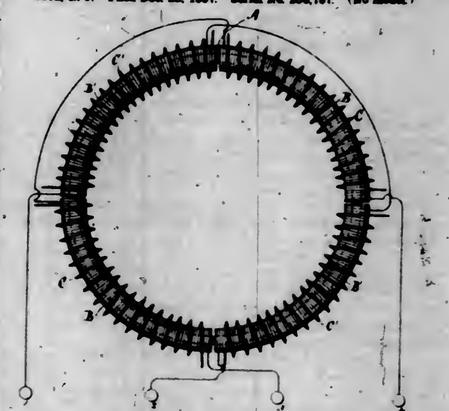
Claim.—1. The combination, with a motor containing separate or independent circuits on the armature or field-magnet, or both, of an alternating-current generator containing induced circuits connected independently to corresponding circuits in the motor, whereby a rotation of the generator produces a progressive shifting of the poles of the motor, as herein described.



2. In a system for the electrical transmission of power, the combination of a motor provided with two or more independent magnetizing-coils and an alternating-current generator containing induced coils corresponding to the motor-coils, and circuits connecting directly the motor and generator coils in such order that the currents developed by the generator will be passed through the corresponding motor-coils, and thereby produce a progressive shifting of the poles of the motor, as herein set forth.

3. The combination, with a motor having an annular or ring-shaped field-magnet and a cylindrical or equivalent armature, and independent coils on the field-magnet or armature, or both, of an alternating-current generator having correspondingly independent coils, and circuits including the generator-coils and corresponding motor-coils in such manner that the rotation of the generator causes a progressive shifting of the poles of the motor in the manner set forth.

4. In a system for the electrical transmission of power, the combination of the following instrumentalities, to wit: a motor composed of a disk or its equivalent mounted within a ring or annular field-magnet, which is provided with magnetizing-coils connected in diametrically-opposite pairs or groups to independent terminals, a generator having induced coils or groups of coils equal in number to the pairs or groups of motor-coils, and circuits connecting the terminals of said coils to the terminals of the motor, respectively, and in such order that the rotation of the generator and the consequent production of alternating currents in the respective circuits produces a progressive shifting of the poles of the motor, as hereinbefore described.



381,969. ELECTRO-MAGNETIC MOTOR. NIKOLA TESLA, New York, N. Y., assignor of one-half to Charles F. Peck, Englewood, N. J. Filed Nov. 30, 1887. Serial No. 256,963. (No model.)

Claim.—The combination, with a motor having independent energizing or armature circuits, of an alternating-current generator with corresponding induced circuits connected with the motor for effecting a progressive shifting of the poles of the motor-armature, and

a source of continuous current for energizing the field of said motor, as set forth.

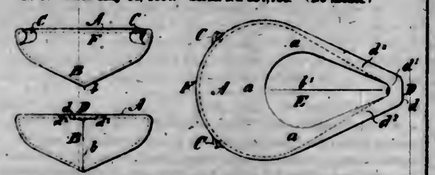
381,970. SYSTEM OF ELECTRICAL DISTRIBUTION. NIKOLA TESLA, New York, N. Y., assignor of one-half to Charles F. Peck, Englewood, N. J. Filed Dec. 23, 1887. Serial No. 258,787. (No model.)

Claim.—1. The combination, with a core closed upon itself, inducing or primary coils wound thereon and connected up in independent pairs or sets, and induced or secondary coils wound upon or near the primary coils, of a generator of alternating currents and independent connections to the primary coils, whereby by the operation of the generator a progressive shifting of the poles of the core is effected, as set forth.

2. The combination, with an annular or similar magnetic core and primary and secondary coils wound thereon, of an alternating-current generator having induced or armature coils corresponding to the primary coils, and independent circuits connecting the primary coils with the corresponding coils of the generator, as herein set forth.

3. The combination, with independent electric transmission-circuits, of transformers consisting of annular or similar cores wound with primary and secondary coils, the opposite primary coils of each transformer being connected to one of the transmission-circuits, an alternating-current generator with independent induced or armature coils connected with the transmission-circuits, whereby alternating currents may be directed through the primary coils of the transformers in the order and manner herein described.

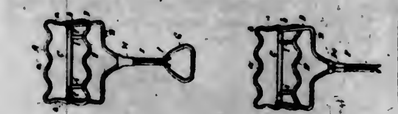
381,971. FILLING AND POURING BOBBLE. NATHAN THOMPSON, Brooklyn, N. Y.; John C. Thompson administrator of said Nathan Thompson, deceased. Filed Sept. 21, 1887. Serial No. 250,363. (No model.)



Claim.—1. The combination, with a can or analogous vessel having a pouring-hole, of a hinged cover for the pouring-hole, a cross-piece or clamp sliding upon the cover, and lugs or ears on opposite sides of the pouring-hole, with which the cross-piece is engaged by its sliding movement to hold the cover closed, substantially as herein described.

2. The combination, with a can or vessel having the pouring-hole *b*, of the hinged cover provided with the ribs or bearers *c'*, terminating in inclines, the cross-piece or clamp D, sliding upon the cover and depressed between said bearers to prevent its turning, and lugs or ears on opposite sides of the pouring-hole, with which the cross-piece or clamp is engaged by sliding, substantially as herein described.

3. The combination, with a can having an opening in its top, of the base-plate B, fitted and secured to the can about said opening and having the pouring-hole *b*, and at opposite sides of the pouring-hole the lugs or ears *b'* of the cover C, hinged to the base-piece, and the cross-piece or clamp having a sliding connection with the cover and fitted to said guides, and serving to hold the cover closed, substantially as herein described.



4. The combination, with a can having a pouring-hole in the top and a tubular throat-piece extending inward from the pouring-hole, of a hinged cover closing the pouring-hole, a cross-piece or clamp having a sliding connection with the cover, and lugs or ears on opposite sides of the pouring-hole, with which the cross-piece or clamp engages by sliding to hold the cover closed, substantially as herein described.

381,972. INVALID'S BED-PAN. GEORGE W. TOOKER, New York, N. Y. Filed May 11, 1887. Serial No. 237,793. (No model.)

Claim.—A bed or invalid pan the sides of which converge toward each other and form an angular bottom adapted to sink within the mattress or bed.

381,973. BUCKLE. EDWARD H. WHEELER, Waterbury, Conn. Filed Dec. 30, 1887. Serial No. 259,413. (No model.)

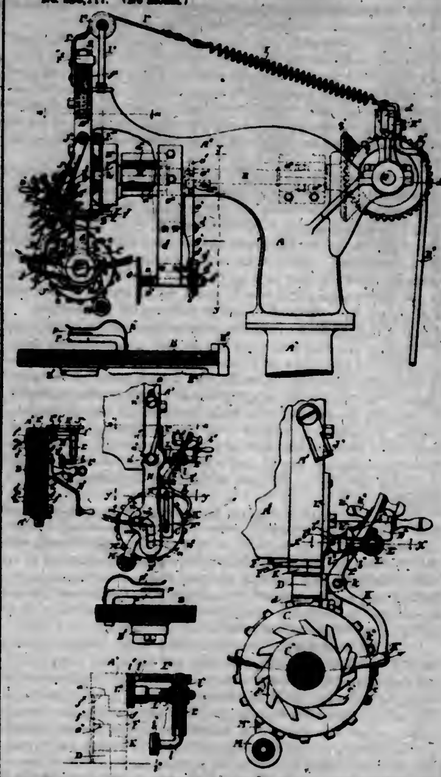
Claim.—1. The combination, with the herein-specified tongue-frame provided with a cross-bar having teeth, of the buckle-frame provided with a resistance-bar having its upper edge serrated to act in opposition to the said teeth, substantially as and for the purpose described.

2. The combination herein described, with the buckle-frame and the tongue-frame, of the supports extending from one frame and loops or eyes on the other frame to receive the said supports, the loops being oppositely inclined or flared to form cam-ways which bear against the sides of the frame having the supports to hold the two parts of the buckle distended or open.

3. The herein-described buckle, composed of two frames hinged together, and a cam-way placed between the frames to bear against the side of one of the frames and hold the frames distended, substantially as and for the purpose described.

4. The herein-described buckle, composed of two frames hinged together and having the sides of a frame flexible, and having the ends of one of the frames made flaring to effect a deflection of the sides of the frame and create a tension when closing the buckles, which will automatically open the buckle when free from any external force, substantially as specified.

5. The combination herein described, with the buckle-frame having loops, of the tongue-frame having supports which are held in the loops and having its sides indented to overlap the said loops, whereby the tongue-frame is prevented from slipping over the buckle-frame, substantially as described.



6. The buckle-frame having its side bars folded to form loops and bring the top bar below the cross-bar, for the purpose described, in combination with the tongue-frame journaled in said loops and having its teeth adapted to act in opposition to the said top bar, substantially as and for the purpose described.

7. The herein-described buckle-frame, having its side bars folded to form loops, which loops are flared, in combination with the tongue-frame journaled in the said loops, substantially as described.

8. The herein-described buckle-frame, composed of folded side bars, a resistance-bar, shank and oppositely-disposed hooks made from a single wire, the opposing sides of the hooks being beveled, the clip uniting the wires of the shank, and the tongue-frame journaled in the loops formed by the folded side bars of the buckle-frame, substantially as described.

9. The combination, with the buckle-frame and the tongue-frame having end supports, of the cross-bar secured at its ends to the said supports and having one edge extended and serrated to form teeth, substantially as and for the purpose described.

381,974. NUMBERING-MACHINE. SAMUEL K. WHITE, Chicago, Ill., assignor to Shan Smith, same place. Filed Mar. 31, 1887. Serial No. 233,117. (No model.)

Claim.—1. The combination, with the frame and type-disks of a numbering-machine, of a vertically-reciprocating frame carrying said disks, a bar, D, supporting the said disks and pivoted to the reciprocating frame, and means for locking said bar D in position for operation, substantially as described.

2. The combination, with the machine-frame and type-disks, of a vertically-reciprocating frame carrying said disks, a support for the disks pivoted to the said reciprocating frame, and devices for rotating the disks, comprising a connecting-bar pivoted to the machine-frame, the pivots of the said disk-support and the connecting-bar being located in alignment with each other when the connecting frame is at the upper limit of its vertical movement, whereby the disk-support may be swung about its pivot without turning the disks, substantially as described.

3. The combination, with the machine-frame and type-disks, one of which is provided with ratchet-teeth, of a vertically-reciprocating frame carrying said disks, a support, D, for the disks pivotally connected with said reciprocating frame, a swinging arm, J, pivoted concentrically with the disks, a spring-pawl upon said arm, engaging the ratchet-teeth of the said disk, said a connecting-bar pivoted to the outer end of said arm J and to the machine-frame, the pivots connecting the said disk-support and connecting-bar with the frame F and the machine-frame being located in alignment with each other when the frame is at the upper limit of its movement, substantially as described.

4. The combination, with the machine-frame, the type-disks, and the reciprocating frame carrying said disks, of a roller, P, mounted

upon the machine-frame over the reciprocating frame, a strap attached to the reciprocating frame and passing over the said roller, and a spring, I, attached to the said strap and to the frame, substantially as described.

5. The combination, with the machine-frame, the type-disks, and a reciprocating part or frame carrying said disks, of an upwardly-yielding cam-plate, as l', mounted upon the machine-frame, and a movable part, as lever K, mounted upon the part or frame which carries the disks, and engaging the latter to prevent them from turning, said movable part being provided with a projection or finger located in the path of the said cam-plate, whereby the disks are released at each upward movement thereof, substantially as described.

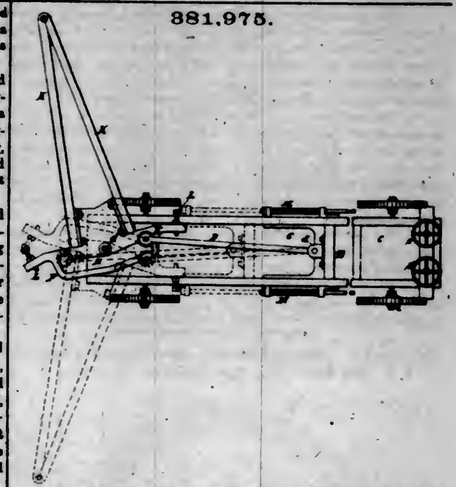
6. The combination, with the machine-frame, the type-disks, and a vertically-reciprocating frame carrying said disks, of a lever pivotally connected with the frame and provided with a cross-bar engaging the disks, and an upwardly-yielding cam-plate mounted upon the machine-frame, said lever being provided with a projecting part or finger for engaging the cam-plate, whereby the lever is moved to release the disks at each upward movement of the latter, substantially as described.

7. The combination, with the machine-frame, the type-disks, and vertically-reciprocating frame carrying the disks, comprising a lever, K, pivotally connected with the reciprocating frame and provided with a cross-bar, K', and a horizontal finger, k^2, of a rock-shaft, L', mounted upon the machine-frame and provided with an arm supporting a cam-plate, l', located in the path of the finger k^2, said rock-shaft being provided also with an arm, L^2, a stop upon the machine-frame in position to engage said arm L', and a spring applied to hold said cam-plate in the path of the finger k^2, substantially as described.

8. The combination, with the machine-frame, the type-disks, one of which is provided with ratchet-teeth, and a reciprocating frame carrying said type-disks, of a lever, K, pivotally connected with the reciprocating frame and provided with a cross-bar, K', a horizontal finger, k^2, and an arm, k^4, engaging the said ratchet-teeth, a rock-shaft, L', mounted upon the machine-frame and provided with an arm supporting a cam-plate, l', located in the path of the finger k^2, said rock-shaft being provided also with an arm, L^2, a stop upon the machine-frame engaging said arm L^2, and a spring applied to retain the said cam-plate normally in the path of the finger k^2, substantially as described.

9. The combination, with the machine-frame, the type-disks, and the vertically-reciprocating frame carrying said disks, of an inking device comprising an inking-roller, an arm pivoted concentrically with the disks and sustaining the inking-roller, a crank-arm attached to the said roller-supporting arm and provided with a crank-pin, and a stationary part or arm provided with a slot engaging said crank-pin, and constructed to swing the inking-roller about the axis of the disks as the latter are bodily moved, substantially as described.

10. The combination, with the machine-frame, the type-disks, a vertically-reciprocating frame carrying said disks, and a support for the disks, pivotally connected with the frame to allow said disks to be swung upwardly, of an inking device comprising an inking-roller, an arm pivoted concentrically with the disks and sustaining the inking-roller, a crank-arm attached to said arm and provided with a crank-pin, and a part or arm, N, provided with a cam-slot engaging said crank-pin, said arm N being pivoted to the machine-frame, so that it may be swung upwardly with the disks, and means for holding the said arm N in its operative position, substantially as described.



11. The combination, with the machine-frame, the reciprocating frame F, the type-disks, and the bar D, supporting said disks and pivotally connected with said frame, of the inking-roller, the arm M', supporting said roller, the crank-arm m', provided with a crank-pin, and the arm N, pivoted at its upper end to the machine-frame, the pivotal axis of said arm N being located somewhat below the pivot of the bar D when the frame is at the upper limit of its movement, whereby the inking-roller will be moved when the disks are swung bodily upward and forward, substantially as described.

12. The combination, with the machine-frame, the type-disks, the vertically-reciprocating frame carrying said disks, and a bar, D, supporting the disks and pivotally connected with the frame, of an inking device comprising an inking-roller, a pivoted arm carrying said roller, a crank-arm attached to said roller-supporting arm and provided with a crank-pin, an arm, N, pivoted to the machine-frame and provided with a cam-slot engaging the said crank-pin, and means for holding the said arm N in operative position, the said arm N and the bar D being provided with an interlocking slot and pin, whereby the arm N will be moved with the bar D when said bar is swung about its pivotal axis, substantially as described.

881,975. BALING-PRESS. HARVEY B. WOLFE, Louisville, Ky., assignor of one-half to Brennan & Co. Southwestern Agricultural Works, same place. Filed Jan. 23, 1887. Serial No. 225,696. (No model.)

Claim.—1. In a baling-press, the combination of a slotted reversible cam provided with set-screws, a roller moving in the slot, and a pitman pivoted to said roller, whereby as the cam is rotated the pitman forces the plunger into the pressing-chamber and the set-screws release the roller at any desired point to permit it to move to the other end of the slot in the cam for a new stroke, substantially as and for the purpose described.

2. In a portable baling-press, a slotted cam angular in shape and provided with depressions at the ends, and carrying set-screws, in combination with a roller in the cam-slot, a pitman, and springs to force the roller when released to the opposite end of the cam-slot.

881,976. COMBINED POST-OFFICE DATER, CANCELER, AND REGISTER. JOHN T. ARGO, Poindexter, Ky. Filed Oct. 12, 1887. Serial No. 252,154. (No model.)

Claim.—1. The combination, with the hand canceling-stamp and a series of independent registering-wheels, of the yielding frame and the series of independent actuating-pawls connected with said frame, one pawl being provided for each registering-wheel, substantially as and for the purpose described.

2. The combination, with the stamp and the series of independent registering-wheels having ratchet-wheels secured to their sides, of the yielding frame and the corresponding series of independent actuating-pawls connected with the frame and adapted to engage with said ratchet-wheels, substantially as described.

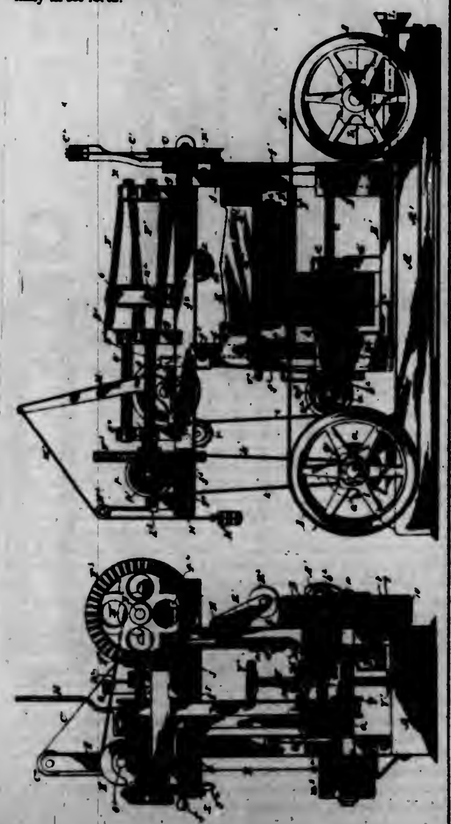
3. The combination, with the stamp, the registering-wheels having ratchet-wheels, and the actuating-pawls, of the yielding frame connected with said pawls and the push-buttons adapted to be pressed upon for projecting the actuating-pawls within the path of said ratchet-wheels, substantially as described.

4. The combination, with the stamp, the registering-wheels having ratchet-wheels, and the actuating-pawls connected with a yielding frame, of the push-buttons having slotted stems and the pins passing through said slots in the stems of the push-buttons for limiting their movements, substantially as set forth.

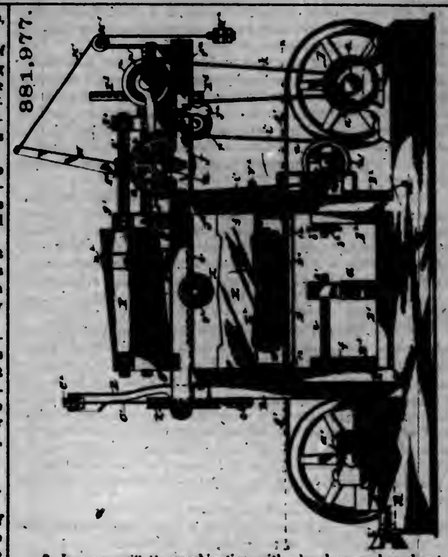
5. The combination, with the stamp, the registering-wheels having ratchet-wheels, and the actuating-pawls adapted to engage with said ratchet-wheels and having the extended portion n', of the push-buttons connected with said extended portions n' of the actuating-pawls, substantially as and for the purpose described.

6. The combination, with the stamp, the independent registering-wheels, and the actuating-pawls, of the push-buttons connected with the pawls and the springs for normally holding the push-buttons projected and holding the pawls out of the path of the ratchet-wheels, substantially as set forth.

7. The combination, with the frame of the stamp, composed of the side plates, cross-bar, handle, and middle plate, the registering mechanism located between the cross-bar and middle plate, and the actuating-pawls, of the frame H, the standards E, one of said standards carrying the actuating-pawls, the cross-tie e', and the spring interposed between the cross-tie and said middle plate, substantially as set forth, for the purpose specified.



8. The combination, with the side plates, A, of the frame, the registering mechanism, and the dating-wheels mounted on a shaft supported between the side plates, of the standards E, having openings through which the dating-wheels extend, the actuating-pawls carried by one of the standards, and the frame H, substantially as specified.



9. The combination, with the stamp, the series of independent registering-wheels having ratchet-wheels, the independent detent-pawls carried by a common plate, and the actuating-pawls connected with a plate common to all, of the standards and the frame H, substantially as and for the purpose specified.

10. The herein-described combined post-office dater, stamp-canceler, and register, composed of side plates having flanges a and lugs a', the cross-bar B, the handle C, the middle plate, D, the independent registering-wheels having ratchet-wheels, the detent-pawls, the actuating-pawls, the push-buttons connected with the actuating-pawls, the springs n^3, the standards having openings, the frame H, the spring for projecting the frame, the rollers F, the ink-ribbon, the dating-wheels, and the plate J, carrying the office-stamp, substantially as described.

881,977. BAND-SAW MILL. HARI W. AVERY, Lowell, Mich. Filed Sept. 20, 1887. Serial No. 250,207. (No model.)

Claim.—1. In a saw-mill, the combination, with a band-saw, of a set of uprights, and a saw-guide extending from one upright to the other, adjustably secured at its ends to said uprights, and adapted to receive and support the saw-blade back of its cutting-edge, substantially as set forth.

2. In a saw-mill, the combination, with a band-saw and an elevating log-carriage, of a set of uprights, and a saw-guide consisting of a pair of thin parallel plates extending between the uprights and adjustably secured thereto, said guide adapted to receive and support the passing saw-blade back of its cutting-edge, substantially as set forth.

3. In a saw-mill, the combination, with a band-saw and an adjustable guide through which the saw passes, of an elevating log-carriage and a gaging-roller adjustably secured to the mill-frame a distance from the guide relative to the thickness of the board to be cut, substantially as set forth.

4. In a saw-mill, the combination, with a band-saw, pulleys for the band-saw, a driving-shaft upon which one of said pulleys is mounted, and a tension-shaft mounted so as to be moved to tighten the band-saw upon its pulleys, of a log-carriage, an adjustable guide, a gaging-roller, a means of elevating the log-carriage, and means for rotating a log supported on the log-carriage, substantially as set forth.

5. In a saw-mill, the combination, with a band-saw actuated by driving-pulleys, of a log-carriage having a vertical movement, a saw-guide adjustably secured to the frame, and a gage-roller located in close proximity to the guide for gaging the thickness of the board being cut, substantially as set forth.

6. In a saw-mill, the combination, with a log-carriage having a vertical feed movement, of a band-saw, mechanism to rotate a log simultaneously with the upward feed movement of the log-carriage, and a gaging-roller having contact with a log being operated upon, substantially as set forth.

7. In a saw-mill, the combination, with a log-carriage having a vertical feed movement, of a band-saw, a guide for said saw, mechanism to rotate a log simultaneously with the upward feed movement of the log-carriage, and an engaging-roller having contact with a log being cut, substantially as set forth.

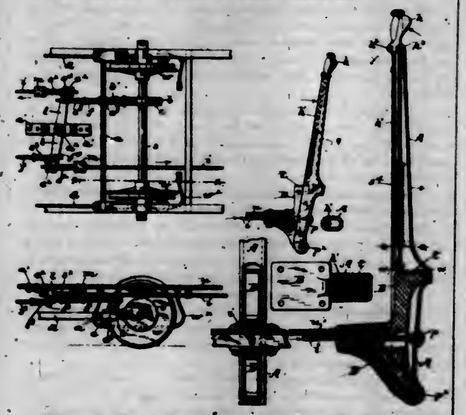
8. In a band-saw mill, the combination, with a log-carriage having a vertical feed movement, of a band-saw, mechanism to rotate a log simultaneously with the upward feed movement of the log-carriage, and an adjustable saw-guide adapted to receive the saw and pass with it into the kerf of the log, substantially as set forth.

9. In a saw-mill, the combination, with a band-saw, of an adjustable gaging-roller adapted to regulate the thickness of the board being cut and an elevating log-carriage adapted to maintain a steady feed to the saw, substantially as set forth.

10. In a saw-mill, the combination, with a band-saw, of a guide composed of a top and bottom plate, and a slotted spacing-plate adjustably secured between the top and bottom plates by means of screws or similar devices, substantially as set forth.

11. In a saw-mill, the combination, with a band-saw, of a guide for the saw, said guide being composed of a pair of beveled plates, and a slotted spacing-plate adjustably secured between said beveled plates by means of screws passing through the slots, substantially as set forth.

12. In a saw-mill, the combination, with a frame, a vertically-movable log-carriage, and a pair of clamping-bars pivoted on said car-



riage, of a screw passing through a threaded hole in the adjacent edges of said bars and thence to the frame, whereby the carriage is raised by the screw, substantially as set forth.

13. In a saw-mill, the combination, with a frame, a vertically-movable log-carriage, a base-plate having a slotted guard formed on its edge, and a pair of clamping-bars pivoted on the base-plate and extending through the slot in the guard, said bars having a threaded hole in their adjacent edges and held together by a sliding link, of a screw passing through said hole in the pivoted bars and adapted to turn therein, thereby elevating or lowering the carriage, substantially as set forth.

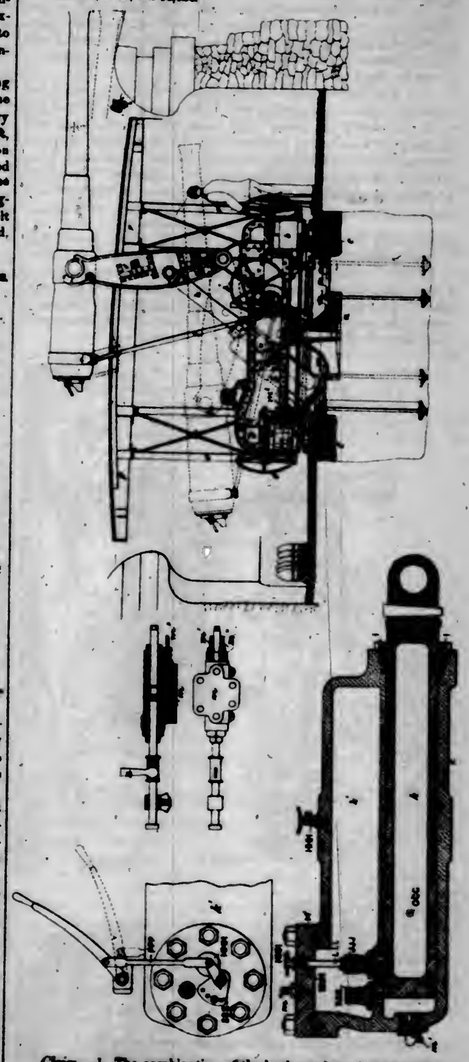
14. In a saw-mill, the combination, with a band-saw, pulleys to support the saw, and a driving-shaft to move the saw, of a log-carriage, head and tail stocks on the log-carriage, a mandrel journaled in the head-stock, a shaft geared with said mandrel, a fixed hand-wheel on the end of this shaft to rotate it, and an adjusting-screw extending through the log-carriage and into the frame and adapted to regulate the height and support in position the log-carriage, substantially as set forth.

15. In a saw-mill, the combination, with a frame, an elevating log-carriage, pulleys on the frame, a drive-shaft connected with one of the pulleys, and a band-saw carried on the pulleys, of a secondary shaft, *p*, in position to be driven by a belt from the main drive-shaft, a cone-shaft geared with shaft *p*, a second cone-shaft receiving motion therefrom, the latter having a worm thereon, a transversely-located shaft receiving motion from said worm, a shaft below said transverse shaft receiving motion from the latter, a mandrel journaled in the log-carriage receiving motion from said lower shaft, and a shifting-belt on the cone-shafts, whereby the motion to the mandrel is regulated, substantially as set forth.

881,978. CAR-BRAKE. ELIJAH R. BAKER, Cambridgeport, Mass. Filed Aug. 5, 1887. Serial No. 246,216. (No model.)

Claim.—1. The combination, in a car-brake mechanism, of a pivotally-mounted spring-retracting thrust-lever having pull-rods loosely mounted thereon, adapted to move in unison with said lever and also adapted to move independently thereof, substantially as hereinbefore described, and for the purpose specified.

2. The combination, with brake-bands and brake-levers mounted and arranged substantially as herein described, of a pivoted thrust-lever, as *l*, having its free ends adapted each to freely receive a brake-rod, *i*, collars engaging the lever and loosely mounted on said rod, and springs also engaging the lever, for the purpose specified.



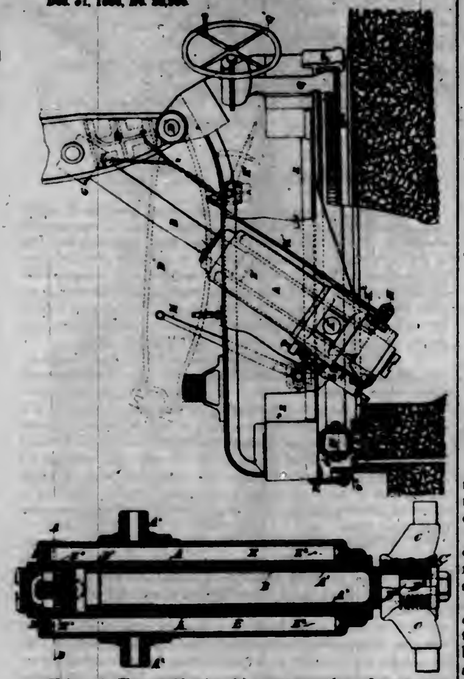
3. The combination, with a brake-wheel, a brake-band, and a pivotally mounted spring-retracting thrust-lever, of a mounted brake-lever as A, a pull-rod jointed thereto and having its other end loosely mounted in said thrust-lever, to travel in unison therewith when pressure is applied and adapted to move independently thereof when the pressure is released, and a pull-rod similarly mounted connecting the brake-band and thrust-lever, substantially as hereinbefore described.

4. The combination, with a mounted brake-wheel, an adjustably-secured band-brake therefor, and bell-crank lever *b'*, of the spring-retracting thrust-lever *l*, a pull-rod, *f*, mounted as described and jointed to the lever *b'*, a brake-rod, *i*, adapted to actuate the thrust-lever, &c., and a pivoted main brake-lever having the latter rod jointed thereto, substantially as shown and described.

5. In a car-brake, the combination of a stationary frame having a series of notches therein, a band-brake having an end thereof notched or corrugated to engage the notched frame, and a bolt passing through the band and frame to adjustably secure the band in position, substantially as described.

6. The combination, in a car-brake mechanism, of the brake-stand B, the hollow brake-lever A, pivoted thereto, a spring locking-catch mounted within said lever and engaging the brake-stand, a pull-rod jointed to the brake-lever, and a pivotally-mounted thrust-lever connected with a brake band and wheel, having the end of said pull-rod mounted therein so as to actuate the thrust-lever in one direction only, substantially as shown and hereinbefore described.

881,979. CARRIAGE FOR HEAVY ORDNANCE FOR LAND DEFENCE. WILLIAM D. BALDWIN, Washington, D. C., administrator of William J. Hoyle, deceased. Filed July 18, 1887. Serial No. 244,698. (No model.) Patented in England Jan. 6, 1885, No. 208, and in Italy Mar. 31, 1886, No. 18,080.

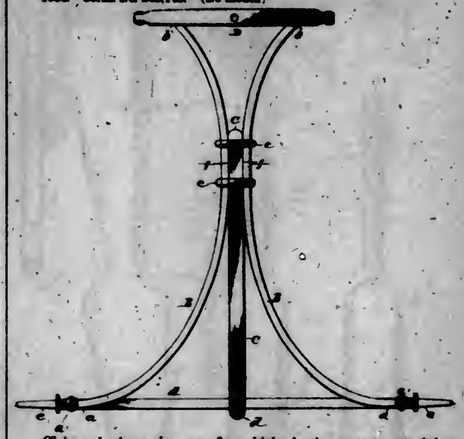


Claim.—1. The combination of the horizontal-turning turn-table, the frame connecting by a joint at its lower end to the turn-table and rocking vertically about said joint, the gun carried at the opposite end of the frame, and the overhead shield supported by and moving with the turn-table and provided with the aperture through which the gun rises and descends, substantially as and for the purpose set forth.

2. The combination of the frame having the pivotal support at its lower end and rocking vertically about such support, the gun at the upper end of the frame, the hydraulic cylinder, the air-vessel adjacent thereto, the ram working in the cylinder and connected with the pivoted frame for raising and lowering the gun, and the pump having its suction and delivery pipes connected with the cylinder and air-vessel, substantially as and for the purpose set forth.

3. The combination, in a gun-carriage, of the hydraulic cylinder, the air-vessel adjacent thereto, the ram working in the cylinder and connected with the support by which the gun is raised and lowered, two or more passages communicating with the cylinder at or near its lower end and with the corresponding end of the air-vessel, and the controlled valves of said passages, substantially as and for the purpose set forth.

881,980. MOUNTING FOR HEAVY ORDNANCE FOR LAND DEFENCE. WILLIAM D. BALDWIN, Washington, D. C., administrator of William J. Hoyle, deceased. Filed July 27, 1887. Serial No. 245,457. (No model.) Patented in England Mar. 6, 1886, No. 3,909, and in Italy Dec. 31, 1886, No. 20,926.



Claim.—1. The combination, in a gun-mounting, of a ram connected with a movable frame which carries the gun, a cylinder into which the ram is driven by the recoil of the gun, an air-receiver formed by communicating cavities in the walls of the cylinder, a passage connecting the interior of the cylinder with the cavities of the air-receiver, a valve in this passage which opens automatically to permit escape of liquid from the cylinder to the air-receiver cavities, but closes to prevent return from the cavities to the cylinder, and a by-pass valve which opens a return-passage between the air-receiver cavities and the cylinder, substantially as and for the purpose set forth.

2. The combination, in a gun-mounting, of a ram connected with a movable frame which carries the gun, a cylinder into which the ram is driven by the recoil of the gun, an air-receiver formed by communicating cavities in the walls of the cylinder, a passage connecting the interior of the cylinder with the cavities in its walls, a valve in this passage which opens automatically to permit escape of liquid from the cylinder to the air-receiver cavities, but closes against return, a by-pass valve which opens a return-passage between the cavities and the cylinder, and a pump with its suction-pipe connected with the interior of the cylinder and its delivery-pipe connected with the cavities in the cylinder-walls, substantially as and for the purpose set forth.

3. The combination, in a gun-mounting, of a ram connected with a pivoted frame which carries the gun, a cylinder into which the ram is driven by the recoil of the gun, an air-receiver adjacent to the cylinder, a passage connecting the cylinder with the air-receiver, a valve in this passage which opens automatically to permit escape of liquid from the cylinder to the air-receiver, but closes against return, a by-pass valve which opens a return-passage between the air-receiver and the cylinder, and gear connecting the by-pass valve with the gun-carrying frame, which gear closes said valve as the gun reaches the firing position, substantially as and for the purpose set forth.

4. The combination, in a gun-mounting, of a ram connected with a pivoted frame which carries the gun, a cylinder into which the ram is driven by the recoil of the gun, an air-receiver adjacent to the cylinder, a passage connecting the cylinder with the air-receiver, a valve in this passage which opens automatically to permit escape of liquid from the cylinder to the air-receiver, but closes against return, a by-pass valve which opens a return-passage between the air-receiver and the cylinder, a pinion on the stem of the by-pass valve, a rack engaging with the pinion, and a chain or like connection between the rack and gun-carrying frame, substantially as and for the purpose set forth.

881,981. RUNNING-GEAR FOR VEHICLES. GEORGE A. ROWE, Oshkosh, Wis., assignor to Herbert M. Hart, same place. Filed Feb. 6, 1888. Serial No. 263,149. (No model.)

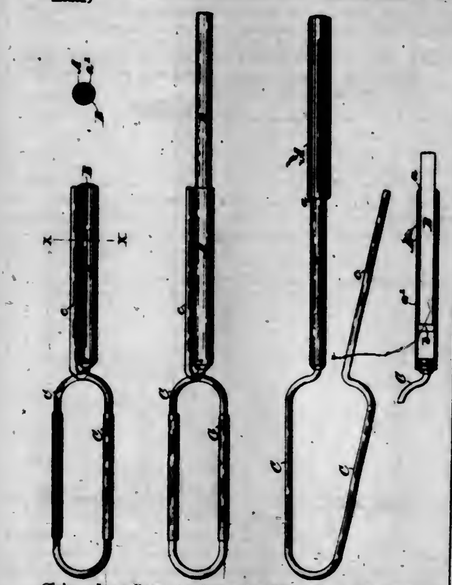
Claim.—1. A running-gear for vehicles having a center straight reach and two curved reaches that are adapted to be clamped to a rear axle by their rear ends, and all secured together near the front end of the middle straight reach, substantially as set forth.

2. The combination, with a rear axle and a head-block, of two curved reaches and a straight reach located between the curved reaches and secured to these reaches and the axle, substantially as set forth.

3. The combination, with a rear axle and a head-block, of two curved reaches which are bent toward each other between their ends that are attached to the head-block and axle, and a straight reach having its rear end secured to the rear axle between the points of attachment of the curved reaches thereto, and its forward end secured to the adjacent bodies of the curved reaches, substantially as set forth.

881,982. FIRE-ESCAPE. HENRY L. BOYLE, Grand Rapids, Mich. Filed Aug. 23, 1887. Serial No. 247,977. (No model.)

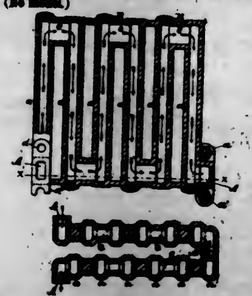
Claim.—1. In a fire-escape, the combination of a friction-block having transverse cord-holes I passing through it and a guide loop or eye at its upper side, cords passing through said loop or eye and transverse cord-holes from opposite sides, and a strap or support attached to the block, substantially as described.



2. In a fire-escape, the friction-block B, having transverse cord-holes passing therethrough, the bail A, and loop E, in combination with the cords C, passing through said loop, and also through the transverse cord-holes, substantially as described.

3. The combination of the friction-block B, provided with the support A and loop E, the cords C C, adapted to pass through the openings in said block, the block D, and the supporting-strap G, all constructed as described.

4. In a fire-escape, a friction-block provided with one or more openings for the cords, in combination with two cords, one cord passing through the opening in one direction and the other cord passing through from the opposite direction, and said block adapted to be retarded in its sliding motion by means of the friction between the cords and the friction-block, as set forth.



5. The combination of the friction-block B, having transverse cord-holes I, and the cords C, passing through said holes from the opposite sides of said friction-block, with the check-block D, arranged upon the cords below said friction-block and adapted to be moved up or down upon said cords for increasing or decreasing the frictional resistance thereon, substantially as described.

381,983. HAIR CURLING AND CRIMPING DEVICE. MARK CAMPBELL, Chicago, Ill. Filed Jan. 27, 1888. Serial No. 262,125. (No model.)

Claim.—In curling, crimping, or frizzing appliances, the combination of a handle, a heating-core, and a cylinder, tube, casing, or jacket operatively located exterior of said core, the arrangement of said parts being such that either the core or said outer member is fixed to the handle and the other member is capable of movement longitudinally thereof for a distance sufficient to expose the core, substantially as shown, and for the purpose set forth.

381,984. RADIATOR FOR STEAM OR HOT WATER. WILLIAM W. CANFIELD, New York, N. Y., assignor, by mesne assignments, to the National Heating Company, same place. Filed Nov. 18, 1887. Serial No. 255,622. (No model.)

Claim.—1. The combination of a series of radiator-sections, each of which is cast in a single piece, composed of a series of hollow bars, the space within the bars communicating at alternate ends, and the side bars having ingress and egress ports for the heating medium so formed that any number of said sections may be banked by uniting the ports, and when so united the bars of the different sections will be staggered or arranged so that the bars of each successive lower section will be situated in the plane passing vertically through the space between the bars of the section next above it, substantially as shown and described.

2. A radiator-section consisting of a series of hollow bars cast in a single piece, the space within the bars communicating at alternate ends, one of the side bars having a port on one end thereof opening in a direction at right angles to a plane passing longitudinally through the bars of the section, and the opposite side bar having a port formed in a shoulder or lug attached or formed on the side thereof and opening in a direction opposite to that of the first-named port, both of said ports being on the same end of the radiator-section, substantially as shown and described.

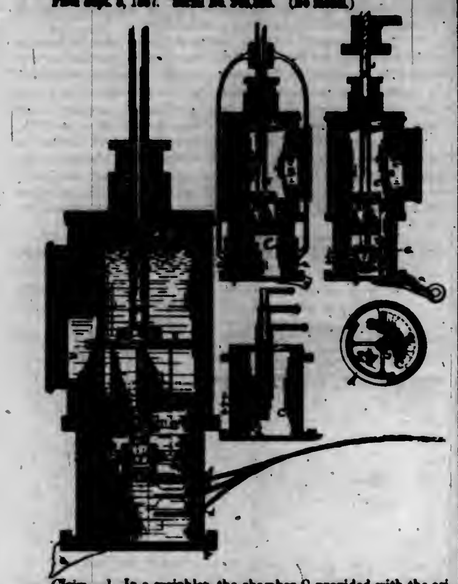
381,985. WHEEL-CULTIVATOR. WILLIAM I. GADDABY, South Bend, Ind. Filed Sept. 19, 1887. Serial No. 249,662. (No model.)

Claim.—1. In a wheel-cultivator, the round cross-bar B, rigidly secured to the tongue E, the round upright arms A A, carrying the wheels and provided with sleeve-couplings A' A', adjustably mounted on the bar B and having set-screws a^2 a^2, in combination with the vertically-adjustable brackets C C, loosely mounted and swinging laterally on the arms A A, and the spring H, engaging and traveling on the guide-brackets F, secured to the vertically-swinging plow or cultivator beams pivotally secured to said brackets C C, all constructed, arranged, and operating substantially as shown and described.

2. In a cultivator, and in combination with the supporting-frame, the vertically-adjustable bracket secured thereto, and the plow or cultivator beam pivotally attached to said bracket and movable therewith, an elastic supporting mechanism for the beam, consisting of a spring engaging and traveling on a track or way, substantially as described, said elastic supporting mechanism being interposed between the adjustable bracket and beam and connected to both, whereby the bracket can be raised or lowered on the supporting-frame to adjust the position of the plow or cultivator beam without disturbing or otherwise affecting the action of the supporting mechanism, substantially as set forth.

3. In a cultivator, a suitable supporting-frame and a vertically-adjustable bracket mounted thereon, in combination with a plow or cultivator beam pivotally secured to the adjustable bracket, a track or way on the beam, and a spring secured at one end to the adjustable bracket and movable therewith and having its free end engaging with and traveling on the track or way on the beam, all constructed, arranged, and operating substantially as shown and described, whereby the bracket can be raised or lowered on the frame to adjust the position of the plow or cultivator beams without affecting the tension of the spring.

4. In a cultivator, a supporting-bracket mounted on a suitable frame, a vertically-swinging plow or cultivator beam pivotally secured to said bracket and an adjustable track on the forward end of the beam, and provided with locking-notches in its opposite ends, in combination with a spring secured at one end to the supporting-bracket and having its free end engaging with and traveling on the track or way, all constructed, arranged, and operating substantially as shown and described.



5. In an arched cultivator, a cross-bar rigidly secured to a tongue, upright arms carrying the wheels and provided with sleeve-couplings on their upper ends adjustably mounted on the cross-bar, and supporting-brackets adjustably mounted and swinging laterally on said upright arms, in combination with the vertically-swinging plow or cultivator beams pivotally secured to the supporting-brackets, tracks or ways secured to the plow or cultivator beams, and springs secured at one end to the supporting-brackets and having their free ends engaging with and traveling on the tracks or ways on the beams, all constructed, arranged, and operating substantially as described.

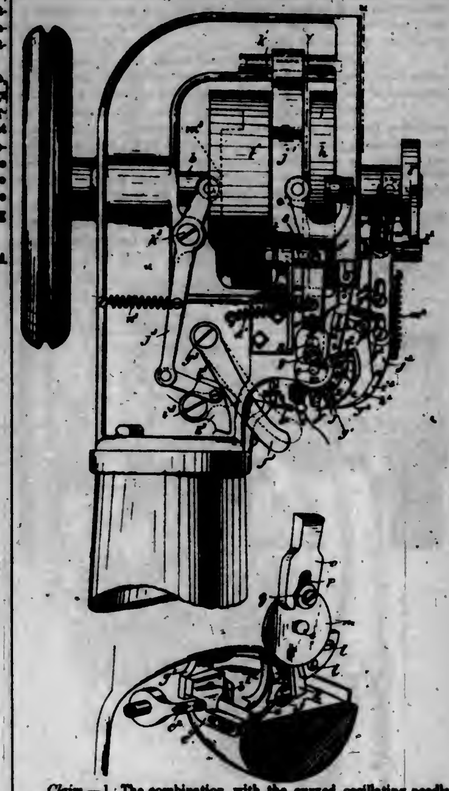
6. In a cultivator, the supporting-bracket C, adjustably mounted on the frame, the vertically-swinging plow or cultivator beam D, pivotally secured to said bracket C, the bracket or yoke F, located on the forward end of the beam, and adjustable track or way G, secured to the bracket or yoke F, in combination with the spring H, secured at one end to the supporting-bracket C and having its free end engaging with the track or way G, all constructed, arranged, and operating substantially as shown and described.

7. In a cultivator, the supporting-bracket C, mounted on the frame, the vertically-swinging plow or cultivator beam D, pivotally secured to said bracket C, the bracket or yoke F, located on the forward end of the beam, and the adjustable track or way G, secured to said bracket or yoke F, and having the locking-notches $G' G^2$ in its opposite ends, in combination with the spring H, secured at one end to the supporting-bracket and provided with a roller, i, on its free end, which engages with the track or way G, all constructed, arranged, and operating substantially as shown and described.

8. In an arched cultivator, a cross-bar rigidly secured to a tongue, upright arms carrying the wheels and provided with sleeve-couplings on their upper ends adjustably mounted on the cross-bar, supporting-brackets adjustably mounted and swinging laterally on said upright arms, and vertically-swinging plow or cultivator beams pivotally secured to the supporting-arms and having tracks or ways secured to their forward ends, in combination with springs secured at one end to the supporting-brackets and having their free ends engaging with the tracks or ways on the beams, all constructed, arranged, and operating substantially as shown and described.

381,986. SPRINKLER. CHARLES H. COLLINS, South Bend, Ind. Filed Sept. 5, 1887. Serial No. 248,888. (No model.)

Claim.—1. In a sprinkler, the chamber C, provided with the orifices *d e f*, arranged at different distances from the end of the chamber in parallel lines and oblique to the axis of said cylinder, and pierced at different angles of obliquity converging toward a point or line upon the outside of said chamber, as and for the purpose set forth.



2. In a sprinkler, the upright chamber C, provided with the jet-openings *d e f*, consisting of horizontal slits arranged at different distances from the end of the chamber in parallel lines, combined with a valve, G, actuated by a proper valve-stem parallel with the axis of the chamber, whereby one or more of said openings may be opened or closed at will.

3. In a sprinkler, the chamber C, provided with jet-openings arranged at different distances from the end of the chamber, combined with a slide or rotating valve, G, a puppet-valve, K, and a valve-stem, J, with mechanism to operate the same from the outside of said chamber.

4. In a sprinkler, the chamber C, provided with the jet-openings *d e f*, arranged at different distances from the end of the chamber, a valve-stem, J, a puppet-valve, K, rigidly attached thereto, and a valve, G, loosely attached to said stem, so that the valve K will be actuated in advance of the movement of said slide-valve, as set forth.

5. In a sprinkler, the cylindrical chamber C, having the jet-openings *d e f*, arranged in parallel lines, combined with the spring-valve G, of elastic metal, longitudinally divided and of normally greater diameter than the interior of said chamber, whereby by elastic expansion the valve will compensate wear, said valve being adapted to reciprocate longitudinally of the chamber and provided with a valve-stem parallel with the axis of the chamber, as set forth.

381,987. SEWING-MACHINE FOR CONNECTING SOLES AND UPPERS. FRANK A. CONANT, Boston, and JOSEPH CONANT, Quincy, Mass., assignors to the Leather Lock Sewing Machine Association, Portland, Me. Filed Apr. 30, 1883. Serial No. 268,674. (No model.)

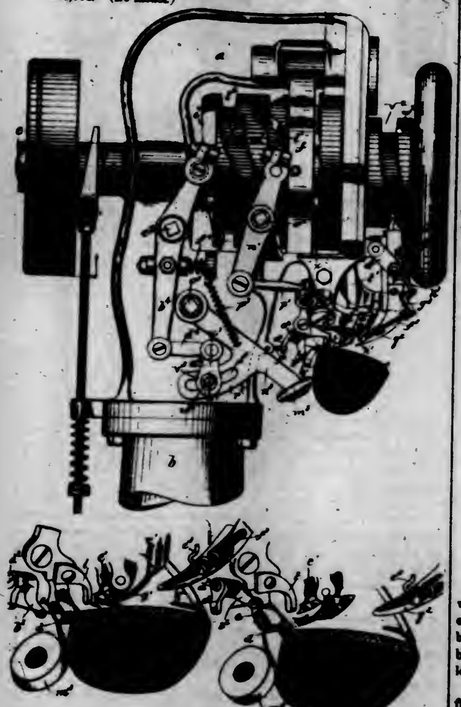
Claim.—1. The combination, with the curved oscillating needle and loop releasing and taking-up devices co-operating therewith, of an independent tongue-forming knife, and mechanism whereby said knife is moved alternately into and out of the path in which the needle moves, substantially as and for the purpose specified.

2. The combination of the curved needle, mechanism to oscillate it, cast-off and take-up devices and operating mechanism therefor, an independent tongue-forming knife, and mechanism alternating in its action with the operative mechanism of the needle, whereby the knife is moved alternately into and out of the path in which the needle moves, as set forth.

3. The combination, with the needle, the cast-off and the take-up, and their operative mechanism, of the knife, the oscillatory and laterally-movable hub supporting the knife, the stud supporting said hub, and mechanism, substantially as described, whereby the hub and knife are successively moved laterally and oscillated, as set forth.

4. The combination of the needle, the independent tongue-forming knife, and the take-up and their operating devices, of the cast-off composed of the slotted arm having the spring-pressed fingers or jaws b^2 b^3, and mechanism, substantially as described, whereby said arm is inserted in the loop formed by the needle and moved upwardly to receive a portion of the needle in its slot, and then depressed to cause its fingers to grasp the loop and separate it from the barb of the needle, as set forth.

5. The combination, with the curved oscillating needle, of the looper-arm pivoted to a fixed support and provided with the arm c^2, and the oscillating swing-piece *f*, pivotally connected to the arm c^2, as set forth.



6. The combination, with the curved reciprocating needle and the loop casting-off and taking-up devices, of the swinging rest f^9, the cam A^5, supporting said rest, and the cam m^2, lever j^3, spring n^3, and connecting-rod P, whereby said cam is oscillated and supported with a yielding pressure, whereby it is adapted to support the rest f^9 at various points, as set forth.

7. The combination, with the tongue-forming cutter and the loop-forming mechanism, of the edge gage or rest, c', the pointed dog f', the oscillatory levers supporting said gage and dog, and mechanism, substantially as described, whereby the dog and gage are moved toward and from each other to grasp and release the work and laterally to feed the work, as set forth.

8. The combination of the curved needle, its arm, the reciprocating slide f, and the rod i, connecting the needle-arm and slide and composed of the jointed sections having a locking device, as set forth.

9. The combination of the tongue-forming knife, mechanism for oscillating the same, the needle, looper, and cast-off, and their operative mechanism, the loop-spreader, and operative mechanism therefor, substantially as described, whereby the spreader is moved forward under the needle into the loop, and then downward and held upon the tongue while the loop is being tightened, as set forth.

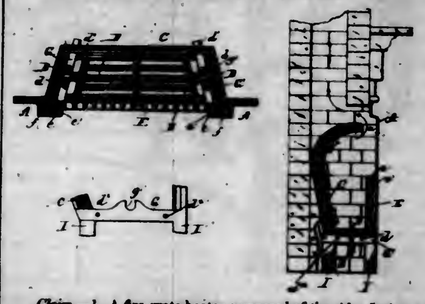
381,988. SEWING-MACHINE FOR UNITING SOLES TO UPPERS. PETER A. CUPAL, Boston, Mass., assignor to the Leather Lock Sewing Machine Association, Portland, Me. Filed Feb. 23, 1887. Serial No. 228,531. (No model.)

Claim.—1. In a machine for connecting soles and uppers, the combination, with work-feeding and stitch or loop forming mechanism, substantially as described, of the segmental tongue-cutting knife, a holder therefor mounted to oscillate in a plane which is oblique to the plane in which the needle moves, and mechanism for oscillating said holder, the arrangement being such that the knife when at the forward extreme of its movement stands in the path in which the needle moves, as set forth.

2. The combination, with the stitch or loop forming and the work-feeding mechanism, of the segmental tongue-cutting knife, the lever or holder carrying said knife and mounted to oscillate in a plane which is oblique to the plane in which the needle moves, and the cam, lever, and connecting-rod, whereby said knife-holder is oscillated, as set forth.

3. The combination, with the tongue-cutting and loop-forming mechanism, of the swing-piece or carrier, mechanism to oscillate it, the back-gage secured to a lever pivoted to said carrier, the feed-dog fitted to slide in a segmental slot in said carrier, and the slide p, fitted to reciprocate in said carrier and operatively connected with the feed-dog and with the lever supporting the back-gage, as described, and mechanism for reciprocating said slide, whereby the back-gage and feed-dog are moved alternately toward and from each other, as set forth.

4. The combination, with the tongue-cutting and stitch or loop forming mechanism, of the back-gage, the feed-dog, the mechanism whereby said gage and dog are operated, as described, and the depth-gage attached to the pivoted lever v, said lever having a curved slot, w, receiving a stud or pin on the slide p, which oscillates the back-gage and feed-dog, whereby the depth-gage is raised and lowered with the feed-dog, as set forth.



5. The combination, with the tongue-cutting and stitch or loop forming mechanism, of the swing-piece or carrier, the slide p, fitted to reciprocate therein, the feed-dog fitted to reciprocate in a segmental guide in the carrier, the spring-controlled crank journaled in the slide, and the connecting-rod journaled on the wrist-pin of the crank and pivoted to the feed-dog c', said crank being normally held by its spring with its wrist-pin depressed, and adapted to be turned by hand against the pressure of said spring to raise the feed-dog, as set forth.

6. The combination, with the tongue-cutting and loop-forming mechanism, of the swing-piece or carrier, the slide p, fitted to reciprocate therein, the depth-gage, the lever v, supporting said gage, the spring-controlled crank journaled in the slide and having its wrist-pin a' engaged with a slot in said lever v, as set forth.

7. The combination, with the needle, the looper, and the take-up and operating devices therefor, of the loop-spreader, mechanism, substantially as described, for imparting thereto a combined oscillatory and vertical reciprocating movement, the cast-off composed of a bent finger and a rock-shaft, the latter being journaled in bearings on the loop-spreader, and mechanism for oscillating the cast-off, as set forth.

8. The combination of the spring-supported lever n^3, having the rest m^2 and the segmental slotted arm r^4, the fixed stud passing through the slot of said arm, the nut r^5, working on the threaded outer end of the stud, and mechanism, substantially as described, for oscillating said nut and thereby causing it to alternately hold and release the rest, as set forth.

381,989. FIRE-GRATE. DAVID H. CRESSLEY, Steubenville, Ohio. Filed Dec. 21, 1885. Serial No. 186,372. (No model.)

Claim.—1. A fire-grate heater composed of the sides flaring outwardly from back to front, the back rearwardly-inclined at its lower end and outwardly curved at its upper end, the front having a space between it and the top edge of the back, the front grate, and the bottom grate supported at its ends on gudgeons and provided with a lever for shaking, substantially as specified.

2. In a fire-place heater, the combination, with the sides and the front having vertically-grooved keepers, of the front grate fitted in the grooves of the keepers and having its upper edge beveled, substantially as and for the purpose described.

3. In a fire-place heater, the combination, with the cross-bars and the bottom grate having gudgeons and stops at its ends, of the stops d^9, for limiting the movements of the grate, substantially as specified.

4. The combination, with the front A, having integrally formed therewith the vertically-grooved keepers d, and having the vertical grooves f in its rear side, of the front grate fitted in the grooves of the keepers, the sides B, having their front edges seated in the grooves f, the bottom grate, and the back, substantially as described.

5. In a fire-place heater, the combination of the cross-bars, the bottom grate having end gudgeons fitting in openings in the cross-bars, stops projecting from the ends of the grate on each side of the gudgeons, corresponding stops extending from the cross-bars, and the lever fitted to one of the gudgeons for shaking the grate, substantially as set forth.

381,990. CUT-OFF FOR SPOUTS. FRANK DEELER, Port Jervis, N. Y. Filed Apr. 14, 1887. Serial No. 234,703. (No model.)

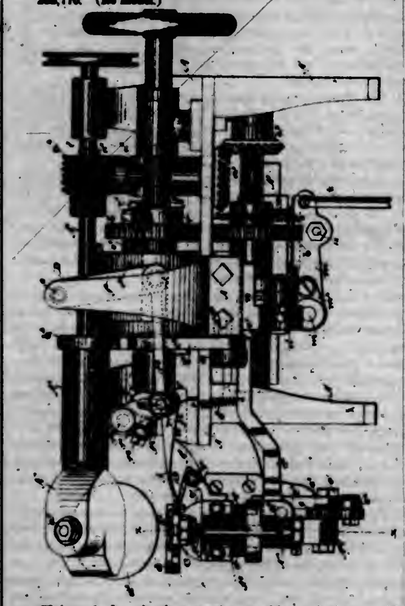
Claim.—In a cut-off, the combination of the casing A, having the pipes A^2, B, and D, and deflector E, with the conical strainer C, located in the pipe B and having its upper edge flush with the bottom of the receptacle and provided with the screen C^2 and perforations C', each pair of perforations being connected by slots C^3, and having flanges C^4 opening inwardly, substantially as and for the purpose specified.

381,991. REVERSING-GEAR FOR PRINTING-PRESS CYLINDERS. GEORGE D. HAMM, Buffalo, N. Y. Filed June 30, 1886. Serial No. 206,860. (No model.)

Claim.—In a reversing-gear for printing-press cylinders, the combination, with the cylinder A, provided with the cam-route C C', of pivoted lever B, having the pawl f pivoted thereto, said pawl supported upon cam C by means of pin g, and the ratchet-disk c, all arranged and operating in the manner and for the purpose specified.

381,992. WATCHMAN'S TIME-DETECTOR. GEORGE B. FRENCH, Boston, Mass. Filed June 26, 1884. Serial No. 134,655. (No model.)

Claim.—1. In a watchman's time-detector apparatus, a series of branch circuits leading from a receiving-station to different stations to be visited and a return-wire common to several of said stations, combined with a generator of electricity connected in circuit with the branch wire at the station to be visited and a receiving-instrument having a switch or circuit-changer by which the said branch circuits are connected one at a time successively with the said receiving-instrument, substantially as described.



2. A watchman's detector apparatus comprising a magneto-generator consisting of a movable armature and field-magnet at each station, a circuit connecting said station with a receiving-station, and receiving apparatus comprising recording mechanism, the operation of which is controlled by the currents generated at the stations, and a circuit-changer that connects the said branch circuits one at a time successively with the receiving apparatus, substantially as described.

381,993. WATCHMAN'S TIME-DETECTOR. GEORGE B. FRENCH, Boston, Mass. Filed Dec. 22, 1886. Serial No. 222,209. (No model.)

Claim.—1. The combination, with a moving recording-surface, of a series of recording devices and an electro-magnet controlling the operation thereof, and a series of branch circuits corresponding with said recording devices, and each being subdivided and leading to two separate stations, a return-wire common to one series of stations connected with one set of subdivided circuits and another return-wire for the other series of stations, and a commutator controlling the said return-wires, whereby the controlling electro-magnet is connected with one return-wire while records are being made from one series of stations and with the other return-wire while records are being made from the other series, substantially as and for the purpose described.

2. The combination, with a time-motor or clock and recording-surface moved thereby, of a series of recording devices and a number of branch circuits leading from said recording devices, respectively, to the different stations to be visited, and a return-wire common to said stations, and a magneto-electric generator included in the branch wire at each of the stations, substantially as and for the purpose described.

381,994. LEATHER-GOUGING MACHINE. SAMUEL T. FRENCH and WILLIAM C. MEYER, Boston, Mass. Filed Apr. 23, 1887. Serial No. 236,770. (No model.)

Claim.—1. In a leather-gouging machine, a bed over which the leather or other material is passed, combined with a revolving cutter and an oscillating carrying-head for the cutter, substantially as described.

2. In a machine for gouging leather, the bed over which the leather or other material is fed, combined with a cutter, its shaft, and a swiveled or pivoted head carrying the said cutter and lying in a plane parallel with the bed, whereby the cutter may revolve on its own axis, and also move in the arc of a circle above or near the bed, substantially as described.

3. In a machine for gouging leather or other material, the bed having a convexed surface to receive the material, combined with a

revolving cutter, and means, substantially as described, for moving in the arc of a circle above the convex-surfaced bed to remove a piece having one convexed side from the exposed side of the material, substantially as described.

4. The bed to receive the material and the rotary cutter, with means, substantially as described, for moving it in a curved arc over the bed, combined with an intermittent feeding device for automatically feeding the material forward, substantially as described.

5. In a leather-gouging machine, the bed to receive the material, the cutter, and means, substantially as described, for revolving it, combined with a pivoted oscillating head carrying the cutter, and means for oscillating the said head, substantially as described, whereby the revolving cutter is moved in the arc of a circle adjacent to the bed, as set forth.

6. The bed and feeding device to feed the material over the bed, and a holding-down device to hold the material firmly, combined with a cutter arranged to travel over the bed, by means, substantially as described, to remove a small chip from the exposed side of the material, substantially as described.

7. The yielding bed, a locking device for it, the holding-down device, means, substantially as described, for moving it, and an intermittent feeding device arranged to feed the material forward between the bed and the holding-down device when the latter is disengaged from the bed, combined with a cutter arranged to travel over the bed in a curved path, substantially as described.

8. The yielding bed-support and the removable bed proper having a curved bearing-surface, combined with a holding-down plate, and the guides arranged at each end of the bed proper, substantially as described.

9. In a leather-gouging machine, the bed to receive the material, the revolving cutter, and means, substantially as described, for moving in a curved arc over the bed, combined with a holding-down device for the material placed upon the bed, substantially as described.

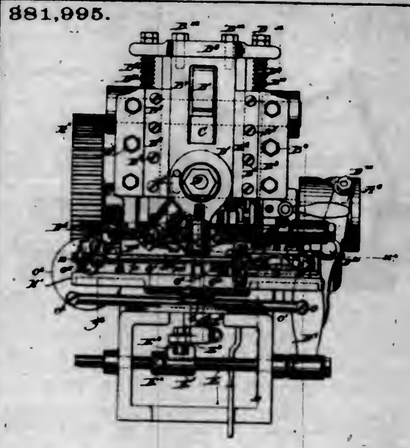
10. The yielding bed-support and the holding-down plate having an oval-shaped opening therein, combined with an adjustable guide, d^3, and the yielding guide d^3, substantially as described.

11. The yielding bed upon which the material is placed and the holding-down plate, and adjusting mechanism, substantially as described, for moving the holding-down plate to retain the material firmly upon the bed and compensate for different thickness of stock, substantially as described.

12. In a leather-gouging machine, the bed, holding-down device, and cutter, combined with a feeding-finger, and means, substantially as described, moved by the cam-grooved hub for actuating the feeding-finger, and adjusting means for varying the throw of the feeding-finger, substantially as described.

13. In a leather-gouging machine, the bed and oscillating cutter, combined with means, substantially as described, controlled by the shaft A^4, for permitting the cutter to operate, and the clutch mechanism for throwing said means into engagement with the shaft A^4, and a controlling mechanism, substantially as described, for automatically disengaging the clutch mechanism after the said shaft A^4 has made a certain number of revolutions, as set forth.

14. In a leather-gouging machine, the yielding bed the holding-down device for holding the material firmly upon the bed, and an intermittent feeding device, substantially as described, combined with a rotary cutter carried by a swivel or pivoted carrying-head, whereby the cutter is given two movements—viz., about its own axis and about an axis parallel with the surface of the bed—substantially as described.



15. In a leather-gouging machine, the bed, and the intermittent feeding device, substantially as described, for feeding the material intermittingly over the bed, combined with a cutter, its shaft, the swivel or pivoted carrying-head for the shaft and cutter, whereby the cutter is both rotated about its own axis and moved in a curved path above the bed, and means for vibrating or swinging the cutter-carrying head back and forth, substantially as described.

16. In a leather-gouging machine, the leather cutting and feeding devices, combined with a controlling mechanism comprising a clutch mechanism and means for releasing it, the lever *o*, controlled by said means for throwing the feed-dogs into engagement with the ratchet-toothed bar *p*, means for moving the ratchet-toothed bar *p* forward step by step, and adjusting mechanism for automatically stopping the rotation of the clutch mechanism and for returning the ratchet-toothed bar *p* to its normal position at any time desired, substantially as described.

381,995. MACHINE FOR CUTTING AND EMBOSSING BUTTON-HOLES. ZACHARY T. FRENCH and WILLIAM C. MEYER, Boston, Mass. Filed Aug. 30, 1887. Serial No. 248,277. (No model.)

Claim.—1. The slide-bar B^7 and guides in which it reciprocates, combined with the tool-carrier carried by it, the button-hole-slit-cutting tool, and the embossing-tool, to operate substantially as described.

2. The slide-bar B^7, guides in which it is reciprocated, and the tool-carrier pivoted on the said slide-bar, combined with the rocker

having the arms B B^6, and with the tongue adapted to be moved into and out of operation when it is desired to reciprocate or leave at rest the said slide-bar, substantially as described.

3. The slide-bar B^7, guides in which it is reciprocated, and the tool-carrier pivoted on the said slide-bar, combined with means, substantially as described, to oscillate the said tool-carrier, for the purposes set forth.

4. The slide-bar B^7, the pivoted tool-carrier and its attached tools, the tongue and the rocker having arms B and B^6, and with the shaft A^4 and the double-throw cam, to operate the said rocker twice during each rotation of the said shaft, substantially as and for the purpose set forth.

5. The slide-bar B^7, the pivoted tool-carrier, its tools and the tongue and rocker having arms B and B^6, the former provided with an adjustable yoke, A^7, having a roller, *a*, combined with the shaft A^4 and cam to act upon the said roll, substantially as described.

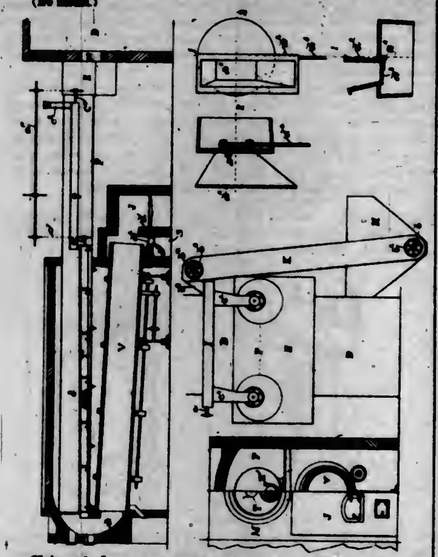
6. The slide-bar, the tool-carrier pivoted thereon and provided with tools D^2 and D^3, the rocker, and the tongue adapted to be interposed between an arm of the said rocker and the said slide-bar, combined with locking mechanism, substantially as described, between the said tool-carrier and the said tongue, whereby the tongue is restrained from being moved forward between the slide-bar and arm B^6 of the rocker to reciprocate the said slide-bar when the tool D is in position to descend upon the material, as set forth.

7. The slide-bar, the constantly-moving rocker, and the tongue, combined with means, substantially as described, to automatically withdraw the tongue at the completion of any desired number of reciprocations of the said slide, as set forth.

8. The slide-bar B^7 and its pivoted tool-carrier and tools, combined with the table and the oscillating bed E^9, substantially as described.

9. The slide-bar B^7, its pivoted tool-carrier and tools, the table, and the oscillating bed thereon, having dies to co-operate with the said tools, combined with the strip-carrier and guides therefor, substantially as described.

10. The slide-bar, the tool-carrier, its tools, the table, the oscillating bed therein, and the strip-carrier, combined with an adjustable guide to enable the tools to strike the material in the strip-carrier more or less distant from the edge thereof, substantially as described.



11. The slide-bar, the tool-carrier, its tools, the table, the oscillating bed therein, and the strip-carrier, combined with an adjustable guide to enable the tools to strike the material in the strip-carrier more or less distant from the edge thereof, and with two yielding guides, one at each side the said adjustable guide, substantially as described.

12. In a machine for cutting and embossing button-holes, the ratchet-wheel m^3, means to move it intermittingly, and its attached adjustable wheel m^3, combined with the lever c^{23} and its attached catch to co-operate with the said wheel m^3, substantially as described.

13. The cross-head D^7, rod *d'*, slotted disk e^2, the bearing-block, the clamping-nut, the threaded sleeve, and rod *p*, combined with the slide-block C^7 and its attached feeding-finger, substantially as described.

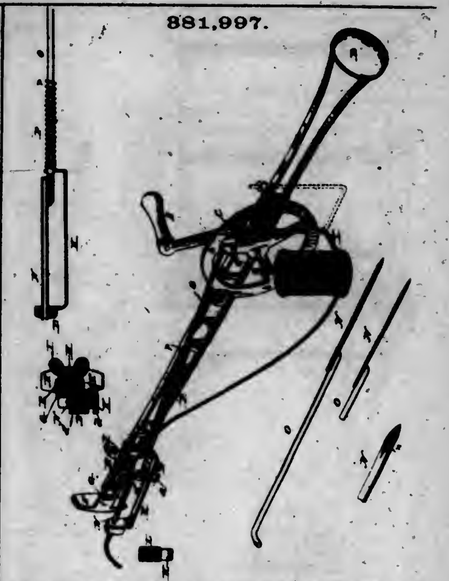
14. The strip-carrier, the sliding block C^7, the block e^2, pivoted thereon, and the feeding-finger, combined with an adjusting device to turn the feeding-finger more or less upon its fulcrum-pin to correctly enter the holes of the strip-carrier, substantially as described.

381,996. APPARATUS FOR CAUSTICIZING SODA, &c. Gustavus W. Hammond, Boston, Mass. Filed Apr. 5, 1887. Serial No. 233,749. (No model.)

Claim.—1. In an apparatus for the recovery of lime employed in causticizing soda or other chemicals, a filtering apparatus, I, a hopper, H, and a conveyer to carry the carbonate of lime formed in the process of causticizing from the said filtering apparatus to the said hopper, combined with a rotary calcining-furnace and with means, substantially as described, to convey the carbonate of lime from the said hopper to the said rotary calcining-furnace, substantially as described.

2. In an apparatus for the recovery of lime employed in causticizing soda or other chemicals, a filtering apparatus, I, a hopper, H, and a conveyer to carry the carbonate of lime formed in the process of causticizing from the said filtering apparatus to the said hopper, combined with a rotary calcining-furnace and with the chute K and scoops or buckets therein to convey the carbonate of lime from the said hopper to the said calcining-furnace.

3. In an apparatus for the recovery of lime employed in causticizing soda or other chemicals, a filtering apparatus, I, a hopper, H, and a screw conveyer to carry the carbonate of lime formed in the process of causticizing from the said filtering apparatus to the said hopper, a combustion-furnace, and a rotary calcining-furnace having one end extended into the said combustion-furnace, combined with means, substantially as described, to convey the carbonate of lime from the said hopper to the said calcining-furnace, substantially as specified.



4. In an apparatus for the recovery of lime employed in the causticizing of soda or other chemicals, a filtering apparatus, I, and a rotary calcining-furnace connected therewith, combined with means, substantially as described, to convey the carbonate of lime formed in the process of causticizing from the said filtering apparatus to the calcining-furnace, substantially as described.

381,997. FABRIC-TURFING IMPLEMENT. CARLETON C. HARRIS, Rochester, N. Y. Filed May 2, 1887. Serial No. 236,528. (No model.)

Claim.—1. The frame having a handle attached thereto, the driving-wheel journaled in said frame, a needle and needle-bar having crank-connection with the wheel, the presser-foot supported by the needle and bar, a spring on the bar by which said foot is pressed toward the point of the needle, and the clasp on the frame, serving as guide and fulcrum for the needle and bar, all in combination, substantially as described.

2. The combination, with the frame and its adjustable rest or foot, of a needle and needle-bar and operating mechanism, substantially as described, and the clasp separate from the frame and foot, but secured to the frame by a set-screw, and serving as a guide to said needle and bar and as a clamp to retain the adjustable rest or foot in position, substantially as shown and set forth.

3. The combination, with the frame, of the rest attached thereto, the driving-wheel carried by the frame, the needle and bar rigidly connected, said bar having crank-connection with the driving-wheel,

and a guide for the needle and bar longitudinally adjustable on the frame, substantially as set forth.

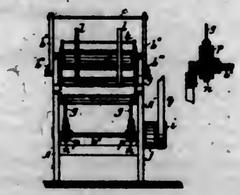
4. The combination, with the needle and bar, of the presser-foot carried by said needle and bar and the spring secured on the needle-bar and bearing said foot forward toward the point of the needle.

5. The combination, with the needle and bar, said needle being rigidly attached to but offset from said bar, of a yoke having one end surrounding the needle-bar and the other end surrounding the needle, a presser-foot on the needle end of the yoke, and a spring on the needle-bar pressing the yoke toward the needle-point, the offset of the needle serving as a stop for said yoke, substantially as set forth.

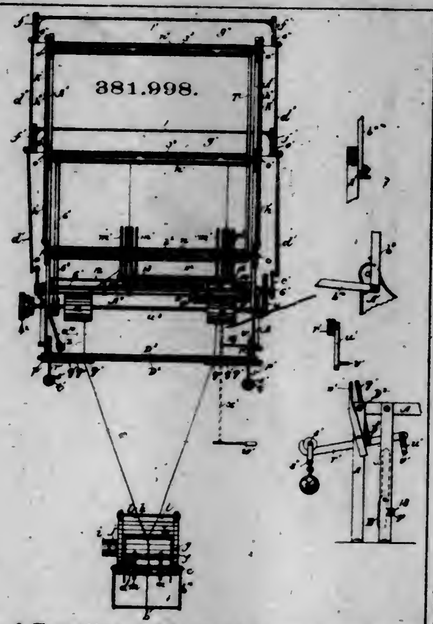
6. The hollow cylindrical needle having a point at one side and an inward projection of the wall of the tube at the heel or side opposite said point, substantially as set forth.

381,998. MACHINE FOR SPLITTING WARPS. FRANK HASKELL, Westbrook, Me. Filed Apr. 9, 1887. Serial No. 234,363. (No model.)

Brief.—The object of the invention is to provide improved mechanism for separating warps or chains after they have been dyed.



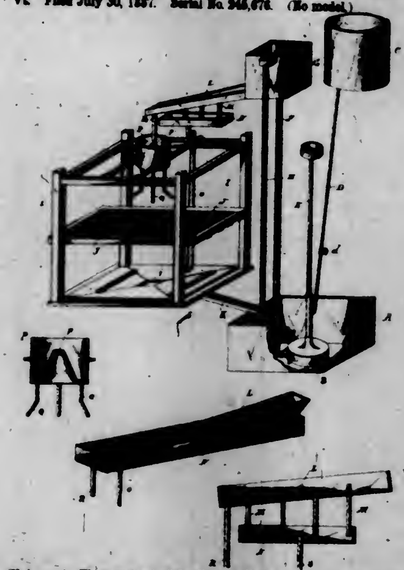
Claim.—1. The combination of a tension device consisting of a series of rods supported by arms, a rod or bar with means for agitating the same, consisting of a lever and an eccentric and rods, and two or more pairs of rollers, substantially as described.



2. The combination of a tension device consisting of a series of rods with supporting-arms and a roller, a rod or bar with means for agitating the same, consisting of a lever and an eccentric and rods, and two or more pairs of rollers, substantially as described.

3. The combination of a tension device consisting of two or more rods with supporting-arms and a roller, a rod or bar with means for agitating the same, consisting of a lever and an eccentric and rod, two or more pairs of rollers, and a guide or guides in front of each pair of rollers, substantially as described.

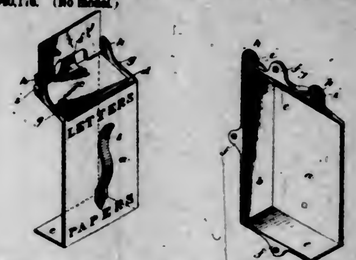
4. The combination of the rods *b* and *c*, supported by the arms b^{10} and b^9, roller *d*, guides *m m*, bar *f* and means for agitating the same, fingers *g' g'*, and rollers *n* n^9, substantially as described.



5. The combination of the rods *b* and *c*, supported by the arms b^{10} and b^9, roller *d*, guides *m m*, fingers *g' g'*, guides *p' p'*, and rollers *n* n^9, substantially as described.

6. The combination of the guides p' p', fingers q' q', rod D^2, shaft D^3, lever r', pulley s', weighted carrier s^4, arm s', with pin r', levers E and 18, the framing e, having the slot F, rod x', arm y', rod H, spring I, arm e^{10}, shaft z, arm a', and shipper-guides, substantially as described.

381,999. METHOD OF AND APPARATUS FOR FEEDING CHILLED SHOT IN STONE-SAWING MACHINES. ELI J. HAWLEY, Manchester, Vt. Filed July 30, 1887. Serial No. 245,676. (No model.)



Claim.—1. The method of feeding chilled shot to a stone-sawing machine, consisting in discharging the shot from the reservoir mixed with a sufficient quantity of water to carry them down the feed-trough, gradually diminishing the quantity of water after it leaves the reservoir and while flowing through the trough, and finally discharging the shot and the reduced quantity of water onto the stone.

2. In a stone-sawing machine, the combination, with the gang-frame and a reservoir for mixed chilled shot and water, of a feed-trough provided at its lower end with a discharge-pipe, the said trough being constructed and arranged, substantially as described, so as to retain the shot while flowing through it, and to gradually discharge a quantity of the water after it leaves the reservoir and while flowing through the trough.

3. In a stone-sawing machine, the combination, with the gang-frame and a reservoir for mixed chilled shot and water, of a feed-trough provided at its lower end with a discharge-pipe, a water-box beneath said trough, a series of drain-pipes whose upper ends extend through the bottom of the feed-trough on different levels, and whose lower ends extend into the water-box, and a pipe leading from said box to the bottom of the gang-frame, substantially as described.

382,000. LETTER-BOX. LEWIS A. HOKE, York, Pa., assignor of one-half to Noah Stamp, same place. Filed June 3, 1887. Serial No. 240,178. (No model.)

Claim.—1. A letter-box composed of a front, *a*, one side, *b*, a top, *c*, provided with a slit and with ears for the cover, a bottom, *e*, fastening-ears *f*, a cover, *j*, and a spring for the reception of papers, parcels, and the like, all constructed and arranged substantially as shown and described.

2. A letter-box composed of a front, *a*, provided with an indicator substantially such as specified, one side, *b*, a top, *c*, having a slit, and provided with ears for the cover, a bottom, *e*, fastening-ears *f*, and a cover, *j*, all arranged substantially as shown and described.

3. A letter-box composed of a front, *a*, one side, *b*, a top, *c*, provided with a slit, and with ears for the cover, a bottom, *e*, and fastening-ears *f*, all constructed as one casting, and a cover, *j*, substantially as described.

382,001. ELECTRIC GAS-LIGHTER. CHARLES W. HOLMES, Brookline, Mass. Filed June 22, 1887. Serial No. 242,122. (No model.)

Claim.—1. The combination of the gas-burner provided with a stationary electrode and a rotating gas-cock with a vibrating electrode mounted on the spindle of said gas-cock, and an actuating-spring tending to turn the said electrode in one direction, and a locking device which holds the said electrode with the spring strained, the said electrode being connected with the gas-cock and causing the latter to move with it when turned in either direction, substantially as described.

2. The combination of the burner and stationary electrode with the vibrating spring-actuated electrode and locking device therefor, and the rotating gas-valve connected with said vibrating electrode by engaging devices admitting of a small lost motion between said electrode and gas-cock, substantially as and for the purpose set forth.

382,002. TRACE ATTACHMENT. WILLIS J. HOWARD, Mariposa, Cal. Filed Sept. 28, 1887. Serial No. 250,771. (No model.)

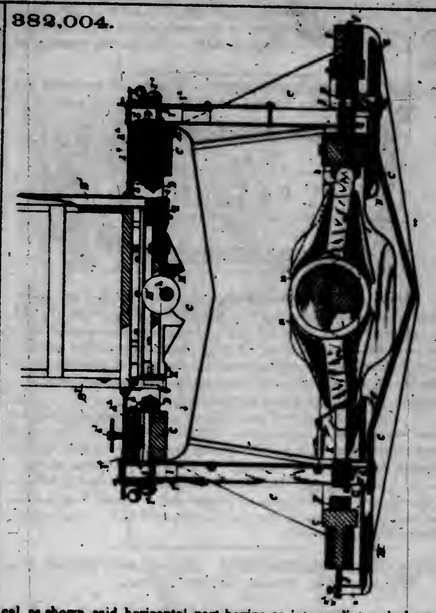
Claim.—1. The combination of the trace, the hooked plate A, made tapering at its rear end where it is fastened in the trace, and the flat laterally-moving spring B, which closes the mouth of the hook, substantially as shown.

2. The combination of the trace and the flat hooked plate A, which is secured thereto, with a spring which is secured to the side of the plate, and which has a lateral movement, so as to close the mouth of the hook, substantially as described.

382,003. HYDRAULIC VALVE. MILTON B. KINSEY, McKee's Rocks, Pa. Filed Dec. 6, 1887. Serial No. 257,115. (No model.)

Claim.—1. In a hydraulic valve, the combination, with the valve-casing having an enlarged chamber, 6, a pressure-port communicating therewith, a machine-port, 5, and a cylindrical bore between the port 5 and the chamber 6, of a valve-stem having a packing-disk which encircles the valve-stem and closes the space between the stem and the side of the said cylindrical bore, said packing-disk working with the valve-stem between the port 5 and the chamber 6 and into the chamber 6, substantially as and for the purpose set forth.

2. In a hydraulic valve, the combination, with the valve-casing having an enlarged chamber, 6, a pressure-port communicating therewith, a machine-port, 5, and a cylindrical bore between the port 5 and the chamber 6, of a valve-stem having a packing-disk which encircles the valve-stem and closes the space between the stem and the side of the said cylindrical bore, said packing-disk working with the valve-stem between the port 5 and the chamber 6 and into the chamber 6, said disk being cup-shaped and the concavity being on the side next the chamber, substantially as and for the purpose set forth.



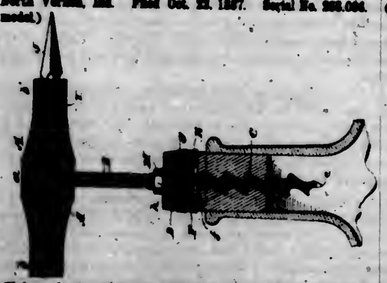
3. In a hydraulic valve, the combination, with the valve-casing having a pressure-port, a machine-port, and an exhaust-port, of a valve-stem working within the casing and having a packing-disk which moves between the pressure-port and the machine-port, and a second packing-disk which moves over the exhaust-port, said disk being concave, the concavity being on that side of the disk which is foremost in the motion of the valve over the port when the disk is under pressure, substantially as and for the purpose set forth.

382,004. MACHINE FOR MAKING BUNGS. FRANK M. LA BOITEAUX, Cincinnati, Ohio. Filed June 19, 1886. Serial No. 205,574. (No model.)

Claim.—1. The combination, substantially as specified, of a machine for making bungs and a cut-off saw for severing the blanks from strips, with feed tube or trough to convey the blanks from the saw to the cutting devices, said tube having between its receiving and discharge end a spiral section or part, as E', to turn the said severed blanks a quarter-revolution to bring the grain of the wood vertical.

2. The combination, substantially as specified, of the cut-off saw for severing square bung-blanks from a strip or strips, the feed-trough B B' B^2 B^3, with the hollow cutters D, sliding bed H, and piece E *e*, the said saw and trough B B' B^2 being arranged above the cutters, said part B having a spiral curve to turn said blanks a quarter-revolution, and devices for forcing the blanks through the same and the vertical part B^3 of the trough leading from the horizontal trough B B' B^2 to the cutters.

3. The combination, substantially as specified, with a bung-machine, of a feed-trough a part of which is horizontal and part vertical, as shown, said horizontal part having an intermediate spiral section, B', with a spring, as *b*, at the discharge end of the horizontal part to bear upon the leading block passing through said trough to force it into the vertical part which leads to the cutter.



4. Compressing mechanism for bung-machines, consisting of the following parts, in combination, to wit: the frame C, the bed E, mounted in ways to slide within said frame, the plungers G, secured in each end of said sliding frame, the cam L, shaft *l*, shoes M, and arms *m*, extending from said shoes to the ends of the frame to actuate the frame in its ways, the cups F, secured in the ends of frame C, the adjustable stops J, and the followers *f*, to discharge the finished bung, substantially as shown and described.

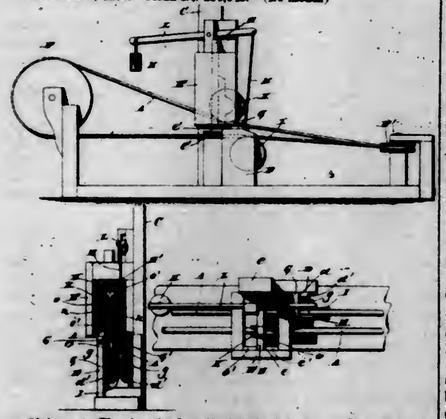
5. In a bung cutting and compressing machine, the combination of the stationary hollow cutters D, secured in each end of the machine-frame, the sliding bed H, the followers E, secured in each end of the sliding bed, the eccentric H', and shaft A, to reciprocate the said bed between the opposite cutters, with the cups F, secured in the ends of frame C, the sliding frame K, and plungers G in each end of said frame, and mechanism, such as shown, to move the sliding frame between the cups, the tubes B^3, to convey blanks to the cutters, and the tubes I I', to convey the circular blanks from the cutters to the compressors, the said cutting mechanism being located above the compressing mechanism, substantially as shown and described.

6. In a bung-machine, the combination of the hollow cutter, the means shown to force blanks through it, the tube I, to deliver said blanks, and the spring-pressed gate I^2, and alarm I^3, to sound when the gate is forced by the feed clogging, substantially as set forth.

382,005. CORKSCREW. PIERCE MCCARTHY and PETER TIERNEY, North Vernon, Ind. Filed Oct. 22, 1887. Serial No. 253,094. (No model.)

Claim.—1. A corkscrew consisting, essentially, of a stem having an ordinary screw thereon, and a rubber washer secured on said stem, substantially as set forth.

2. A corkscrew consisting, essentially, of a handle, a stem, a recessed rubber washer mounted on the stem, and a pair of nuts for holding the washer in place, substantially as and for the purpose set forth.

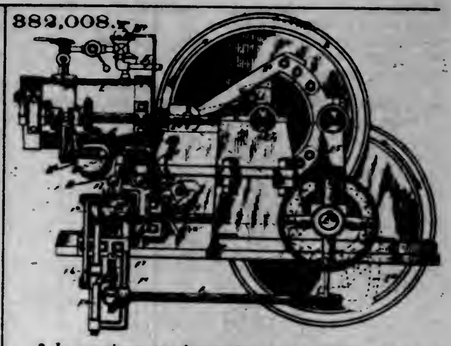


382,006. STATION-INDICATOR. KIMBERLY G. HICKERSON, Passaic, N. J. Filed Jan. 13, 1888. Serial No. 260,671. (No model.)

Claim.—1. In a station-indicator, the combination of two rollers made in two halves, one of which is tongued and the other grooved, an internally-screw-threaded cap inclosing one end thereof and a square-socketed cap inclosing the other, said square socket having a square spindle and a cylindrical journal at the end, gear-wheels mounted upon the square spindles, and intermediate gears uniting them, substantially as and for the purpose described.

2. The combination of two rollers carrying a printed band between them, each having a square spindle at one end, a gear-wheel upon each spindle, a journal, F, and two gear-wheels thereon located between the gears upon the spindles and carrying ratchet-wheels, a pulley, G, inclosing said ratchet-wheels and having an angular recess, *g*, therein, and a pawl having an angular end, *i*, located in said recess and having also two arms for engagement with said ratchet-wheels, substantially as described.

382,007. BELT-TIGHTENER. CHARLES PIERCE, Monticello, Iowa. Filed Jan. 6, 1888. Serial No. 259,949. (No model.)



Claim.—1. The herein-described belt-tightener, adapted to be disposed at an intermediate point of an endless belt, and consisting of the lower grooved frame, D, and the upper grooved frame, E, the sliding carriers G and H, mounted in the grooves in the said frames, the idle-pulleys mounted in the said carriers and adapted to bear respectively against the lower and upper sides of the belt, the lever L, mounted on a suitable bearing at the upper end of the upper frame and connected at one end to the carrier G, and the weight N, attached to the opposite end of the lever, substantially as and for the purpose specified.

2. In a belt-tightener, the combination of the upper gravity-carrier having a pulley bearing on the upper portion of the belt, the lower carrier having a similar pulley to bear against the lower portion of the belt, the lever mounted on a stationary pivot and having a weight on one end, and the connecting-rod between the lower carrier and the other end of the said lever, substantially as specified.

382,008. STEAM OR GAS MOTOR ENGINE. BENJAMIN C. POLE, Camden, N. J. Filed June 12, 1886. Serial No. 204,976. (No model.)

Claim.—1. In combination with an engine-energizer, a coupling connecting it with a second shaft, said coupling being automatically operated by said energizer, substantially as and for the purpose set forth.

2. In an engine-motor, the energizer, combined with a second shaft by a friction-brake automatically operated by said energizer, substantially as and for the purpose set forth.

3. In an engine-motor, the energizer, combined with a second shaft by a rocking arm, and ratchet-and-pawl mechanism adapted to be automatically operated by said energizer, substantially as and for the purpose set forth.

4. In an engine-energizer, combined with a second shaft by a friction-brake automatically attached and detached by said energizer, the governors to regulate the speed thereof, substantially as and for the purpose set forth.

5. In an engine-motor, the energizer, combined with a second shaft by a rocking arm, ratchet-and-pawl mechanism adapted to be automatically operated by said energizer, and the governors to regulate the speed thereof, substantially as and for the purpose set forth.

6. In an engine-energizer, as set forth, connected with two shafts, one or both shafts provided with governors for regulating the speed thereof, substantially as and for the purpose set forth.

7. In an engine-energizer, combined with a second shaft, a pawl and ratchet-wheel or roller-friction automatically operated by itself, substantially as and for the purpose set forth.

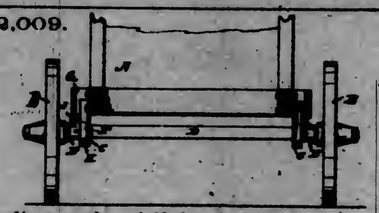
8. In an engine-energizer, combined with a second shaft, a connection adapted to operate the clutch of a friction-coupling connecting said energizer with said shaft, as and for the purposes set forth.

9. In an engine-energizer provided with a piston-rod and cross-head, a connecting-rod to a vibrating arm adapted to receive the percussion of the fly-wheels and connected by a pawl and ratchet or friction-roller to a second shaft, substantially as and for the purpose set forth.

10. In an engine-energizer, combined with a second shaft provided with automatic connections, being cams or cranks, to operate a connecting-rod, adapted to attach and detach mechanism that connects the energizer with the second shaft, substantially as and for the purpose set forth.

11. An engine-motor provided with the following elements: an energizer, combined with fly-wheels and adapted to be automatically attached and detached to and from a second shaft, provided with governors to regulate the speed thereof, substantially as and for the purpose set forth.

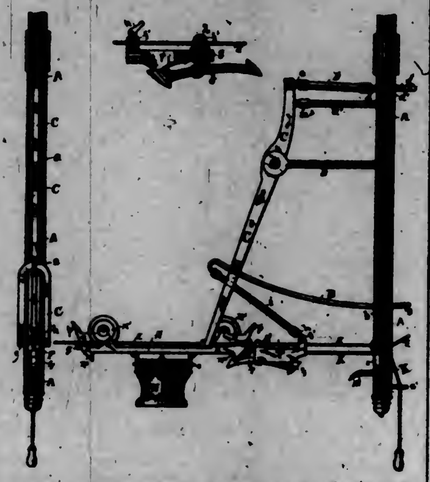
12. The combination, in a gas-engine energizer operating its own and a second shaft, of the governor to control the supply of gas used by the energizer and adapted to control the speed of the second shaft, substantially as and for the purpose set forth.



13. The combination, with an engine-energizer, of a friction-brake provided with an outer rim, A^5, and a side cover, A^6, provided with an interior free wheel, A^7, and a wheel, A^3, that is keyed on shaft A, also provided with springs, and an operating strap to a clutch mechanism suitably connected and operated by said energizer, as and for the purposes set forth.

14. The combination, with an engine-energizer, of the connection E^3 to the vibrating arm E^4, operating the yoke, with pawl E^6, or friction-roller H^4, to a wheel, H^3, or ratchet F^3, combined and keyed on a shaft, F^2, adapted to be automatically connected with the moving power by yielding or flexible connection E^{10} to the energizer, as and for the purposes set forth.

382,009. AXLE FOR THRASHING-MACHINES. FRANKIN W. REMINGTON, Richmond, Ind. Filed Feb. 28, 1888. Serial No. 264,616. (No model.)

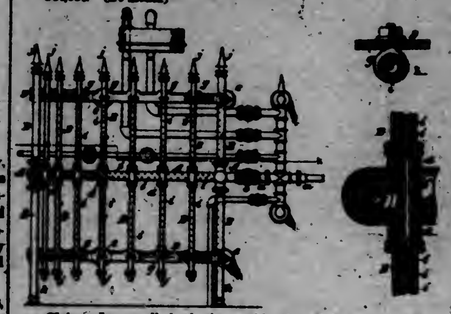


Claim.—1. The combination, substantially as set forth, of a thrasher-frame, an axle disposed across thereunder, chains secured to the end thereof and provided at their inner ends with upwardly-projecting bosses, jaws secured to the thrasher-framing and engaging the inner ends of the chains, downwardly-open spring-cups secured to the thrasher-frame over said bosses, and springs disposed within said cups and engaging said chain-bosses.

2. The combination, substantially as set forth, of a thrasher-frame,

a pair of jaws secured to each side thereof and projecting downwardly, downwardly-open spring-cups at each of said pairs of jaws, springs disposed within each spring-cups, a wooden axle extending across under the thrasher-frame between and through said jaws, chains secured to said axle and provided with rectangular enlargements at their inner ends engaging within the jaws, and bosses projecting upwardly from the inner end of each of said chains into engagement with said springs.

382,010. STORE-SERVICE APPARATUS. THOMAS A. SHERIN, FRANK D. SHERIN, and ADAM BRADY, Columbus, Ohio. Filed Feb. 27, 1888. Serial No. 265,682. (No model.)



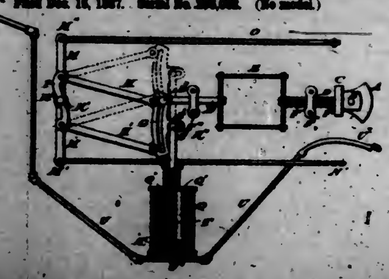
Claim.—1. In a store-service apparatus, the combination of the hanger A, having the outwardly-projecting arm *a*, the propelling-lever C, pivoted to the arm *a* and provided with the loop *c* on its lower end, the elastic tube D, and the connecting-bar *d*, adapted to be adjusted on the hanger A, all substantially as and for the purpose specified.

2. In a store-service apparatus, the combination of the hanger A, having the outwardly-projecting arm *a*, the propelling-lever C, pivoted to the arm *a* and provided with the loop *c* on its lower end, the elastic tube D, and the connecting-bar *d*, with the trunk-wire E, the catch-block F, loosely mounted thereon and having a spring-actuated and pivoted trigger, the rod B, and the elastic rubber tube *i*, connecting said block and rod, substantially as and for the purpose described.

3. In a store-service apparatus, the combination of the hanger A, having the outwardly-projecting arm *a*, the propelling-lever C, pivoted to the arm *a* and provided with the loop *c* on its lower end, the elastic tube D, and the connecting-bar *d*, with the trunk-wire E, secured to the hangers, the pulley K and tripping-pin M in the lower end of said hangers, the catch-block F, having a cord passing over said pulley and a pivoted trigger, the adjustable rod B, and the elastic rubber tube *i*, connected with said block, and a car mounted upon the trunk-wire, substantially as and for the purpose described.

4. In a store-service apparatus, the combination of the hanger A, having the outwardly-projecting arm *a*, the propelling-lever C, pivoted to the arm *a* and provided with the loop *c* on its lower end, the elastic tube D, and the connecting-bar *d*, with the trunk-wire E, secured to the hangers, the pulley K and tripping-pin M in the lower end of said hangers, the catch-block F, having a cord passing over said pulley and a pivoted trigger, the adjustable rod B, and the elastic rubber tube *i*, connected with said block, and a car mounted upon the trunk-wire and having the checkers a^2 and the upwardly-extended fingers *p* and bumper *q*, substantially as and for the purposes described.

382,011. NEEDLE-BATH. BENJAMIN C. SMITH, Brooklyn, assignor to Fred. Adee & Co., New York, N. Y. Filed Aug. 26, 1887. Serial No. 247,891. (No model.)



Claim.—In a needle-bath, the combination of the central horizontal distributing-pipe, A, couplings *d d*, carried by said pipe, vertical pipes B B, fitting said couplings, braces D D, and straps *g*, all arranged for operation substantially as herein shown and described.

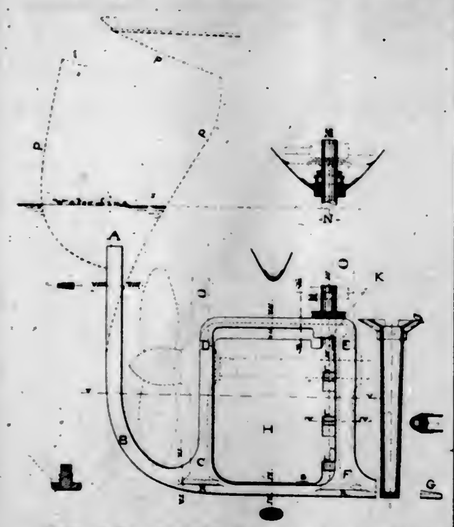
382,012. HOT-AIR SYRINGE. ELI T. SHARP, Philadelphia, Pa., assignor to the S. S. White Dental Manufacturing Company, same place. Filed Feb. 13, 1888. Serial No. 263,821. (No model.)

Claim.—The hot-air syringe consisting of the bulb, the inlet-valve thereof, the pipe-connection, the outlet-valve, and the heating-chamber, substantially as described.

382,013. CAR-BRAKE. JAMES S. STEWART, Philadelphia, Pa. Filed Dec. 16, 1887. Serial No. 258,052. (No model.)

Claim.—1. In an automatic-impact brake mechanism, the combination of an air-cylinder provided with a piston adapted to be actuated by compressed air to shift the parts of the brake mechanism, whereby the said mechanism can be controlled by the engineer to close the brakes by either a pull or push of the buffer, substantially as described.

2. In an automatic-impact brake mechanism, the combination of an air-cylinder provided with a piston adapted to be actuated by compressed air to shift the parts of the brake mechanism, and a spring bearing against said piston to drive it back to place when the air-pressure is removed, substantially as described.



3. In an automatic-impact brake mechanism, the combination of arms H H', lever I, guard or guide G, air-cylinder Q, piston-head R, stem R', and air-pipes U, all arranged and operating substantially as described.

4. In an automatic-impact brake mechanism, the combination of arms H H', lever I, guard or guide G, air-cylinder Q, piston R, stem R', and spring T, to return the piston to place when the actuating air-pressure is removed, substantially as described.

5. In an automatic-impact brake mechanism, the combination of arms H H', lever I, lugs K K', rod J, lever-arm V, link G, piston-rod R', piston-head R, cylinder Q, spring T, and air-pipes U U', substantially as described.

382,014. STERN-POST AND STERN-FRAME FOR STEAMSHIPS.

WALFRID T. SYLVÉN, Washington, D. C. Filed Jan. 4, 1888. Serial No. 259,793. (No model.)

Claim.—1. The combination of one common or balanced rudder located in the longitudinal axis of a ship or vessel, a stern-post or stern-framing, an opening in said stern-post or stern-framing of suitable form to receive said rudder, and propellers located astern of such rudder, one or more of said propellers on each side of the said rudder, the dead-wood of the vessel being continued between said propellers, the whole relatively arranged substantially as described.

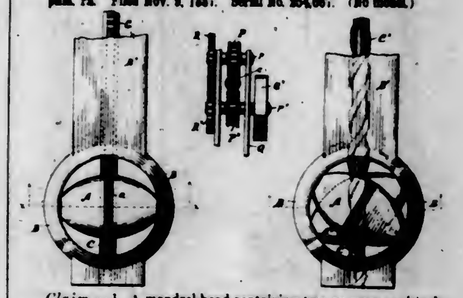
2. The combination, with a common or balanced rudder and two or more propellers located astern of and on each side thereof, of a protecting-frame, A B C D E F G, the forward portion, C D E F G, forming a suitable opening and support for the rudder, and the after portion, A B C, serving as a shield for the propellers, substantially as and for the purpose set forth.

382,015. POLE-ATTACHING AXLE-PLATE FOR WHEELED SCRAPERS, AGRICULTURAL MACHINES, AND SIMILAR PURPOSES.

STEPHEN W. TAFT, Kennett Square, Pa. Filed Feb. 4, 1888. Serial No. 263,033. (No model.)

Claim.—1. The metal axle-plate D, having lateral arms D', provided with seats *d* for the axle-bar, a projecting pivoting-boss, I, to receive the body-coupling, and a forwardly-projecting portion, D^2, having a seat for receiving and supporting the pole formed integral, substantially as set forth.

2. The combination, with the axle A and pole C, of the metal axle-plate D, having the lateral arms D', with seats *d* for the axle at the ends of said arms, the forwardly-extending portion D^2, provided with flanges *e* for supporting the pole, and the attaching-bolts F and H, substantially as set forth.



3. The pole-attaching axle-plate provided with recesses *n*, in combination with the axle-bar A and stay-chain hooks N, confined in said recesses, substantially as and for the purpose set forth.

4. The axle-plate having the lateral arms D', forward extension D^2, and projecting pivot-boss I, provided with the washer L, detachably secured to the top of said boss, in combination with the axle A, pole C, and body-coupling B', having an opening to fit over said boss, substantially as and for the purposes set forth.

5. The stay-chain hook N, having the bifurcated end for engaging a link of the stay-chain and the head n^2 at its opposite end, in combination with an axle, A, and axle-plate D, having the recess *n* for embracing said hook to confine it in position when said plate is attached to the axle, substantially as set forth.

382,016. ROLLER MANDREL.

STEPHEN P. M. TASKER, Philadelphia, Pa. Filed Nov. 9, 1887. Serial No. 254,667. (No model.)

Claim.—1. A mandrel-head containing two or more positively-driven rolls, substantially as and for the purposes set forth.

2. In combination, a mandrel-head containing two or more rolls, and driving mechanism, essentially such as set forth, for positively driving said rolls, substantially as and for the purposes set forth.

3. In a roller mandrel substantially such as set forth, the combination of two or more mandrel-rolls, gearing for positively driving said rolls, and a prime mover for actuating said gearing.

4. In a mandrel for rolling tubes, the combination of a mandrel-rod, rolls mounted rotatively therein, a prime mover mounted in connection with said mandrel-rod, and gearing operatively uniting said prime mover and rolls, substantially as set forth.

5. In a mandrel for rolling tubes, the combination of mandrel-rolls mounted rotatively therein, teeth identified with said rolls, propulsive gearing engaging with said teeth, and means for applying power to said propulsive gearing.

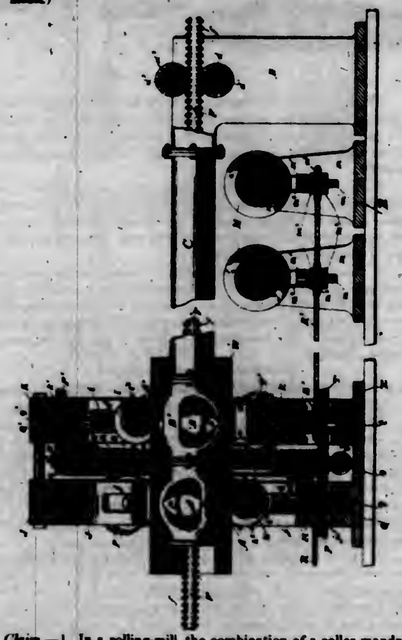
6. The combination, to form a mandrel for rolling tubes, of two or more rolls provided with teeth, a mandrel-head for carrying said rolls, and a rack which is engaged with the teeth of said rolls, substantially as and for the purposes set forth.

7. The combination, to form a mandrel for rolling tubes, of two or more rolls provided with teeth, a mandrel-head for carrying said rolls, a rack which is engaged with the teeth of said rolls, and means for imparting longitudinal thrust to said rack, substantially as and for the purposes set forth.

8. The combination, to form a mandrel for rolling tubes, of two or more rolls provided with teeth, a mandrel-head for carrying said rolls, and a rack which passes between or among the rolls and is engaged with the teeth of said rolls, substantially as and for the purposes set forth.

9. The combination, to form a mandrel for rolling tubes, of two or more rolls provided with teeth, a mandrel-head for carrying said rolls, a rack which passes between or among the rolls and is engaged with the teeth of said rolls, and means for imparting longitudinal thrust to said rack, substantially as and for the purposes set forth.

10. The combination, in a roller mandrel, of two ellipsoidal rolls the axes of which are inclined to each other, and which are provided with teeth, a mandrel-head carrying said rolls, and a rack which is engaged with the teeth of said rolls, substantially as and for the purposes set forth.



11. The combination, in a roller mandrel, of two ellipsoidal rolls the axes of which are inclined to each other, and which are provided with teeth, a mandrel-head carrying said rolls, a rack which is engaged with the teeth of said rolls, and means for imparting longitudinal thrust to said rack, substantially as and for the purposes set forth.

12. The combination, in a roller mandrel, of two ellipsoidal rolls the axes of which are inclined to each other, and which are provided with sunken teeth circumscribing their central portions, a mandrel-head carrying said rolls, and a spiral rack which passes between said rolls and is engaged with the sunken teeth thereof, substantially as and for the purposes set forth.

13. The combination, in a roller mandrel, of two ellipsoidal rolls the axes of which are inclined to each other, and which are provided with sunken teeth circumscribing their central portions, a mandrel-head carrying said rolls, a spiral rack which passes between said rolls and is engaged with the sunken teeth thereof, and means for imparting longitudinal thrust to said rack, substantially as and for the purposes set forth.

382,017. ROLLING-MILL FOR MAKING TUBES.

STEPHEN P. M. TASKER, Philadelphia, Pa. Filed Nov. 14, 1887. Serial No. 256,108. (No model.)

Claim.—1. In a rolling-mill, the combination of a roller mandrel having two or more mandrel-rolls, gearing for positively driving said rolls, a prime mover for actuating said gearing, and external compressing-rolls, substantially as set forth.

2. In a rolling-mill, the combination of a roller mandrel having two or more mandrel-rolls, gearing for positively driving said rolls, a prime mover for actuating said gearing, external compressing-rolls, gearing for positively driving said compressing-rolls, and a prime mover for actuating said gearing, substantially as set forth.

3. In a rolling-mill, the combination of a roller mandrel having two or more mandrel-rolls, gearing for positively driving said rolls, a prime mover for actuating said gearing, external compressing-rolls, and adjusting-gearing for simultaneously setting up toward a common center all of the external compressing-rolls, substantially as set forth.

4. In a rolling-mill, the combination of a roller mandrel having two or more mandrel-rolls, gearing for positively driving said rolls, a prime mover for actuating said gearing, external compressing-rolls, gearing for positively driving said compressing-rolls, a prime mover for actuating said gearing, and adjusting-gearing for simultaneously setting up toward a common center all of the external compressing-rolls, substantially as set forth.

5. In a rolling-mill, the combination of a roller mandrel having two or more mandrel-rolls, gearing for positively driving said rolls, a prime mover for actuating said gearing, external compressing-rolls, and idler carrying-rolls for carrying and supporting the ingot, substantially as set forth.

6. In a rolling-mill, the combination of a roller mandrel having two or more mandrel-rolls, gearing for positively driving said rolls, a prime mover for actuating said gearing, external compressing-rolls, adjusting-gearing for simultaneously setting up toward a common center all of the external compressing-rolls, idler carrying-rolls for carrying and supporting the ingot, and adjusting-gearing for adjusting the vertical set of said carrying-rolls, substantially as and for the purposes set forth.

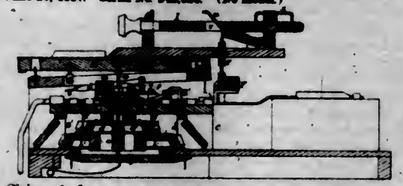
7. In a rolling-mill, the combination of a roller mandrel having two or more mandrel-rolls, gearing for positively driving said rolls, a prime mover for actuating said gearing, external compressing-rolls, gearing for positively driving said compressing-rolls, a prime mover for actuating said gearing, adjusting-gearing for simultaneously setting up toward a common center all of the external compressing-rolls, idler carrying-rolls for carrying and supporting the ingot, and adjusting-gearing for adjusting the vertical set of said carrying-rolls, substantially as and for the purposes set forth.

8. In a rolling-mill, the combination of a series of roller mandrels, each containing two or more rolls, the rolls of said respective mandrels being alternated or interdisposed as set forth, gearing common to the rolls of all of the mandrels for positively driving said rolls, a prime mover for actuating said gearing, and a series of sets of external compressing-rolls corresponding in number with the mandrels, the rolls of said respective sets being alternated or interdisposed as set forth, and operating respectively in connection with corresponding rolls of corresponding mandrels, substantially as set forth.

9. In a rolling-mill, the combination of a series of roller mandrels, each containing two or more rolls, the rolls of said respective mandrels being alternated or interdisposed as set forth, gearing common to the rolls of all of the mandrels for positively driving said rolls, a prime mover for actuating said gearing, a series of sets of external compressing-rolls corresponding with the number of mandrels, the rolls of said respective sets being alternated or interdisposed as set forth, and operating respectively in connection with corresponding rolls of corresponding mandrels, gearing for positively driving said compressing-rolls, and a prime mover for actuating said gearing, substantially as set forth.

10. In a rolling-mill, the combination of a series of roller mandrels, each containing two or more rolls, the rolls of said respective mandrels being alternated or interdisposed as set forth, gearing common to the rolls of all of the mandrels for positively driving said rolls, a prime mover for actuating said gearing, a series of sets of external compressing-rolls corresponding with the number of mandrels, the rolls of said respective sets being alternated or interdisposed as set forth, and operating respectively in connection with corresponding rolls of corresponding mandrels, and adjusting-gearing for simultaneously setting up toward a common center all of the compressing-rolls of all of the sets, substantially as set forth.

11. In a rolling-mill, the combination of a series of roller mandrels, each containing two or more rolls, the rolls of said respective mandrels being alternated or interdisposed as set forth, gearing common to the rolls of all of the mandrels for positively driving said rolls, a prime mover for actuating said gearing, a series of sets of external compressing-rolls corresponding with the number of mandrels, the rolls of said respective sets being alternated or interdisposed as set forth, and operating respectively in connection with corresponding rolls of corresponding mandrels, gearing for positively driving said compressing-rolls, a prime mover for actuating said gearing, and adjusting-gearing for simultaneously setting up toward a common center all of the compressing-rolls of all of the sets, substantially as set forth.



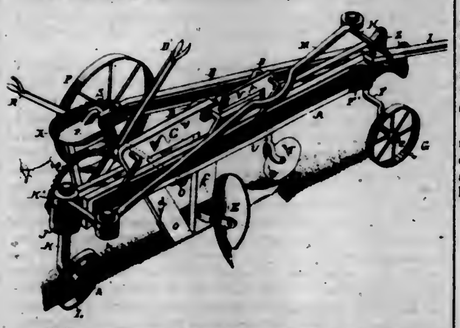
12. In a rolling-mill, the combination of a series of roller mandrels, each containing two or more rolls, the rolls of said respective mandrels being alternated or interdisposed as set forth, gearing common to the rolls of all of the mandrels for positively driving said rolls, a prime mover for actuating said gearing, a series of sets of external compressing-rolls corresponding with the number of mandrels, the rolls of said respective sets being alternated or interdisposed as set forth, and operating respectively in connection with corresponding rolls of corresponding mandrels, and idler carrying-rolls for carrying and supporting the ingots, substantially as set forth.

13. In a rolling-mill, the combination of a series of roller mandrels, each containing two or more rolls, the rolls of said respective mandrels being alternated or interdisposed as set forth, gearing common to the rolls of all of the mandrels for positively driving said rolls, a prime mover for actuating said gearing, a series of sets of external compressing-rolls corresponding with the number of mandrels, the rolls

of said respective sets being alternated or interdisposed as set forth, and operating in connection with corresponding rolls of corresponding mandrels, adjusting-gearing for simultaneously setting up toward a common center all of the external compressing-rolls, idler carrying-rolls for carrying and supporting the ingot, and adjusting-gearing for adjusting the vertical set of said carrying-rolls, substantially as set forth.

14. In a rolling-mill, the combination of a series of roller mandrels, each containing two or more rolls, the rolls of said respective mandrels being alternated or interdisposed as set forth, gearing common to the rolls of all of the mandrels for positively driving said rolls, a prime mover for actuating said gearing, a series of sets of external compressing-rolls corresponding with the number of mandrels, the rolls of said respective sets being alternated or interdisposed as set forth, and operating in connection with corresponding rolls of corresponding mandrels, gearing for positively driving the sets of external compressing-rolls, a prime mover for actuating said gearing, adjusting-gearing for simultaneously setting up toward a common center all of the external compressing-rolls, idler carrying-rolls for carrying and supporting the ingot, and adjusting-gearing for adjusting the vertical set of said carrying-rolls, substantially as set forth.

382,018. REED-ORGAN. ISRAEL B. TAYLOR, Boston, Mass. Filed June 27, 1887. Serial No. 242,693. (No model.)



Claim.—1. In a reed-organ, the combination, with each stop I, having the slot *v*, as described, and with the valve-operating lever E of such stop, of the goose-neck *u*, arm H, and push-pin *t*, the latter being applied to the said lever, as specified.

2. The combination of the key A, having the adjustable-button *c*, the push-pin *a*, valve *b*, lever *d*, fulcrumed in the movable bar B, said bar being supported at its ends in the arms *d'*, which arms are pivoted to the ends of the case, the lever *h*, connected to lever *d* by link *g*, and the button *l* on the push-pin *a* and concentric therewith.

3. The combination of the movable bar B, shaft *n*, having an arm, *p*, provided with cranks *o*, and pivoted to the bar B, board *m*, arm *q* of the lever E, which lever has an arm, *r*, the bar F, operated by the arm *b* of shaft *s*, and the series of crank-levers E', whereby all the valves of the several sets of reed-chambers can be simultaneously opened.

382,019. THREE-WHEEL RIDING-PLOW. STEPHEN B. TOLSON and JAMES C. TOLSON, Kansas City, Mo. Filed Dec. 16, 1887. Serial No. 258,108. (No model.)

Claim.—1. The combination, in a wheel riding-plow, of the supporting-wheels and beam, colter and plow carrying frames or standards, a series of pivoted links loosely connecting the plow and colter carrying frames to the beam, and a hand-lever connected with one of said links, whereby the same are operated in unison to simultaneously raise and lower the colter and plow, substantially as described.

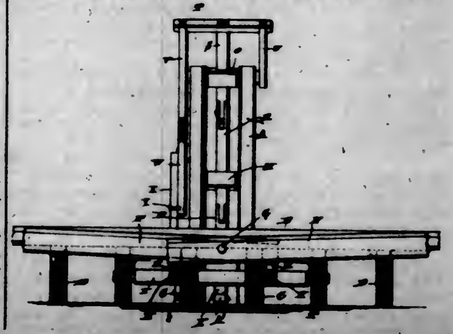
2. In a wheel-plow, the combination, with suitable supporting-wheels and beam, of the plow and colter carrying frames or standards, and a series of pivoted links loosely connecting said plow and colter carrying frames to the beam, said links having their free ends oscillating above the beam, to which they are pivoted, in the manner and for the purpose described.

382,020. CANTEEN. BERNICE A. TEEL, Helena, N. Mex. Filed July 21, 1887. Serial No. 244,909. (Model.)

Claim.—A canteen having two compartments, one for liquid, the other for solid food, the two compartments being divided by a partition and detachably united together, the solid-food compartment being provided with vessels having sliding covers which conform in shape to the compartment, and the liquid-compartment provided with a nozzle, substantially as described.

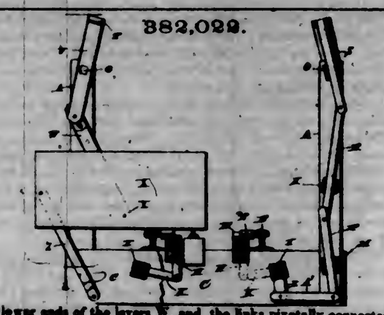
382,021. VAPOR-STOVE. J. BENNETT WALLACE, Chicago, Ill., assignor to George M. Chart & Company, same place. Filed Nov. 10, 1887. Serial No. 255,612. (No model.)

Claim.—1. The combination, with the non-generating burners of a vapor-stove and the two-part feed-pipe by which they are supplied, of a damper-valve, G, constructed with beveled edges *e* and located in said pipe at the junction of the parts thereof, substantially as specified.



2. In a vapor-stove, the combination, with the feed-pipe C *c*, carrying the non-generating burners, the part C having its end bored to render it true for the valve and the end of the part *c*, of a valve, G, having bevel-surfaces *e* and located within such prepared part of the pipe C, substantially as specified.

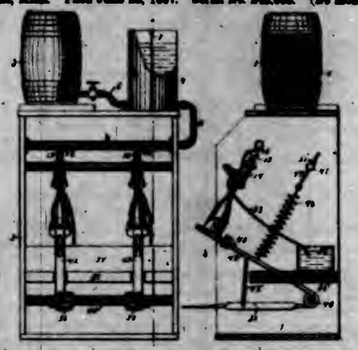
3. In a vapor-stove, a feed-pipe made in two parts, C and *c*, each carrying a non-generating burner, the part C being interiorly bored from one end to the point *g*, as set forth, and the part *c* being fitted in such bored end, in combination with a valve, G, located in the bored portion of part C and controlling the further of said burners, substantially as specified.



382,022. RAILROAD OR FARM GATE. NATHAN WISNER and SIDNEY R. SHAVER, Ingram, Ark. Filed Dec. 19, 1887. Serial No. 258,261. (No model.)

Claim.—1. The combination of the jump-gates, the links Z, connected to the outer ends thereof and to fixed points, the operating-rails adapted to be actuated by the wheels of a passing train, the levers W, pivotally connected to the gates near the centers thereof, and connections between the said levers and the operating-rails, whereby, when the operating-rails are actuated, the gates will be opened, substantially as described.

2. The combination of the operating-rails, the rock-shafts, connections between the said rails and the said rock-shafts, the series of connected levers P, R, and S, the jointed levers V W, connected to and operated by the said series of levers, connections between the levers P and the rock-shafts, the jump-gates X, pivotally connected to



382,022.

the lower ends of the levers W, and the links pivotally connected to the outer ends of the jump-gates, substantially as described.

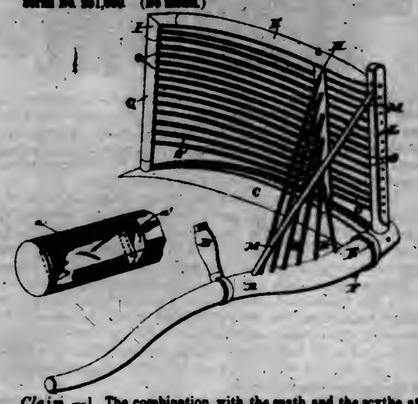
3. The operating-rails E F, fulcrumed together near their inner ends and arranged alongside the track-rails, whereby the outer ends of the rails E F will be elevated so as to be operated upon by the wheels of a passing train, in combination with the rock-shaft I, connected to the rails E F, the jump-gates X, the links Z, pivotally connected to the gates, the levers W, connected to the gates, and the system of levers between the rock-shaft I and the levers W, for the purpose set forth.

382,023. BEER-BOTTLING MACHINE. JOHN C. RAUER, Minneapolis, Minn. Filed June 22, 1887. Serial No. 242,092. (No model.)

Claim.—1. In a bottle-filling machine, the combination, with the filling-pipe, of the plunger 15, having an opening through it and having the inclined lower face, the slide-valve 17, having the opening 18 and having the inclined face bearing against the inclined face of the plunger, and the spring 27, bearing against said slide, all substantially as described.

2. The combination, in a bottling-machine, with the filling-pipe, of the plunger 15, having an opening, 16, communicating with said pipe, the valve-case sliding on said plunger, and the cut-off slide 17, arranged in said case and provided with the opening 18, all substantially as described.

3. The combination, in a bottle-filling machine, with the plunger 15, having the inclined lower end, and the slide 17, having the inclined face bearing against the lower end of said plunger, of the vertically-sliding valve-case 14, provided with the opening 26, and the rubber gasket 30, all substantially as described.



4. The combination, in a bottle-filling machine, of a stationary plunger, a movable case surrounding said plunger and adapted to receive the end of a bottle-neck, the cut-off slide located in said case, and the spring-valve connected with the case below said slide, substantially as described.

5. The combination, in a bottle-filling machine, with the filling-pipe, of the sliding cut-off valve, the air-outlet valve 23, connected therewith and provided with the pipe 33, and a bottle-support, substantially as described.

6. The combination, in a bottle-filling machine, of a cut-off valve adapted to be opened by the pressure of a bottle-neck against it, an adjustable bottle-support, an adjustable spring connected with said bottle-support and drawing it toward said valve, and a treadle connected with said lever for withdrawing the same, all substantially as described.

7. The combination, in a bottle-filling machine, of a cut-off valve having its lower end provided with a central cushion or packing and adapted to make an air-tight joint with a bottle-mouth, and an escape-valve arranged below the cut-off and provided with a tube extending into a suitable receptacle adapted to contain a supply of water, whereby the air in the bottle may be allowed to escape while the carbonic-acid gas is retained and the outside air is prevented from coming in contact with the liquid, substantially as described.

382,024. GRAIN-CRADLE. JOSHUA BAILEY, Jonesborough, Ga., assignor of one-half to F. G. Bates, same place. Filed Sept. 20, 1887. Serial No. 251,082. (No model.)

Claim.—1. The combination, with the snath and the scythe attached thereto, of the uprights G and H, secured at their lower ends to the scythe respectively near its outer and inner ends, the socket-piece I, having its vertical arm arranged on the upper end of the upright G, the top finger, K, secured to the upper end of the upright H and inserted at its outer end in the horizontal arm of the socket-piece, the said fingers being extended inward beyond the upright H, the upright L, secured to the lower end of the snath and attached at its upper end to the inner end of the finger K, the fingers O, secured at their inner ends in the upright L and at their outer ends in the upright G, and passing at their intermediate points through the upright H, the brace M, extending from the upper end of the upright L to the snath, and the brace N, extending from intermediate points of the upright H to the snath, substantially as specified.

2. In a grain-cradle, the combination of the snath and the scythe secured thereto, the outer and inner uprights, G and H, secured at their lower ends to the scythe, the top finger, K, connecting the upper ends of the said uprights and extending inward beyond the inner upright, the upright L, attached at its lower end to the snath, and having an aperture in its upper end to receive the inner end of the finger K, the fingers O, passing through the upright H at intermediate points of its length and secured at their ends, respectively, to the uprights G and L, the brace M, inserted at its ends in apertures in the upright L and the snath, and the brace N, inserted at their ends in apertures at intermediate points of the upright H and the snath, substantially as and for the purpose hereinbefore specified.

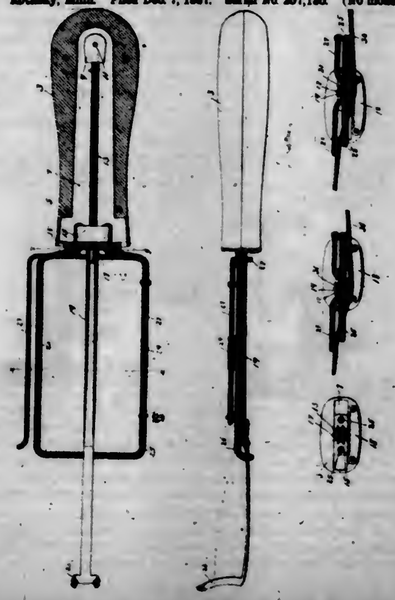
382,025. MACHINE FOR SETTING STAPLES. WILLIAM J. BROWN, Jr., Philadelphia, Pa., assignor to the Wire Staple Company, same place. Filed Oct. 20, 1886. Serial No. 217,502. (No model.)

Claim.—1. The combination, in a machine for inserting and clinching metallic staples by a single movement, of a staple-case through which staples are presented and driven, a reciprocating driver moving in said staple-case, an adjustable anvil secured to a spindle or arm, and a revolving cam adapted to operate on said anvil to bring it into greater or less proximity to the mouth of the staple-case and clamp the material to be fastened, substantially as set forth.

2. The frame or base B, with its arm A, staple-case C, driver D, adjustable anvil E, and revolving cam H, constituting a staple inserting and clinching device, substantially as described.

882,026. TURBINE WATER-WHEEL. NATHAN F. DURNBAR, York, Pa. Filed Dec. 17, 1887. Serial No. 258,177. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of the turbine water-wheel case, the gate inclosed therein, the gate-arms, their central spindle or journal, the cover over the case, and the arms secured to the cover near its outer margin, interposed between the cover and gate, and provided with a central ring to form a bearing for the gate-arms, for the purposes specified.



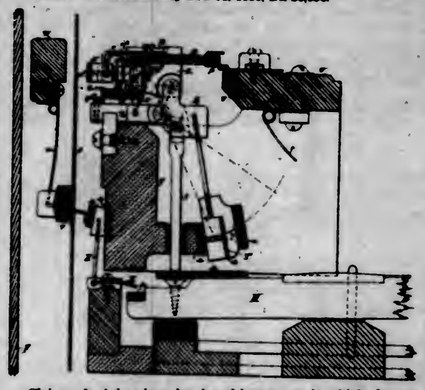
2. The combination, substantially as hereinbefore set forth, of a turbine water-wheel case, the gate inclosed therein, the gate-ring, the recesses on its inner margin, the gate-arms, their central journal, the cover over the case, the cover-arms interposed between the cover and gate, and the lugs on the cover-arms bearing on the gate in the recesses of the gate-ring to limit both its vertical and lateral movement.

3. The combination, substantially as hereinbefore set forth, of the turbine water-wheel case, the gate inclosed therein, the gate-ring, the gate-arms, their central journal, the cover over the case, the arms secured to the cover near its outer margin and interposed between the cover and gate, the rack on the top of the gate-ring, and the worm on the case meshing therewith.

4. The combination, substantially as hereinbefore set forth, of the turbine water-wheel case, the gate inclosed therein, the gate-arms, their central journal, the cover over the case, the arms interposed between the cover and case, the central ring on the cover-arms forming the bearing for the gate-arms' journal, the set-screws passing horizontally through the cover and abutting against the ends of the cover-arms, and the vertical set-screws passing through slots in the cover into lugs on the cover-arms to insure accurate centering and adjustment of the gate-ring.

5. The combination, substantially as hereinbefore set forth, of the cover, the cover-arms, the adjusting-screws passing horizontally through the cover and abutting against the ends of the cover-arms, slots in the cover near its outer edge, lugs on the cover-arms, and set-screws passing through said slots to connect the cover and its arms and to permit of their relative adjustment.

882,027. DEVICE FOR SHARPENING RAZORS. PETER J. CARMAN, Rothsay, Minn. Filed Dec. 7, 1887. Serial No. 257,180. (No model.)



Claim.—1. The combination, with the recessed handle 3, provided with the rack-bar 18, of the shaft 13, pivotally secured within the recess of said handle and provided with the pinion 17, engaging said rack-bar, and the razor-holder 19, secured to said shaft, substantially as described.

2. The combination, with the recessed handle 3, provided with the rack-bar 18, of the shaft 13, pivotally secured within the recess of said handle and provided with the pinion 17, engaging said rack-bar, and the razor-holder 19, secured to said shaft, substantially as described.

3. The combination, with the recessed handle 3, provided with the rack-bar 18, of the shaft 13, pivotally secured within said recessed handle and provided with the pinion 17, engaging said rack-bar, the razor-holder 19, secured upon said shaft, and the frame 25, secured upon said shaft and extending upon opposite sides of said razor-holder.

4. The combination, with the recessed handle 3, provided with the rack-bar 18, of the shaft 13, pivotally secured within said handle and provided with the pinion 17, engaging said rack-bar, the razor-holder secured to said shaft, the frame 25, and the spring friction-clamp 27, all substantially as described.

882,028. KEY-BOARD MUSICAL INSTRUMENT. ANDREA LUIGI CALDERA, Turin, Italy. Filed June 30, 1887. Serial No. 242,982. (No model.) Patented in Italy Dec. 31, 1886, No. 20,950.

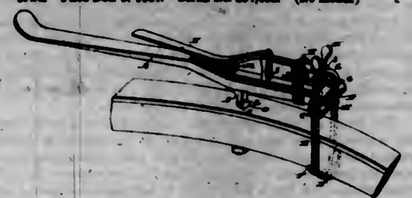
Claim.—1. A key-board stringed instrument in which the string is vibrated by the direct thrust of a knee-jointed plectrum or mechanical finger whose pivotal center is parallel to the string, the said center receiving a motion toward the string, and the finger or plectrum, after being so moved forward to deflect the string, receiving an oscillating motion on its center, as specified.

2. In a key-board stringed instrument in which the string is vibrated by the direct thrust of a plectrum or finger moving in two directions, as herein described, the combination, with the said plectrum or finger, of a weighted arm acting as a store of power to overcome the resistance of the string to the motion of the plectrum or finger, and as a means of quickly returning the "action" to the normal position after the string has been vibrated, substantially as specified.

3. In a key-board stringed instrument, the combination of the finger N, the pivoted arm M, the guide-pin *n*, and the spring connecting the finger N and arm M and forcing the former forward with an elastic or yielding pressure, substantially as and for the purpose specified.

4. In a key-board stringed instrument, the combination, with the yielding finger N and the elbow-lever M, pivoted on a center parallel to the string in a jack, L, having a motion perpendicular to the string, of the stop *r* on the jack for preventing the oscillation of the finger in one direction, the tie P, for producing the oscillation of the finger in the opposite direction on its forward motion, and the tie Q, for restoring it to its normal position on its return, as described.

5. In a key-board stringed instrument, the combination, with the yielding or spring finger N, and the elbow-lever M, carrying the same, pivoted in a jack, L, of the lever K, and radius-link O, for producing the longitudinal parallel motion of jack L, as specified.



6. In a key-board stringed instrument, the combination, substantially as herein specified, of the spring-finger N, elbow-lever M, carrying the same and pivoted in a jack, L, ties P Q, controlling the elbow-lever, radius-link O, and lever K, guiding and actuating the jack L and the weighted arm T, acting as a store of power, as described.

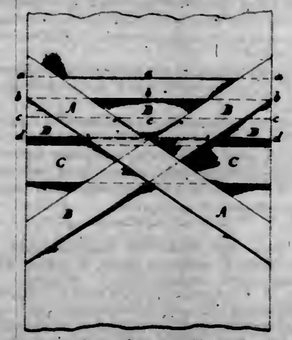
7. In a key-board stringed instrument, the combination, substantially as herein specified, of the spring-finger N, elbow-lever M, carrying the same, and pivoted in a jack, L, ties P Q, controlling the elbow-lever, radius-link O, and lever K, guiding and actuating the jack L, the weighted arm T, acting as a store of power, and the spring *t*, acting as a cushion for the weight T and assisting it to return the action quickly to the normal position, as described.

8. In a key-board stringed instrument, the combination, with the spring plectrum or finger pivoted on a center parallel to the string supported in a jack moving in a direction perpendicular to the string and with the tapes for oscillating the finger on its center, of the springs *p* and *q*, for imparting elasticity to the action of the tapes, as specified.

9. In a key-board stringed instrument, a knee-jointed mechanical finger or plectrum acting on the string, as described, and having an acting face of felt beveled to an acute angle and projecting substantially as shown and described.

882,029. TIRE-BOLT HOLDER. THOMAS R. CASEY, Cedar Falls, Iowa. Filed Dec. 5, 1887. Serial No. 257,032. (No model.)

Claim.—1. In a bolt-holder, the combination of the handle A, having the stud D on its under side, and the hook-shaped jaws E E, pivoted to the handle and having the arms G G on their upper ends provided with finger-holds H H, substantially as specified.

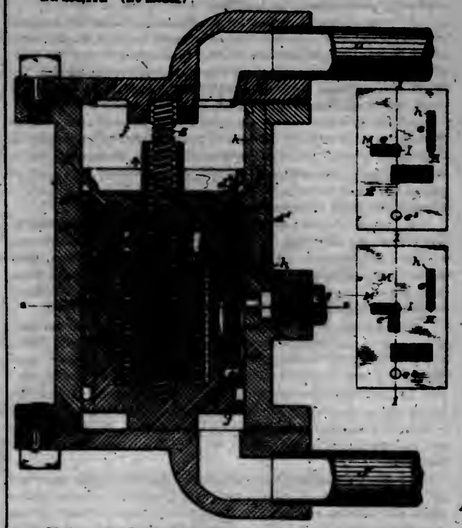


2. In a bolt-holder, the combination of the handle A, having the depending stud D, the jaws E E, pivoted to the handle, and the lever K, connected at one end to the jaws, substantially as and for the purpose specified.

3. In a bolt-holder, the combination of the handle having the depending stud D, the jaws E E, having the arms G G, and the lever K, having the fork L, engaging the said arms, whereby the jaws may be operated by the hand which grasps the handle, substantially as specified.

4. In a bolt-holder, the combination of the handle A, having the depending stud D, the jaws E E, pivoted to the handle and having the arms G G, and the spring-actuated lever pivoted on the upper side of the handle and engaging the arms G G, whereby the jaws are normally held open, substantially as specified.

5. In a bolt-holder, the combination of the handle A, having the depending stud D, the jaws pivoted to the handle and having the arms G G, the standard I on the handle, the lever K, pivoted to the end of the said standard and engaging the arms G at one end, and the spring M, secured to the handle and bearing against the lever, substantially as and for the purpose specified.



882,030. PANTALOONS. HENRY T. CARLEY, Trenton, N. J. Filed Sept. 30, 1887. Serial No. 250,670. (No model.)

Claim.—1. A pair of pantaloons provided with a knee-protector consisting of bands of inelastic woven fabric crossing each other at angles and stitched at their ends to the side seams of the leg of the garment, and having at the upper side thereof a cross-band stitched to the cloth of the garment at its upper edge and containing a loose horizontal fold opening upwardly, substantially as shown and described.

2. A pair of pantaloons provided with a knee-protector made of inelastic bands of woven fabric crossing each other at angles and fastened to the garment at the side seams of the leg, and having an upper horizontal band containing a loose fold running lengthwise of the band, substantially as shown and described.

882,031. AIR-BRAKE. THOMAS S. B. DEVOE, Chicago, Ill., assignor of one-half to Lysander Hill, same place. Filed Dec. 16, 1887. Serial No. 258,111. (No model.)

Claim.—1. In an air-brake system having an air-reservoir for each car and in which the movement of compressed air to and from the brake-cylinder is governed by a sliding piston actuated by varying the air-pressure in the train-pipe, the combination of the piston, the train-pipe, and the auxiliary reservoir K, not used for service-stops or grading purposes, but for applying air-pressure to the inner end of the piston, and of such capacity that its pressure is practically unaffected by the movements of the piston, substantially as described, whereby the initial pressure against the inner end of the piston is maintained substantially undiminished during the entire outward traverse thereof.

2. In an air-brake system having an air-reservoir for each car and in which the movement of the compressed air to and from the brake-cylinder is governed by a sliding piston actuated by varying the air-pressure in the train-pipe, the combination of the piston and ports with a storage-reservoir for ordinary service purposes and a separate reservoir for applying a practically uniform air-pressure to the inner end of the piston, substantially as described.

3. In an air-brake system in which the movement of the compressed air to and from the brake-cylinder is governed by a sliding piston actuated by varying the air-pressure in the train-pipe above the normal atmospheric pressure, the combination of the piston and ports with a storage-reservoir for ordinary service purposes and an independent reservoir for emergency-stops, both of which are controlled by the movement of a single piston, substantially as described.

4. In an air-brake system in which the movement of the compressed air to and from the brake-cylinder is governed by a sliding piston actuated by varying the air-pressure in the train-pipe above the normal atmospheric pressure, the combination of the piston with the service-reservoir and its port, all of which are controlled by the movements of a single piston, and with an independent emergency-reservoir and its port, substantially as described.

5. In an air-brake system in which the movement of the compressed air to and from the brake-cylinder is governed by a sliding piston actuated by varying the air-pressure in the train-pipe, the combination of the piston and its ports with a storage-reservoir for ordinary service purposes, and with an independent reservoir or reservoirs for applying air-pressure to the inner end of the piston and for emergency-stops, substantially as described.

6. In an air-brake system having an air-reservoir for each car, the combination, with the train-pipe and brake-cylinder, of two or more reservoirs under each car and a controlling-valve and ports operated by a piston and adapted for the admission of air from either of said reservoirs at will to the brake-cylinder, substantially as described.

7. In an air-brake system having an air-reservoir for each car, the combination of two or more storage-reservoirs with a valve and its ports attached to a piston, which at different points of its traverse

successively discharge their contents into the brake-cylinder, substantially as described.

8. In an air-brake system, the combination of a port-controlling piston with two storage-reservoirs which, through different ports in the piston, discharge into the brake-cylinder at different positions of said piston, substantially as described.

9. In an air-brake system, the combination of a service-reservoir and an independent reservoir with a valve and its ports attached to a piston and so arranged that the air in the independent reservoir is applied in a substantially uniform pressure upon the piston between the limits of its traverse and is discharged into the brake-cylinder at the outer end of such traverse, substantially as described.

10. In an air-brake system, the combination of two or more storage-reservoirs with a piston and ports capable of admitting air from either of said reservoirs at will to the brake-cylinder, said piston being subject at one end to the variable air-pressure of the train-pipe and at the other end to an air-pressure which is substantially uniform between the limits of its traverse, as herein set forth.

11. In an air-brake system, the combination of the port-controlling piston, the train-pipe, and an independent reservoir whose contents are not subject to depletion or variation for service-steps, grading, or the governing of the piston, but are employed to furnish a uniform pressure against the inner end of the latter between the limits of its entire traverse, substantially as described.

12. In an air-brake system in which the movement of the compressed air to and from the brake-cylinder is governed by a sliding piston actuated by varying the air-pressure in the train-pipe, the combination of the train-pipe, brake-cylinder, car-reservoir, and a valve and its ports attached to a piston and arranged to as to open the brake-release port and discharge the brake-cylinder when the piston is at an intermediate position between the extreme ends of its traverse and to close the same when at the end of its traverse, substantially as described.

13. In an air-brake system, the combination of a service-reservoir, an emergency-reservoir, and a train-pipe and brake-cylinder with a valve and its ports attached to a piston and arranged so that it at one end of its traverse vents air from the emergency-reservoir to the brake-cylinder, at an intermediate position vents air from the service-reservoir to the brake-cylinder, and at another intermediate position discharges the air from the brake-cylinder, substantially as described.

14. In an air-brake system, the combination of the port-controlling piston with a graduated series of springs arranged to apply yielding resistances at different points along its traverse corresponding to the several ports, whereby it is adapted to temporarily hold said ports open or closed, substantially as described.

15. In an air-brake system, the combination of the train-pipe, brake-cylinder, and car-reservoir with a valve and its ports attached to a piston which at one extremity of its traverse holds the discharge-port of the brake-cylinder closed, at an intermediate position between the ends of its traverse holds said port open, and at another position admits air from a reservoir to the brake-cylinder, substantially as described.

16. In an air-brake system, the combination of a service-reservoir, an emergency-reservoir, a train-pipe, and a brake-cylinder with a valve and its ports attached to a piston which at one end of its traverse holds the brake-cylinder closed, at the other end of its traverse vents air from the emergency-reservoir to the brake-cylinder, at one intermediate position vents air from the service-reservoir to the brake-cylinder, and at another intermediate position discharges air from the brake-cylinder, and a series of springs to temporarily hold the piston in its required positions for operating the intermediate service and release ports, substantially as described.

17. In an air-brake system, the combination of a port-controlling valve attached to a piston subject throughout its traverse to a substantially uniform pressure against its inner end with a series of differential springs acting successively against said uniform pressure, substantially as described.

18. In an air-brake system, the combination of two or more storage-reservoirs, a piston and ports capable of admitting air from either of said reservoirs at will to the brake-cylinder, and a graduated series of springs to hold the piston temporarily at different points in its traverse, substantially as described.

19. In an air-brake system, the combination of two or more storage-reservoirs, a piston-valve and ports capable of admitting air from either of said reservoirs at will to the brake-cylinder, said piston being subject at one end to the variable air-pressure of the train-pipe and at the other end to a pressure substantially uniform throughout its traverse, and a graduated series of springs to hold the piston temporarily at different points in its traverse, substantially as described.

20. In an air-brake system, the combination of a train-pipe, brake-cylinder, air-reservoir, and ports connecting the same with a valve controlling said ports and operated by a piston so arranged as to discharge the brake-cylinder at a position intermediate between the extreme ends of the traverse of the piston, with a spring or weight arranged to cooperate in the restoration of the piston to its normal position at the end of its traverse when the pressure is increased in the train-pipe, whereby this restoration may be effected without releasing the brakes, substantially as described.

21. In an air-brake system, the combination of a port-controlling piston which at a position intermediate between the extreme ends of its traverse opens the release-port to discharge the brake-cylinder and release the brakes with a resistance-spring arranged to temporarily arrest the movement of the piston at the point where it opens said release-port, substantially as described.

22. In an air-brake system, the combination of separate service and emergency reservoirs on each car, and ports with a piston and valve governing said ports, and a resistance-spring adapted to temporarily arrest the movement of the piston at the point where it opens the service-port, substantially as described.

23. In an air-brake system, the combination of a service-reservoir, a piston whose inner end is subject to a substantially uniform pressure between the limits of its traverse, a release-port opened by the piston at an intermediate point in its traverse, and a spring to temporarily arrest the movement of the piston at the point where it opens said release-port, substantially as described.

24. In an air-brake system, the combination of a service-reservoir, a piston whose inner end is subject to a substantially uniform pressure between the limits of its traverse, and a resistance-spring to arrest the piston at the service-port from the service-reservoir to the brake-cylinder and enable the latter to be held open or closed at will, substantially as described.

25. In an air-brake system, the combination of a train-pipe, brake-cylinder, and car-reservoir and ports connecting the same, and a valve controlling the ports and attached to a piston with two or more springs which apply their resistance to the piston in the same direction, and which, as the piston moves in its traverse, come successively into action, substantially as described.

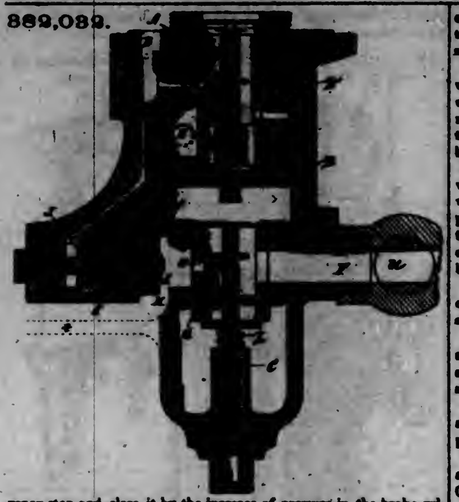
26. In an air-brake system, the combination of a train-pipe, brake-cylinder, and car-reservoir and ports connecting the same, and a valve controlling the ports and attached to a piston operating under a substantially uniform pressure upon its inner end, with two or more springs which come successively into action against its outer end to resist said pressure, substantially as described.

27. In an air-brake system, the combination of the piston and ports, spring S or weight, the springs S' S", the reservoirs, and the train-pipe, arranged to operate substantially as described.

28. In an air-brake system in which the piston releases the brakes when at an intermediate position between the extreme ends of its traverse, the combination of the cock *n* with the separate open-air port M' and the normal open-air port M, whereby the piston may be enabled to release the brakes when at the inner end of its traverse or when in said intermediate position, substantially as described.

29. In an air-brake system, the combination of a port-controlling piston with an open-air port, M, which, when unobstructed, causes the brakes to be released when the piston is at a position intermediate between the ends of its traverse, an open-air port, M', which, when unobstructed, causes the brakes to be released when the piston arrives at the inner end of its traverse, and means for putting either of said open-air ports under the control of the piston and withdrawing the other from its control so long as it may be desirable so to do, substantially as described.

30. The combination of the movable hollow piston D with the sliding ring 1, flange or plate 3, stem 4, and springs S' S", substantially as described.



31. In an air-brake system, the combination of a train-pipe, brake-cylinder, air-reservoir, and ports connecting the same, and a valve controlling the ports and operated by a piston, with two slides and two springs acting, respectively, upon said slides, and arranged so that the piston in its movement successively encounters the resistance of said springs, substantially as described.

382,082. AIR-BRAKE FOR RAILROAD-CARS. THOMAS S. B. BENDS, Chicago, Ill., assignor of one-half to LYMANDER BEE, same place. Filed Dec. 16, 1887. Serial No. 258,112. (No model.)

Claim.—1. The combination of the brake-cylinder, the train-pipe, the car-reservoir, and the main valve-operating piston with a passage leading from the train-pipe to the open air for locally venting the train-pipe to the atmosphere, and with means whereby said passage is opened by preliminarily lowering the pressure in the train-pipe in applying the emergency-step, and closed by a sufficient increase of pressure in the brake-cylinder, substantially as described.

2. The combination of the brake-cylinder, the train-pipe, the car-reservoir, and the main valve-operating piston with a passage leading from the train-pipe to the open air for locally venting the train-pipe to the atmosphere, and a valve or valves which open said passage by the movement of the main valve-operating piston in applying the emergency-step and close it by the increase of pressure in the brake-cylinder, substantially as described.

382,082.

3. The combination of the brake-cylinder, the train-pipe, the car-reservoir, and the main valve-operating piston with a passage leading from the train-pipe to the open air for locally venting the train-pipe to the atmosphere, and a valve which opens said passage when the main valve-operating piston opens the emergency-port, and which is controlled by the movement of that piston, substantially as described.

4. The combination of the brake-cylinder, the train-pipe, the car-reservoir, and the main valve-operating piston with a passage leading from the train-pipe to the open air for locally venting the train-pipe to the atmosphere in applying the emergency-step, and a valve which closes said passage by the pressure of the air in the brake-cylinder, substantially as described.

5. The combination, in a fluid-brake mechanism, of a train-pipe, brake-cylinder, air-reservoir, and a main valve-operating piston, B, with a discharge-passage leading from the train-pipe to the open air, provided with a valve, which is operated by the final movement of the piston B in applying the brakes for emergency-stops, thereby venting the train-pipe to the atmosphere, substantially as described.

6. The combination of the brake-cylinder, the train-pipe, the car-reservoir, the main valve-operating piston, the passage leading from the train-pipe to the open air for locally venting the train-pipe directly to the atmosphere in applying the emergency-step, and the valve for closing said passage by an increase of pressure in the brake-cylinder, with a spring or its equivalent to aid in holding said passage open against the increasing pressure of the brake-cylinder, substantially as described.

7. In a fluid-brake mechanism, the combination of the main piston B with a supplementary piston, N, and a single valve operated by said pistons whose movement opens and closes the local discharge-passage leading from the train-pipe to the atmosphere, substantially as described.

8. In a fluid-brake mechanism, the combination of the main piston B with a valve operated thereby to open the local discharge-passage leading from the train-pipe to the atmosphere, and a supplementary piston for operating said valve to close said discharge, substantially as described.

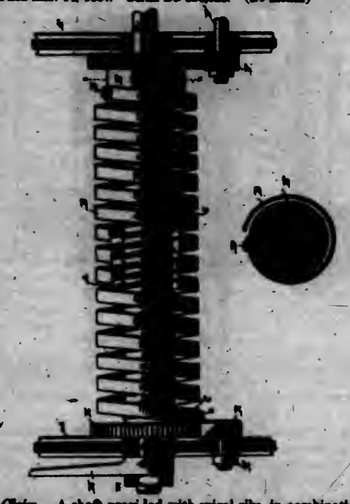
9. In a fluid-brake mechanism, the combination of the main piston B with a valve operated thereby to open the local discharge-passage leading from the train-pipe to the atmosphere, and a supplementary piston, which under the influence of the brake-cylinder pressure operates said valve to close said discharge, substantially as described.

10. In a fluid-brake mechanism in which the movement of air to and from the brake-cylinder is controlled by a main valve-piston, the combination of an auxiliary piston actuating a valve which vents the train-pipe to the atmosphere, with a packing-ring or seat for the purpose of preventing the movement of the piston until a substantial difference of pressure upon its opposite sides has been attained without impairing by a continuance of the differential action the force of the movement of the piston when once it is initiated, substantially as described.

11. In a fluid-brake mechanism, the combination of the main *r* with the auxiliary piston N, which operates to close the local discharge, whereby said discharge is held open after the pressure in the brake-cylinder equals that in the train-pipe, but is effectually closed when the train-pipe pressure becomes further reduced, substantially as described.

12. In a fluid-brake mechanism, the combination of the main *r* with the auxiliary piston N, which operates to close the local discharge, whereby said discharge when closed is held closed during the readmission of air to the train-pipe, even under a greater pressure in the train-pipe than in the brake-cylinder, and until the pressure in the brake-cylinder is reduced, substantially as described.

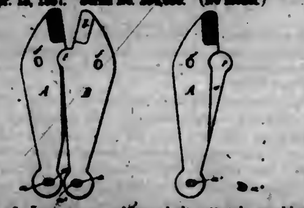
13. In a fluid-brake mechanism, the combination of the main *r* with the auxiliary piston N, which operates to close the local discharge, whereby said discharge is held open until the pressure in the train-pipe is less than that in the brake-cylinder, is then effectually closed through the further decrease of pressure in the train-pipe, and remains closed until by the discharge of the brake-cylinder the pressure therein becomes less than that in the train-pipe, substantially as described.



14. In a fluid-brake mechanism, the combination of the valve-carrying thimble O with a stem, *b*, and spring P, substantially as described.

15. In a fluid-brake mechanism, the combination of the piston B and valve G and the valve-carrying thimble O with the stem *b* and spring P, and with the ring Q and its spring Q', substantially as described.

16. In a fluid-brake mechanism, the combination of the piston B and valve G and the valve-carrying thimble O and its pin *o* with the piston N and its stem N', substantially as described.

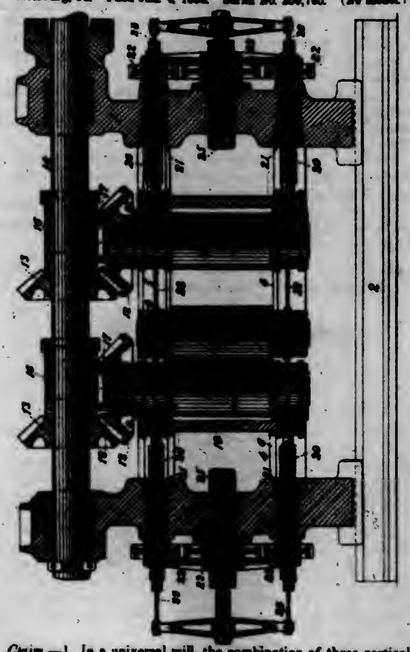


17. In a fluid-brake mechanism, the combination of the piston B and valve G and the piston-rod N' with the hollow stem *b*, the thimble O, the pin *o*, and the spring P, substantially as described.

382,033. SHEEP-SHEARING. PHILIPPE A. DEMS, Paris, France. Filed Mar. 14, 1887. Serial No. 230,933. (No model.)

Claim.—A shaft provided with spiral ribs, in combination with a spring which is wound thereon and attached at one end to said shaft, a handle for rotating said shaft, a ratchet and retaining-pawl for holding the shaft as the spring is wound, a sleeve attached to the other end of said spring and rotating independently of said shaft, and gearing actuated by said sleeve, substantially as set forth.

382,034. BOLT-CUTTER. WILLIAM L. DUDDERS, Paterson, N. J. Filed Apr. 13, 1887. Serial No. 234,693. (No model.)



Claim.—1. In a compound-lever bolt-cutter, in combination with the handles H H, the cutting-levers A B, having their inner ends provided with the elliptical opening *a'* and adjusting-piece *a*, the latter

being of such size and shape that when placed in either end of said elliptical opening it will make and keep said opening circular in form and adapted to shift the center of said circular opening inward or outward, substantially as described, and for the purposes set forth.

2. As a new article of manufacture, the compound-lever bolt-cutter herein described, consisting of the following elements, viz: the handles H H, pivoted to each other and to the cutting-levers A B, the latter being pivoted to the plates P C and hinged to each other, and being provided at their outer ends with the jaws *b b*, and at their inner ends with the elliptical openings *a'*, the said plates P C, and the adjusting-pieces a^2, all constructed and arranged substantially as described, and for the purposes set forth.

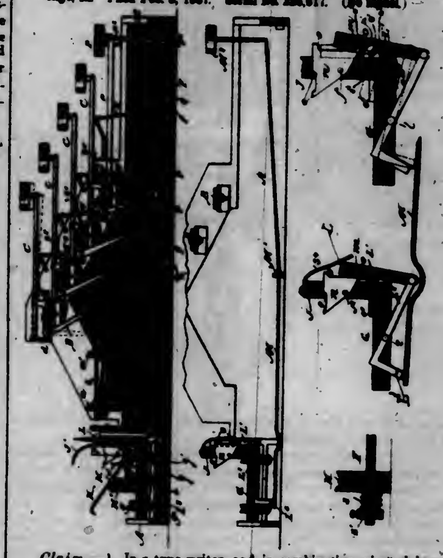
382,035. ROLLING-MILL. JOSEPH FAWELL and JAMES HEMPHILL, Pittsburg, Pa. Filed Jan. 4, 1888. Serial No. 259,785. (No model.)

Claim.—1. In a universal mill, the combination of three vertical rolls, the outer rolls being positively driven and the intermediate roll being driven by or from one of the outer rolls, substantially as set forth.

2. In a universal mill, the combination of three vertical rolls, driving mechanism connected to the upper ends of the outer rolls, and the intermediate roll driven by or from one of the outer rolls, substantially as set forth.

3. In a universal mill, the combination of three vertical rolls, bevel gear-wheels secured to the upper ends of the outer rolls, correspondingly-shaped gears secured to the power, as described, and semicircular ribs connected to the gear-wheels on the power-shaft and engaging grooves in the gear-wheels on the rolls, substantially as set forth.

4. In a universal mill, the combination of three vertical rolls, the outer rolls being positively driven and the intermediate roll being movable and driven by or from either of the outer rolls, substantially as set forth.



5. In a universal mill, the combination of three vertical rolls, the outer rolls being positively driven and the intermediate rolls held in frictional contact with one of the outer rolls and driven thereby, substantially as set forth.

6. In a universal mill, the combination of two positively-driven vertical rolls and an intermediate roll held in frictional contact with one of the outer rolls, said outer roll and the intermediate roll being provided with intermeshing pinions, substantially as set forth.

7. In a universal mill, the combination of two positively-driven vertical rolls, an intermediate roll, and a fluid-pressure mechanism for shifting and holding the intermediate roll in frictional contact with the outer rolls alternately, substantially as set forth.

8. In a universal mill, the combination of three-high horizontal rolls and three vertical rolls, the intermediate roll thereof being driven by or from one of the outer rolls, substantially as set forth.

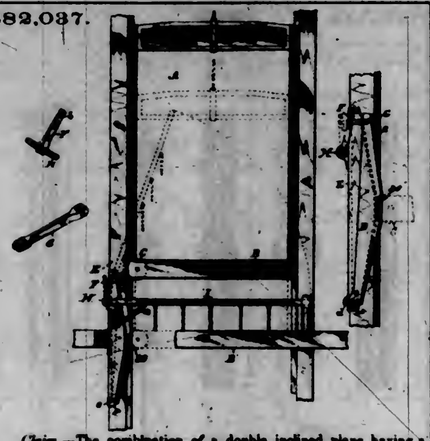
382,036. TYPE-WRITING MACHINE. BERNARD GRANVILLE, Chicago, Ill. Filed Feb. 5, 1887. Serial No. 226,617. (No model.)

Claim.—1. In a type-writer, and in combination, pivoted key-levers substantially horizontal in the machine, sliding and converging type-bars, also substantially horizontal, having type on their end faces, and intermediate connections between the key-levers and the type-bars, a laterally-moving carriage, and a platen in rear of, opposite to, and facing the ends of the type-bars, and an inking mechanism, all substantially as and for the purpose described.

2. In a type-writer, and in combination, pivoted key-levers substantially horizontal in the machine, sliding and converging type-bars, also substantially horizontal, having type on their end faces, and intermediate connections between the key-levers and the type-bars, a laterally-moving paper-carriage, and a platen in rear of, opposite to, and facing the ends of the type-bars, and a vertically-arranged and rotating ink-disk, all substantially as and for the purpose described.

3. The combination of the plates *a a'*, provided with holes a^6, in convergent alignment, type-bars *b*, of uniform size corresponding to that of the holes a^6, bell-crank levers D, key-levers C, vibrating rods E, pendants *e'*, and rock-shaft F, provided with lateral arms, and mechanism for operating the carriage, substantially as specified.

4. The combination of the key-levers C, the vibrating bars E, the pendants *e'*, the rock-shaft F, located near the base of the machine and provided with lateral arms *f*, spring *s*, and arm f^3, the pawl *i'*, and the ratchet I, substantially as specified.



5. In a type-writing machine, the combination, with horizontal type-bars, and with a platen and a carriage provided with a ratchet-bar, I, and connected with a stationary part of the machine through a retractile spring, of the pawls *i i'* and the lever Q, having an upright bar, *q'*, provided with lugs *r*, engaging said pawls, said lever extending back to the key-board, where it is connected with a key, Q', as and for the purpose specified.

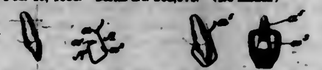
6. In a type-writing machine, the combination, with a group of convergent type-bars placed horizontally in the machine, of a platen and a rotary ink-disk supported vertically between the type and platen, with one edge covering the printing-point, and mechanism, substantially as shown, connecting the disk with the operating-keys, as and for the purpose specified.

7. The combination, with a vibrating frame and the upright pieces L', provided with a clamp, L, of cam-plates *o*, arranged to engage pins *m* on one side of the uprights and guide the motion of said uprights in one direction, and vibrating cams *n'*, arranged to engage with pins *m'* on the opposite side of the uprights and guide their motion in the other direction, substantially as specified.

382,037. HATCHWAY-GATE FOR ELEVATORS. CREWS M. GREENMAN, Wyandotte, Kans. Filed Dec. 5, 1887. Serial No. 256,961. (No model.)

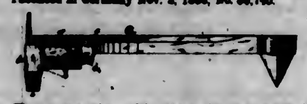
382,037.

Claim.—The combination of a double inclined plane having a straight portion at the middle of its length, and arranged in the elevator-hatchway so that said straight portion will be opposite the floor of the building, said plane being pivoted at its lower end, so that its upper end may vibrate in a vertical plane, a rock-shaft extending at right angles to said inclined plane and provided with an arm extending at right angles from said shaft, a link which connects said arm to the upper end of said inclined plane, a radially-moving bar or gate, also extending at right angles from said shaft, and a roller carried by the platform of the elevator, which engages said inclined plane during the upward and downward movements of said platform, substantially as described.



382,038. PRINTER'S RULE-CASE. MOSES C. HARRIS, San José, Cal. Filed Sept. 1, 1887. Serial No. 248,869. (No model.)

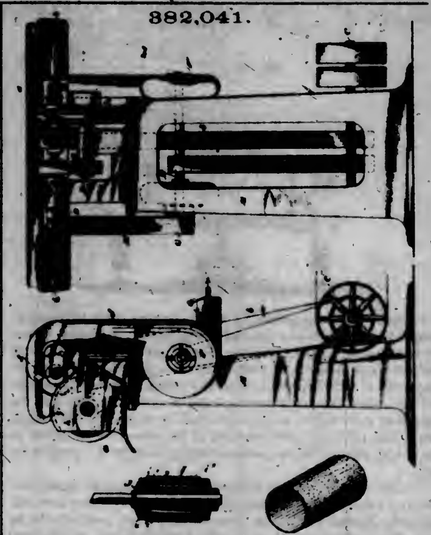
Claim.—1. A printer's rule-case having its boxes or compartments of less width than the height of rule, so that in no position can the rule or rules lie flat in the bottom of the case, but will always stand on edge at a greater or less angle of inclination with the bottom of the case.



2. A printer's rule-case having its boxes or compartments of less sidewise diagonal than the height of a rule, substantially as set forth.

382,039. CERVIX-CLAMP. WOODBURY S. HOW, Philadelphia, Pa., assignor to the S. S. White Dental Manufacturing Company, same place. Filed Feb. 13, 1888. Serial No. 263,671. (No model.)

Claim.—The dental clamp having two jaws, one of which has two bearing points or surfaces for one side of a tooth and the other of which has a bearing point or surface for the opposite side of the tooth between said two bearing-points on the opposite jaw, substantially as described.



382,040. HORSESHOE. HERMANN JONAS and CARL HIRSCH, Dresden, Saxony, Germany. Filed June 28, 1887. Serial No. 242,773. (No model.) Patented in Germany Nov. 2, 1886, No. 39,765.

Claim.—The combination, with a horseshoe constructed with the tapered mortise *a*, the notch *b*, and the backward-extending hole *c*, of the removable toe-piece *d*, made narrow at its lower end and adapted to fit the mortise *a*, the screw-threaded shank *d'*, adapted to the cylindrical hole *c*, and the nut *e*, working upon the projecting end of said shank, substantially as and for the purpose set forth.

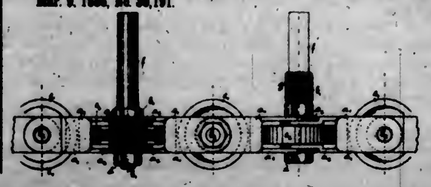
382,041. BUFFING-MACHINE. THOMAS E. KRAVY, Cleveland, assignor, by direct and mesne assignments, of one-half to Augustine A. Tibbals, Akron, Ohio. Filed July 5, 1887. Serial No. 243,344. (No model.)

Claim.—1. In a buffing-machine, a roll made of elastic material,

sheet-metal strips arranged within the roll to expand the same, and caps on the roll, which confine the ends thereof, substantially as set forth.

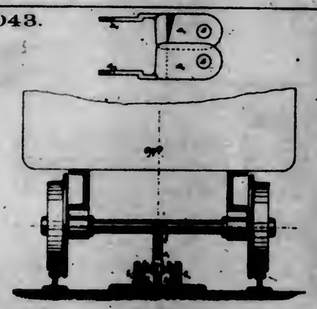
2. In a buffing-machine, an elastic roll, metallic spring-plates within the roll, a supporting-axle, adjustable caps on the roll to expand the same and to confine the ends, and a buffing-band upon the roll, substantially as set forth.

3. The process of cleaning a buffing-roll while at work and of removing the dust from about the roll at the same time, consisting in applying a blast of air to the surface of the roll at a tangent thereto opposite to the direction of rotation, and in maintaining an air-exhaust about said blast and buffer-roll to carry away the dust, substantially as set forth.



4. In a buffing-machine, the combination of a buffing-roll and a hood extending partly around the roll, and having a tube to maintain an exhaust about said roll, with air-blast mechanism having the jet or delivery point of the blast arranged to direct the air at a tangent to the surface of the buffing-roll, whereby the sand-paper is cleaned on the roll and the dust is removed, substantially as set forth.

382,042. PULLEY. WILLIAM H. KIRK, Kansas City, Mo., assignor of one-half to John Olden and John J. O'Keefe, both of same place. Filed July 25, 1887. Serial No. 245,197. (No model.)



Claim.—A pulley or sheave consisting in a metal rim provided with the usual arms and hubs, and with perforated lugs which project from the surface of said rim, wooden blocks arranged around said rim, so as to form the exterior face of the pulley, opposite flanges which extend around the edges of the metal rim and engage said blocks, and suitable bolts which are passed through said flanges and engage said perforated lugs, substantially as set forth.

382,043. DRAWING-CHAIR. CONSTANTIN C. KLIMEK, FRIEDRICH PERKOWSKI, and ANTON SOLLMANN, Knighsitte, Prussia, Germany. Filed July 2, 1887. Serial No. 243,261. (No model.) Patented in Germany Mar. 9, 1886, No. 36,191.

382,043.

Claim.—1. The combination, with a traction-chain having links constructed each with two opposite corresponding side pieces, so that the end of each side piece shall overlap the end of the next adjacent side piece, and, forming the joint of the chain, be also the bearing for the journal of a friction-wheel, of friction-wheels mounted in each link, with their axes alternately perpendicular to each other, and with the journals of their shafts running in bearings formed by the overlapping ends of said links, said journals being at the same time the pivots on which said side pieces turn, substantially as and for the purpose set forth.

2. The combination with a traction-chain having links constructed with two corresponding opposite side pieces so formed that each link shall carry friction-wheels with their axes alternately perpendicular to each other vertically and horizontally, of shafts for the said friction-wheels having vertical axes projecting above said chain far enough to reach and actuate the vehicle to be propelled by said chain, substantially as and for the purpose set forth.

3. The combination, with a traction-chain having links constructed each with opposite corresponding side pieces so formed that each link shall carry friction-wheels, with their shafts set alternately perpendicular to each other and running in bearings in the said opposite side pieces of said links, of a conductor to direct said chain, composed of bars of right-angle iron placed with perpendicular sides facing each other, and having bars of right-angle U-iron interposed between them, substantially as and for the purpose set forth.

4. In a traction-chain, the combination of the side plates, a' a^3, the friction-wheels c' c^3, and the shafts b' b^3, substantially as and for the purpose set forth.

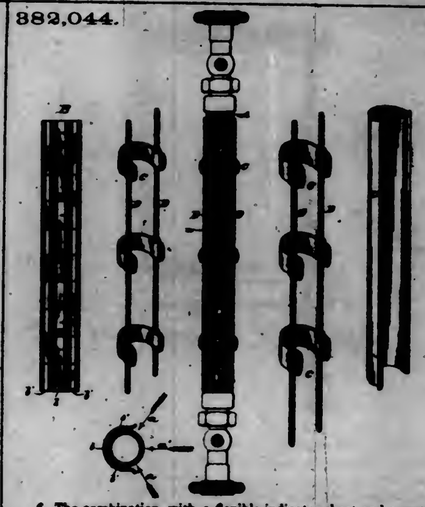
5. In a traction-chain, the combination of the side pieces, a' a^3, the friction-wheels c' c^3, the shafts b' b^3, and the projection f, substantially as and for the purpose set forth.

6. In a traction-chain, the combination of the side pieces, a' a^3, the friction-wheels c' c^3, the shafts b' b^3, the threaded coupling g, and the projection f, substantially as and for the purpose set forth.

7. The combination of the traction-chain hereinbefore described, composed of the side pieces, a' a^3, the friction-wheels c' c^3, and the shafts b' b^3, with a conductor for said chain, composed of the angle-irons h' h' and the U-iron h^3, constructed, arranged, and used substantially as and for the purpose set forth.

382,044. WATER-GAGE INDICATOR. ANDREW F. LAUDENBERGH and OTTO F. OLSON, Chicago, Ill.; said Laudenbergh assignor to said Olson. Filed Dec. 5, 1885. Serial No. 184,802. (No model.)

Claim.—1. The combination, with a gage-tube, of an indicator provided with a longitudinal line or lines and comprising a sheet or strip, and a separate clamp or holding device adapted to receive said strip and to sustain the latter adjacent to the tube, whereby the said strip may be removed and replaced when desired, substantially as described.



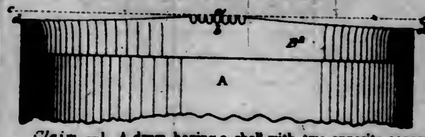
2. The combination, with a gage-tube, of an indicator partially embracing the tube and marked with a central longitudinal line and other lines parallel with the central line, substantially as described.

3. The combination, with a water-gage tube, of an indicator consisting of a strip of paper, cloth, or other similar material provided with longitudinal lines of contrasting shade or color, substantially as described.

4. The combination, with a water-gage tube, of an indicator consisting of a strip of paper, cloth, or similar material having thereon a central longitudinal light line and one or more light lines parallel with the central line and separated therefrom by lines of contrasting color, substantially as described.

5. The combination, with a water-gage tube, of an indicator consisting of a strip of paper, cloth, or similar material provided with longitudinal lines of contrasting color, and having a graduated scale upon one or more of the light lines, substantially as described.

382,044.

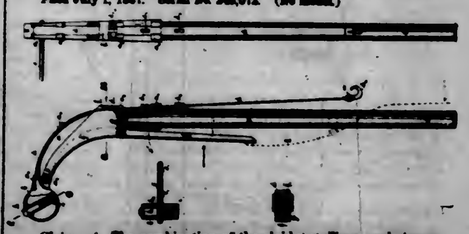


6. The combination, with a flexible indicator-sheet and a water-gage tube, of a clasp or clamp adapted to detachably hold the sheet to the tube, substantially as described.

7. The combination, with a water-gage tube and a flexible indicator-sheet, of a clamp consisting of a series of clasps connected by strips, substantially as described.

8. The combination, in a clamp for holding indicator-sheets to water-gage tubes, of strips D, and a series of clasps attached to said strips, one or more of said clasps being movable on the strips, substantially as described.

382,045. DRUM. HENRY G. LEDERER, Philadelphia, Pa. Filed July 30, 1888. Serial No. 209,869. (No model.)

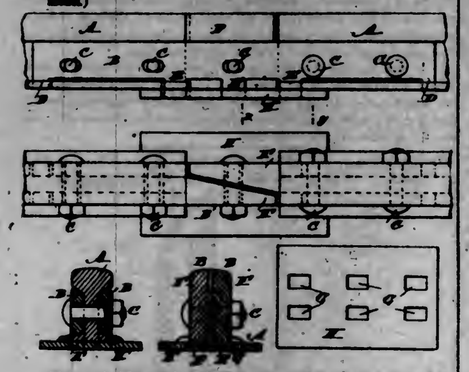


Claim.—1. A drum having a shell with two opposite concave recesses in the top thereof, substantially as and for the purpose set forth.

2. The shell A, having the pair of concave arcs formed upon the outer edge of its upper end, whereby convexity is given to the under surface of the batter-head contiguous to the series of mares resting longitudinally thereon, substantially in the manner herein shown and described.

3. The combination, with the shell or cylinder of a drum, having the pair of concave arcs upon the upper end, whereby convexity is given to the under surface of the batter-head, of a series of mares whose end portions rest within recesses formed for their reception in said shell, and means for imparting tension or relaxation to said series of mares, substantially in the manner herein shown and described.

382,046. APPARATUS FOR PUTTING DRIVING-BELTS ON PULLEYS. HERMANN R. LEDERMANN, Schalke-bei, Prussia, Germany. Filed July 1, 1887. Serial No. 243,072. (No model.)



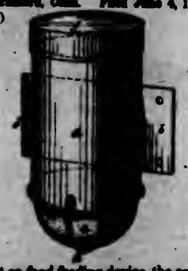
Claim.—1. The combination of the rigid metallic curved piece a, having guides a' a^2 a^3, the staff c, the elastic strip d, having legs d' d^2, handle d^3, and pin e, the head b, having the pins c' and spring

i, the lever f f', pivoted at c, and provided with fork f', and the spring g, substantially as and for the purpose set forth.

2. The combination of head b with the slide A, provided with spring i and pin k', and the pin e, having groove e' and recesses e^2, substantially as and for the purpose set forth.

3. The combination of the rigid shaft, curved rigid top piece, sliding elastic head, movable head having the fitting-pin, and the forked lever, all constructed and operated substantially as described.

382,047. FISH-PLATE. GABRIEL LEMMON, Cincinnati, Ohio, and Hiram Goldsmith. Filed Jan. 11, 1888. Serial No. 260,503. (No model.)

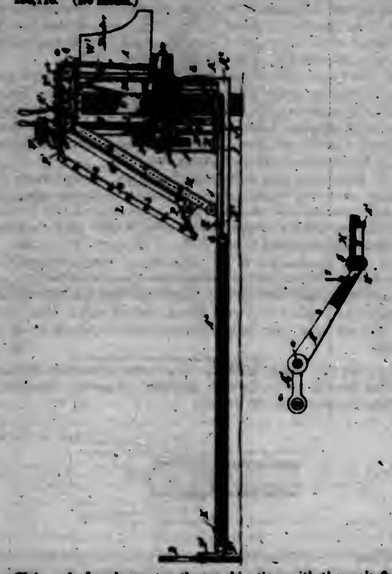


Claim.—1. The combination, with the rail A, of the fish-plate B, having the teeth D and E, the teeth E passing into apertures in the plate H, and the teeth D passing into apertures in the base of the rail, substantially as herein shown and described.

2. The combination, with the rail A and the plate H, of the fish-plate B, having the upwardly-projecting tongue F, the top of which is flush with the rail, and the teeth D E on its bottom edge, the teeth E passing into apertures in the plate H, and the teeth D into apertures in the base of the rail, substantially as herein shown and described.

3. The combination, with the rails having their ends placed a suitable distance apart, of the fish-plates B, having the upwardly-extending and overlapping tongues F projecting into the space between the ends of the rails and provided with teeth on their lower edges, substantially as herein shown and described.

382,048. SALT-FEEDING DEVICE. CHARLES LINDER and THORVALD F. HANSEN, Branford, Conn. Filed June 4, 1887. Serial No. 240,271. (No model.)



Claim.—1. In a salt or feed feeding device, the combination, with a protecting case or frame having an exposing-opening, of a solid salt or feed block fitting the same loosely and protruding at one end from the exposing-opening, with a narrow point of support projecting from the case out under the block and contacting with the protruding end of the block at or near the middle thereof, substantially as and for the purpose set forth.

2. In a salt-feeding device, the combination, with a case, c, having an exposing-opening at the base, of the supporting-ball d' under said opening, with the sliding or gravitating salt or feed block e, loosely fitting said case and adapted to rest on said ball at its exposed or protruding end, substantially as herein set forth.

3. The combination, with the sliding or gravitating salt or feed block e, of the case c, having the attaching bars or ears b, and the supporting-ball d, arranged and operating substantially as herein shown and described.

4. The combination of the case c, ears or bars b, lid f, and loop or ball d with the salt or feed block e, arranged and operating substantially as shown and described.

382,049. HARVESTER. SAMUEL D. HARNER, Miamisburg, Ohio, assignor to Mary Hoddis, same place. Filed May 2, 1884. Serial No. 130,110. (No model.)

Claim.—1. In a harvester, the combination, with the main frame carried by a single driving-wheel and occupying a fixed position in respect to the same, of a platform-frame extending laterally from said main frame and wheel, and an intermediate frame composed of two arms pivotally mounted at one end upon the axle of the driving-wheel, one upon each side thereof, and pivotally connected at their opposite ends in front of said wheel to the platform-frame, substantially as set forth.

2. In a harvester, the combination, with the main frame carried by a single driving-wheel and occupying a fixed position in respect to the same, of a platform-frame extending laterally from said main frame and wheel, and an intermediate frame composed of two arms pivotally mounted at one end upon the axle of the driving-wheel, one upon each side thereof, and pivotally connected at their opposite ends in front of said wheel to the platform-frame, and levers E and S, for adjusting the position of the platform and intermediate frames, substantially as described.

3. The combination, with the main frame, the platform-carrying frame, and means for varying the height of said platform-frame in respect to the main frame, of a jointed elevator-frame pivoted at one end to the platform-carrying frame and at the other end to the main frame and extending over the drive-wheel, substantially as described.

4. The combination of the axle, the main frame mounted in a fixed position with relation to the axle, platform-carrying frame, connecting-frame, and jointed elevator-frame connecting the main frame and platform-carrying frame, substantially as described.

5. The combination of the main frame mounted in a fixed position with relation to the axle, the axle, the platform-carrying frame, an intermediate connecting-frame pivoted upon the axle, a cutter-bar carried by the platform-carrying frame, an actuating-wheel revolving upon the axle upon which the connecting-frame swings, and mechanism, substantially as described, for transmitting motion from said wheel to the cutter-bar, substantially as described.

6. The combination of the main frame mounted in a fixed position with relation to the axle, the axle, the platform-frame, intermediate connecting-frame pivoted upon the axle, the cutter-bar, the bell-crank lever pivoted adjacent to the joint between the platform-frame and the connecting-frame, the crank-wheel turning on the axle of the connecting-frame, and means connecting the said bell-crank lever to the crank-wheel and to the cutter-bar, substantially as described.

7. The combination, with the drive-wheel, main frame mounted in a fixed position with relation to the axle, platform-carrying frame, and connecting-frame pivoted on the axle, of the cutter-bar, gears 3 4 J I, crank-wheel J^2, bell-crank lever H, and connecting-rods f f', substantially as described.

8. The combination, with the main frame mounted in a fixed position with relation to the axle, axle, platform-carrying frame, con-

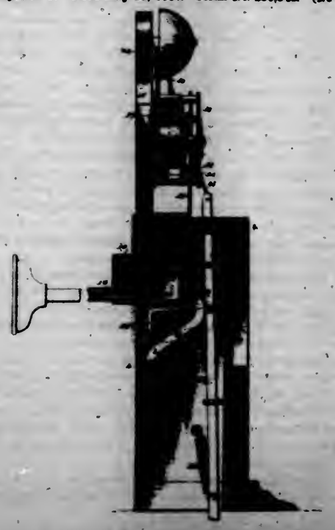
necting-frame pivoted on the axle, and jointed elevator-frame connecting the main frame and platform-frame, of rollers having journals coinciding with the joints of the elevator-frame, and connections, substantially as described, whereby movement is communicated from the drive-wheel to the roller on the main frame and from the latter to the next roller, substantially as described.

9. The combination of the main frame mounted in a fixed position with relation to the axle, the axle, the platform-frame jointed thereto, the cutter-bar, the driving-gear, and the bell-crank lever having its pivot adjacent to the joint of the platform-frame, and connecting means whereby said lever communicates motion from the driving-gear to the cutter-bar, substantially as described.

10. The combination of the main frame, the platform-frame, the swinging connecting-frame, and grain-elevating appliances supported by a frame composed of two parts jointed together, one held to standards upon the said main frame and the other by said platform-frame, substantially as described.

11. The combination of the main frame, swinging connecting frame, platform-frame, and jointed elevator-frame provided with rollers carrying aprons, one of said rollers carrying a sprocket-wheel, around which passes a chain to a sprocket-wheel upon a shaft coincident with the outer joint of the elevator-frame, substantially as described.

382,050. WICK-TRIMMER. AUGUST MEYER, Hamburg, Germany. Filed Nov. 11, 1887. Serial No. 254,993. (No model.) Patented in Belgium July 2, 1887, No. 78,054.



Claim.—1. The combination, with a tube closed at the bottom and furnished with lateral openings, of wings for bearing on the top of the tubes of a lamp-burner, said wings being provided in their lower edges, between the parts which are to bear on the latter tubes, with recesses *i i* of a depth and form corresponding with the height which the wick is desired to project above the said tubes and with the transverse sectional profile of the so-projecting part, substantially as and for the purpose herein described.

2. The wick-cleaner consisting of the slit contractile close-bottomed tube E, having openings *x x* and wings *m n*, substantially as herein described.

3. The wick-cleaner consisting of a tube, E, having a conical recess in the exterior of its bottom, having openings *x x* in its sides, and having wings *m n*, substantially as described, and explained by the accompanying sheet of drawings.

382,051. PNEUMATIC ANNUNCIATOR. WILLIAM R. OSTRANDER, Brooklyn, N. Y. Filed May 20, 1887. Serial No. 239,348. (No model.)

Claim.—1. The combination, with an alarm-train, of a toothed bar arranged to engage therewith said formed with an elongated slot, a pin passing through said slot, an operating-bar, and connections between the toothed bar and the operating-bar, substantially as described.

2. The combination, with an alarm-train, of a sliding bar provided with a catch-tooth which is arranged to engage with the train, an operating-bar, and connections between the operating-bar and the toothed bar, substantially as described.

3. The combination, with an alarm-train provided with a toothed wheel, of a toothed bar arranged to engage with said toothed wheel and formed with an elongated slot, through which there is passed a supporting-pin, an operating-bar, and connections between the toothed bar and the operating-bar, substantially as described.

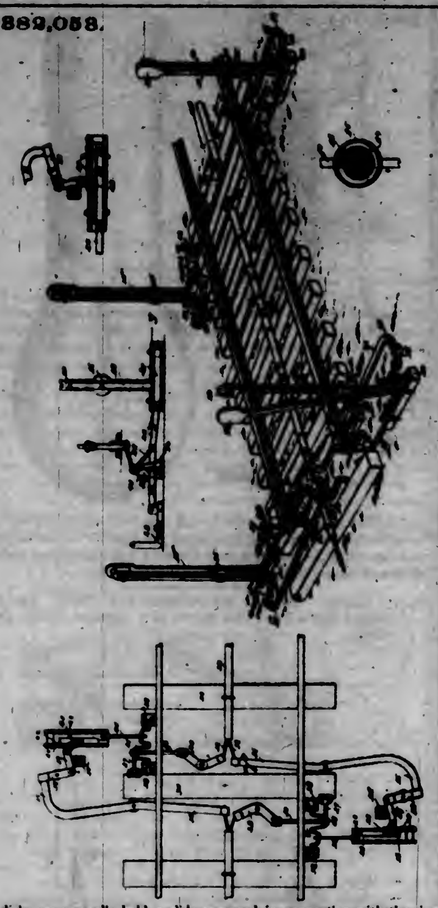
4. The combination, with an alarm-train provided with a toothed wheel, 43, of a bar, 37, provided with a tooth, 6, and a slot, 40, a pin, 39, which passes through the slot 40, sheaves 42, an operating-bar, 34, and a cord passing from the operating-bar over the sheaves 42 to the bar 37, substantially as described.

382,052. CONVEYING APPARATUS. HENRY U. PALMER, Brooklyn, N. Y. Filed Dec. 19, 1887. Serial No. 258,573. (No model.)

Claim.—1. The combination, with a float provided with a track for receiving loaded coal-cars, of an endless horizontal carrier extending beneath said cars, a hopper or hoppers arranged between the track-rails for directing the coal onto said carrier as it falls from the car, and an elevating apparatus for receiving the coal from the carrier and delivering it at a suitable height, substantially as described.

2. The combination, with a float provided with a plurality of tracks for receiving loaded coal-cars, of endless horizontal carriers extending beneath said cars, hoppers arranged between the track-rails for directing the coal onto said carriers as it falls from the cars, chutes *f*, for receiving the coal from the carrier and delivering it to an elevating apparatus, and an elevating apparatus for receiving the coal from said chutes and delivering it at a suitable height, substantially as described.

3. The combination, with the float provided with a track for receiving cars, of an endless horizontal carrier arranged to receive the coal from the cars, an elevating apparatus arranged to receive the coal from the carrier, and the hopper *k*, and a chute, *l*, arranged to receive the coal from the elevating apparatus and pivoted to turn horizontally, whereby the coal can be delivered in different directions, substantially as described.



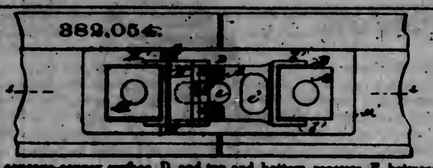
382,053. BLOCK-SIGNAL. GEORGE W. FITZGERALD, Louisville, Ky. Filed May 23, 1887. Serial No. 239,057. (No model.)

Claim.—1. The combination, with two signal-disks located at opposite ends of a block, of springs, against the tension of which the disks are normally held, a slide arranged in connection with the signal-disk at the entrance to the block, a tripping-bar connected to said slide and to a stop which holds the disk at the other end of the block, substantially as described.

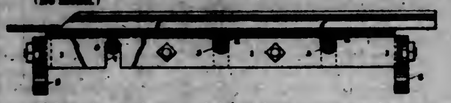
2. The combination, with two signal-disks and their supporting-levers, of springs, stops which hold the signal-disk levers against the tension of the springs, slides arranged in connection with the levers and formed with shoulders adapted to bear upon the levers, a rock-shaft, connection between the slide and the rock-shaft, a tripping-lever, also connected to the rock-shaft, a bell-crank lever, a connecting-wire leading from said bell-crank lever to a lever, 31, said lever, and a lever, 36, that is connected to the stop of the second signal-disk, substantially as described.

3. In a block signaling apparatus, the combination of a lever, 12, a spring, 16, arranged in connection with the lever, a stop, 23, a slide, 21, formed with a shoulder, 22, a link, 26, a crank-shaft, 25, a tripping-bar, 27, connected to said shaft, a lever, 29, also connected to the crank-shaft, a connecting-wire, 32, a lever, 31, to which the wire 32 is connected, and a lever, 36, connected to the stop 23, all substantially as described.

382,053.



382,054. NUT-LOCK. HARRIMAN H. PHILLIPS, Vanalboyne, Ontario, Canada. Filed July 12, 1887. Serial No. 244,194. (No model.)

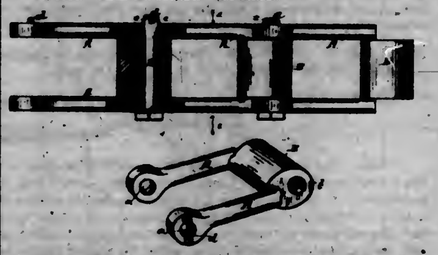


Claim.—1. A nut-lock consisting of the body A, provided with an aperture, *a*, at one end, the recess B at the opposite end, and a central concavo-convex surface, D, and a plate, H, provided with the pin A, fitting in the concave surface of the body, the recess H' at its free end, and the lips K, adapted to be bent over upon the body, substantially as described.

2. The combination, with the body A, provided with an aperture, *a*, at one end, a recess, B, at the opposing end, a central transverse concavo-convex surface, D, and top and bottom recesses, E, between said surface D and the apertured end, of the slotted plate H, provided with pin A, a recess, H', and top and bottom lips, K, the said plate adapted to be hinged to said body at the aforesaid concavo-convex portion and held in connection with said body by compressing the lips K into said recesses E, substantially as set forth.

382,054.

382,055. DRIPPING-GRATE. PETER REHLAND and CHARLES FRANCK, Fort Jervis, N. Y. Filed July 20, 1887. Serial No. 244,888. (No model.)



Claim.—A grate-frame consisting of the frame 1, having the semi-circular recesses 2 in its upper side edges, and the capping-frame 5, covering both the sides and ends of the frame and provided with the flange 6, having the vertical slots 7 and secured to the said frame, substantially as herein shown and described.

382,056. METHOD OF SIGNALING AT SEA. DANIEL RUSSELL, Fredericksburg, Va. Filed Dec. 30, 1887. Serial No. 259,262. (No model.)

Claim.—1. The method hereinbefore described for maritime signaling by sound and the reverberating echoes of sound upon the surface of oceans as well as submerged beneath in the depths of seas, lakes, and rivers by the explosive concussive projectile force of field-guns, in combination with concussive metallic balls on the surface and submerged, as receivers of sound, and the echoes of sound, by day or night, in calm or storm, and means for illuminating by electric light for signaling between ships at sea, or between ships and shores, and for similar purposes, substantially as described.

2. The method of signaling by the explosion of field-guns from a ship's deck, either on the surface of the seas or submerged beneath in the depths, in combination with concussive metallic balls, as hereinbefore described, to trace the range of the explosive concussive projectile, reverberating echoes as well as that of shot, and of shell, torpedoes, &c., exploded by the time-fuse during flight, to mark the time of obstruction or of exhaustion of sound on the line of the prolongation of the trajectory of the flight, substantially as and for the purpose described.

382,057. DRIVE-CHAIN. HOWARD BENNETT, Columbus, Ohio, assignor to the Lozier Manufacturing Company, same place. Filed Oct. 10, 1888. Serial No. 216,491. (No model.)

Claim.—In a drive-chain, the combination, with the links provided in their ends with pintle-seats, and with stop-bars *d*, projecting from the outer faces of the side bars and crossing the pintle-seats, of the pintles round in cross-section and having their ends which project beyond the side bars slotted to form the tangs *e e*, said tangs being bent inward over the outer faces of the stop-bars, substantially as set forth.

382,058. HAME-TUG. JAMES S. SCOTT, Burlington, Iowa. Filed July 11, 1887. Serial No. 244,092. (Model.)

Claim.—As an improved article of manufacture, a hame-tug consisting of a metallic plate having a loop, *c*, formed on its forward ends, and lateral loops *b*, formed near its opposite ends, lateral flanges B, formed about midway of its length and having a series of perforations, the said plate also having lugs with perforations *b'* at its corners, and

382,058.

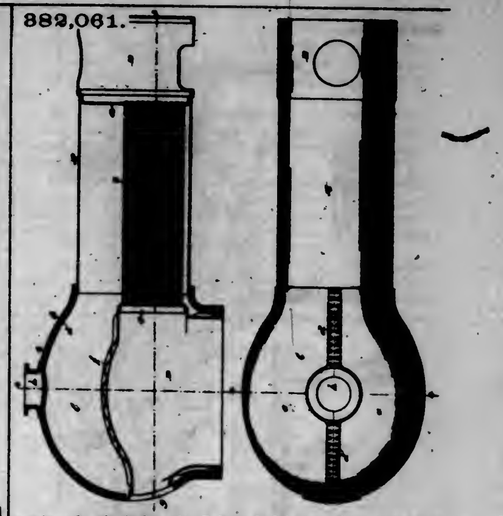
the leather backing C, riveted thereto at the corners of the plate and united by rows of stitches through the perforations, substantially as specified.

382,059. BUSTLE. LIDA SMITH, New York, N. Y. Filed Sept. 1, 1887. Serial No. 248,542. (No model.)

Claim.—In a bustle, the combination, with the flat metallic ribs *f f*, curved and covered as specified, reaching only through the convex side of said bustle and fastened by their ends to the top and bottom of said bustle, the cover *c'* of said ribs extending far enough on either side to form the flap *c*, and the flap *c*, integral with said cover, of a piece of textile fabric stretched across the concave side of said bustle, secured thereto as specified, and extending far enough to form the flaps *d* integral therewith, the flaps *d*, the waistband *a*, sewed upon said bustle, the buckle *b*, fastened to one end of said waistband *a*, and buttons and button-holes *d*, securing the flaps *c* and *d* together, all substantially as and for the purpose set forth.

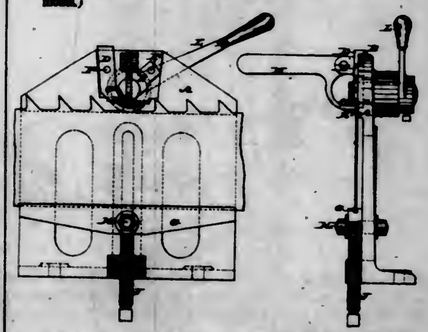
382,060. FORK-GUARD. CHARLES H. STEBBINS, Northampton, Mass. Filed Dec. 14, 1887. Serial No. 257,599. (No model.)

Claim.—The combination, with a fork provided at its shank with the pivoted guard B, and the chamber *f*, extending parallel with the guard-pivot, of a plunger located in said chamber, having a shank extending therefrom, and a head fitting said chamber, and a coiled spring inclosing said shank and acting between the base of said chamber and said plunger-head to force the outer end of the plunger against one leg of the guard, substantially as set forth.



382,061. STEAM-BOILER. GEORGE S. STRONG, New York, N. Y. Filed Oct. 31, 1887. Serial No. 253,393. (No model.)

Claim.—1. The herein-described steam-boiler, consisting of the cylindrical portion A, the approximately spherical furnace portion C, and the vertically-corrugated arched portion K, forming the roof to the furnace, substantially as described.



2. The herein-described steam-boiler, consisting of the cylindrical portion A and the approximately spherical furnace portion C, the latter being formed of the two plates *c*, struck up to approximately hemispherical form and united at their meeting edges, substantially as described.

3. The combination, with the cylindrical portion A, of the approximately spherical portion C, formed of the two plates *c*, struck up to approximately hemispherical form and united at their meeting edges, and the vertically-corrugated arched plates *k*, forming the roof to the furnace, substantially as described.

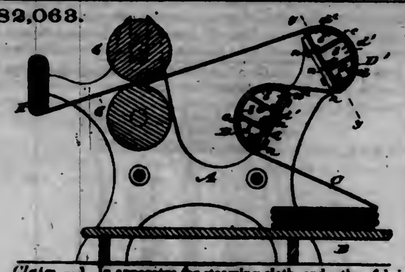
382,061.

382,062. MACHINE FOR SWAGING SAW-TEETH. JOHN F. TRIBELL, Clinton, Iowa. Filed Mar. 23, 1888. Serial No. 268,206. (No model.)

Claim.—1. In a saw-tooth-swaging machine, the frame A, in combination with the rotary die C, having a cut-away portion, C', and the block D, having abutment D', all substantially as and for the purpose set forth.

2. In a saw-tooth-swaging machine, the frame A, in combination with the rotary die C, having cut-away portion C', the block D, with abutment D', and die-support E, the periphery of the die being in contact with said support E, all substantially as described.

3. In a saw-tooth-swaging machine, a die, in combination with a die-block and die-support made interchangeable with each other in relation to the die, substantially as and for the purpose set forth.



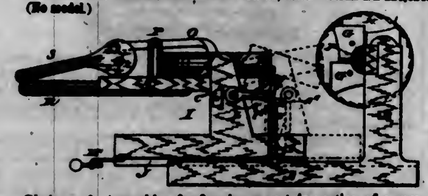
4. In a saw-tooth-swaging machine, the slotted frame A, having a threaded boss, in combination with a grooved bar, G, the bolt H, the screw J, and pivoted clamp K, having the cone K', all substantially as and for the purpose set forth.

5. In a saw-swaging machine, the combination of a frame, a saw-support, a female die, and a male die having a corner or pinching-off edge or face, substantially as and for the purpose set forth.

382,063. APPARATUS FOR STEAMING CLOTH AND OTHER FABRICS. VOORHEES T. VAN FLEET, Somerville, N. J. Filed May 26, 1887. Serial No. 239,262. (No model.)

Brief.—In order to obtain steam more or less wet, the inlets for the same and outlets for the water of condensation are arranged at different heights from the bottoms of the compartments of the steaming-beams, stop-cocks rendering the several compartments independent of one another.

382,063.



Claim.—1. In apparatus for steaming cloth and other fabrics, the perforated steaming-beams D D', constructed with a series of longitudinal compartments arranged one above the other and provided with steam inlets and outlets at their opposite ends at different heights or levels relatively to the bottoms of their respective compartments, substantially as and for the purpose herein set forth.

2. The combination of the partly-circular perforated steaming-beams D D', arranged one above the other to flow in reverse directions, and provided with longitudinal compartments *d d' d''*, disposed one above another, the steam-inlet and exhaust pipes *e h*, having branches *f f' f''* and *i i' i''*, arranged to connect with said compartments at different heights from the bottoms thereof, respectively, and the valves *g k*, controlling said branches, essentially as shown and described.

3. In a machine of the character described, a series of steam-chambers having their respective outlets for water of condensation arranged on different levels from their bottoms, substantially as specified.

382,064. MACHINE FOR FORMING SAW-HANDLES. CHARNEY L. S. WALKER, Newark, N. J. Filed Dec. 15, 1886. Serial No. 221,686. (No model.)

Claim.—1. A machine for forming a certain portion of a saw-handle, as herein set forth, consisting of cutters arranged on a horizontally-adjustable shaft or arbor, as C, and adapted to form beads on the edge of said saw-handle, and a suitable sliding rest or carrier having a pivoted holding device for holding and guiding said saw-handle to said cutters, substantially as and for the purposes set forth.

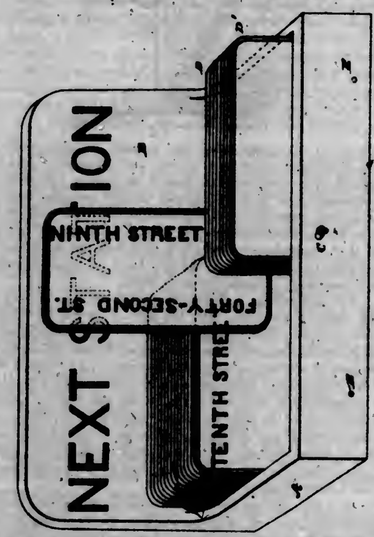
2. In a machine for forming certain portions of a saw-handle, as described, the combination, with a suitable slide-rest, as I, having a pivoted support for the work, a bed, as A, in which said parts slide, and cutters, as G and H, and a shaft or arbor, as C, on which the cutters are hung, of arms or supports, as B, and adjustable bearings, as D, on arms B for said shaft or arbor, substantially as and for the purpose described.

3. In a machine for forming certain portions of a saw-handle, as described, the combination, with a suitable bed provided with supports and bearings for a shaft or arbor, cutters, as G and H, and a slide-rest, as I, of a pivotally-arranged plate or carrier, as N, provided with a handle, as R, and suitable holding device for said saw-handle, substantially as and for the purposes set forth.

4. In a machine for forming certain portions of a saw-handle, as described, the combination, with a suitable bed provided with supports and bearings for a shaft or arbor, cutters, as G and H, and slide-rest, as I, provided with a pivotally-arranged plate or carrier, as N, of a lever, as O, fulcrum, as P, and cam or eccentric, as Q, adapted to operate said lever and clamp said saw-handle, substantially as and for the purposes set forth.

5. In a machine for forming certain portions of a saw-handle, as described, the combination, with a suitable bed, provided with supports and bearings for a shaft or arbor, cutters, as G and H, slide-rest, as I, and pivotally-arranged plate or carrier, as N, of arms or supports, as L, provided with vertically-adjustable bearings, as M, and cam-rod, as C', for adjusting said bearings, substantially as and for the purposes set forth.

6. In a machine for forming certain portions of a saw-handle, as described, the combination, with a suitable bed, provided with supports and bearings for a shaft or arbor, cutters, as G and H, slide-rest, as I, provided with a pivotally-arranged plate or carrier, as N, and arms or supports, as L, of a guide-plate, as T, provided with guides, as U, and mechanism, substantially as described, for raising said plate automatically when said slide-rest is drawn back and to drop out of the way of said cutters automatically when said slide-rest is fed forward, substantially as and for the purposes set forth.

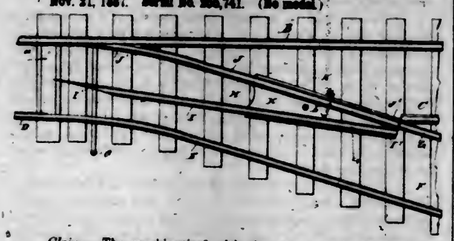


7. In a machine for forming certain portions of a saw-handle, as described, the combination, with a suitable bed provided with supports and bearings, a shaft or arbor, as C, held in bearings in the bed, cutters, as G and H, slide-rest, as I, provided with a pivotally-arranged plate or carrier, as N, and suitable clamping device, of a guide-plate, as T, provided with guides, as U, having bearings in suitable supports, as L, one pivot, *t*, extending entirely through said support L, an arm, as A', secured upon the extended pivot of plate T, and a post, as B', attached to the bed A, which the arm A' engages, substantially as and for the purposes set forth.

8. In a machine for forming certain portions of a saw-handle, as described, the combination, with a suitable bed, slide-rest, a pivoted device for holding said saw-handle, and shaft or arbor, as C, of cutters G, cutter-carrier F', and washers, as D', and cutters, as H, said cutters G adapted to be secured to said cutter-carrier F' and to co-operate with said cutters H in forming certain portions of said saw-handle, substantially as and for the purposes set forth.

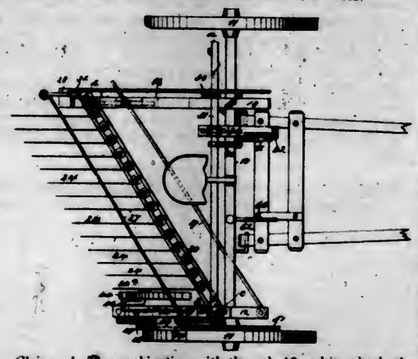
9. In a machine for forming certain portions of a saw-handle, as described, the combination, with a suitable bed provided with supports and bearings, a shaft or arbor, as C, provided with cutters, as G and H, and a slide-rest, as I, provided with a suitable clamping device, and pivotally-arranged plate or carrier N, for holding said saw-handle, of adjustable stops, as E', adapted to limit the feed to the depth of cut desired, substantially as and for the purposes set forth.

10. In a machine for forming certain portions of a saw-handle, as described, the combination, with a suitable bed provided with supports and bearings, a shaft or arbor, as C, provided with cutters, as G and H, and a slide-rest, as I, pivotally-arranged plate or carrier, as N, provided with a suitable clamping device for holding said saw-handle, suitable supports, as L, guide-plate, as T, provided with guides, as U, and a post, as E', of an arm, as A', adapted to co-operate with said post E' to raise said guide-plate T, and an adjustable wedge-shaped projection, A'', at the end of said arm A', whereby the throw of said arm may be adjusted, substantially as and for the purposes set forth.



382,065. STREET AND STATION INDICATOR. MARY J. WARNER, Sacramento, Cal. Filed Jan. 16, 1888. Serial No. 261,131. (No model.)

Claim.—1. A street and station indicator consisting of a casing and a series of cards pivoted at one end within the casing, each card having the names of two streets oppositely arranged with respect to each other and near the opposite edges thereof, substantially as described.



2. In a street or station indicator, the combination, with a casing, of a series of cards consisting of plates having a hem, *a*, and pivoted at one end within and about the center of the said casing, each card having the names of two streets on the same side oppositely arranged with respect to each other and near the opposite edges thereof, substantially as herein shown and described.

382,066. RAILROAD-SWITCH. HENRY D. BALDWIN, Shelbourg, assignor of one-half to Samuel H. Sexton, Lafayette County, Wis. Filed Nov. 21, 1887. Serial No. 256,741. (No model.)

Claim.—The combination, with the outer continuous-track rail, B, inner disconnected main-track rails, C D, an outer continuous switch-rail, E, leading to the rail D, and an inner switch-rail, G, converging with the end of the rail C, of the straight rail I, beveled at its front end, I', the switch-rail J, converging with the end I² of the rail I adjacent to the converging ends of the rails C G, and diverging at its beveled end J' from the end I' of the rail I, the plate K, connecting the rails I J, and the pivot L near said converging ends of the said rails I J, substantially as set forth.

382,067. HORSE HAY-RAKE. JULIUS H. BALLY, Paradise Hill, Ohio. Filed Nov. 28, 1887. Serial No. 256,319. (No model.)

Claim.—1. The combination, with the axle 10 and its wheels, the rake-head pivotally connected at one end with the axle and adjustable horizontally toward and from the axle at its opposite end, means for said adjustment, and the vertically and laterally swinging teeth connected at their inner ends with said head, of the lift-bar parallel with the rake-head and through bearings in which said teeth freely pass, a rock-shaft, connections between said rock-shaft and the lift-bar for swinging the teeth vertically on the rake-head, and means for operating said rock-shaft, substantially as set forth.

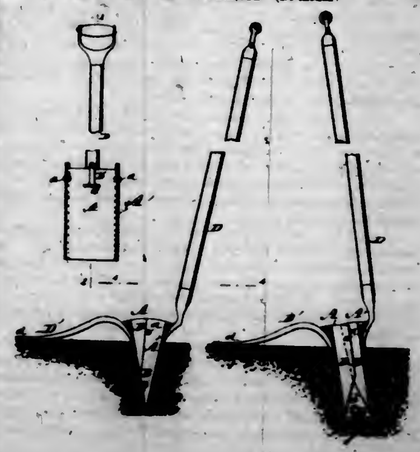
2. The combination, with the axle, its wheels, the rake-head extending obliquely rearward from the axle, a rearwardly-extending cross-bar connecting the outer end of the head with the axle, and the vertically and laterally swinging teeth carried by said rake-head, of a lift-bar parallel with the rake-head and having bearings through which the teeth freely pass, a rock-shaft parallel with the axle, a horizontal lever connecting the inner end of the lift-bar with said rock-shaft, a bell-crank lever on the outer end of said rearwardly-extending cross-bar, the horizontal arm of which is connected to the outer end of the lift-bar, a vertical lever-arm on the rock-shaft connected with the vertical arm of the bell-crank lever, and a hand-lever for operating the rock-shaft, substantially as set forth.

3. In a hay-rake, the combination, with the frame, the rake-head secured to the frame and extending obliquely rearward, and the rake-teeth secured thereto, of a vertically and longitudinally rocking kicker mounted on the frame and adjacent to the inner end tooth, 24ª, and means for operating said kicker, substantially as set forth.

4. The combination, with the axle, its wheels, a rearwardly-extending cross-bar, 12, and the rake-head pivoted thereto and horizontally adjustable toward and from the axle and having the teeth, of the transverse crank-shaft 46, journaled in the rear end of the cross-bar, the vertically and longitudinally rocking kicker 44, secured thereto adjacent to the tooth 24ª, and gearing operating the said shaft from one of the wheels on the axle, substantially as set forth.

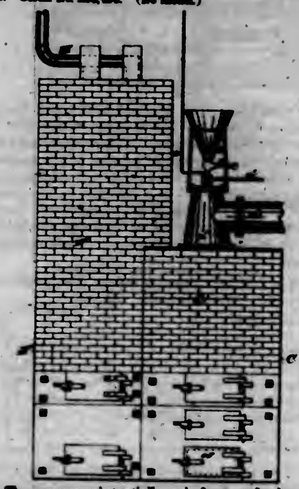
5. In a hay-rake, the combination, with a rake-head, of circular plates mounted in circular recesses formed in the rake-head, standards which extend upward from the plates, and rake-teeth formed with bent ends that fit within the standards, substantially as described.

382,068. GATE. FRANK W. BENNETT, Ottawa, Ohio. Filed Oct. 17, 1887. Serial No. 252,601. (No model.)



Claim.—1. The combination, with a sliding gate and a hinged frame upon which the gate is supported, of a bar pivoted on the free end of the said frame, and having its lower end engaging one of the bars of the gate, and means for locking the said bar in different positions, substantially as described.

2. The combination, with a sliding gate and a hinged frame upon which the gate is supported, of a bar pivoted to the free end of the said frame and having its lower end engaging one of the bars of the gate, and a rod secured to the said hinged frame and having its free end adjustably connected to the upper end of the pivoted bar, substantially as described.

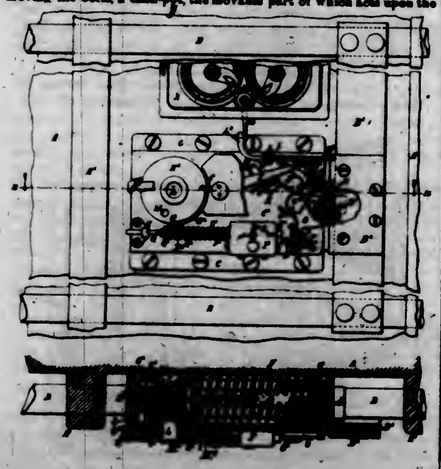


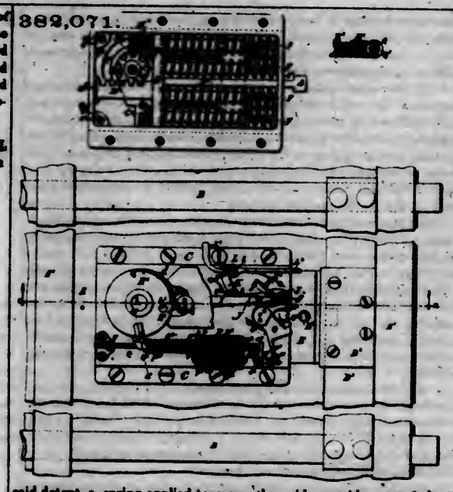
3. A support for a sliding gate, consisting of the triangular frame 7, provided with sockets or eyes 10 for hinging the same, and with the roller 14 and hook 20 for engaging the bars of the gate, the bar 13, pivoted to the pointed end of the frame and provided with a roller, 19, and perforations 16, and the rod 17, secured to the frame 7 and engaging one of the perforations in the bar 13, substantially as herein shown and described.

382,069. PLANTER. ALFRED W. BLACK, Traverse City, Mich. Filed June 22, 1887. Serial No. 242,144. (No model.)

Claim.—A planter consisting of the outwardly-flared jaws of rectangular shape, with their sides extended at right angles thereto and inclined upon the inner edges from near the center downward flush with the bottom edges of said jaws, and which sides are pivoted together near their upper edges, one of said jaws having a handle and the other jaw having a horizontal outwardly-extending gage-arm, substantially as specified.

382,070. PROCESS OF MANUFACTURING ORANGE MINERAL AND RED LEAD. ARTHUR C. BRADLEY, Brooklyn, N. Y. Filed Feb 20, 1887. Serial No. 228,493. (No model.)





Claim.—The process, substantially as before set forth, of manufacturing orange mineral and red lead, which consists, first, in exposing finely-comminuted metallic lead in a shower to an inclosed current of air heated to a temperature sufficient to burn the lead, and collecting the resultant pulverulent litharge, and, secondly, in roasting the said pulverulent litharge.

382,071. SAFE-LOCK. ARTHUR C. BRADLEY, Chicago, Ill., assignor of one-half to James C. Harris, Dayton, Ohio. Filed May 10, 1887. Serial No. 237,602. (Model.)

Claim.—1. The combination, with the bolts of a safe, and springs or weights applied to actuate the bolts, of means for holding the casting-springs or weights from moving the bolts, comprising a detent, a dash-pot, and a spring or other means for actuating the movable part of the dash-pot, substantially as described.

2. The combination, with the bolts of a safe, and springs applied to actuate the bolts, of a detent for holding the casting-springs from moving the bolts, a dash-pot, the movable part of which acts upon the

said detent, a spring applied to move the said movable part of the dash-pot, and means for compressing or winding the bolt-actuating springs, constructed to also compress or wind the spring which moves the movable part of the dash-pot, substantially as described.

3. The combination, with the bolts of a safe, of casting and retracting springs, a detent holding the casting-springs from moving the bolts, a dash-pot, the movable part of which is adapted to engage and move the said detent, a spring-actuating said movable part of the dash-pot, and a sliding part, as plate D, the movement of which compresses the casting and retracting springs, said sliding part being adapted to also engage and compress the spring which actuates the movable part of the dash-pot, substantially as described.

4. The combination, with the bolts of a safe and casting-springs, of a rack-bar, a sliding plate attached to the rack-bar and acting upon said springs, a pinion intermeshing with the rack-bar, a detent holding the casting-springs from moving the bolts, a dash-pot, the movable part of which is adapted to actuate the said detent, and a spring for actuating said movable part of the dash-pot and engaging said sliding plate, whereby the said spring which actuates the movable part of the dash-pot is compressed with the casting-springs, substantially as described.

5. The combination, with the bolts of a safe and casting-springs, of a detent for holding the casting-springs from moving the bolts, a dash-pot, the movable part of which acts upon the said detent, a spring for advancing the movable part of the dash-pot toward the detent, and another spring applied to retract the said movable part of the dash-pot, substantially as described.

6. The combination, with the bolts of a safe and retracting-springs, and a sliding plate, D, against which the retracting-springs act, of a dash-pot comprising a casing, P, a piston and a piston-rod, P², a rod, R, connected with the said piston-rod and provided with a collar or shoulder, and a spring for actuating the said piston applied between the said shoulder of the rod R and the plate D, substantially as described.

7. The combination, with the bolts of a safe and springs, for moving the bolts, of one or more levers for holding the springs under tension, a detent for engaging the lever or levers when the springs are compressed, a time mechanism or other device acting upon the said detent to release the levers and springs at a desired time, and means for winding or compressing the springs constructed to automatically place the lever or levers and detent in position for holding the springs compressed or under tension, substantially as described.

8. The combination, with the bolts of a safe and actuating-springs for moving the bolts, of an arm or lever by means of which the springs are held compressed and which is moved or swung about its pivot in the act of compressing the springs, a second lever provided with a shoulder to engage the lever first mentioned, and with an arm or projection located in the path of the said lever first mentioned, whereby the second lever will be moved or turned by said first lever into position for the engagement of its shoulder with the said lever first mentioned, a detent engaging said second lever, and a time mechanism or other device acting upon said detent to release the levers and springs at a desired time, substantially as described.

9. The combination, with the lever I and detent L, of a lever or levers, as J and K, located between said lever I and detent L and pro-

vided with notches to receive the ends of the levers engaged therewith, said levers being provided with means for holding said notches in position to receive the ends of said lever or levers which enter said notches, substantially as described.

10. The combination, with the bolts of a safe, weights or springs applied to retract the bolts, and a part or plate connected and moving with the bolts, of a lever, as K, provided with a notch or shoulder engaging said part or plate for holding the bolts from movement under the action of the springs or weights, a detent engaging said lever, and means for actuating the detent to release the lever, the engaging surfaces of the said detent and lever being inclined or oblique, substantially as and for the purpose set forth.

11. The combination, with the bolts of a safe and casting-springs and a revolving disk or arm, as H', the turning of which compresses the said springs, said disk being provided with a projection or shoulder, of a lever, I, provided with a projection or arm, *i*, engaging said projection or shoulder, a movable part, detent, or lever engaging the free end of said lever I, and a time mechanism or other means for actuating the said movable part or lever at the time it is desired to unlock the safe, the said disk or revolving part H' being provided with a pin or stud, h^3, adapted to engage said arm *i*, substantially as described.

12. The combination, with the bolts of a safe and casting-springs, of a revolving disk or arm, as H', the turning of which compresses the said springs, a spring-strip, H^3, attached to said disk or arm, a lever, I, provided with a projection or arm, *i*, engaging the end of said strip, and provided, also, with a projection, i^3, adapted to engage the outer face of the strip, substantially as described.

13. The combination, with the bolts of a safe, of a bolt-actuating device comprising a metal shell or case, a sliding plate mounted in the case and acting against the bolts, springs for casting the bolts located in said shell or case and acting against said sliding plate, a detent engaging said sliding plate, and means for releasing said detent after the door is closed, substantially as described.

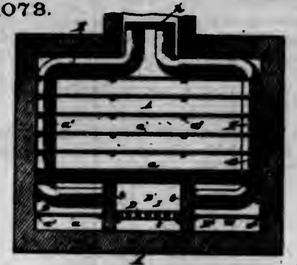
14. The combination, with the bolts of a safe, of a bolt-actuating device comprising a metal shell or case, a sliding plate mounted in the case and acting against the bolts, actuating-springs for casting the bolts located in said case and acting against said sliding plate, a detent engaging said sliding plate, and a spring-actuated motor mounted upon the said case and adapted to engage and move the detent, substantially as described.

15. The combination, with the bolts of a safe, of a bolt-actuating device comprising casting-springs and a moving part or plate against which said springs act, arranged to bear against the bolt-work, and a detent engaging said moving part or plate independently of the bolts, substantially as described.

16. The combination of casting and retracting springs and a shell or casing inclosing the same, the casting-springs being adjacent to the outer or exposed wall of the shell, a sliding plate or casting mounted in the said shell and acting against the bolts, and a detent mounted upon the said outer wall of the case and engaging said sliding plate, substantially as described.

17. The combination, with the bolts of a safe and springs or weights applied to move the bolts, of a sliding part or plate actuated by the springs and acting on the bolts, said sliding part or plate being provided with a projection or stud, and a pivoted detent provided with a notch or shoulder to engage the stud, and with a spring-arm located in the path of the stud, whereby the detent will be automatically engaged with the stud by contact of the latter with said part or arm, substantially as described.

382,072. NAIL OR RIVET FOR BOOTS OR SHOES. G. ANDREA CAVALLI, San Francisco, Cal. Filed Jan. 20, 1887. Renewed Oct. 7, 1887. Serial No. 251,769. (No model.)



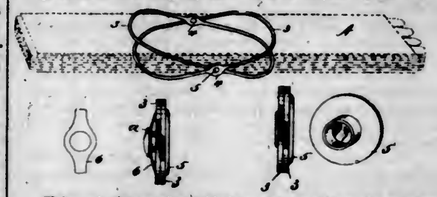
Claim.—1. The herein-described nail or rivet, having a thread, *a*, and longitudinal ribs *b b*, projecting beyond the thread.

2. The herein-described nail or rivet, having the thread *a* and the longitudinal ribs *b b*, extending beyond the thread, a flattened end, A', having threads on its sides, as shown.

382,073. OVEN. LEVI COLE, Elmira, N. Y. Filed July 26, 1887. Serial No. 245,517. (No model.)

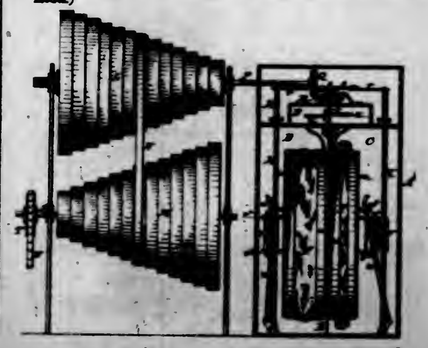
Claim.—1. A baker's oven comprising three lower compartments, an upper compartment over the same, a central flue in the top thereof, doors for said compartments, smoke-pipe leading from the opposite sides of the rear end of the central lower compartment into the two compartments alongside thereof and up through the upper compartment at its opposite sides to the central flue, substantially as set forth.

382,073.



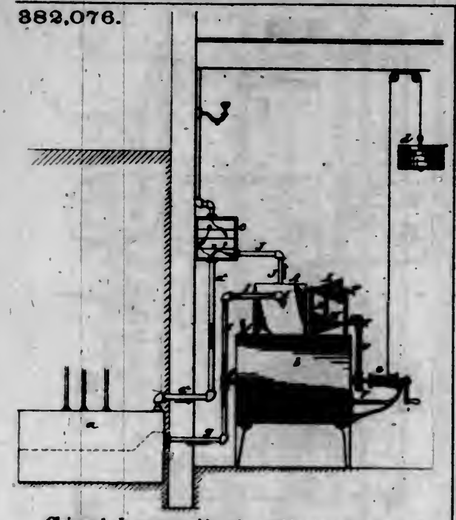
2. The combination, with an oven provided with the upper baking-chamber, A, the lower side baking-compartments, B B^3, and perforated shelves held in said chamber and compartments, and a fire-pot, B', centrally below said chamber A and between said compartments B B^3, of pipes H, projected from said fire-pot at each side, passing through said baking-compartments and main baking-chamber up into the flue, a damper, *K*, at the outlet ends of said pipes, double doors E' E' for the compartment A, doors E^3 E^3 for the lower side compartments, B B^3, and means for regulating the heat in the oven, substantially as shown and described.

382,074. CLASP. JAMES H. COMATY, West Haven, Conn. Filed Sept. 10, 1887. Serial No. 249,266. (No model.)



Claim.—The jaw or member of the herein-described cast-off clasp, having its cast-off finger cut from the back of the jaw and bent parallel, or nearly so, with the outer projection of the jaw or member, substantially as described.

382,075. GLOVE-PACKAGE BINDER. CHARLES CONNOLLY, Holyoke, Mass. Filed Aug. 20, 1887. Serial No. 247,495. (No model.)



Claim.—A glove-package binder consisting of two links, 3, one within the other and pivoted together about midway between their ends, combined with a friction-spring at one or both joints of the binder, substantially as set forth.

382,076. DEVICE FOR MIXING GAS AND AIR. EDWARD B. DENNY, Newark, N. J. Filed Oct. 25, 1884. Serial No. 146,674. (No model.)

382,076.

Claim.—1. In a gas-machine, the combination of an air-pump, its operating-motor, a generator, a mixing-chamber, a closed air-measuring device, and suitable pipe-connections for these parts, arranged to supply air under the same pressure to the generator and to said closed measuring device, with a regulator operating to control the movements of said measuring device in the way described.

2. In a gas-machine, the combination of a generator, an air-pump, and an air-measuring device with a governor device consisting of connected cone-pulleys and suitable connections, with the valves of the air-measuring device, for regulating the speed of the latter, substantially as described, for the purpose specified.

3. In combination, in a gas-machine, the generator *a*, the air-pump *b*, the case A, the flexible air-measuring chambers F, their operating-connections, the valves G and their operating-connections with said chamber-connections, the cone-pulleys L M, their connecting-belt N, the gear-connections Q R for the cone-pulley L with said valve-connections, a motor for the pump, and the belt V, connecting the cone-pulley M with said pump-shaft, substantially as described, for the purpose specified.

4. The combination, in a gasoline-gas machine, of a generator and an air-pump, an air-measuring device consisting of flexible chambers having controlling-valves and connected to each other, the belt-connected cone-pulleys, suitable gear-connections for the latter and for said valves, a motor for said pump, and suitable connections for said pump-shaft with one of said cone-pulleys, all constructed and arranged to operate in the way described.

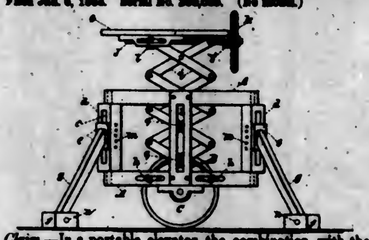
5. The combination, in a gas-machine, of the flexible air-measuring chambers, their valve-controlling mechanism and air-pump, with the belt-connected cone-pulleys having suitable connection with said valve mechanism, whereby to control the quantity of air required for reducing the density of the gas, substantially as described.

6. The combination, in a gas-machine, of an air-pump and a mixing-chamber, with an air-measuring attachment consisting of co-operating flexible chambers, the belt-connected cone-pulleys, and valve mechanism connecting said chambers with said cone-pulleys, substantially as described, for the purpose specified.

7. The combination, in a gas-machine, of an air-pump, its operating-motor, flexible air-measuring chambers, their controlling-valves, and a mixing-chamber having pipe-connections with said generator and said measuring device, with a regulator composed of the belt-connected cone-pulleys, one of which is connected to the said flexible chambers by intermediate gear mechanism and the other to the pump-shaft by a belt, all constructed and arranged to operate in the way described.

8. The combination, in a gas-machine, of the air-pump *b*, the generator *a*, and the mixing-chamber *c* with the flexible air-measuring chambers, the air-supply pipes I *g*, the connected cone-pulleys, and valves connected with said pulleys and with the said flexible chambers, substantially as described, for the purpose specified.

9. In a gas-machine, the combination of a generator, a pump for supplying air thereto, an air-measuring attachment, consisting of flexible chambers operated by air under pressure from said pump, and valves controlling the movements of said chambers, with a regulator connected with and controlling said valves, and suitable connections for positively operating said regulator from the air-pump-driving mechanism, substantially as described, for the purpose specified.



10. A gas-machine having in co-operative combination the following instrumentalities, viz: an air-pump, flexible air-measuring chambers having direct connection therewith, the regulating cone-pulleys, valves controlled by said cone-pulleys, a generator connected with said air-pump, and a mixing-chamber connected with said air-measuring chambers, the operation being such as to cause the air-measuring chambers to be operated by an excess of air-pressure over the gas-pressure in the normal working of the machine, substantially as herein set forth.

11. The combination, in a gas-machine, of suitable air-measuring chambers having controlling-valves, an air-pump forcing air under pressure through said measuring-chambers, and a generator receiving air under pressure from said pump, with a governor device consisting of connected cone-pulleys and suitable mechanism connecting the latter with the said valves and with the air-pump, substantially as described, for the purpose specified.

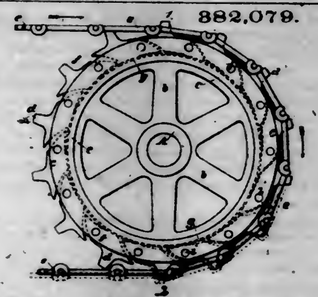
12. In a gas-machine, the combination of a generator, an air-pump, its operating-motor, flexible air-measuring chambers, pipes for supplying air under pressure to the generator and to the measuring-chambers, a regulator composed of stepped cone-pulleys placed in reverse relation and connected by an adjustable belt, and having connection with said flexible chambers and with the pump-shaft, for operation in the way described.

13. The combination, in a gas-machine, of a generator and an air-pump and measuring and mixing chambers for the fluids, suitable pipe-connections for said parts, and valves arranged to control the operation of the air-measuring chambers with the cone-pulleys and their connecting-belt, all operating to control the movements of the measuring device, as described.

382,077. PORTABLE ELEVATOR. JAMES DEE, Jerseyville, Ill. Filed Jan. 6, 1888. Serial No. 259,688. (No model.)

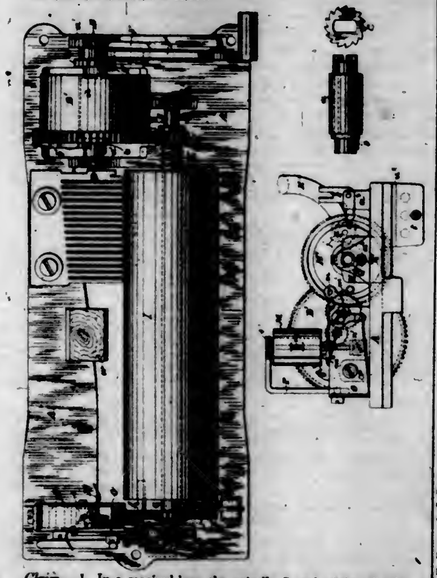
Claim.—In a portable elevator, the combination, with the base-frame thereof, of the pivoted bars *d*, having slots *e* and pins *m*, and the sliding blocks *c*, in which are secured bars *g*, having shoes *f*, pivotally secured to the lower ends thereof, all constructed and adapted to operate substantially as and for the purpose set forth.

382,078. NUT-LOCK. WILLIAM DEER, Philadelphia, Pa., assignor of two-thirds to Daniel B. Ruffner and Gideon B. Bolton, same place. Filed Mar. 19, 1887. Serial No. 231,551. (No model.)



Claim.—A nut-fastener consisting of a single strip of material having one end coiled, forming a spring and an eye, C, and the other end portion, D, bent around the said eye C, and having a spring portion, E, adjacent to the said eye, and the ends E and D being set out in opposite directions, all as described.

382,079. SPROCKET-WHEEL. WILLIAM D. SWAIM, Chicago, Ill., assignor to The Beart Manufacturing Company, same place. Filed Dec. 3, 1887. Serial No. 257,410. (No model.)



Claim.—A sprocket-wheel having bodily-movable teeth or sprockets, the movements of which vary the pitch of the wheel, substantially as and for the purpose set forth.

882,079.

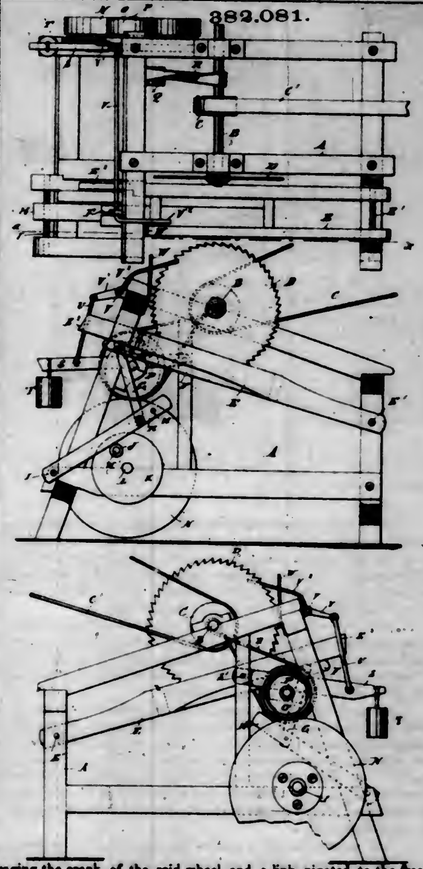
882,080. MUSICAL BOX. EDMOND FONTAINEMOZ, La Mothe, near Yverdun, Switzerland. Filed Oct. 3, 1888. Serial No. 315,173. (No model.) Patented in Belgium May 14, 1888, No. 78,119; in France May 18, 1888, No. 176,937; in England May 24, 1888, No. 6,962, and in Germany May 31, 1888, No. 41,897.

Claim.—1. In a musical box, the spindle G and pinion H adjustable upon the same, substantially as described.

2. In a musical box, the cylinder-spindle G and bearings G^1 G^2, in combination with the spring-plate K, substantially as described, and for the purposes set forth.

3. In a musical box, the hollow shaft or collar *a*, having at one end the pin *b* and adapted to carry at the other the ratchet-wheel *c*, in combination with the fixed shaft B, all substantially as described, and for the purposes set forth.

4. In a musical box, the frame O, for carrying the fly and its train of wheels, formed from a single piece of metal and having a bent arm, P, and steel bearing-plate *s*, in combination with the three-armed lever or trigger, the spring of which bears directly upon the bed-plate, substantially as and for the purposes set forth.



5. In a musical box, the bent arm *k*, pivoted in the lug a^2 and adapted to operate the air-changing device, substantially as described.

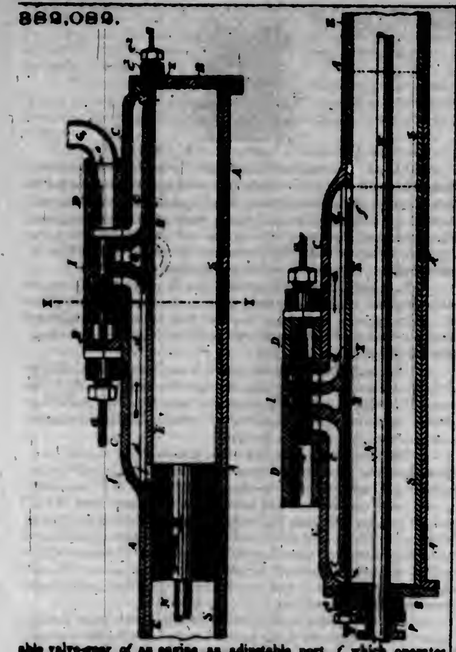
6. In a musical box, the combination of the winding-handle E, spring F', pawl F, ratchet-wheel *c*, pawl D, and spring D', substantially as described, and for the purposes set forth.

882,081. CIRCULAR SAWING MACHINE. JOSEPH W. FRANK, Emporia, Florida. Filed Oct. 1, 1887. Serial No. 251,266. (No model.)

Claim.—1. In a sawing-machine, the combination, with the main frame and a feed-frame for carrying the block-carriage pivoted to the main frame, of a crank-wheel journaled in the main frame below the free end of the feed-frame, an arm pivoted to the main frame and engaging the crank of the said wheel, and a link pivoted to the free end of the said arm and to the under side of the feed-frame, substantially as herein shown and described.

882,081.

2. In a sawing-machine, the combination, with the main frame and a saw-arbor journaled therein, of a feed-frame pivoted to the main frame, a crank-wheel journaled in the main frame below the free end of the feed-frame, an arm pivoted to the main frame and engaging the crank of the crank-wheel, a link pivoted to the free end of the said arm and to the under side of the feed-frame, and intermediate mechanism for operating the crank-wheel from the saw-arbor, substantially as herein shown and described.

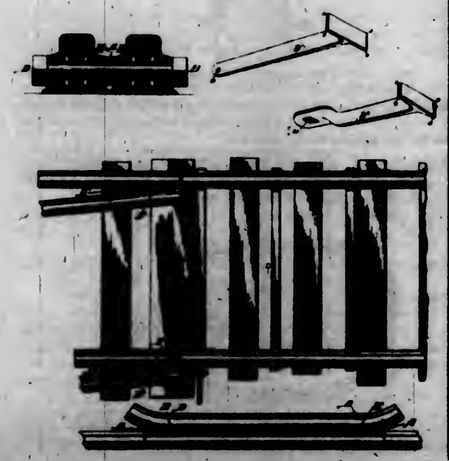


3. In a sawing-machine, the combination, with a saw-spindle and a saw, of a shaft operated from said saw-spindle, means, substantially as described, for raising and lowering said shaft, a friction-pinion secured on said shaft and engaging a friction-wheel, a shaft carrying said friction-wheel and also provided with a crank-disk, a pivoted arm operated by the crank-pin of said crank-wheel, a link pivotally connected with said pivoted arm, and a feed-carriage pivotally connected with said link and moving in front of said saw, substantially as shown and described.

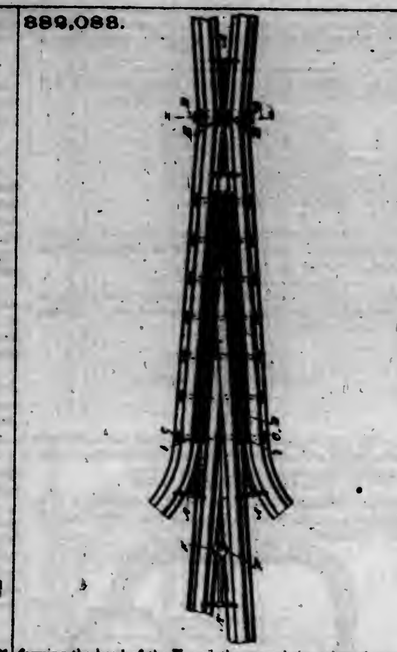
4. In a sawing-machine, the combination, with the saw-arbor and a transverse shaft operated from the saw-arbor, of a weighted pivoted arm in which one end of said shaft is mounted, a link connected with the free end of said pivoted arm, an arm connected with said link and secured to a shaft, and a second arm fastened on said shaft and adapted to be held in a locked position, and devices for locking the same in position, substantially as shown and described.

882,082. REHEAT-ATTENDED STEAM-ENGINE. MICHAEL GARLAND and ASHA D. CATLIN, Bay City, Mich.; said Catlin assignor to said Garland. Filed Sept. 16, 1887. Serial No. 249,962. (No model.)

Claim.—1. In combination with the cylinder, piston, and suitable valve-gear of an engine, an adjustable port, *f*, which operates when set at different points lengthwise of the cylinder to effect the cushioning of the piston during longer or shorter portions of the stroke of said piston, all substantially in the manner and for the purposes hereinbefore set forth.



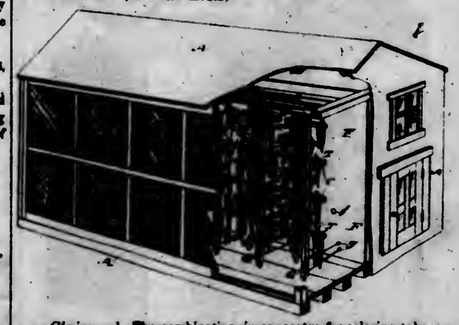
882,082.



2. In an engine adapted to be driven by steam, (or any other elastic medium,) the combination, with the cylinder, piston, and suitable valve-gear, of adjustable ports *f f*, arranged one near each end of the cylinder and separately adjustable lengthwise of the cylinder, as specified, whereby the cushioning of the piston on the cylinder may be effected differently at the opposite ends of the cylinder and the piston-stroke, all substantially as hereinbefore set forth.

882,083. FOOT-GUARD FOR RAILWAYS. THOMAS A. GRIFFIN, Chicago, Ill. Filed Oct. 20, 1887. Serial No. 252,726. (No model.)

Claim.—1. A foot-guard for railways, consisting of a T-shaped single piece of metal formed from a short section of rail by drawing out the head thereof to form the stem of the T, the flange thereof

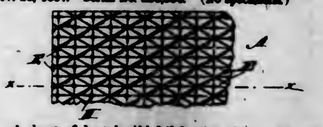


882,083.

forming the head of the T, and the stem being pierced near its end for the reception of a bolt or other fastening.

2. A foot-guard for railways, consisting of a piece of T-shaped metal, its head constructed to rest upon the rails and its stem being twisted or flattened at its end and provided with a spike-hole, substantially as described.

882,084. APPARATUS FOR COLORING TOBACCO. JAMES K. HARDWICK and JAMES J. REDDEN, Marshall, N. C. Filed Dec. 20, 1887. Serial No. 258,262. (No model.)



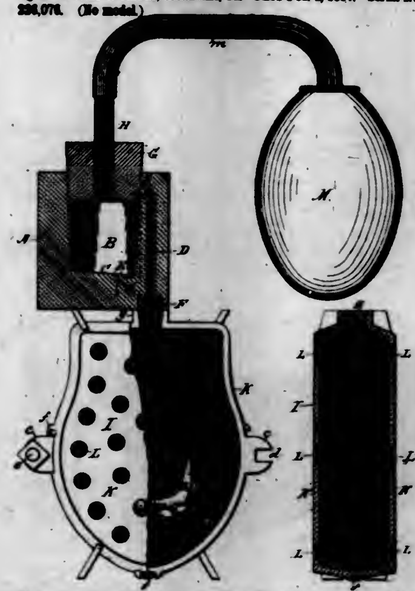
Claim.—1. The combination, in apparatus for coloring tobacco plants or leaves, of a structure provided with a transparent or translucent outer wall, an inner light-reflecting wall, and plant or leaf supports or racks arranged between the two walls, substantially as shown and described, whereby the plants or leaves on the racks will receive both direct and reflected light to give them a uniform color, as herein set forth.

2. The combination, in apparatus for coloring or bleaching tobacco plants or leaves, of a structure provided with a glass or transparent outer wall, an inner light-reflecting wall, and a series of revolvable tobacco-supports arranged between said outer and inner walls, substantially as herein set forth.

3. The combination, in apparatus for coloring or bleaching tobacco plants or leaves, of a house or structure provided with a glass or transparent outer wall and an inner light-reflecting wall, thereby subjecting the plants or leaves to direct and reflected light, substantially as specified, a series of revolvable tobacco-supports arranged be-

hind said wall, and cords wound on these supports and leading to one side of the bleaching-room for operating the supports, substantially as herein set forth.

882,085. DENTAL FOIL. THOMAS J. HENRY, New York, N. Y. Filed Nov. 28, 1887. Serial No. 256,260. (No specimens.)



Claim.—A sheet of dental gold-foil having depressions covering its surface, the continuity of the metal at each of said depressions being slightly broken, as and for the purpose specified.

882,086. DOOR-BUTTON. FRANK J. HERRIN, New Britain, assignor of one-half to William Edgar Simonds, Hartford, Conn. Filed May 2, 1887. Serial No. 236,530. (No model.)

Claim.—The combination of the mortised button *a*, the pivot-pin *b*, and rubber cushion *c*, secured in the mortise, all substantially as described, and for the purpose set forth.

882,087. CRUCIBLE. JOSEPH R. HOLDEN, Washington, D. C., assignor to Craft C. Carroll, Hendville, Pa. Filed Feb. 1, 1887. Serial No. 226,076. (No model.)

Claim.—1. A crucible having a central melting-chamber and a discharge-passage extending from the bottom of the melting-chamber through the side wall to a point near the top, and thence to an opening in the base of the crucible, substantially as described.

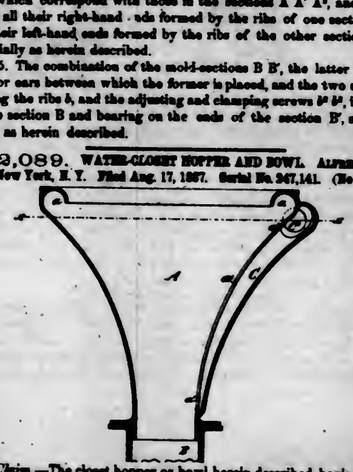
2. A crucible having a tortuous discharge-passage in its wall and a discharge-opening in its base, substantially as described.

3. A crucible provided with a tortuous discharge-passage in its wall, a discharge-opening in its base, and a nipple embedded in said base and forming a continuation of said discharge-opening, substantially as described.

4. The combination, with the crucible A, having a tortuous discharge-passage in its wall and the discharge-opening in its base, of the tubular stopper G, the tube H, the rubber pipe *m*, and the air-injector M, substantially as described.

882,088. MOLD FOR CASTING SAW-TEETH. H. [illegible] HERMES, New York, N. Y. Filed Feb. 20, 1886. Serial No. 228,627. (No model.)

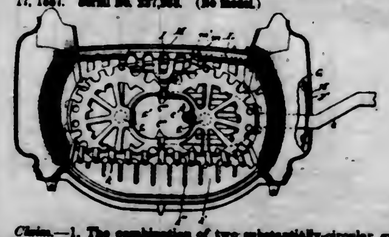
Claim.—1. The combination, in a mold for casting saw-teeth with diamonds or other hard stones, of the mold-sections constructed to form a cavity, and pins removably fitted opposite each other in said sections and projecting into said cavity from opposite sides thereof, whereby a stone supported between the ends of said pins will, when the tooth is cast, be completely surrounded by metal in which the pins are embedded, substantially as herein described.



2. The combination, with mold-sections forming a cavity between them, of pins *n n'*, removably fitted in said sections and projecting into the cavity opposite each other, the said pins having cup-shaped or concaved inner ends for more securely retaining a stone between them, substantially as herein described.

3. The combination, with the two side sections of a mold having in the cavity formed between them the lateral enlargements *d*, of pins removably fitted in said sections opposite each other and projecting into the cavity on opposite sides thereof and from said lateral enlargements, substantially as herein described.

4. The combination, with the lower mold-sections, A A' A^3, constructed to form portions of mold-cavities, and pins *n n'*, fitted thereto for holding stones therein, of the upper mold-sections, B B', supported on said lower mold-sections and provided on their faces with ribs *b*, the said sections B B' being placed face to face, with the ribs *b* of each between the ribs *b* of the other, and containing portions of mold-cavities which correspond with those in the sections A A' A^3, and which have all their right-hand ends formed by the ribs of one section and all their left-hand ends formed by the ribs of the other section, substantially as herein described.



5. The combination of the mold-sections B B', the latter having lugs or ears between which the former is placed, and the two sections having the ribs *b*, and the adjusting and clamping screws b^2 b^2, inserted in the section B and bearing on the ends of the section B', substantially as herein described.

882,089. WATER-CLOSET HOPPER AND BOWL. ALFRED IVERS, New York, N. Y. Filed Aug. 17, 1887. Serial No. 247,141. (No model.)

Claim.—The closet hopper or bowl herein described, having in its side a water-supply channel or feeder extending substantially upright on the exterior thereof and communicating with the interior thereof by a slot, which also is substantially upright in the hopper or bowl, as and for the purpose herein described.

882,090. FIRE-POT FOR STOVES. WILLIAM J. KEEP, Detroit, Mich., assignor to the Michigan Stove Company, same place. Filed Feb. 17, 1887. Serial No. 227,923. (No model.)

Claim.—1. The combination of two substantially-circular grate-sections partially rotatable in a horizontal plane, each provided with a side opening to form a dump-hole between them, with a draw-slide for closing said dump-hole, and connected with one of said sections, whereby the said section and slide may be simultaneously operated, substantially as described.

2. The combination of the two partially-rotatable grate-sections C, each having a side opening, *d'*, and hook *c''*, adapted to alternately move into the dump-hole formed by said openings, substantially as described.

3. The combination, with the partially-rotatable grate-sections C, one of said sections being provided with an opening to form a dump-hole, of a vibrating draw-slide supported beneath the same and closing said dump-hole, and a bar, *c*, moving with said slide, and lugs *c'*, depending from one of said sections and receiving the bar *c* and transmitting motion from the bar *c* to said section, substantially as described.

4. The combination, with partially-rotatable grate cut away to form a dump-opening, and a spider beneath the same, provided with downwardly-projecting lugs D, of the swinging draw-slide R, arranged to slide on said lugs to close the opening and engaging the grate, substantially as described.

5. The combination, with the spider A, having cross-bars B, of the crescent-shaped sections C, one of which is provided with depending lugs and supported by and pivoted on said cross-bars, and the draw-slide R, filling the dump-hole between the crescent-shaped sections, and provided with the bar *c*, passing between the lugs on one of the sections, and the link I, connecting the two sections to move them simultaneously, substantially as described.

6. The combination, with a fire-pot, of a front grate comprising the vertical bars *k* and a plate arranged above said bars and at an angle thereto, having a series of slots, *k''*, forming short lateral bars *k'* in line with the bars *k*, substantially as described.

7. In a fire-pot, the combination, with the grate-support, of the frame M, supported thereby and formed with bars *m'*, and projections *m*, formed on said bars, and the lining formed of castings L, having lugs *l* on their backs engaging said projections, substantially as and for the purposes specified.

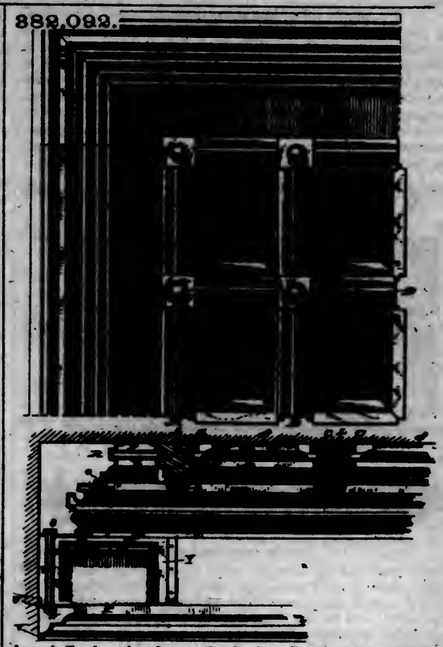
8. The combination, with the grate-support having upwardly-projecting lugs *a*, of the skeleton frame M, having bars *m'*, with projections *m* on their sides, and also having downwardly-projecting grate-bars passing between the lugs *a'*, engaging said lugs, and the lining formed of castings, united to said frame by lugs *l* on their backs engaging the projections *m*, substantially as described.

882,091. SPOOL OR BOBBIN. JOSEPH H. KEMBA, Antrim, N. H., assignor to H. I. N. Hayes, Cambridge, Mass. Filed Mar. 19, 1887. Serial No. 231,519. (No model.)

Brief.—The object of the invention is to produce a bobbin or spool which shall be strong and durable and at the same time of light weight.

Claim.—1. A spool or bobbin having a hollow barrel constructed in two parts united at a central point, the form of the bore toward the ends of the barrel being conical or rounded, substantially as and for the purposes set forth.

2. A spool or bobbin having a hollow barrel constructed in two parts united at a central point, the form of the hollow or bore being conical or rounded toward the ends of the barrel and enlarged or of substantially uniform diameter through the middle portion of its length, substantially as and for the purposes set forth.

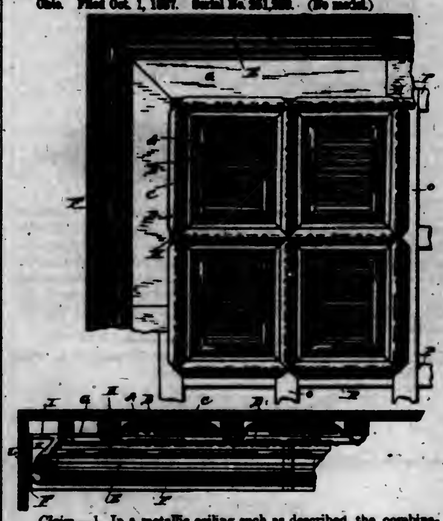


3. A spool or bobbin having a hollow barrel of wood constructed in two parts united at a central point, the meeting ends overlapping, as set forth, in combination with a metallic sustaining-ring, *c*, extending around within the bore of the barrel at a central point only, as set forth.

882,092. METALLIC CEILING. WILLIAM R. KINNEAR, Columbus, Ohio. Filed Oct. 1, 1887. Serial No. 251,231. (No model.)

Claim.—1. In a metallic ceiling such as described, the combination of separate panels provided upon the sides with the shoulders B and flanges C, the said flanges adapted to receive a line of nails, and strips of molding suspended between the said panels and provided with the channels E, adapted to fit over the shoulders B of the said panels, substantially as described.

2. In a metallic ceiling such as described, the combination of separate panels provided upon the sides with the shoulders B and flanges C, the said flanges adapted to receive a line of nails, strips of molding suspended between the said panels and provided with the



882,092.

channels E, adapted to fit over the shoulders B of the said panels, and the ornamental drops G, provided with the channels H, adapted to fit over the shoulders B of the said panels, substantially as described.

3. In a metallic ceiling such as described, the combination of the cornice O, provided with the flange P and channels S, the frieze Y, and the bending T, said bend provided with the channel W and flanges U and V, substantially as described.

882,093. METALLIC CEILING. WILLIAM R. KINNEAR, Columbus, Ohio. Filed Oct. 1, 1887. Serial No. 251,232. (No model.)

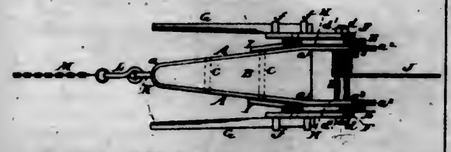
Claim.—1. In a metallic ceiling such as described, the combination of separate panels provided upon their edges with corresponding beads or moldings, said moldings being each adapted to fit any of the moldings of the abutting panels, and mitered at the corners of the panels, so that the moldings of the obliquely-abutting panels meet without changing the line of the said moldings.

2. In a metallic ceiling such as described, the combination of panels provided with corresponding beads or moldings upon the edges adapted to fit one over the other, and a cornice having a bead or molding corresponding to those upon the said panels and adapted to pass under the same, and further provided with a depending flange and adapted to rest against the side of the room and to receive a line of nails, substantially as described.

3. In a ceiling such as described, and in a cornice therefor composed of separate pieces, brackets provided with flanges for concealing the meeting edges of the said pieces, substantially as described.

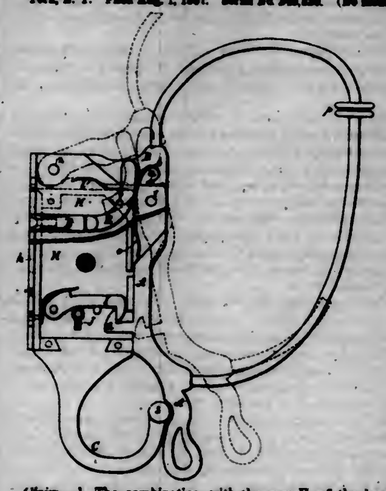
382,094. METALLIC CEILING. WILLIAM B. KINNEAR, Columbus, Ohio. Filed Oct. 1, 1887. Serial No. 251,269. (No model.)

Claim.—1. In a metallic ceiling such as described, the combination of separate panels provided upon two adjoining sides with the folded edges C and flange D, and upon the opposite sides with the hooked edges F, the corners of the said panels cut away to receive the drops G, and the said drops provided with flanges H, adapted to rest under the folded edges of the said panels, substantially as described.



2. In a metallic ceiling such as described, the combination of separate panels provided upon two adjoining sides with the folded edges C and flanges D, and upon the opposite sides with the hooked edges F, and a cornice provided upon opposite sides of the said paneling with edges corresponding to the edges C and F, respectively, substantially as described.

382,095. BOLTING-REEL. RUDOLF KNEPPLER, Cleveland, Ohio. Filed May 12, 1887. Serial No. 237,934. (No model.)

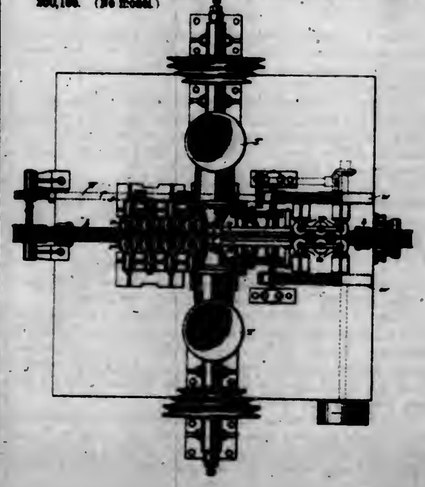


Claim.—The combination, with the shaft, the arms D, and the heads, of the hoops E on the outer ends of said arms, the flexible strip G over said hoops, the bolting-cloth made in sections, the adjacent ends of which are secured to said strip, the lacing-hooks I on the outer edges of the strip G, and the clamping-hoops secured around the hoops E between the sections of cloth and over the strip G, and lacings J between the hooks, substantially as and for the purpose specified.

382,096. STUMP-PULLER. LEBBEUS LAPO, Pittsburg, N. H. Filed Dec. 27, 1887. Serial No. 259,163. (No model.)

Claim.—A metallic stump-puller frame formed of two integral arms carrying a windlass near their front ends, together with pawls, ratchets, and levers, and provided on the outside of the fold a with a hook and eye, whereby the stump-puller may be used as described.

382,097. COAT AND HAT HOOK. WILLIAM H. LAWSON, New York, N. Y. Filed Aug. 1, 1887. Serial No. 245,230. (No model.)



Claim.—1. The combination, with the case H, of the hook-section B, pivoted to the case and swinging upwardly, the hook-section A, pivoted to the case, and the spring O, to swing the hook-section A forward and upward, the hook C below the case H and behind the shank of the hook-section A, so as to be closed thereby when the section is swung down, the interlocking projections upon the shanks of the respective hook-sections A B, the catch G, and spring-latch I, substantially as set forth.

2. The combination, with the two hook-sections A B, the shanks of which interlock when brought together, and the case H, to which the said sections are pivotally connected, of the arm E, projecting from the shank of the section B, the open ring D at one side of the case H, the spring *l* between the shank of the section B and the top of the case H, the catch G, and latch I, substantially as set forth.

3. The combination, with the case H and the stationary hook C below the same, of the hook-sections A B, pivoted to the case and having interlocking projections, the open ring D upon the case, the arm E upon the hook-section B, the springs *l* and *o*, for acting upon the hook-sections to open the same when unlatched, the catch G, and the spring-latch I, for holding the parts when closed, substantially as set forth.

382,098. APPARATUS FOR PREPARING SECONDARY-BATTERY PLATES. ALBERT P. MADDEN, Newark, N. J., assignor to The Electrical Accumulator Company, of New York. Filed Sept. 20, 1887. Serial No. 250,168. (No model.)

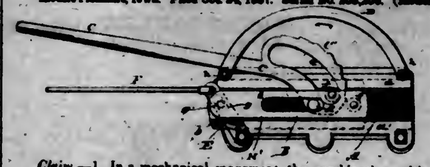
Claim.—1. The combination, in a machine for the described purpose, of a moving surface and two or more rolls or cylinders for advancing the mold or form, two tubes or passages opening upon opposite sides of the advancing mold or form, from which the paste emerges to unite therewith, and two series of revolving disks located upon opposite sides of the mold or form, respectively, for smoothing the surfaces thereof.

2. In a machine for the described purpose, the combination of a moving surface and two or more rolls or cylinders for advancing the mold or form, two tubes or passages opening, respectively, upon opposite sides of the advancing mold or form, from which the paste emerges to enter the mold or form coincidently, two series of revolving disks located upon opposite sides of the mold or form, respectively, for smoothing the surfaces thereof, and a series of idle-rollers for supporting the mold or form in position until the operation is completed, all arranged to co-operate substantially as described.

382,099. HOSE-NOZZLE. IVES W. MCCAFFET, Chicago, Ill., assignor to John H. Brown, same place. Filed Dec. 12, 1887. Serial No. 257,670. (No model.)

Claim.—A hose-nozzle consisting of a butt-section and a rotatable point-section, the butt-section receiving and forming a seat for the point-section and having a lip, F, at its outer end, the point-section having a shoulder, E, and both sections having ports and passages for the water adapted to be opened and closed by the rotation of the point-section, and being secured together by the turning down of the lip F over shoulder E, substantially as set forth.

382,100. CORN-HARVESTER. JOHN T. MCHENRY, Chicago, Ill. Filed Oct. 28, 1887. Serial No. 253,056. (No model.)



Claim.—1. In a corn-harvester, the combination of a pair of screw conveyers forming the jaws of the harvester, a pair of rollers located beneath and to the rear of the said conveyers, and rotating knives located longitudinally to the rear of the conveyers and vertically between the conveyers and the rollers, as set forth.

2. In a corn-harvester, the combination of conveyers forming the jaws for receiving and drawing the stalks into the machine, and rollers beneath and to the rear of the conveyers for pulling the stalks vertically downward, with rotary cutters at the end of the conveyers for severing the ears from the stalks, and with rotating radial arms in front and to the side of the knives for feeding the ears downward as they are severed from the stalks, as set forth.

3. In a corn-harvester, the combination of conveyers forming the jaws for receiving and drawing the stalks into the machine, rollers beneath and to the rear of the conveyers for pulling the stalks vertically downward, rotary cutters at the rear end of the conveyers for severing the ears from the stalks, conveyers extending rearwardly from the knives for carrying the ears to the rear of the machine, and rotary hubs having radial arms for feeding the ears from the cutters to the conveyers, all as set forth.

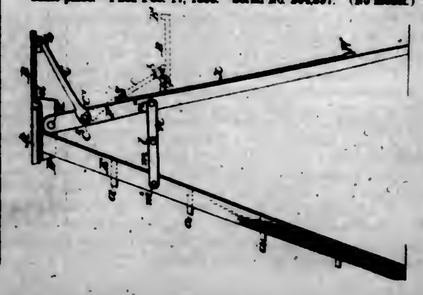
382,101. MECHANICAL MOVEMENT. THOMAS R. MCKINNEY, Mount Pleasant, Iowa. Filed Oct. 24, 1887. Serial No. 253,266. (Model.)

Claim.—1. In a mechanical movement, the combination, with a base-plate, of a box adapted to slide therein, carrying a roller, and a lever pivoted to the base-plate and provided with a curved slot, in which the roller on the box rests, substantially as set forth.

2. In a mechanical movement, the combination, with a base-plate having grooves or ways, of a box adapted to slide therein, and a notched segmental lever pivoted to operate within the box and engage a roller journaled therein to give the box a sliding movement and retain it in locked adjustment, substantially as set forth.

3. In a mechanical movement, the combination, with a base-plate having ways or guides, of an open box to slide therein, having elongated slots in its inner and outer faces, a post secured to the base-plate and extending through these slots, a notched segmental lever loosely mounted on said post, and a roller journaled in the box, with which the segmental lever engages to operate the box and retain it in locked adjustment, substantially as set forth.

4. In a mechanical movement, the combination, with a base-plate having guides or ways, of an open box to slide therein, a post secured to the base-plate and adapted to work in elongated slots in the box, a lever having a segment notched on one face and smooth on the other, and rollers journaled in the box to engage the segment on both faces, substantially as set forth.



5. In a mechanical movement, the combination, with a base-plate, of an open box to slide therein, a notched segmental lever pivoted to work in said box, rollers to engage said segment, and a rod connected to one end of the sliding box, substantially as set forth.

6. In a mechanical movement, the combination, with a base-plate, of an open box to slide therein, a notched segmental lever pivoted to work in said box and engage rollers journaled therein, a bar or link pivoted to the base-plate, having a sliding connection with the box, and a rod connected to the free end of the link, substantially as set forth.

7. In a mechanical movement, the combination, with a base-plate, of an open box to slide therein, a segmental notched lever pivoted to work between the plates of the box, a roller journaled in the box to engage the notches of the segmental lever, and a pair of semi-elliptical plates to guide said lever, substantially as set forth.

8. In a mechanical movement, the combination, with a base-plate, of a box to slide therein, a notched segmental lever pivoted to work in said box, a roller journaled in the box and adapted to engage the segmental lever, and a rod so connected to the sliding box that its pulling action will always be in a line at right angles to the axis of said roller, substantially as set forth.

382,102. STEP-LADDER WITH JURY-SHELF. JAMES T. W. MCLAUGHLIN, Harrisburg, Pa., assignor of one-half to Lafayette Crull, same place. Filed Feb. 17, 1888. Serial No. 264,397. (No model.)

Claim.—1. The shelf B, provided with the cross-ledges B' B² on its under side, and having the braces C hinged or pivoted thereto and to the legs F of the ladder permanently, in combination with the landing-battens D, provided with the stop or stops *d* thereon, adapted to be engaged detachably by the ledge B² on the free end of said shelf, substantially as herein shown and described.

2. In a step-ladder, the shelf B, provided with the cross-ledges B' B², and with the braces C, formed of a continuous rod, bent into U form, having its middle joined by staples *b* to the ledge B', and having its ends pivoted to the legs F of the ladder, in combination with cross ledges or stops S S' at various elevations below the landing on ladder, for supporting said shelf thereby direct or reversed, substantially as and for the purposes shown and described.

382,103. HAME-FASTENER. ADDIS G. MCLEOD, Hallock, Minn. Filed Feb. 8, 1888. Serial No. 263,284. (No model.)

Claim.—1. The herein-described hame lock or fastener, composed of the clip having a hook at each end and a slot at one end, the upper end of the slot being enlarged, the hinged clamp consisting of the plate having one end bent substantially at right angles and having a turn-button at its other end, and the lever having a hook at one end and pivoted to the bent end of the plate, the hook extending in an opposite direction to the said bent end of the plate, the other end of the lever having an opening to receive the said catch, and the chain connected at its end with the clip and the said clamp and passing through the said slot in the clip, substantially as and for the purpose described.

2. The combination, with the clamp and the chain, of the clip having a hook at each end and a slot at one end, which slot extends around the hook and is enlarged at one end, substantially as and for the purpose described.

3. The combination, with the plate D, having the bent end *d*, and the lever having the hook *d'*, pivoted to the end of *d*, of the catch or turn-button E, pivoted to D and adapted to pass through an opening in the free end of D', and the clamp, all substantially as and for the purpose described.

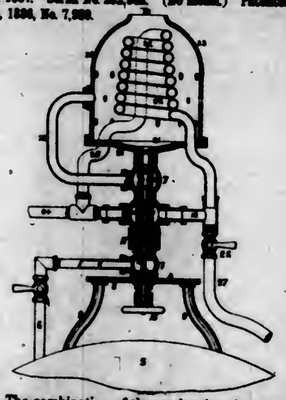
382,104. GRATE-BAR. MAXIMILIAN H. MOSKOVITS, Kansas City, Mo., assignor of one-half to Cassarina Moskovits, same place. Filed Nov. 29, 1887. Serial No. 256,443. (No model.)

Claim.—1. In a grate-bar, a longitudinal supporting-web, A, provided with a transverse zigzag web, B, provided with openings *b' b''* upon opposite sides of the supporting-web, for the purpose set forth.

2. In a grate-bar, a zigzag web mounted upon a straight supporting-web extending transversely across the serrations of the zigzag web, the latter being provided with openings *b' b''* upon opposite sides of the supporting-web, substantially as described.

3. The combination, in a grate-bar, of a straight longitudinal supporting-web, A, at its under side, a zigzag upper web, B, supported upon said straight web by means of necks *e*, and lugs C, provided with projections M, all arranged and adapted to operate as described.

4. A grate-bar having a straight longitudinal supporting-web at its under side, in combination with a zigzag upper web supported upon said straight web by means of necks *e*, whereby air spaces *d* are formed, in the manner and for the purpose described.

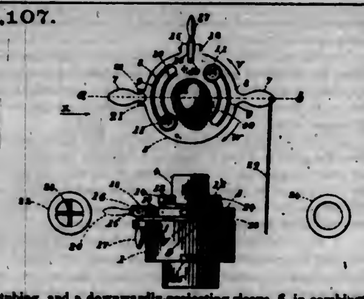


382,105. METHOD OF COLORING GLASSWARE. HENRY B. MUELLER, Pittsburg, Pa. Filed Mar. 3, 1888. Serial No. 266,092. (No model.)

Claim.—1. The method hereinbefore described of coloring glassware, which consists in painting glassware with a pigment, burning the pigment, and subjecting the glassware in a closed muffle to the action of coal-gas, substantially as and for the purposes described.

2. The method hereinbefore described of coloring glassware, which consists in painting glassware with a pigment, burning the pigment, subjecting the glassware in a closed muffle to the action of coal-gas, and, finally, developing the color, substantially as and for the purposes described.

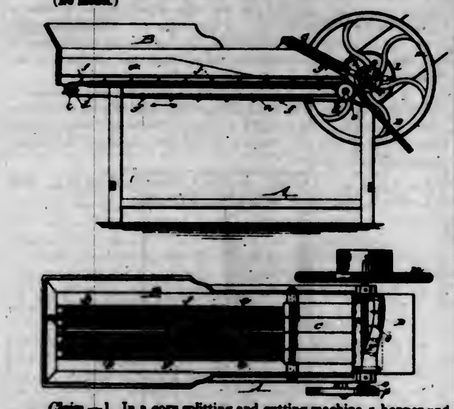
382,106. OIL SPRAY OR VAPOR LAMP. ALEXANDER NELSON and JAMES TAYLOR, Inbermuir, County of Renfrew, Scotland. Filed Mar. 20, 1887. Serial No. 232,262. (No model.) Patented in England June 15, 1886, No. 7,899.



Claim.—The combination of the combustion-chamber of a vapor-burner with a burner-body below the chamber, and having upper and lower internal enlargements, a burner-tube within the burner-body opening into the combustion-chamber and extending through and past the said upper enlargement to the lower one and made with a conical mouth at its lower end, an adjustable conical nozzle in the lower enlargement for the issue of oil, an inlet for steam or compressed air into the lower enlargement, an inlet for heated air into the upper enlargement, and holes through the burner-tube to admit air from the upper enlargement.

382,107. PIPE-COUPLING. JOHN G. FRASER, Buffalo, N. Y. Filed Feb. 20, 1888. Serial No. 265,026. (No model.)

Claim.—1. A pipe-coupling consisting of a top provided with handles and with two curved slots having inclined ways on each side and enlarged holes 11 at the ends; an upper pipe for connecting with an



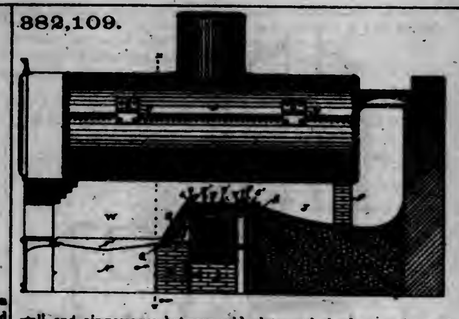
382,107.

elastic tubing, and a downwardly-projecting sleeve, 6, in combination with two screw-bolts provided with heads under which the inclined ways move while operating the coupling, and an elastic packing-ring and metal supporting-ring, as and for purposes described.

2. In a pipe-coupling, a cover, 3, having handles and two curved slots with bolt-holes at the ends and inclined slideways on each side, in combination with two screw-bolts secured to the body of the coupling and having heads under which the inclined ways move, a pivoted handle on the cover, and lugs 21 on the body of the coupling, between which the handle drops, for holding the coupling in position, substantially as described.

382,108. CORN SPLITTING AND CUTTING MACHINE. CLINTON J. FOSTER, Bowling Green, Ky. Filed Sept. 21, 1887. Serial No. 250,203. (No model.)

Claim.—1. In a corn splitting and cutting machine, a hopper and the endless chains or belts for advancing the ear-corn endwise therein, in combination with a revolving cylinder having one or more spirally-arranged transverse knives or cutters, a series of cutters, G, adjustably secured thereon so that their points project beyond the cutting-edge of the transverse cutters in a plane at right angles thereto, and a pivoted swinging board at the discharge end of the hopper adjacent to the cutters for holding the ear-corn while being operated on by said cutters, substantially as described.



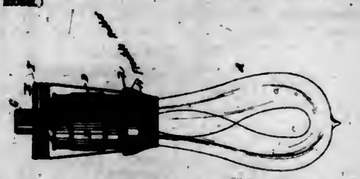
2. The combination, with a hopper and means for advancing the ear-corn endwise therein, of a revolving cylinder having transverse cutters or knives, the slotted cutters G, the nuts and bolts for adjustably securing said cutters to the transverse cutters, and the swinging grooved board for holding the ear-corn while being operated on by the cutters, substantially as described.

3. An improved corn splitting and cutting machine comprising a main frame, a hopper divided by a central partition in two channels or guides, endless chains or bands moving in said channels and advancing the ear-corn endwise therein, a swinging board at the discharge end of the hopper having a grooved under surface for the passage of the corn and for holding the corn endwise in the hopper, and a rotating cylinder having a plural number of cutters for cutting the corn held by said board, substantially as described.

382,109. FURNACE BRIDGE-WALL. THOMAS REESE, Jr., Erie, Pa. Filed Jan. 31, 1888. Serial No. 262,994. (No model.)

Claim.—1. The combination, in a boiler-furnace, of two plates, one an inclined plate, forming the rear of the fire-box, and the other a horizontal plate without openings therein over the top of the bridge-

382,109.



wall, and air-passages between said plates and the front and top of the bridge-wall, with one transverse air-exit opening between the rear edge of the inclined plate and the front edge of the horizontal plate, and another transverse air-exit opening at the rear edge of the horizontal plate, whereby the air in its traverse from the ash-pit through said passages is brought into contact with said plates and discharged into the furnace at two points only, one at the front edge and one at the rear edge of the bridge-wall, substantially as and for the purpose set forth.

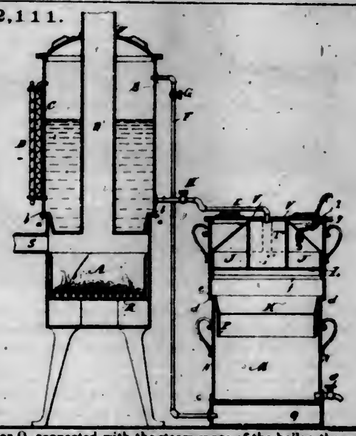
2. The combination, in a boiler-furnace, of the plates R' and U, forming the upper walls of air-passages *f* and *b*, and adapted to heat the air during its passage through them, with an air-exit opening, *c*, from said passages between the plates R' and U, at the front of the bridge-wall, and an air-exit opening between the plate U and a plate, S, at the rear of the bridge-wall, substantially as and for the purpose set forth.

3. The combination, in a boiler-furnace, of the bridge-wall K and the rear wall, H, with the rear wall cap-plate, S, the plate U, raised above the bridge-wall K, the air-exit opening *a* between the plates U and S at the rear of the bridge-wall, and the air-exit opening *c* between the plates U and R' at the front of the bridge-wall, substantially as and for purpose set forth.

4. The combination, in a boiler-furnace, of the wall H, cap-plate S, the bridge-wall K, the plate U, and air-exit opening *a*, with the passages *b* and M, communicating with the opening *a*, the opening L through the bridge-wall K and its door O, the wing walls P P, supporting the rear plate, R', of the fire-box, the air-passage *f*, and the air-exit opening *c* at the front of the bridge-wall, substantially as and for the purpose set forth.

382,110. PROTECTOR FOR ELECTRIC-LAMP SOCKETS. CHRISTOPHER P. REILLY, New York, assignor of two-thirds to Thomas F. Ryder, West New Brighton, N. Y. Filed Mar. 3, 1888. Serial No. 265,923. (No model.)

Claim.—1. A covering for electric-lamp sockets, which consists of a cap and casing partially surrounding the socket and secured together by a moisture-tight joint, in combination with a rubber sleeve connecting the casing and the lamp-globe and making tight joints with each.

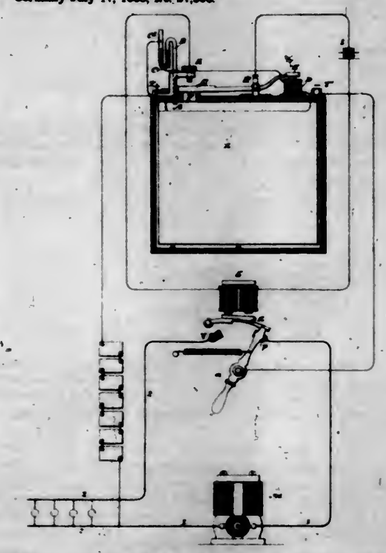


2. A covering for electric-lamp sockets, which consists of a cap and a casing partially surrounding the socket and making moisture-tight joints with each other, the said casing being provided with a bead at its outer end, in combination with a soft-rubber sleeve, forming a tight joint with the lamp-globe and adapted to fit over the bead, as and for the purpose set forth.

382,111. MACHINE FOR MAKING COFFIN. EDMUND K. SARGEANT, Brockville, Ontario, Canada. Filed Feb. 3, 1887. Serial No. 226,262. (No model.) Patented in Canada Mar. 31, 1886, No. 26,796.

Claim.—1. The combination, with the heater and the boiler, of the steam-chamber Q, connected with the steam-space of the boiler, the urn supported by said chamber, and the water-pipe leading from the water-space of the boiler and communicating with said urn, substantially as and for the purpose specified.

2. The combination, with the heater and the boiler, of the steam-



382,111.

chamber Q, connected with the steam-space of the boiler, the urn supported by said chamber, the removable filter, the pipe I, connected with the lower part of the boiler, and the pipe F, connected with the steam-space of the boiler and with said steam-chamber, substantially as described.

3. The combination, with the steam-chamber and the urn removably supported thereby, of the receptacle P, removably supported by said urn and formed with interior bead, *f*, and the filter removably supported by said bead, substantially as described.

382,112. AUTOMATIC SWITCH FOR SECONDARY BATTERIES. JOHN S. SELLON, Hatton Gardens, County of Middlesex, England, assignor to The Electrical Accumulator Company, of New York. Filed Aug. 30, 1887. Serial No. 248,201. (No model.) Patented in England Jan. 13, 1883, No. 217; in France June 30, 1883, No. 156,156, and in Germany July 17, 1883, No. 27,868.

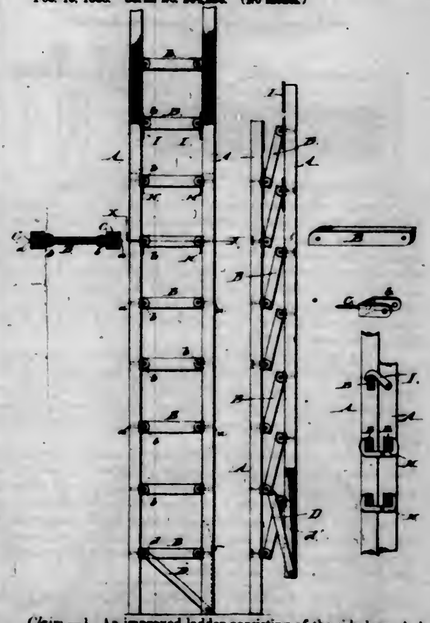
Claim.—1. The combination of a secondary battery, a charging-circuit, a working-circuit, and a switch for transferring the battery from one circuit to the other, a magnet for operating said switch, and a device for opening and closing the circuit of said magnet operated by the accumulation of gas due to the decomposition of the electrolytic liquid.

2. The combination of a secondary battery, electro-magnetic switch mechanism therefor in an electric circuit, with a circuit-closer consisting of two insulated electrical contacts in a tube connected with a cell of said battery, and a globule or cylinder of mercury operated by variations in the pressure of gas in said tube to make or break said electric circuit.

3. The combination of an electrolytic cell having means for confining the generated gas or gases, a receptacle containing a conducting material operated by the pressure of the confined gas to connect the terminals of an electric circuit, and an electro-magnet operating an escape-valve.

4. The combination of an electrolytic cell having means for confining the generated gas or gases, a receptacle containing a conducting material operated by the pressure of the confined gas to connect the terminals of an electric circuit, and an electro-magnet controlling the local circuit containing an electro-magnetic switch operating to disconnect the battery from the charging-dynamo.

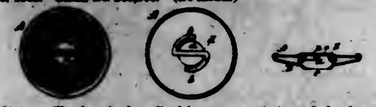
5. The combination of a secondary-battery cell having means for confining the generated gas or gases, a receptacle containing a conducting material operated by the pressure of the confined gas to connect the terminals of an electric circuit, and an electro-magnet controlling a local circuit containing an electro-magnetic switch operating to disconnect the battery from the charging-dynamo and connect it with the working-circuit.



382,113. INHALER. CHRISTOPHER C. SHARP, Indianapolis, Ind. Filed Sept. 17, 1887. Serial No. 249,917. (No model.)

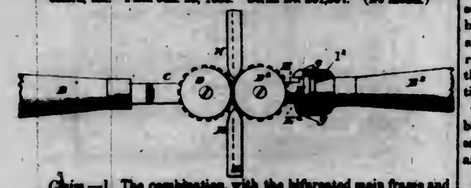
Claim.—1. An inhaler for use in administering medicines, consisting of a hollow chamber provided with tubes adapted to enter a person's nostrils, a substance in said chamber for holding the medicine, and an air-tube extending from the outside and terminating in the chamber near the entrance to the tubes for the nostrils, substantially as set forth.

2. The combination of the chamber A for holding the anæsthetic, formed in two parts and screwed together, and provided with tubes having removable tips *a*, and a handle, A', perforated longitudinally and extending into said chamber to near the entrance of said tubes, substantially as set forth.



382,114. LADDER. ROBERT A. SHERMAN, Plover, Wis. Filed Feb. 16, 1888. Serial No. 264,226. (No model.)

Claim.—1. An improved ladder consisting of the side bars, A A, one of which is provided with the slot *d'*, the rungs B, pivoted in sockets *b*, and the brace D, consisting of a strip of metal pivoted at one end in the slot *d'* and provided at its opposite end with means for engaging the projecting end of one of the pivot-pins of the lower rung, substantially as described.



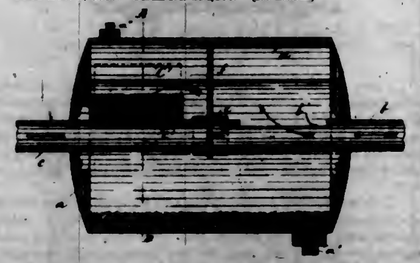
2. The combination, with a ladder, of the plates H, pivoted to the side bars of said ladder and provided with hooks at each end, and a pivoted plate, I, having a single hook, substantially as herein described.

382,115. BUTTON. ALFRED J. SHIPLEY, Waterbury, Conn., assignor to The Scovill Manufacturing Company, same place. Filed Mar. 5, 1888. Serial No. 266,262. (No model.)

Claim.—The herein-described button, consisting of the face and back adapted to be secured together, the one constructed with inwardly-projecting tongues cut from the center of said part, and so as to form a central opening in said part, the other part constructed with a central opening corresponding to the opening in the first part, combined with a bar of substantially S shape across said tongued opening, the said tongues closed down over the ends of the bar, substantially as described.

382,116. DEVICE FOR SETTING SAWS. WILLIAM T. SLOCUM, Calera, Ala. Filed Jan. 23, 1888. Serial No. 261,697. (No model.)

Claim.—1. The combination, with the bifurcated main frame and the setting-wheels journaled one upon each side of the bifurcation, of the bifurcated gage on said shaft and adjustable in the bifurcation parallel with the axes of said wheels, substantially as described.



2. The combination, with the main frame and the setting-wheels journaled thereon, of the guides on said main frame, the gage having bifurcated shank, the arms of which work in said guides, and the adjusting-screw passed through said shank and engaging a screw-threaded hole in the main frame, substantially as described.

3. The combination, with the main frame provided with a setting-wheel, of the casting E, carrying a setting-wheel, and a casting I', engaging said casting E and adjustable lengthwise on said frame, substantially as and for the purpose described.

4. The combination, with the main frame provided with a setting-wheel, and having squared portion, as described, and the casting carrying the setting-wheel and having arms engaging said squared portion, and a collar having a flange, of the casting I', engaging the flange of the collar and adjustable on the frame, substantially as and for the purpose described.

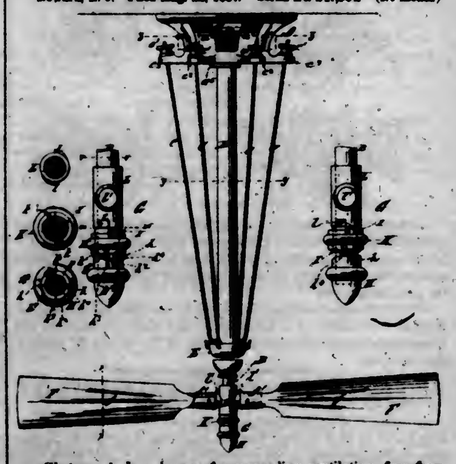
5. The combination, with the main frame provided with a setting-wheel, and having squared portion *k* and screw-threaded portion *c*, of a casting having depending arms E embracing said squared portion, a collar sliding loosely on the frame and having a flange, F, a setting-wheel journaled on said casting, and a handle provided with a casting having arms *g* engaging the flange of said collar, and internally threaded to engage the threaded portion of the frame, substantially as and for the purpose described.

382,117. SAND-TRAP. BENJAMIN F. SMITH, Somerville, Mass. Filed Nov. 3, 1887. Serial No. 254,169. (No model.)

Claim.—The horizontal case or chamber *a*, having inlet and outlet pipes *b c*, with perforations *b' c'* and partition *d*, as described, combined with the open-partition *f*, secured to the interior of case *a*, and extending downward below the perforations *b' d*, and the perforated or netting deflector C, secured to the pipe *c* around its opening *c'*, as and for the purpose set forth.

382,118. UMBRELLA-SUPPORT. ABNER B. SNYDER, Brooklyn, N. Y. Filed Aug. 30, 1887. Serial No. 248,374. (No model.)

Claim.—1. A bracket or stand and a universal joint journaled thereon and composed of an annulus provided with journaling-lugs rotatable in said bracket or stand, and a clamping member fitted to said annular member and rotatable in a plane at right angles to the plane of rotation of the annular member and adapted to receive and hold a rod, substantially as described.



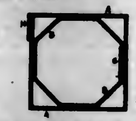
2. A bracket or stand provided with a slotted bow and a set-screw, combined with a universal joint composed of a rotatable member journaled in said slotted bracket and another member fitted to said first-named member and provided with an opening or recess to receive the thing to be supported and clamped, and rotatable with the first-named member and also at right angles to its plane of rotation, substantially as described.

3. The annular member *g*, having laterally-projecting lugs *h*, combined with the member *j*, having an opening, *k*, and lugs *m*, fitted in said annular member, a bracket provided with bearings for said lugs, and a set-screw, substantially as set forth.

4. A bracket or stand combined with a universal joint composed of a rotatable member, *g*, having bearings in said bracket or stand, and a second member, *j*, fitted to rotate with said rotatable member and also having an independent rotation of its own, and also provided with an opening or recess to receive the thing to be clamped, and a set-screw arranged in the bracket or stand and bearing against the last-named member to force it and the device contained in its recess against the face of the first-named member to clamp and hold the said device at any desired inclination or elevation, substantially as described.

5. The bracket or stand combined with a universal joint composed of a rotatable member, *g*, having the notched or corrugated face, and a second member having a recess to receive the thing to be clamped and co-operating with said notched first-named member in holding and retaining the said thing to be clamped, and a clamping-screw, substantially as described.

382,119. FAN FOR VENTILATING PURPOSES. JOHN STEWART, Newark, N. J. Filed Aug. 22, 1887. Serial No. 247,304. (No model.)

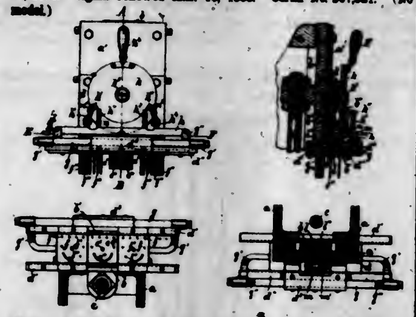


Claim.—1. In a hanger for suspending ventilating-fans from above, substantially as described, the combination, with the vertical fan-shaft B, provided with the power-pulley *b* at its upper end, of the

crown-piece A, inclosing the said pulley, the rigid central extension-piece, D, the upper end of which is seated in the said crown-piece, and the series of stay-rods C C, attached to the lower end of the extension-piece D and binding the latter to the said crown-piece, substantially in the manner and for the purpose described.

2. In a hanger for suspending ventilating-fans from above, substantially as described, the combination, with the vertical fan-shaft B, provided with the power-pulley *b* at its upper end, of the crown-piece A, inclosing the said pulley, the rigid central extension-piece, D, the upper end of which is connected with the said crown-piece by means of a ball-and-socket joint, and the series of adjustable stay-rods C C, attached to the lower end of the extension-piece D and adapted to compensate for any divistion or inclination of the crown-piece with relation to the vertical extension-piece D and shaft B, substantially in the manner and for the purpose described.

3. In combination with a fan for ventilating purposes, the stopping and starting clutch G, consisting of the vertically-movable ring K, formed with the upper shoulders *k*, and lower shoulders *k'*, the rigid horizontal cam H, formed with the shoulders *h*, cam-surfaces *h' h²*, and depressions *h²*, and the fan-hub L, formed with the shoulders *l*, the whole arranged and operating substantially in the manner and for the purpose described.

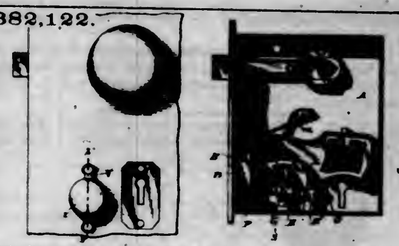


382,120. BOX OR CASE. ALBERT H. STOREY, London, England, assignor to the Storey Patent Case Company, (Limited,) same place. Filed Aug. 30, 1887. Serial No. 248,206. (No model.) Patented in England Sept. 18, 1883, No. 4,446.

Claim.—1. A box or case of card-board or other material, having an inner and an outer shell, the inner one having twice as many sides as the outer shell and the alternate sides of the inner shell being opposite the angles of the outer shell, as and for the purpose set forth.

2. A box or case of card-board or other material, having an inner and an outer shell, the inner one having twice as many sides as the outer shell and having its alternate sides in contact with the sides of the outer shell, while the intermediate sides of the inner shell are opposite the angles of the outer shell.

382,121. HEELING-MACHINE. MERRILL A. TYLER, Boston, and EDWARD MERRITT, Brockton, Mass., assignors to the American Heeling Machine Company, Portland, Me. Filed Mar. 27, 1885. Renewed May 20, 1886. Again renewed Mar. 16, 1888. Serial No. 267,331. (No model.)

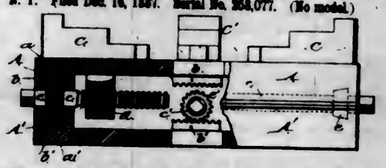


Claim.—1. In a heeling-machine, the driver-block *e* and right and left awl-blocks *f f*, located in horizontal guides below the plunger *b*, in which they are laterally adjustable, so as to bring one of such driver and awl blocks centrally below the plunger of the machine, as and for the purpose set forth.

2. In a heeling-machine, the vertically-movable and laterally-adjustable driver-block *e*, in combination with vertically-movable and laterally-adjustable right and left awl-blocks *f f*, as and for the purpose set forth.

382,122. KEY-HOLE GUARD. CHARLES R. UHLHAUS, Peoria, Ill. Filed Apr. 8, 1887. Serial No. 234,127. (Model.)

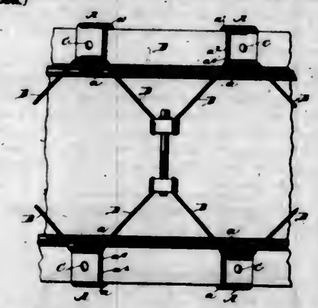
Claim.—1. The combination, with a lock-case and a sliding key-hole guard, E, of a pivoted tumbler, L, having a portion of its marginal surface normally in and inclined to the path of said block when advancing, and another portion of its marginal surface normally in and inclined to the path of the key-bit, and a spring adapted to offer a yielding resistance to the displacement of said tumbler by the action



382,122.

of the key or block upon said surfaces, whereby the key may be prevented from remaining in position to obstruct the advance of the block, and both accidental advancement and partial retraction of the block may be avoided.

2. The combination, with the lock-case A, provided with the integrally-formed lug F, of the sliding key-hole guard E, the shaft H, and rigidly-connected arm G, for actuating said guard, the shaft-actuating bar H', with its encircling-spring 2, the pivoted tumbler L, having two oppositely-inclined marginal surfaces, and the spring *m*, acting upon said tumbler, substantially as set forth.

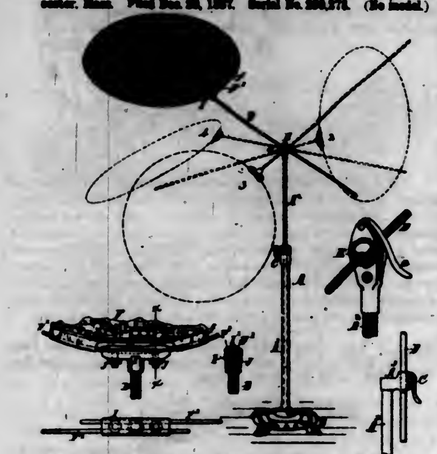


382,123. LATHE-CHUCK. FRANK H. VAN HOUTEN, Rochester, N. Y. Filed Dec. 16, 1887. Serial No. 258,077. (No model.)

Claim.—1. In a lathe-chuck, the jaws C C and the shells A A', each having an annular socket, in combination with an annular rack seated in each of said sockets, the shafts *c*, having pinions engaging the rack in one of said shells, and the shafts *c'*, provided with pinions engaging the rack in the other shell, substantially as and for the purpose specified.

2. In a lathe-chuck, the jaws C C, and the shells A and A', each having an annular socket, in combination with a rack seated in one of said shells, a rack seated in the opposite shell, and a plural series of shafts journaled in different planes, the shafts of one series having pinions engaging the rack in one shell and those of the other series having pinions engaging the rack in the opposite shell, substantially as described.

382,124. HOOK FOR DRUM-HEAD STRAINERS. GEORGE VAN ZANDT, Chicago, Ill. Filed Aug. 31, 1887. Serial No. 248,426. (No model.)



Claim.—1. In a drum-head strainer, a hanger for the straining-wire, formed of a sheet-metal strip folded back upon itself to provide along the line of fold a bearing, *a*, wherein the straining-wire is clasped and bent to form a curved lip, *a'*, which engages upon the edge of the hoop, the two leaves of such folded strip being brought closely together flatwise from the fold, substantially as and for the purpose set forth.

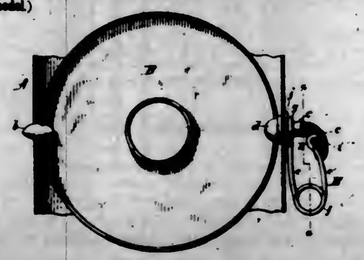
2. In a drum-head strainer, a hanger for the straining-wire, formed of a sheet-metal strip folded upon itself to receive and clasp the straining-wire along the line of fold and bent to provide a curved lip which engages the edge of the hoop, the two leaves of such sheet-metal hanger being brought together from the fold and held against slipping upon one another by a rivet, substantially as set forth.

3. In a drum-head strainer, a hanger for the straining-wire, formed of a sheet-metal strip folded upon itself to receive and clasp the straining-wire along its line of fold, and bent to provide a curved lip which engages the edge of the hoop, the two leaves of such sheet-metal hanger being brought together from the fold, and combined with a rivet passing through both leaves and extending into the hoop, substantially as and for the purpose set forth.

382,125. PHOTOGRAPHIC HEAD-SCREEN. OTIS C. WHITE, Worcester, Mass. Filed Dec. 30, 1887. Serial No. 259,573. (No model.)

Claim.—1. In a photographer's head-screen, the fabric screen-shade mounted at its border on a bow or hoop and supported at its edge, in combination with an adjusting-rod, to which the ends of said hoop are secured to maintain the fabric extended, substantially as set forth.

2. In a photographer's head-screen, a fabric shade or screen peripherally mounted upon a flexible hoop that is expansible for straining the fabric, and a binding-clamp that detachably holds the ends of said hoop in position and connects said shade to its supporting-rod.



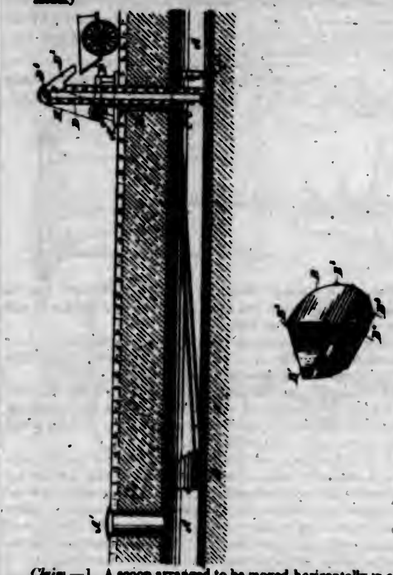
3. In a photographer's head-screen, a fabric shade having its supporting-hoop connected with the rod or arm by a joint and movable thereon to give adjustment of the shade to different planes coincident or diagonal to the longitudinal axis of the rod, substantially as set forth.

4. In combination, the fabric screen having the hem *f*, the expansible wire hoop or bow F', rove through said hem, and the supporting-rod D, provided with a connecting-head, to which the respective ends of said wire are detachably fastened, for the purpose set forth.

5. The longitudinally-grooved clamping-head I, its cap I', having screw-threaded shanks, and nuts J, in combination with the shade-supporting wire F and rod D, substantially as and for the purpose set forth.

6. In a photographer's head-screen, the fabric shade F, circumferentially supported by an expansible border, in connection with its adjusting-rod D, and the universally-adjustable clamping-joint E, having the binder *e*, for releasing and tightening said joint, in combination with an extensible standard, A, and the binder C, for retaining the movable part of said standard at raised or depressed position, substantially as shown and described.

382,126. STOVE-PIPE DAMPER. JAMES M. WILLIAMS, Jr., Hamilton, Ontario, Canada. Filed July 5, 1887. Serial No. 243,260. (No model.)



Claim.—1. The combination, with the damper provided with an enlargement or shoulder, *d*, and a journal, *c*, formed in one piece with the damper, of a spring-handle, E, provided with two arms, one of said arms being attached to the journal *c*, and the other arm bearing against the stove-pipe, whereby the shoulder *d* is caused to bear against the inner surface of the pipe and hold the damper from turning, substantially as set forth.

2. The combination, with the damper provided with a journal, *c*, having a recess, *i*, of a spring-handle, E, provided with a ring or eye, *g*, encircling said journal, and a hook, A, engaging in the recess of the journal, substantially as set forth.

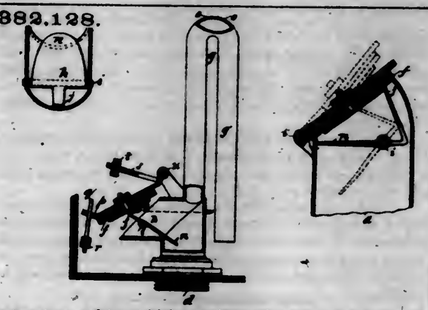
3. The combination, with the damper provided with an enlargement, *d*, and a journal, *c*, having a recess, *i*, of a handle, E, composed of spring-arms *e e'*, connected by a coil, *f*, one of said arms being provided with an eye, *g*, which surrounds the journal *c*, and the other arm with a hook, A, which engages in the recess of the journal, substantially as set forth.

382,127. MECHANISM FOR CLEANING SEWERS. JOHN A. WYMAN, New York, N. Y. Filed May 17, 1887. Serial No. 238,470. (No model.)

Claim.—1. A scoop arranged to be moved horizontally in a sewer and to move the earthy and other deposits found therein from one point thereof to another and deposit them at different points for removal, in combination with an adjustable bulk-head, substantially as specified, and for the purpose set forth.

2. The horizontally-adjustable scoop, B, made of two or more sheets of metal, provided with inwardly-projecting flanges having in them slots for permitting the sheets to be adjusted in the manner described, whereby the scoop is made capable of use in sewers of different diameters, as described.

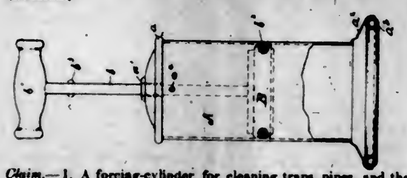
3. In combination with a street or other sewer, a scoop for removing the earthy matter from a sewer, a bulk-head for checking the movements of the earthy matter, and suitable mechanism for imparting movement to said scoop, substantially as set forth.



4. In a mechanism for cleaning sewers, the combination of an elevator supplied with a series of buckets for elevating the material carried forward by the scoop, and a bulk-head for arresting the movements of said material, the arrangement of the parts being substantially as described, whereby the lower end of the elevator is made capable of being inserted into a sewer.

382,128. WATER-CLOSET-SUPPLY APPARATUS. JOHN P. ADAMS, Cambridge, Mass. Filed Aug. 12, 1887. Serial No. 246,764. (No model.)

Claim.—1. In a tank for water-closets, having an outlet-port, combined with a valve for opening and closing said port, and a lever pivoted in the mouth or throat of the outlet-port, one arm of said lever acting against the valve and the other extending into the waterway or throat of the outlet-port, substantially as hereinbefore set forth.



2. A tank for water-closets, having a main and supplemental com-

382,128.

partment, an outlet-port in the supplemental compartment, a valve to open and close said outlet-port, a port communicating between the two compartments, and a lever pivoted in the mouth or throat of the outlet-port, one arm of said lever acting against the valve and the other extending into the water-way or throat of the outlet-port, substantially as hereinbefore set forth.

382,129. FORCING-CYLINDER FOR CLEANING TRAPS. JOHN H. AUSTIN, New York, N. Y. Filed Apr. 20, 1887. Serial No. 236,147. (No model.)

Claim.—1. A forcing-cylinder for cleaning traps, pipes, and the like, comprising a cylinder open at its lower end and a piston in said cylinder, substantially as set forth.

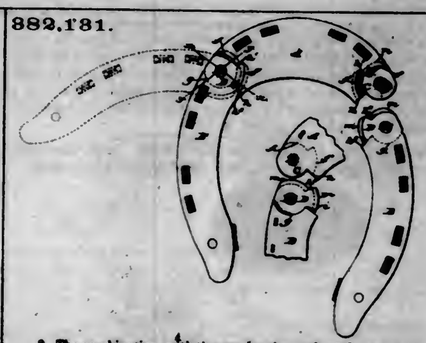
2. A forcing-cylinder for cleaning traps, pipes, and the like, comprising a metallic cylinder open at its lower end and a water-tight piston in said cylinder, substantially as set forth.

3. A forcing-cylinder for cleaning traps, pipes, and the like, comprising a rigid cylinder open at one end and provided with a packing-ring around its open end, in combination with a piston working in said cylinder, substantially as set forth.

4. A forcing-cylinder for cleaning traps, pipes, and the like, comprising a rigid cylinder open at its lower end and having a closed top with a central guide-aperture, and a packing-ring around the open end of the cylinder, in combination with a piston working in said cylinder, a packing-ring carried by the piston between it and the cylinder, and an operating-rod fixed to the piston and extending upward through the aperture in the top of the cylinder, substantially as set forth.

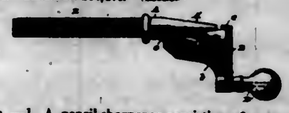
5. A forcing-cylinder for cleaning traps, pipes, and the like, comprising a cylinder open at its lower end, an outwardly-flaring flange at the open mouth of the cylinder, and a packing-ring within said flange, in combination with a forcing-piston working in said cylinder, substantially as set forth.

382,130. REAR SIGHT FOR FIRE-ARMS. DANIEL V. BEAR, Plover, Wis. Filed Jan. 14, 1888. Serial No. 260,744. (No model.)



Claim.—A rear sight of white material having a curved or depressed upper surface and an underlying dark spot at the central point of said depression, said spot being in contradistinction to a vertical line.

382,131. HORSESHOE. JOHN B. REDMAN, Walla Walla, Wash., and EDWARD W. REDMAN, Portland, Oreg. Filed Oct. 26, 1887. Serial No. 253,415. (No model.)

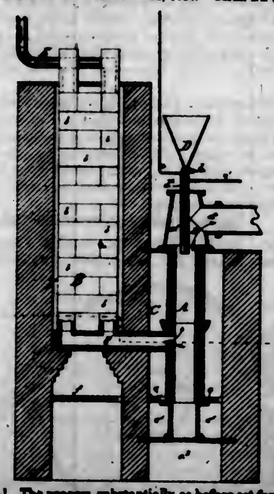


Claim.—1. The combination, with the overlapping ends of the toe and heel sections of a sectional horseshoe, and with a transverse pin uniting the two, of a tongue, *m*, upon the one section entering a slot, *n*, in the opposite section to form a rule-joint having the pin as its pivotal center, said tongue being disposed to engage its slot when the two sections are in normal position, and to be released only when the sections are swung out at about a right angle with each other, all substantially in the manner and for the purpose herein set forth.

382,131.

2. The combination, with the overlapping ends of the toe and heel sections of a sectional horseshoe having a transverse pivot-pin uniting the two, and a terminal segmental tongue, *m*, upon the one section, describing an arc having the pivot-pin as its center, and adapted to enter a slot, *n*, in the opposite section, of a second terminal segmental tongue formed upon the same section as the first to enter a counterpart slot in the opposite section, but describing an arc of greater radius, having the same pivot-pin as its center to form a double rule-joint, substantially in the manner and for the purpose herein set forth.

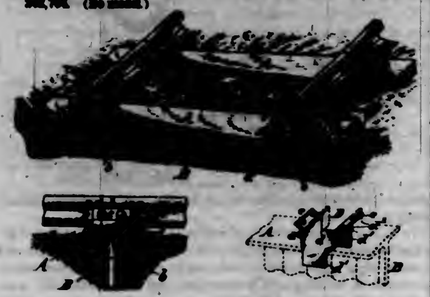
382,132. PENCIL-SHARPENER. CLARK WM. REDMAN, New York, N. Y., assignor to the Eagle Pencil Company, same place. Filed Mar. 17, 1888. Serial No. 267,472. (Model.)



Claim.—1. A pencil-sharpener consisting of a pencil-receiving socket having the usual cutter or reducing device, and provided with crank-handle B B', as and for the purpose hereinbefore set forth.

2. The pencil-receiving socket formed with an opening for the passage of the blade or pencil-cutter, in combination with the crank-handle B B', formed with a cutter bed or seat, and the cutter secured to said bed and projecting through said opening in the socket, as and for the purposes hereinbefore set forth.

3. The sharpener having its receiving-socket formed of a cylindrical portion, A, and a conical portion, A', and provided with a crank-handle, B B', as and for the purposes set forth.



382,133. PROCESS OF MANUFACTURING THE OXIDES OF READILY-OXIDIZABLE METALS FOR PAINTS, &c. ARTHUR C. BRADLEY, Brooklyn, N. Y. Filed Feb. 21, 1887. Serial No. 228,290. (No model.)

Claim.—1. The process, substantially as before set forth, of manufacturing an oxide of a metal, which consists in exposing the metal in a comminuted condition to the action of an inclosed current of air heated to a temperature sufficient to burn the metal without contact with any other substance.

2. The process, substantially as before set forth, of manufacturing the oxide of a metal, which consists, first, in exposing the metal in a finely-comminuted condition and in a descending shower to an inclosed current of air heated to a temperature sufficient to burn the metal, and, second, in collecting the dust oxide from said current.

382,134. RAILROAD-TIE. WILLIAM H. BRITTON, Buffalo, N. Y., assignor of one-half to William H. Britton, Jr., Jewett M. Richmond, and Alan S. McAllister, all of same place. Filed Feb. 2, 1888. Serial No. 262,704. (No model.)

Claim.—1. A metallic railroad-tie composed of a horizontal bed-plate, A, and a vertical rib or plate, B, provided with vertical corrugations, substantially as set forth.

2. A metallic railroad-tie composed of a horizontal bed-plate, A, and a vertically-corrugated rib or plate, B, arranged centrally on the under side of the bed-plate and extending lengthwise thereof, substantially as set forth.

3. In a metallic railroad-tie, the combination, with the horizontal bed-plate A and the vertically-corrugated rib or plate B, of lips *c c'*, formed integral with the bed-plate, one set of said lips being arranged at or near one edge of the bed-plate and the other set of lips at or near the opposite edge of the bed-plate, substantially as set forth.

382,135. FLOUR-BOLT. CHARLES H. BROWN, Milwaukee, Wis. Filed Oct. 10, 1887. Serial No. 251,873. (No model.)

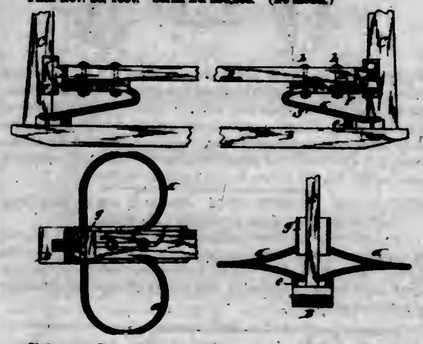
Claim.—1. The combination, with the bolting-reel, of a flexible cylinder arranged within said reel, and means whereby said cylinder is alternately collapsed and expanded, thereby throwing the material intermittently from the flexible cylinder against the surrounding bolting-reel, substantially as set forth.

2. The combination, with a bolting-reel, of a flexible cylinder arranged within the bolting-reel, fixed inclined whereby the flexible cylinder is moved inwardly and collapsed, and springs whereby the flexible cylinder is moved outwardly and expanded, substantially as set forth.

3. The combination, with a bolting-reel, of a flexible cylinder arranged within said reel, longitudinal bars supporting said flexible cylinder, stationary notched rings with which said longitudinal bars engage, and springs whereby said longitudinal bars are moved outwardly, substantially as set forth.

4. The combination, with the bolting-reel and the flexible cylinder F, arranged within the same, of notched rings I, secured to the stationary frame of the machine, longitudinal ribs *f*, supporting the flexible cylinder, curved spring-arms G, to which said ribs are attached, and longitudinal bars J, secured to the outer ends of said spring-arms and engaging with the notched rings I, substantially as set forth.

5. The combination, with the bolting-reel and the flexible cylinder arranged within the same, of elevating-buckets secured to the outer surface of the flexible cylinder, and means whereby the flexible cylinder is alternately collapsed and expanded, substantially as set forth.



382,136. COFFIN. JOHN H. CHAMBERS, Schenectady, N. Y. Filed Jan. 9, 1888. Serial No. 260,202. (No model.)

Claim.—1. The combination, with a plurality of caskets and the conductor leading to a point below the surface of the earth, of pipe-connections between said caskets and conductor, substantially as and for the purpose described.

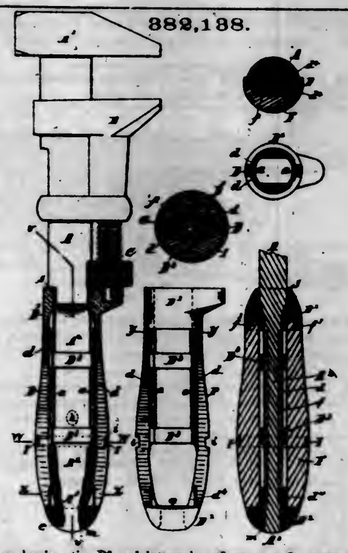
2. The combination, with the casket and conductor leading to a point below the surface of the earth, of a pipe-connection between said casket and conductor and a disinfectant-coal in said connection, substantially as and for the purpose described.

382,137. VEHICLE-SPRING. EDWARD CLUFF, Rochester, N. Y. Filed Nov. 26, 1887. Serial No. 256,322. (No model.)

Claim.—1. In combination with the bolster B, stake C, and the bar D, over the bolster and parallel therewith, the spring S, composed of the vertical coils *a a* at opposite sides of the bolster, and united at the top by the loop *l*, extending with its closed end toward the end of the bar D, and the bases of the coils terminating with bearings on top of the bolster nearly directly under the closed end of the loop *l*, substantially as described and shown.

2. The spring S, composed of the central horizontal loop, *l*, vertical coils *a a*, extending from the open end of the loop and terminating with horizontal curved bearings *c c* under the closed end of the loop, all formed in one piece, substantially as described and shown.

3. In combination with the bolster B and stakes C C, the bar D, provided with the longitudinal slot *d*, the plate *f*, formed with the guide *g*, and the bolts *b b*, passing through said plate and slot *d* and fastening the plate to the bar D, substantially as described and shown.



382,138. WRENCH. JOHN H. COES and FRANKLIN I. COES, Worcester, Mass. Filed Dec. 27, 1887. Serial No. 258,968. (No model.)

Claim.—1. The handle-frame composed of the ferrule, tip, and side braces formed integral, and having the tip end D^2 provided with an opening, *e*, in combination with the bar A, having the shank A', supported between the internal surfaces, *a*, of said handle-frame, and extending through the opening in said tip, with its end fastened or riveted at the outer end of the handle-frame, substantially as shown and described.

2. A wrench having its handle constructed as herein described, with the metal handle-frame composed of the ferrule, tip, and connecting-braces formed integral and internally fitted to support the shank of the bar at *a a*, and provided with the lips *d* adjacent to the shank-supporting surfaces, in combination with the side plates, F, internally longitudinally grooved or recessed, as described, to fit over and embrace said lips, and means for securing said side plates to the frame, substantially as set forth.

3. The wrench constructed substantially as shown and described, with the handle-frame D, composed of the integral ferrule, tip, and

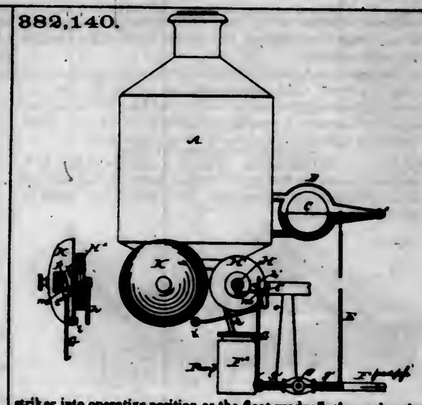
382,188.

side braces, having tips D^3 and internal surfaces, *a a*, for supporting the bar, an opening through the tip end and side notches, *i*, in combination with the bar having the long shank A', extending through the end of the handle fitted between said internal surfaces and fastened or upset at the outside of the tip end, the side plates, F, fitted to the handle-frame, and the ring I compressed into the notches *i* and peripheral groove about the side plates, for the purposes set forth.

382,189. SPINNING-MULE. THOMAS H. COSLEY, Ware, Mass. Filed Jan. 30, 1888. Serial No. 262,303. (No model.)

Brief.—The invention consists in improved means for banding the operative parts of a spinning-mule of the type of the Mason mule, whereby that portion of the copping mechanism embraced in the backing-off and winding-on devices on both sides of the head may be driven by a single band.

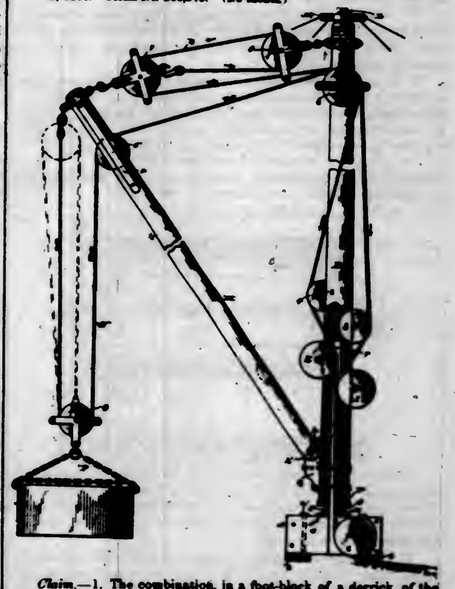
Claim.—The combination, with a dual set of rims or pulleys in a spinning-mule, each set consisting of a driving-pulley, pulleys for operating the backing off and winding on of the copping mechanism and for driving the spindles, of a single band passed or banded about said pulleys, and guide-pulleys *i j* for guiding said band from one set of rims or pulleys to the other, substantially as set forth.



382,140. STEAM-BOILER INDICATOR. LOUIS D. CRUELAIS, Camden, N. J. Filed Nov. 19, 1887. Serial No. 255,694. (No model.)

Claim.—1. In a steam generator and engine, the combination, with an alarm-bell and an adjustable striker, of a rotary shaft receiving motion from the engine and carrying a stud or pin to engage with the striker, a float-chamber connected to the boiler, a float connected to a cock upon a supply-pipe leading to the boiler, and a series of jointed connections whereby when the float descends below the low-water limit the said striker will be brought into operative position, substantially as described.

2. In a combined steam generator and engine, the combination, with a float-chamber and float and a rotary shaft receiving motion from the engine and carrying a stud to engage with a striker, of a bell and striker and a series of jointed connections through which said striker is brought into operative action or engagement with said striker by the gradual descent of the float.



3. The combination, with the bell and striker of a low-water alarm and with the rotary shaft of an engine carrying a stud, *k'*, of the shaft or rod upon which said striker is movable, and a vertically-movable rod carrying a wedge by which said striker is adjusted, said rod being coupled or connected to the float and arranged to move the striker into operative position as the float gradually descends, substantially as described.

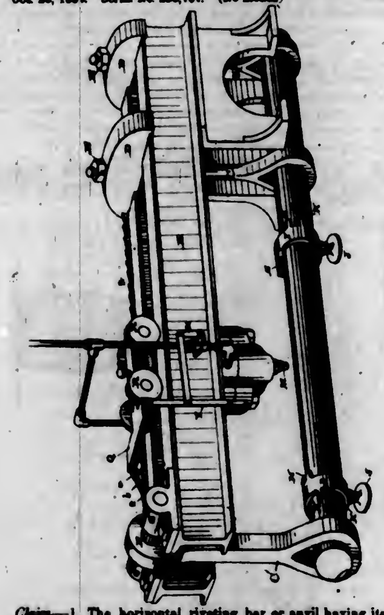
382,140.

4. In a steam generator and engine, the combination, with a float-chamber and float, an automatic striker actuated by the engine, and a water-supply pipe provided with a cock, of connections, substantially as described, coupling said float, striker, and cock, so that the same will act conjointly, as set forth.

382,141. DERRICK. D. HENRY CRAIG, Boston, Mass. Filed Jan. 12, 1888. Serial No. 260,575. (No model.)

Claim.—1. The combination, in a foot-block of a derrick, of the beams bolted side by side and provided with sheet metal on their contiguous sides, the skids having curved ends secured to the under side of said beams and projecting beyond the same at each side, the metal plate rigidly secured between said beams, and the sheaves journaled between said plate and beams, substantially as described.

2. The combination, in a derrick foot-block, of the beams C, bolted side by side, the skids having curved ends bolted to said beams, the metal plate secured between said beams, the metal wearing-surfaces *d*, the pin passing through said beams and plate, and the sheaves journaled on said pin between the plate and beams, substantially as described.



3. The combination, with the foot-block of a derrick, of a metal bearing-plate having a projecting hollow extension or sleeve provided with a shoulder on its interior, the mast having the way *r* formed in its lower portion, and provided with the metal foot-plate having a hollow pivot adapted to fit within said hollow extension or sleeve, and a washer resting on said shoulder, substantially as described.

4. The combination, in a derrick, of the foot-block, the mast resting on the same, the bars A, secured to said mast, the boom having its lower end iron-shod and pivotally secured to said bars, the wooden rest-plate having the concaved or curved upper surface bolted to said mast, and means for operating said boom, substantially as described.

5. The combination, in a derrick, of a foot-block having a channel centrally through it, a plate secured and sheaves journaled in said channel, a metal bearing-plate having a hollow projection or sleeve provided with an interior shoulder, a mast having a foot-plate provided with a hollow pivot adapted to fit within said sleeve, and said mast having a way formed in its lower end, sheaves journaled in boxes secured to the mast, said sheaves fitting partly in mortises in the mast, a wooden rest-plate having a curved or concaved upper surface bolted to the mast, a boom pivotally secured to the mast and having its lower end iron-shod, and a wire hoisting-rope and boom-hoist adapted to pass over the last-named sheaves through the way and foot-block to the power, substantially as described.

6. The combination, in a derrick, of a foot-block having a channel formed centrally through it, a mast adjustably supported on said foot-block and having a way formed in its lower end, sheaves working in mortises formed in said mast and journaled in boxes secured thereto, a boom pivotally secured to said mast and carrying a pulley, 5, near its outer end, a hoisting-wire, N, having one end secured to the outer end of the boom and passing around a pulley, O, to which the weight is hung, thence over pulley 5 to a pulley loosely hung to the upper end of the mast, thence down said mast over a guide-sheave, 4, into the way *r*, formed in the mast, and past pulley 2 into the channel of the foot-block, and a wire boom-hoist, R, having one end secured to a pulley-block, 7, loosely attached to the outer end of said boom, thence over a pulley, 8, loosely hung to the upper end of the mast, thence to pulley 7, thence to pulley 9, loosely hung to the upper end of the mast, and down the mast over guide-sheave 3 into the way and past sheave 1 into the channel in the foot-block, as set forth.

382,142. PIPE-RIVETING MACHINE. Gerrish Cushing, San Francisco, Cal., assignor of one-half to Francis Smith, same place. Filed Oct. 29, 1887. Serial No. 253,787. (No model.)

Claim.—1. The horizontal riveting bar or anvil having its ends suspended beneath the track or frame, in combination with the traveling riveting-plunger, substantially as herein described.

2. The horizontal riveting bar or anvil having one end fixed or suspended, as shown, in combination with a swinging supporting link or yoke at the opposite end, substantially as herein described.

3. The horizontal riveting bar or anvil having one end suspended in fixed supports and the other with the swinging or movable support, in combination with the notched or grooved collars, with the set-screws, whereby the pipe-section is held in position for riveting, substantially as herein described.

4. The collars fitting the riveting bar or anvil and having the grooves or notches in which the end rivets of the pipe-section fit, and the supplemental groove through which fixed pins upon the bar extend and by which the movement of the section is regulated for riveting double seams, substantially as herein described.

5. The horizontal riveting bar or anvil with its holding-collars, and the frame beneath which the bar is supported, in combination with the hydraulic cylinder, the vertically-moving plunger, the water-supply pipes, and the three-way cock or valve whereby the pistons and riveting-plunger are actuated, substantially as herein described.

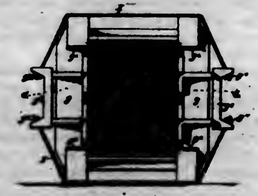
6. The horizontal riveting bar or anvil with its fixed and swinging supports, and the pipe-holding collars, in combination with the hydraulic cylinder and riveting-plunger, the traveling carriage from which the cylinder is suspended, and the feed mechanism whereby the carriage and cylinder are advanced a distance equal to that between the rivet-holes in the pipe, substantially as herein described.

7. The hydraulic riveting-cylinder supported from the traveling carriage upon the main frame, the pipes supplying water to the pistons within the cylinder, and the three-way cock or valve whereby the supply is admitted and discharged, in combination with the swinging lever by which the cock or valve is opened and closed, and the feed mechanism is actuated simultaneously with the movement of the valve by the same lever, substantially as herein described.

382,143. APPARATUS FOR SETTING WRITING-COPIER. JAMES CURRIE, Darien, Conn. Filed Apr. 26, 1887. Serial No. 236,067. (No model.)

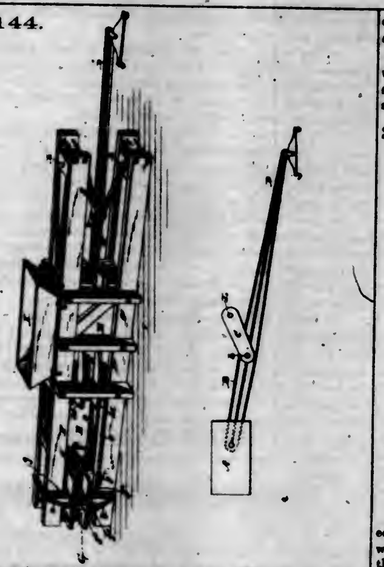
Claim.—1. A board or frame having parallel bars projecting from the face of the frame to form a groove or space between the frame and said bars, and provided with outside fixed end blocks having angular sides, in combination with grooved lettered blocks or cards having inclined sides adapted to said bars and blocks, substantially as and for the purpose set forth.

2. A board or frame having parallel bars projecting from the face of the frame to form a groove or space between the frame and bars, in combination with the reversible grooved lettered blocks or cards, substantially as and for the purpose set forth.



3. The combination of a board or frame having parallel bars provided with outside fixed end blocks having angular sides, and the reversible grooved lettered blocks or cards having inclined sides corresponding to the inclination of the angular side of said fixed blocks, substantially as and for the purpose set forth.

382,144. BALING-PRESS. PETER K. DEDERICK, Londonville, N. Y. Filed Nov. 10, 1887. Serial No. 254,254. (No model.)

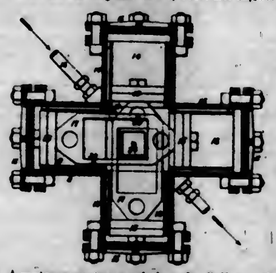


Claim.—1. In a baling-press, the combination, with the bale-chamber having openings, as at H, of the sides, each pivotally supported at a point between its extremities, whereby said sides are permitted to conform to and bear with uniform friction upon the column of pressed material, substantially as described.

2. In a baling-press, the combination, with the bale-chamber having openings, as at H, of the sides provided with passages for the bands on the bales, and each pivotally supported at a point between its extremities, substantially as described, for the purpose specified.

3. The bale-chamber having the openings H and guides O, and provided with the closed sides at the discharge end, substantially as described.

382,144.



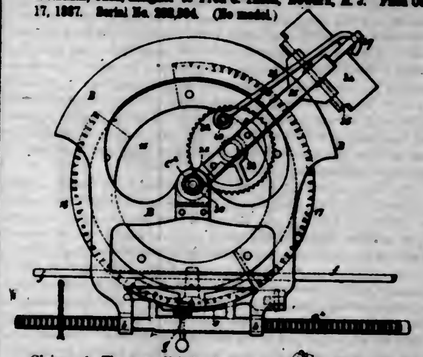
4. The bale-chamber having the openings H and guides O, in combination with the adjustable closed sides at the discharge end, and means for adjusting said sides, substantially as described.

5. The bale-chamber having the openings H, the guides O, and the slotted closed sides at its discharge end, substantially as described.

6. The bale-chamber having the openings H, the guides O, and the adjustable slotted closed sides at its discharge end, substantially as described.

7. In a horizontal baling-press, the combination, with the traverser, of the arms C C, pivoted to the press-frame, and the long lever B, pivoted to the traverser and to the said arms, as shown, and adapted for the direct attachment of the horse at its outer end, whereby the first part of the advancing movement of the traverser is effected by the inward thrust of the lever, due to a direct longitudinal pull on said lever, and without a strain on the arms C C, substantially as described.

382,145. PISTON WATER-METER. FRANK W. DICK, Glasgow, County of Lanark, Scotland. Filed Oct. 19, 1887. Serial No. 252,805. (No model.) Patented in England Oct. 8, 1886. No. 12,860.

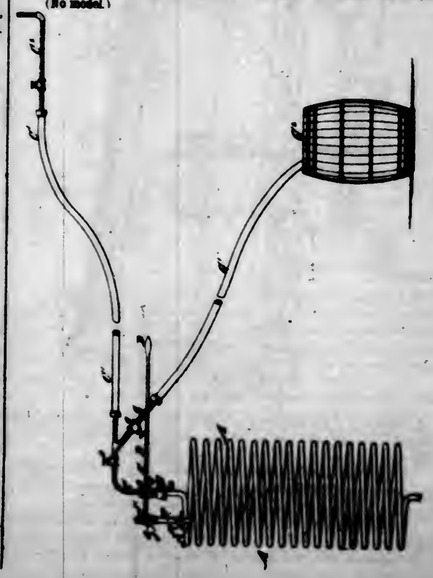


Claim.—1. A meter or motor consisting of cylinders radiating from a center, pistons working in the cylinders and attached to piston-rod plates formed with rectangular openings, a four-motion valve in the openings of the piston-rod plates and working on a port-face, two pins fixed on the upper piston-rod plate, and a star-wheel acted on by the said two pins and fixed on a spindle of the counting mechanism, substantially as and for the purposes herein set forth.

2. A meter or motor having, in combination, cylinders radiating from a center, pistons working in the cylinders and attached to piston-rod plates formed with rectangular openings, and a four-motion valve in the openings of the piston-rod plates and working on a port-face in a rectangular path, substantially as and for the purposes herein set forth.

3. A four-motion valve for a meter or motor in combination with plates or rods moved by pistons and arranged to separately and successively move the valve in directions corresponding to the four sides of a square, substantially as and for the purposes herein set forth.

4. A four-motion valve for a meter or motor, a center pin on the upper side of said valve, and a downwardly-projecting stationary spindle or pin placed centrally to keep away the center pin of the valve, substantially as herein set forth.



382,146. TYPE-WRITING MACHINE. JUAN DE LA CRUZ ROSSAR, Matanzas, Cuba, assignor to Fred G. Tilton, Newark, N. J. Filed Oct. 17, 1887. Serial No. 252,894. (No model.)

Claim.—1. The type-disk having two sets of flexible types at its edge, a pivot for such type-disk, and the index-plate, in combination with the printing mechanism, the centering-arc and arm for moving the same and the type-disk, the pinion, gear-wheel, connecting-rod, finger-plate and spring for moving the disk in relation to the centering-arc, and a stop for limiting the motion in either direction, substantially as set forth.

2. The combination, in a type-writing machine, with the means for moving the paper and giving the impression, of a type-disk having two sets of characters, an index-plate and pivot for supporting the disk, a centering-arc and arm above the type-disk, and an arm below the type-disk, the two arms being connected outside the edge of the index-plate, so as to move together, gearing below the type-disk and finger-plate, and connecting mechanism supported by the arm and serving to turn the type-disk in one direction or the other relatively to the centering-arc, and a stop to limit the motion and cause either one set or the other of the type to occupy the correct position relatively to the centering-disk, substantially as set forth.

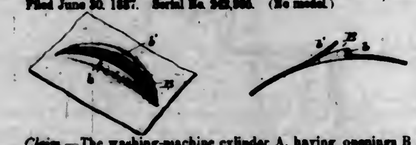
382,147. APPLIANCE FOR CLEANING PIPE-COILS. FREDERICK FARRAR, Brooklyn, N. Y. Filed Nov. 19, 1887. Serial No. 254,602. (No model.)

Claim.—1. The combination, with an injector-pipe, C, having at its end a stopper for closing the end of a coil, of a lever, as D, constructed to engage an adjacent bearing to form a fulcrum, and adapted to act against a bearing on the said pipe, substantially as herein described.

2. The combination, with an injector-pipe, C, and the packed nut E, forming a cap to close the end of a coil, of the lever D, having a fulcrum-hook at the end and adapted to act against a bearing, *c*, on the said pipe, substantially as herein described.

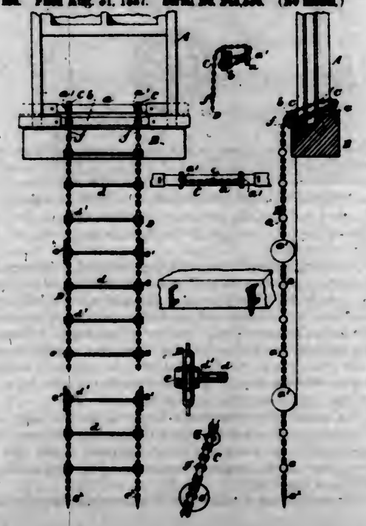
3. The combination, with the injector-pipe C, having the cap E for closing the end of a coil, of the lever D, having a fulcrum point or hook and a long slot, *d'*, receiving the said pipe through it and adapted to bear against a shoulder on said pipe, substantially as herein described.

4. The combination, with the injector-pipe C, having an inducing-branch, G, and a cap or stopper, as E, for closing the end of a coil, of a lever, as D, adapted to bear against a shoulder on said pipe for holding the cap or stopper tightly against the end of a coil, substantially as herein described.



382,148. BOOK-COVER. ESTHER V. FOSLER, Salt Lake City, Utah. Filed Dec. 9, 1886. Serial No. 180,189. (Model.)

Claim.—1. The combination, with the cover and the joint-boards, of the spring-back creased and jointed in the manner stated and thickened in its central portion, substantially as shown and described, the ends of said spring-back being secured between the cover and the joint-boards, as set forth.



2. In a book-cover, the combination, with the joint-boards and the main boards, of the spring-back having creases formed therein and its ends secured between said boards, a space being formed between the inner edges of the main boards and the outer joints of the spring-back, substantially as shown, and for the purpose stated.

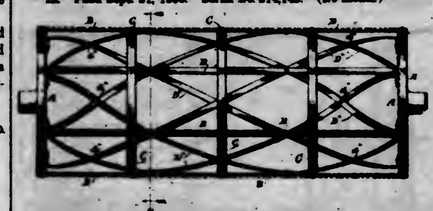
382,149. WASHING-MACHINE. WARREN FOWLER, Mexico, Me. Filed June 30, 1887. Serial No. 242,980. (No model.)

Claim.—The washing-machine cylinder A, having openings B in its periphery and sides, each of which openings has a raised edge lip, *b*, and a flaring and concave-edge lip, *b'*, substantially as described.

382,150. FIRE-ESCAPE LADDER. JOHN W. FRYE, Baltimore, Md. Filed Aug. 31, 1887. Serial No. 248,336. (No model.)

Claim.—1. The combination, with a frame comprising exterior longitudinal ribs for supporting the cloth, of two sets of spiral or obliquely-directed truss-ribs arranged to cross each other and secured together at their points of intersection to form a truss, said truss-ribs being extended the full length of the reel and connected with and constructed to support the exterior ribs, and means supporting the said longitudinal ribs and truss-ribs at the ends of the reel, substantially as described.

2. In a bolting-reel, the combination, with a frame comprising suitable exterior ribs for supporting the cloth, of two sets of spiral or obliquely-arranged truss-ribs, arranged to cross each other and secured together at their points of intersection to form a truss, said truss-ribs being extended the full length of the reel and connected with the exterior ribs of the reel and converged toward the center of the reel at the ends of the latter, and means supporting the said exterior ribs and the truss-ribs at the ends of the reel, substantially as described.



3. In a bolting-reel, the combination, with the cloth and exterior ribs for supporting the cloth, of two sets of spiral or obliquely-directed truss-ribs arranged to cross each other and united at their intersecting points to form a truss, said truss-ribs being connected with the exterior ribs of the reel and converged toward the axis of the reel at the ends of the latter, and reel-heads comprising central hubs located inside of the planes of the heads and provided with radial arms, which are outwardly bent or deflected to form hollow or concave spaces at the ends of the reel, the inwardly-bent or converging ends of the truss-ribs being attached to the said arms near the hubs, substantially as described.

382,151. SHEET-METAL JOINT. R. ELMER GOODSELL, New Haven, Conn., assignor of one-half to Clark R. Bryant, same place. Filed Mar. 3, 1888. Serial No. 266,551. (No model.)

Claim.—The herein-described joint for sheet metal, consisting in a series of slots formed near the edge of the one part and the metal offset in the line of the slots to form a shoulder parallel with the slots, so that the slots will be substantially through the shoulder, the other part constructed with a series of projecting tongues corresponding to the said series of slots, the said tongues introduced through said slots, so as to bring the edge from which the tongues project to abut against the said shoulder, and the tongues closed upon the reverse side of the slotted part, substantially as described.

382,152. BOLTING-REEL FRAME. WILLIAM R. GORTON, Moline, Ill. Filed Sept. 21, 1886. Serial No. 214,165. (No model.)

Claim.—1. In a bolting-reel, the combination, with a frame comprising exterior longitudinal ribs for supporting the cloth, of two sets of spiral or obliquely-directed truss-ribs arranged to cross each other and secured together at their points of intersection to form a truss, said truss-ribs being extended the full length of the reel and connected with and constructed to support the exterior ribs, and means supporting the said longitudinal ribs and truss-ribs at the ends of the reel, substantially as described.

2. In a bolting-reel, the combination, with a frame comprising suitable exterior ribs for supporting the cloth, of two sets of spiral or obliquely-arranged truss-ribs, arranged to cross each other and secured together at their points of intersection to form a truss, said truss-ribs being extended the full length of the reel and connected with the exterior ribs of the reel and converged toward the center of the reel at the ends of the latter, and means supporting the said exterior ribs and the truss-ribs at the ends of the reel, substantially as described.

3. In a bolting-reel, the combination, with the cloth and exterior ribs for supporting the cloth, of two sets of spiral or obliquely-directed truss-ribs arranged to cross each other and united at their intersecting points to form a truss, said truss-ribs being connected with the exterior ribs of the reel and converged toward the axis of the reel at the ends of the latter, and reel-heads comprising central hubs located inside of the planes of the heads and provided with radial arms, which are outwardly bent or deflected to form hollow or concave spaces at the ends of the reel, the inwardly-bent or converging ends of the truss-ribs being attached to the said arms near the hubs, substantially as described.

382,153. METHOD OF PAVING STREETS AND ROADS. PATRICK GRIFFIN, Utica, N. Y., assignor of three-fourths to James F. Leahy, Edward Callahan, and John Hackett, all of same place. Filed Oct. 3, 1887. Serial No. 251,377. (No model.)

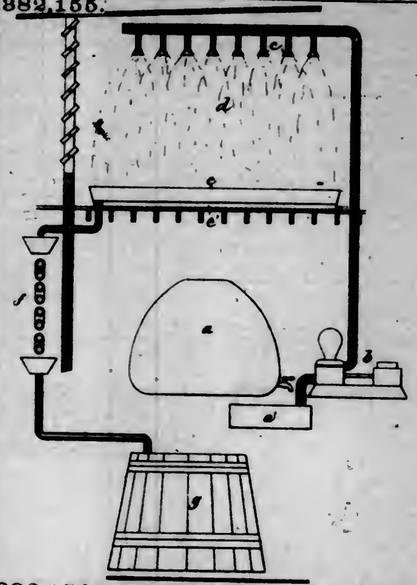
Claim.—1. A roadway constructed by moistening and compressing the earth or clay into a convex surface, covering the same with a layer of water-tight felt or covering, and having a depressed ditch filled with loose stones at each side and the whole covered with a layer of hard wearing-surface.

2. A roadway consisting of successive layers of moistened and compressed earth, clay, or sand covered with a layer of felt, having a depressed ditch filled with loose stones at each side, and the whole covered with a layer of water-tight wearing cement.

382,154. FREIGHT-CAR DOOR. CHARLES HAGEE, Buffalo, N. Y., assignor of one-half to Henry Bosting, same place. Filed Dec. 19, 1887. Serial No. 258,200. (No model.)

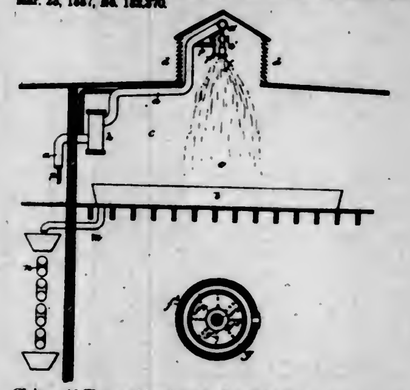
Claim.—1. The combination, with a freight-car having an entrance-opening in its side, and a casing, F, arranged on the inside of the car on one side of the entrance, of a sliding door closing said entrance and adapted to enter said casing, and a rod or brace extending across the entrance on the outside of the sliding door and forming a support for the sliding door, substantially as set forth.

2. The combination, with a freight-car having an entrance-opening in its side, and a casing, F, arranged on one side of said entrance, of a sliding door closing said entrance, a horizontal shaft, A, a drum, G, mounted on said shaft and arranged in the casing F, a cord or chain, *g*, connecting said drum with the sliding door, rollers *l*, arranged below the casing F, a brace-rod, *o*, extending across the entrance for supporting the door, and a hand-crank, *j*, whereby the drum is rotated and the door drawn into the casing F, substantially as set forth.



3. The combination, with a freight-car having an entrance-opening and a sliding door closing said entrance, of a sliding brace-rod extending across the entrance on the outer side of the sliding door and arranged with one end in a horizontal opening formed in one side of the entrance, and provided at its opposite end with a hook which engages in an eye secured to the opposite side of the entrance, substantially as set forth.

4. The combination, with the sliding door E and the casing F, of horizontal guide-rods *m*, arranged in said casing, and between which the sliding door is held, substantially as set forth.



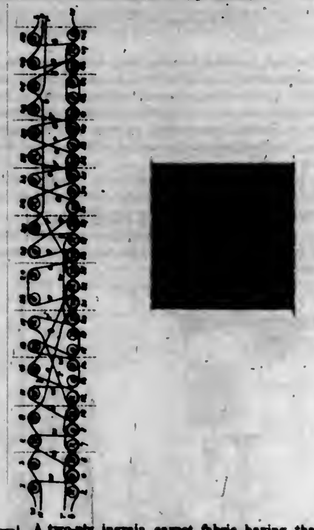
382,155. ART OF MAKING MALT LIQUORS. CLARENCE C. HANFORD, Medford, Mass. Filed Sept. 15, 1887. Serial No. 249,765. (No specimens.) Patented in England Nov. 16, 1886, No. 14,573, and in France Mar. 23, 1887, No. 182,370.

Claim.—The herein-described improvement in the art of making malt liquors, which consists in subjecting the hot infusion or wort taken from the boiler to pressure and delivering it under pressure to the atmosphere in the form of a fine spray, permitting the said spray to fall a considerable distance through the atmosphere, whereby the liquor is cooled and aerated, and subsequently collecting and fermenting the said liquor, substantially as described.

382,155.

382,156. APPARATUS FOR COOLING LIQUIDS. CLARENCE C. HANFORD, Medford, Mass. Filed Apr. 2, 1888. Serial No. 269,462. (No model.) Patented in England Nov. 16, 1886, No. 14,573, and in France Mar. 23, 1887, No. 182,370.

Claim.—1. The combination of a liquid-forcing apparatus, and a pipe leading therefrom, with a series of spraying devices or atomizers connected with said pipe and opening directly into the atmosphere, and an independent or disconnected vat or collecting-receptacle arranged below said spraying devices to receive the liquid therefrom after passing from the spraying device through the atmosphere, substantially as described.



2. The combination of a liquid-forcing apparatus, a delivery-pipe, *a'*, connected therewith, a series of atomizers attached to said delivery-pipe and opening directly into the atmosphere, and a valve interposed between each atomizer and the delivery-pipe, so as to admit of the individual attachment of each atomizer independently of all others, and an independent or disconnected vat arranged a suitable distance below said atomizers, so that the spray from the atomizers will have to pass some distance through the free atmosphere before being collected in the vat, substantially as described.

3. The combination, substantially as shown and described, of a liquid-forcing apparatus, a delivery-pipe leading therefrom, atomizers connected to said pipe, a straining device interposed in said pipe between the pump and the atomizers, and a vat below said atomizers, substantially as described.

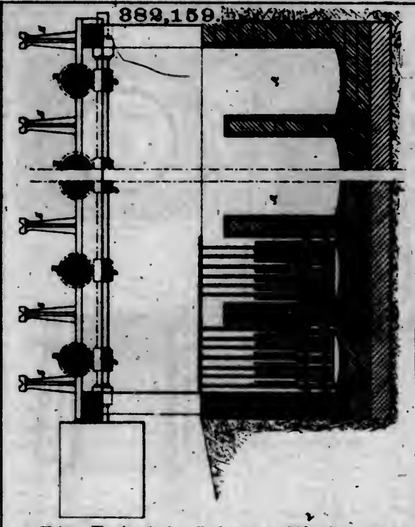
4. The combination of a forcing apparatus and delivery-pipe leading therefrom, and spraying devices communicating with the said pipe, with a ventilator affording a natural current of air through the spray delivered from said spraying devices, and a vat below said spraying devices, substantially as described.

5. The combination, with a forcing apparatus and liquid-delivery pipe leading therefrom, and spraying devices communicating with the said pipe, of an air-compressor and delivery-pipe provided with orifices adjacent to those of the spraying devices, substantially as described.

382,157. CARPET FABRIC. HARRY HARGWOOD, Philadelphia, Pa. Filed Sept. 8, 1887. Serial No. 248,884. (Specimens.)

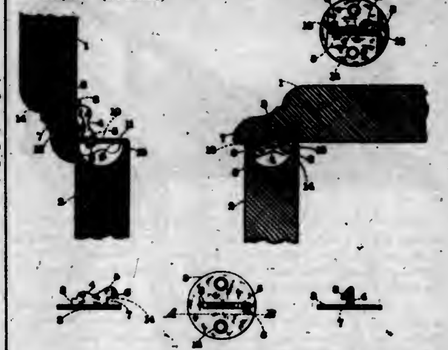
Claim.—1. A two-ply ingrain carpet fabric having the weft-threads divided into sets of five, of which three are in one ply and two in the other, all substantially as set forth.

2. A two-ply ingrain carpet fabric having the wefts divided into sets of five and the warps into sets of four, the wefts being two in one ply and three in the other, and two of the warps each binding one face weft and one back weft, the third binding two face wefts and one back weft, and the fourth binding one face weft and two back wefts, all substantially as set forth.



382,158. HEATING-STOVE. EDWARD HIRE, Jersey City, N. J. Filed Mar. 3, 1887. Serial No. 229,327. (No model.)

Claim.—The combination of an outer shell having a large opening at one end and air-holes in the top and ends, fixed longitudinal guideways at the interior of the shell, a fire-pan provided with bottom flanges and an adjustable and perforated guard-cover, a head-plate attached to one end of the fire-pan and made of a larger size than the end opening of the shell, said head-plate being provided with two series of air-openings, so as to supply air to the interior of the fire-pan and to the space between the same and the shell, and a locking device for locking the fire-pan in position in the shell, substantially as set forth.



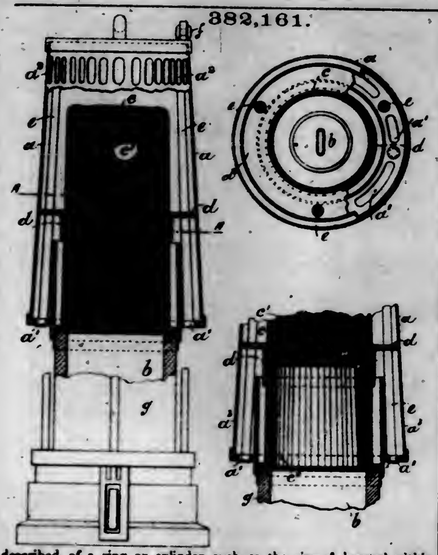
382,159. PROCESS OF BLEACHING. EUGÈNE HERMITE, Paris, France. Filed Feb. 11, 1886. Serial No. 191,691. (No specimens.) Patented in France Sept. 11, 1884, No. 164,389; in Belgium Sept. 13, 1884, No. 66,260; in England Oct. 21, 1884, No. 13,289; in Italy Oct. 23, 1884, No. 17,266; in Germany Oct. 24, 1884, No. 30,549; in Sweden Jan. 10, 1885; in Spain Feb. 26, 1885, No. 6,497; in Norway May 19, 1885, and in Austria-Hungary Jan. 5, 1888, No. 38,317.

382,159.

Claim.—The herein-described process of bleaching, said process consisting in electrolyzing a solution of chloride of magnesium and subjecting the material to be bleached to the action of said electrolyzed solution.

382,160. FASTENER FOR BURIAL-CASKETS. EDWARD HOLMES and BENJAMIN HOLMES, Buffalo, N. Y. Filed Apr. 20, 1887. Serial No. 235,522. (No model.)

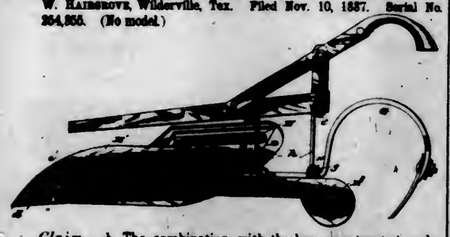
Claim.—1. In a hinge for burial-casket lids, the plate 3, projecting catch-piece 4, and projecting side piece, 6, in combination with the plate 9, having the parts 13 and the openings 10 and 11, substantially as described.



2. The combination of the plate 3, projecting piece 4, side projecting piece, 6, and shoulders 8, with the plate 9 and its openings 10 and 11, substantially as and for the purposes specified.

382,161. MINER'S SAFETY-LAMP. ANDREW HOWAT, Manchester, County of Lancaster, England. Filed Jan. 25, 1888. Serial No. 261,916. (No model.) Patented in England Feb. 5, 1886, No. 1,700; in France Mar. 22, 1886, No. 174,980, and in Belgium Mar. 26, 1886, No. 72,511.

Claim.—1. In a miner's safety-lamp, the combination, with a wire-gauze cylinder or cylinders, and a metal shield or outer casing, of a deflector, such as the ring *d*, inserted between the shield and gauze cylinder, and closing the intervening space, in order that all the air admitted to the lamp may be directed through said gauze cylinder, substantially as herein set forth, for the purpose specified.



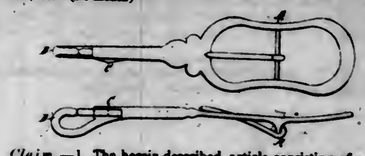
2. In a miner's safety-lamp, the combination, with a wire-gauze cylinder or cylinders, a metal shield or outer casing, and a deflector closing the space between said wire-gauze cylinder and said shield, so as to direct the air through said wire-gauze cylinder, substantially as

382,161.

described, of a ring or cylinder, such as the ring c^3, located within the wire-gauze cylinder, substantially as and for the purposes herein set forth.

382,162. COTTON-CULTIVATOR. WILLIAM H. IRWIN and GEORGE W. HAIRGROVE, Wilderville, Tex. Filed Nov. 10, 1887. Serial No. 254,855. (No model.)

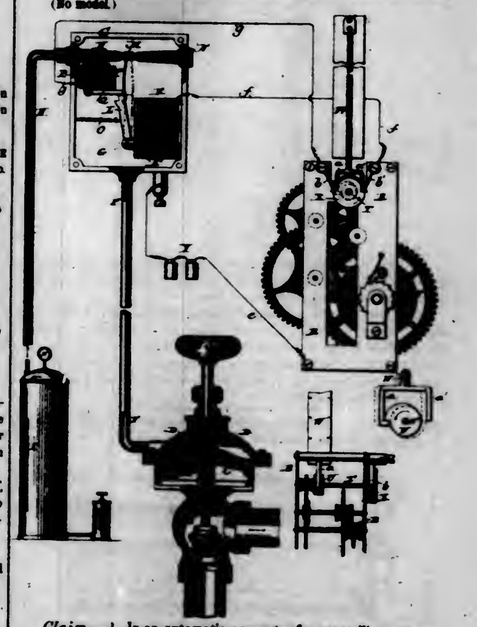
Claim.—1. The combination, with the base constructed as described, of the slotted plate secured thereto, the strip on the rear side of the said plate, the blade having apertures and threaded bolts for adjusting the said blade, and the front and rear cutters or scrapers on the landside, substantially as specified.



2. The combination, with a cotton-cultivator and the base thereof, as described, of the cutters or scrapers on the landside, one secured to the forward and one to the rear edges and extending below the bottom thereof, substantially as specified

382,163. CHURN. LEONORE H. JAMES, Vanceburg, Ky. Filed Sept. 20, 1887. Serial No. 251,023. (No model.)

Claim.—In a churn, the combination, with a suitable base, of a standard vertically supported thereon, having at its top a fixed projecting shelf provided with an opening, and also formed with the opening C and elongated slots *c*, the movable shelf adjustable in said slots by means of screw bolts and nuts, spools or pulleys supported in the opening C, and a dasher supported by the fixed and movable shelves, a belt or band passing over the dasher and pulleys, and movable levers to which the ends of the said band are attached, substantially as described.



382,164. COMBINED BUCKLE AND SPRING-HOOK. WILLIAM JAMES, Port Pirie, South Australia. Filed Feb. 20, 1888. Serial No. 265,093. (No model.)

Claim.—1. The herein-described article consisting of a buckle and conjoined hook, the latter having a slot in its side, and being provided with a slide having an operating chamfered boss located at said side and made about as wide as the body of the hook and longer than the slot, substantially as specified, whereby the obstruction of the slide by dirt or its accidental movement by friction on the front of the device is prevented.

2. In hooks or snaps provided with a spring-slide, the boss C, placed at the side of the hook B and covering the slot in which the slide works, substantially as herein described.

382,165. AUTOMATIC TEMPERATURE-REGULATOR. WARREN S. JOHNSON, Milwaukee, Wis. Filed June 23, 1887. Serial No. 242,336. (No model.)

Claim.—1. In an automatic apparatus for controlling temperature, the combination, substantially as described and claimed, of a main valve, an expansion-chamber controlling the same, an electric three-way valve through which fluid under pressure is admitted to the expansion-chamber, an electric generator and circuit including the valve, a switch in said circuit, a motor by which the switch is caused to close and immediately reopen the circuit, and a thermostat mechanically controlling the action of said motor and switch.

2. In an automatic apparatus for controlling temperature, the combination, substantially as described, of a main valve, an expansion-chamber to operate the same, an electric valve with opening and closing magnets through which fluid under pressure is admitted to the expansion-chamber, a battery-line, a switch by which the circuit may be completed from the battery-line through either magnet, a motor by which the switch is caused to close and immediately reopen the circuit through first one and then the other of the magnets, and a thermostat mechanically controlling the action of said motor, whereby the motor and switch subject to the control of the thermostat are caused to apply the electric current for opening and closing the electric valve, and the latter caused to deliver into and out of the expansion-chamber the fluid by which the main valve is actuated.

3. A three-way valve and two electro-magnets to effect its movement, in combination with a battery-line, a switch through which the battery-line may be connected with one or the other of the valve-magnets, an independent motor for moving the switch, and the thermostat mechanically controlling the motor.

4. In an automatic apparatus for controlling temperature, the combination of a main valve and an expansion-chamber controlling it, an electric valve through which the fluid under pressure is admitted to the expansion-chamber, the switch controlling a circuit through which the electric valve is operated, an independent motor to actuate the switch, and a thermostat acting mechanically to control the motor.

5. In combination with a valve and an expansion-chamber to actuate the same, an electric three-way valve controlling the delivery of fluid into and from the expansion-chamber, an electric circuit including and controlling the three-way valve, a circuit-controlling switch, a motor for said switch operated by power independent of the power which moves the valves, and a thermostat mechanically controlling the motor, whereby the movement of the thermostat under changes of temperature is caused to bring the motor into action, the motor caused to apply the electric current to move the secondary valve, and the latter caused in turn to deliver the fluid which actuates the main valve into or out of the expansion-chamber.

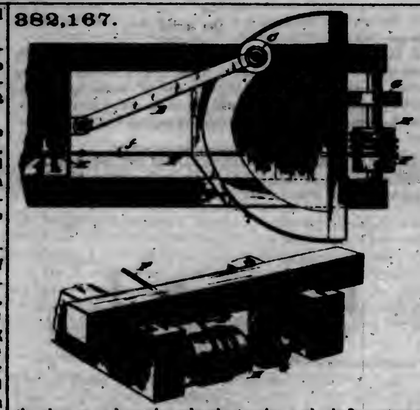
6. In combination with a valve-controlling circuit and a switch to open and close the same, a motor to actuate the switch, and a thermostat acting directly as a detent for the motor to close and reopen the circuit.

382,166. WOODEN FAUCET. OTTO KNUPER, Bridgeport, Conn., assignor of one-half to Clapp Spencer, same place. Filed Dec. 12, 1887. Serial No. 257,945. (No model.)

Claim.—1. A faucet consisting of shank, body, and nozzle of wood, the body having a central opening and the shank and nozzle having openings communicating therewith, a bushing within the body, of uniform diameter, and a rubber valve fitting closely within said bushing, which moves transversely to the openings in the shank of the nozzle.

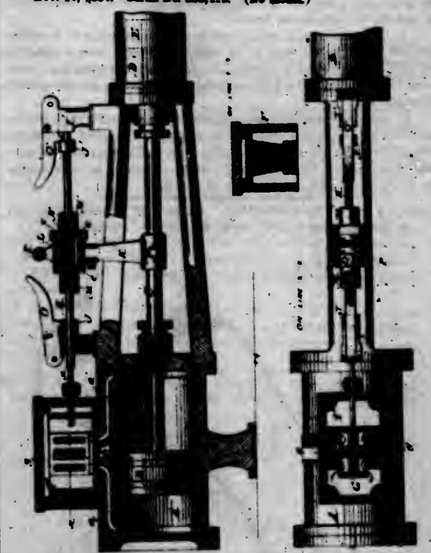
2. The shank, body, and nozzle having openings, as described, and a bushing of uniform diameter within the body arranged transversely to the opening, in combination with a yielding valve fitting close within the bushing, and operating mechanism, substantially as described, whereby the valve is moved transversely to the openings in the shank and nozzle, and to the closed position, after engaging the base of the socket, is expanded by pressure to prevent leakage.

3. The shank, body, and nozzle having openings, as described, and a bushing of uniform diameter within the body, in combination with a valve fitting closely within said bushing, a stem therefor, a cap through which the stem passes, and which is provided with a seat, 12, at its lower end, and operating mechanism, substantially as described, whereby the valve is pressed against the seat and expanded to prevent leakage in the open position and is pressed against the base of the bushing and expanded to prevent leakage in the closed position.



382,167. BALING-PRESS. WILLIAM A. LASLEY, Cherokee, Kans. Filed Sept. 6, 1887. Serial No. 248,771. (No model.)

Claim.—1. In a press, substantially as described, the combination, with the plunger, of a shaft, a cord or rope connecting such shaft with the plunger, and a spring whereby to give such shaft a rotary tendency, all substantially as and for the purposes described.

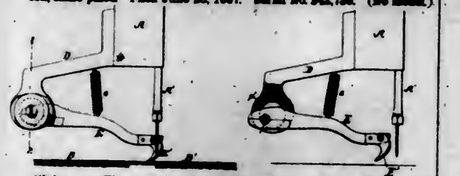


2. In a press, substantially as described, a plunger and a shaft combined with a rope extended between and secured at its opposite ends to said shaft and plunger, and a spring coiled around the shaft and secured at one end thereto and at its opposite end to the framing, substantially as set forth.

3. The combination, in a press, of the plunger provided with a slot fitted to receive a rope, the shaft, the spring for giving such shaft a rotary tendency, and the cord or rope secured to the shaft and provided with a number of knots whereby its connection with the plunger may be adjusted, substantially as described, and for the purpose specified.

382,167.

382,168. VALVE-GEAR. HENRY LEMPENNAU, Quincy, Ill. Filed Nov. 17, 1887. Serial No. 255,416. (No model.)



Claim.—1. In a valve-gear, the reciprocating valve-rod H, having the end collars, J J', in combination with the two independent pivoted dogs O O', alternately engaging the respective collars to hold the valve-rod momentarily at rest, the reciprocating piston-rod, the arm K, fixed rigidly to said rod and acting upon the dogs alternately to effect their disengagement from the collars, the spiral spring loosely embracing the valve-rod, and the two sleeves M M', seated against opposite ends of the spring and connected with the arm K to yield each toward the other, as described, whereby the arm on the piston-rod is caused to directly effect the compression of the spring first in one direction and then in the other against the collars of the valve-rod, and

also to directly trip the dogs, that the spring may move the rod at the proper time.

2. In combination with the piston-rod C, the arm K, fixed rigidly thereto and provided with the sleeve N and roller P, the spiral spring encircling the valve-spindle, the sleeves M and M', seated against the ends of the spring, the valve-spindle provided with the two collars, and the locking dogs or tappets adapted to engage said collars alternately.

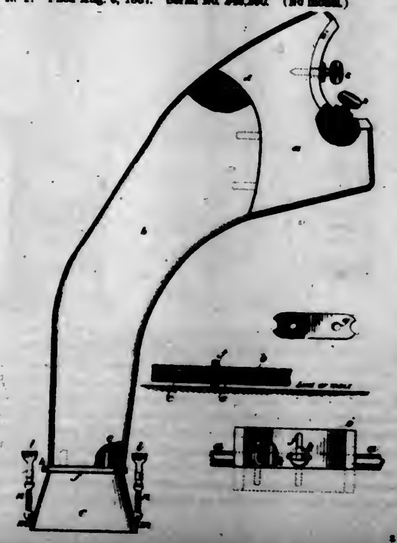
382,169. CUTTING ATTACHMENT FOR SEWING-MACHINES.

HENRY LEPPERD, Philadelphia, Pa., assignor of one-half to John G. Wilson, same place. Filed June 23, 1887. Serial No. 242,720. (No model.)

Claim.—1. The combination of the reciprocating needle-bar of a sewing-machine with a fixed arm, a cutter-lever adapted to be acted on by the needle-bar, and an eccentrically-mounted pivot for the lever, to move the latter into and out of the path of the needle-bar, substantially as set forth.

2. The combination of the reciprocating needle-bar of a sewing-machine, the fixed arm, and a pivoted cutter-lever adapted to be acted on by the needle-bar, with a movable crank, to which the cutter-lever is pivoted, to move it into and out of the path of the needle-bar, substantially as set forth.

3. The combination of the reciprocating needle-bar of a sewing-machine and a pivoted cutter-lever with a crank for throwing the cutter-lever into and out of the path of the needle-bar, and stops for determining the extent of that movement, substantially as described.



4. The combination of the reciprocating needle-bar of a sewing-machine and a fixed arm on the sewing-machine head with a crank in the said fixed arm, a cutter-lever pivoted to the crank, and stops for determining the extent of movement of the crank, all substantially as and for the purpose set forth.

5. The combination of the reciprocating needle-bar of a sewing-machine and a cutter-lever to be operated thereby, with a crank to which the cutter-lever is pivoted, the fixed arm carrying the crank, a nut for operating the crank, and stops for the latter, all substantially as set forth.

6. The combination of the reciprocating needle-bar of a sewing-machine, and a pivoted cutter-lever adapted to be acted on thereby, with a fixed arm, a crank to which the lever is pivoted, and a nut movably connected to the crank and having stop-notches, with a stop-pin on the fixed arm, substantially as specified.

382,170. IRONING-BOARD.

JOSEPH J. H. LIEBOVE, New York, N. Y. Filed Aug. 6, 1887. Serial No. 246,260. (No model.)

Claim.—1. A lady's ironing-board composed of a shoulder-former, *a*, sleeve-former *b*, and adjustable neck-former *i*, having slots *j j* and screws *k k*, substantially as described.

2. A lady's ironing-board composed of a shoulder-former, *a*, sleeve-former *b*, cuff-former *c*, and adjustable neck-former *i*, having slots *j j* and set-screws *k k*, substantially as described.

3. A lady's ironing-board composed of a shoulder-former, *a*, sleeve-former *b*, cuff-former *c*, adjustable neck-former *i*, and block *f*, substantially as described.

382,171. PIPE-HANGER.

GEORGE W. LOTZ, Wheeling, W. Va., assignor of one-half to John S. Trimble, same place. Filed Apr. 28, 1887. Serial No. 236,257. (No model.)

Claim.—1. A pipe-hanger consisting of two parts pivoted together, the upper ends thereof overlapping, with an opening in the end of each adapted to register when the parts are together, and a combined locking and supporting hook passing through said openings with suitable connections between said hook and the rafters or ceiling, substantially as described.

2. A pipe-hanger consisting of the two parts removably connected together at their lower ends, the upper ends overlapping and provided with openings registering, and a fastening and supporting hook independent of the hanger, adapted to pass through the opening in each part, and connections with the ceiling from said hook, substantially as described.

382,172. APPARATUS FOR TESTING PIPES.

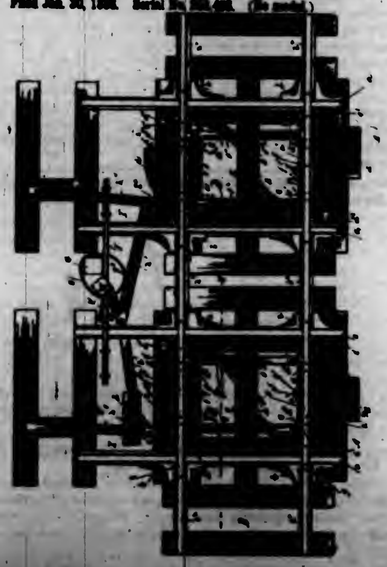
GEORGE W. LOTZ, Wheeling, W. Va., assignor of one-half to John S. Trimble, same place. Filed Jan. 10, 1888. Serial No. 260,321. (No model.)

Claim.—1. In a portable apparatus for testing pipes, &c., wherein a chamber containing liquid and provided with an indicating liquid-column tube and the tube affording connection with the work to be tested, said liquid-column tube communicating with the chamber below the normal level of the liquid, and the other tube communicating therewith above the level thereof, the mouths of said tubes being arranged at or near the middle line of the chamber, the chamber being of such shape that when the instrument is lying on its side the tubes shall not afford an escape-orifice for the liquid, substantially as and for the purpose described.

2. In an apparatus for testing pipes, &c., the combination, with a chamber containing liquid and provided with an indicating liquid-column tube, which is connected with the work to be tested, of a tube extending therefrom and provided with a trap, substantially as and for the purposes described.

3. In an apparatus for testing pipes, &c., wherein a chamber containing liquid and provided with an indicating liquid-column tube is connected with the work to be tested, the combination, with the said vessel, of the indicating liquid-column tube and the tube affording connection with the work to be tested, said tubes entering the chamber at opposite sides and extending therein in opposite directions, substantially as and for the purposes described.

4. In a device for testing pipes, &c., a chamber or vessel for containing the testing-liquid, a liquid-column tube, and a tube affording connection with the work to be tested, said liquid-column tube communicating with the chamber or vessel below the normal level of the liquid, and the other tube communicating therewith above the level thereof, the said tubes being arranged within the chamber, so that when the instrument is lying on its side the tubes shall not afford an escape-orifice for the liquid, and said tubes being provided with traps, substantially as and for the purposes described.



5. In a device for testing pipes, &c., the combination, with the chamber containing the testing-liquid and a pipe connecting the same with a force-pump, of a valve interposed in the line of the pipe, said valve being constituted by a tubular stem provided with a screw-thread, whereby it is forced to its seat to close the passage through the tubular stem and away from its seat to open said passage, substantially as and for the purposes described.

6. In an apparatus for testing pipes, &c., the combination, with the chamber containing the testing-liquid, of a testing-tube extending into the chamber, said tube being constituted of two parts united by a coupling, that part which is attached to the said chamber being made of metal, and the upper part of the tube being made of glass, substantially as and for the purposes described.

7. In an apparatus for testing pipes, &c., wherein a chamber containing liquid and provided with an indicating liquid-column tube is connected with the work to be tested, the combination, with the said chamber, of a tube extending therefrom and provided with a cap over the end thereof, substantially as and for the purposes described.

382,173. RAILROAD-CROSSING.

JOHN T. MARNEY, Forest, Ohio. Filed Jan. 30, 1888. Serial No. 262,493. (No model.)

Claim.—1. As an improvement in railroad-crossings, the rail-sections pivoted at their centers and the bent inclined arms over which said rail-sections move, substantially as shown and described.

2. As an improvement in railroad-crossings, the rail-sections pivotally secured at their centers, the arms *f*', pivotally connected to said rail-sections, the bent inclined arms C, and the supporting-plates 'C, having inclined upper surfaces, substantially as shown and described.

3. As an improvement in railroad-crossings, the pivoted rail-sections having the connecting-arms, the bent inclined arms over which said rail-sections move, the hinged post, the pivoted arms connected thereto, and the jointed levers, substantially as shown and described.

4. The combination, with the stationary post, of the hinged post secured thereto and having a right-angular arm or bracket, the grooved hoop or band, the arm or lever, the pivoted rail-sections, the jointed levers and the connecting-arms secured to said right-angular arm or bracket, and the signal rod or bar, substantially as shown and described.

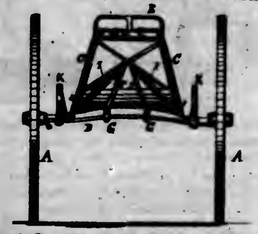
5. As an improvement in railroad-crossings, the transverse plates *a*', secured to the rails by means of spikes, and the chairs secured on the outer sides of said rails, substantially as shown and described, whereby said rails are held as against lateral displacement with relation to each other, as stated.

382,174. ARMATURE FOR DYNAMO-ELECTRIC MACHINES.

ROSS MACKIE, Troy, N. Y., assignor to John B. Tibbitts, same place. Filed May 9, 1887. Serial No. 237,602. (No model.)

Claim.—1. A disk armature having its coils wound in the plane of rotation, the cores of which coils are composed of iron plates arranged in substantially radial lines, as shown, whereby the magnetic density is greatest at the part of the core nearest the axis of the armature.

2. A disk armature having its coils wound in the plane of rotation and of triangular form and the cores thereof constructed of iron plates arranged in substantially radial planes, substantially as set forth.



3. A disk armature having coils of triangular form and wound in the plane of rotation, having cores constructed of iron plates arranged in substantially radial planes and insulated magnetically from one another, substantially as described.

4. In an armature for dynamo-electric machines or electric motors, the core or body built up of iron plates circumferentially discontinuous, insulated from each other, and formed with projections in the plane of the shaft adapted to receive coils of wire or a conductor, substantially as described.

5. An armature having coils wound in the plane of rotation, cores composed of alternate plates of iron and insulating material, and clamping devices uniting the whole arranged at the circumference and about the center, substantially as described.

382,175. TWO-WHEELED VEHICLE.

HJALMAR MALMBORG, Cortland, N. Y. Filed Sept. 16, 1887. Serial No. 249,850. (No model.)

Claim.—1. In a two-wheel vehicle, the combination of a standard or standards projecting upward from the axle and having the ends approximately close together, and two springs, one end of each attached to the upper end of said standard or standards and the other end attached to each side bar of the frame, substantially as specified.

2. In a two-wheel vehicle, the combination, with a standard or

standards, rigidly secured to the axle and projecting upwardly and rearwardly, of two coiled springs located beneath the seat and having their respective ends attached to the upper end of the standard or standards and to the seat-frame, substantially as specified.

3. In a two-wheel vehicle, the combination, with a standard or standards, rigidly secured to the axle and projecting upwardly and rearwardly at a suitable distance below the seat, of two coiled springs, one end of each spring attached to the upper end of the standard or standards and the other end extending in an outward and forward direction and attached to the seat-frame, substantially as specified.

4. The combination of the seat-frame hinged to the thills of a vehicle, the thills rigidly secured to the axle, the standard or standards rigidly secured to the axle and projecting upward with the ends approximately close together and provided with hooks H, and the coiled springs, one end of each secured to the hook H and the other end to a hook, J, on the side bars of the frame, substantially as specified.

382,176. FRUIT-BASKET. JOSHUA H. MARVIL, Laurel, Del. Filed Feb. 23, 1888. Serial No. 264,993. (No model.)

Claim.—1. A basket comprising a circular bottom, a square rim, and a series of splints connecting the bottom and rim, substantially as described.

2. A basket comprising a circular bottom, an approximately square rim or top, splints connecting the bottom and rim, and a hoop confining the splints about the center, the splints being twisted and curved, substantially as described.

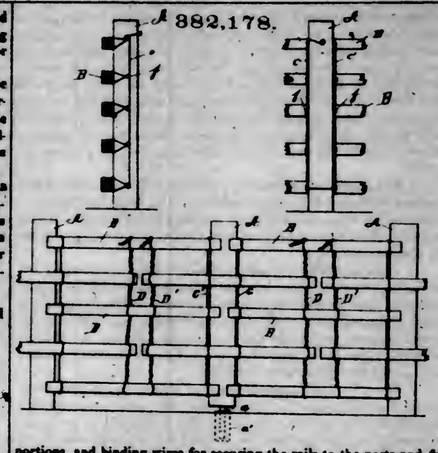
3. A basket comprising a circular bottom, an approximately square rim or top, splints connecting the bottom and rim, and a nearly-central hoop, the splints being twisted and curved, substantially as described.

4. A basket comprising a circular bottom, a series of splints having their lower ends secured to said bottom, and an approximately square top or rim receiving the upper ends of said splints, substantially as described.

5. A basket comprising a circular bottom, an approximately square rim or top composed of parallel strips arranged in pairs, splints having their lower ends secured to the circular bottom and their upper ends secured between the parallel strips of the square rim, and a nearly-central hoop secured to the splints, substantially as described.

6. A basket comprising a circular bottom, an approximately square rim or top, and splints connecting the bottom and rim, the corner-splints being crossed, substantially as described.

7. A basket comprising the circular bottom 1, the vertical splints 2, the hoops 3 and 9, the parallel rim-strips 4 and 5, and the corner pieces or straps 8, substantially as described.



382,177. THILL-COUPLING. OLIVER M. MARSH and JOHN RHEINBURN, West Salem, Ohio. Filed Feb. 21, 1888. Serial No. 264,820. (No model.)

Claim.—The combination of the clip, the shackle provided with recessed ears, the two nuts placed within the recesses, the screw-rod provided with right and left threads and made to pass through both the ears and the nuts, and the shaft-iron provided with a slot, eye, or opening through its inner end, substantially as shown and described.

382,178. FENCE. HENRY MATHS, Logro, Ind. Filed Feb. 13, 1888. Serial No. 263,890. (No model.)

Claim.—1. The herein-described fence, consisting of posts, horizontal rails secured to said posts, every alternate rail extending from one post to another and secured to the same at its ends, and the intervening rails being secured to the posts at or about their middle

382,178.

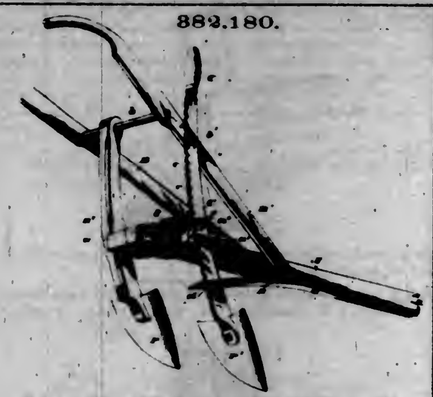
portions, and binding-wires for securing the rails to the posts and for securing the free ends of the intervening rails together and to the middle portions of the alternate rails, substantially as described.

2. The herein-described fence, consisting of posts, every alternate post being firmly and securely anchored in the ground or in position, and the intervening posts being removably anchored in position, horizontal rails secured to the posts, every alternate rail extending between the posts and secured to the same at its ends, and the intervening rails secured to the posts at or about their middle portions and having their ends extending part of the distance between the posts, and binding-wires for securing the rails together and to the posts and for securing the intervening rails together and to the alternate rails between the posts, substantially as described.

3. The herein-described fence, consisting of posts and rails, every alternate rail in the vertical series secured to the posts at its ends, and the intervening rails secured to the posts at or near their middle portions and having their ends extending part of the distance between the posts, and binding-wires securely looped around the rails and secured to the posts, and binding-wires looped around the rails between the posts and securing the free ends of the intervening rails together and to the alternate rails, substantially as described.

4. The herein-described fence, consisting of upright posts, every alternate post of the fence being firmly and securely anchored in position, and the intervening posts being removably anchored in position, horizontal rails secured to the posts, every alternate rail of the vertical series extending the distance between the posts and secured to the same at its ends, and the remaining intervening rails of the vertical series being secured to the posts at or about their middle portions with their ends extending part of the distance between the posts, binding-wires at the posts looped around each rail in the vertical series and secured to the posts opposite each rail, and binding-wires between the posts securing the free ends of the intervening rails together and to the middle portions of the alternate rails, said last-mentioned wires being looped around each rail and twisted between the rails, substantially as set forth.

382,179. DETACHABLE PLOW-POINT. HUGH MCCLINT, Keokuk, Iowa. Filed Jan. 28, 1888. Serial No. 261,888. (No model.)



Claim.—The combination, with the cultivator-tooth A, of the hollow detachable point C, covering the entire inclined portion of the point A, in order to re-enforce the same and exclude all dirt and sand from between the two points, and the set-screw passing through a tapped opening of the point C and impinging on the point A, substantially as specified.

382,180. CULTIVATOR. HENRY L. MCCOY, Lake, Ind. Filed Feb. 17, 1888. Serial No. 264,267. (No model.)

Claim.—1. In a cultivator, the combination, substantially as described, of the plow-beam, the stationary plow-standard affixed thereto, and the vertically-adjustable plow-standard formed of a curved flat metallic bar having notches on its rear edge to form a rack-bar.

382,180.

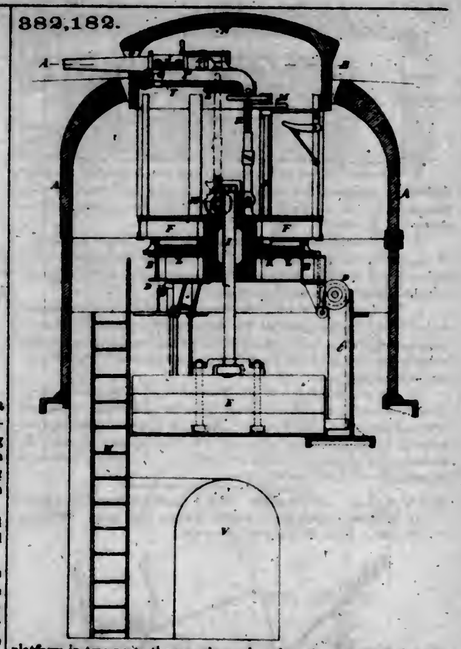
2. In a cultivator, the combination, substantially as before set forth, of the plow-beam, the stationary standard, the adjustable standard whose rear edge is notched in the form of a rack-bar, the spring slotted plate secured to the under side of the plow-beam, through which the adjustable notched standard passes, and the coiled spring secured to the rear end of the plow-beam and having a looped arm encircling the said adjustable standard.

3. In a cultivator, the combination of the beam A, handles B and B', the metallic slotted arm D, the curved standard C, and the coiled spring S, having the hooked arm *e*, substantially as described.

4. In a cultivator, the combination of the beam A, having blocks *a* and *a'*, secured to the rear end thereof, the handles B and B', the stationary standard B^2, the loops a^2 and *b'*, arranged as set forth, the metallic slotted spring-arm D, the curved standard C, having its rear edge notched in the form of a rack-bar, and the spring S, having the looped arm *e*, substantially as described.

382,181. COMBINATION-TOOL. MILLARD F. MCCRAY, Cowgill, Mo., and JOHN E. REDFOX, Detroit, Mich. Filed July 12, 1887. Serial No. 244,102. (No model.)

Claim.—1. The herein shown and described combination-tool, for the purposes specified, composed of two levers, each lever having a head, hub, and handle pivoted together, the head having a claw at its inner corner and a hammer-face at its outer side, which intersects with the sloping end of the head, forming a fixed fulcrum, the hub having a widened portion intermediate the claw, and the pivotal point of the levers provided with a notch forming a cutter which extends flush with the inner side of the hub, and a wire-guide projection having its inner side extended to within a short distance of, but not flush with, the plane of the inner side of the hub, substantially as and for the purpose set forth.



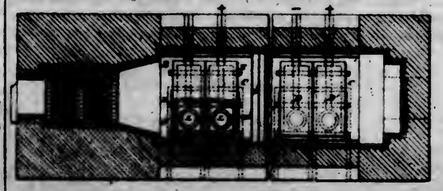
2. The combination of the two levers, each lever composed of a head, hub, and handle pivoted together, each lever having the cutter extended from the hub flush with its inner side, and the wire-guide projection located at a distance from the cutter and having its inner side arranged at a short distance from the plane of the inner side of the hub, substantially as and for the purpose specified.

3. The herein shown and described combination-tool, composed of two levers, each lever having a head, hub, and handle pivoted together, the head having a claw at its inner corner, and a hammer-face at its outer side, which intersects with its sloping end, forming a fixed fulcrum, and having its lower end overlapping the hub, which is widened between the end of the claw and the pivotal point, and has a notch in said widened portion forming a cutter flush with the inner side of the hub, and a wire-guide projection sloping on its outer edge and fitting a corresponding recess in the lower end of the head, and having its inner side extended close to, but not flush with, the inner side of said hub, substantially as and for the purpose described.

382,182. TURRET-MOUNTING FOR ORDNANCE. THORSTEN NORDENFELT, Westminster, England, assignor to the Nordenfelt Guns and Ammunition Company, (Limited,) same place. Filed Feb. 7, 1888. Serial No. 263,273. (No model.)

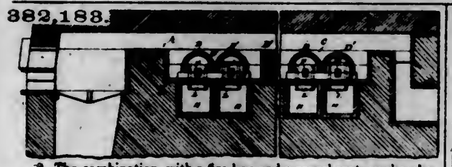
Claim.—1. The combination of the cylinder of armor-plate, the

382,182.



platform in two parts, the one above the other, the upper one capable of turning and the lower one supported by chains passing over pulleys to a counter-weight, and a toothed rack pivoted centrally to the top of the counter-weight, and toothed pinion carried by the upper platform gearing therewith, substantially as described.

2. The combination of the armor-cylinder having the top aperture, the lower and upper platforms within the cylinder, the upper one capable of turning and the lower one supported by chains passing over pulleys to a counter-weight, the toothed rack jointed at its lower end centrally to the counter-weight, the pinion carried by the upper platform and gearing with the rack, and the rising and falling dome-cover supported by uprights of the upper platform and provided with the side aperture or port-hole, substantially as and for the purpose set forth.

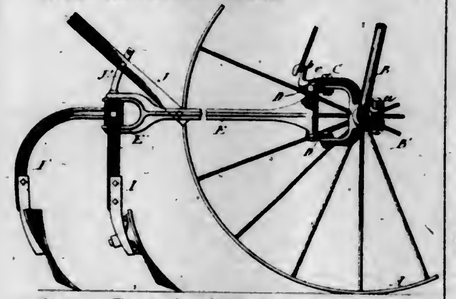


3. The combination of the cylinder of armor-plate, its dome-cover, the platform in two parts, one above the other, the upper one capable of turning and the lower one supported by chains passing over pulleys to a counter-weight, and a toothed rack pivoted centrally to the top of the counter-weight, and toothed pinion carried by the upper platform gearing therewith, the frame turning on trunnions near to the aperture in the dome-cover and having its rear end capable of being raised or lowered to give the required elevation, and the gun-carriage, which can be moved endwise along this frame to bring the gun within the dome-cover or move it out into firing position, substantially as described.

382,183. APPARATUS FOR PRODUCING METALS BY MEANS OF ELECTROLYSIS. JOHANNES CHRIST, Gumtz, Saxe-Altenburg, Germany, assignor to Chemische Fabrik Gumtz, Bottiger & Seidler, same place. Filed Feb. 17, 1886. Serial No. 192,203. (No model.) Patented in Germany June 6, 1886, No. 34,378; in France June 15, 1886, No. 169,560; in Belgium June 16, 1886, No. 69,904, and in England June 19, 1886, No. 7,510.

Claim.—1. The combination, with a fire-box and a reverberatory chamber, of half-retorts on the floor of the reverberatory chamber and electrodes in the half-retorts, substantially as shown and described.

382,183.



2. The combination, with a fire-box and a reverberatory chamber divided by partitions into compartments, of two half-retorts in each compartment and an electrode in each half-retort, substantially as shown and described.

3. The combination, with a fire-box and a reverberatory chamber, of supporting-pieces on the floor of the chamber, half-retorts on the supports, and an electrode in each half-retort resting on the supports, substantially as shown and described.

4. The combination, with a fire-box and a reverberatory chamber, of half-retorts in the chamber, the reverberatory chamber having a compartment below each half-retort, and a tube establishing communication between each half-retort and the compartment below it, substantially as shown and described.

5. The combination, with a fire-box and a reverberatory furnace, of half-retorts in the reverberatory chamber, electrodes in the half-retorts, a compartment below each half-retort, a tube establishing communication between each half-retort and its compartment, and a detachable cap or head piece on the outer end of each compartment, substantially as shown and described.

382,184. CULTIVATOR. JOHN F. PACKER, Chicago, Ill., assignor to the David Bradley Manufacturing Company, same place. Filed Aug. 20, 1887. Serial No. 247,479. (No model.)

Claim.—1. The cross-head F, having two semicircular portions, *f*, for the reception of attaching-sleeves, substantially as and for the purpose specified.

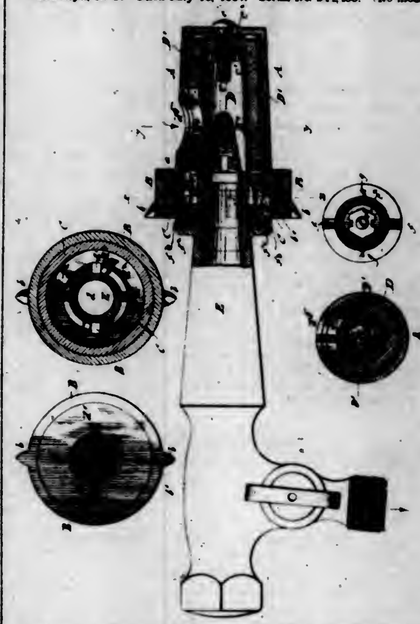
2. The cross-head F, having two semicircular portions, *f*, in combination with the sleeve or collar G, for attaching a cultivator-beam and receiving the wear, substantially as specified.

3. The cross-head F, having two semicircular portions, *f*, with slot *f'*, in combination with the sleeves G and clamping-eyebolts H, for locking the sleeves against movement, substantially as and for the purpose specified.

4. The cross-head F, having two semicircular portions, *f*, and plates D, in combination with a plow-beam for maintaining the alignment of the cross-head and a straight run for the shovels, substantially as specified.

5. The combination of the coupling C, having two arms forming a fork, the attaching-plates D, one being secured to each arm of the fork and provided with holes *d'*, and the beam E, formed of two bars pivotally attached to the plates D by a bolt, *e*, passing through holes *d'* of the plates D, as described, for the purposes specified.

382,185. ATTACHING MOLD-BOARDS. JOHN F. PACKER, Chicago, Ill., assignor to the David Bradley Manufacturing Company, same place. Filed Aug. 20, 1887. Serial No. 247,480. (No model.)

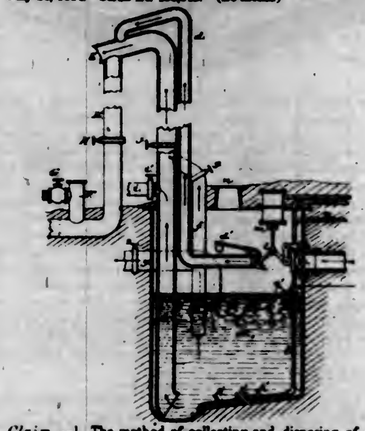


Claim.—The combination, with the mold-board and its standard, of three bosses made integral with one of said parts and arranged in triangular relation to each other to form three bearing-points between

the mold-board and the standard, substantially as shown and described, and for the purpose specified.

382,186. FAUCET ATTACHMENT FOR BARRELS. JACOB PAULUS, Brooklyn, N. Y. Filed July 16, 1887. Serial No. 244,435. (No model.)

Claim.—1. The combination, with a bushing, of an exterior socket secured to said bushing, a screw-collar having an opening and diametrical recesses, an interior socket having diametrical recesses in line with the recesses of the collar, a screw-pivot connecting the interior and exterior sockets, and a faucet the barrel of which is provided with lugs for engaging the recesses of the interior socket and turning the same on its axis, substantially as set forth.



2. The combination of a bushing secured to the faucet-hole of the barrel, an exterior socket having an opening, an interior socket also having an opening, a screw-pivot connection between said sockets, a screw-collar for retaining the exterior socket in the bushing, said screw-collar being provided with recesses, interior inclined rims, and stops at the ends of said rims, and a faucet the barrel of which is provided with lugs engaging rims of the screw-collar and the recesses of the interior socket, substantially as set forth.

382,187. ROD-PACKING. FRANK PINCH, Sidney, assignor to the Excelsior Metallic Packing Company, Middletown, N. Y. Filed Dec. 6, 1887. Serial No. 257,082. (No model.)

Claim.—In a metallic ring packing, the combination, with an outer ring having a peripheral opening and an interior right-angled recess, of an inner ring resting in said recess and having a lug on its periphery projecting outwardly into the peripheral opening in the outer ring, the said inner ring being cut through, and the ends thus formed cut away to form rabbets, into each of which the opposite end of said ring is adapted to fit, and thus causes the ends to overlap, substantially as specified.

382,188. MEANS AND APPARATUS FOR COLLECTING AND SEPARATING SEWAGE. WILLIAM A. PITT, Glenbrook, Conn. Filed July 26, 1884. Serial No. 138,918. (No model.)

Claim.—1. The method of collecting and disposing of sewage from low plains, which consists in collecting the sewage in a closed tank, agitating the same by means of jets or currents of air, and then expelling the mass at a given elevation above the ground by the introduction of compressed air in the tank, as set forth.

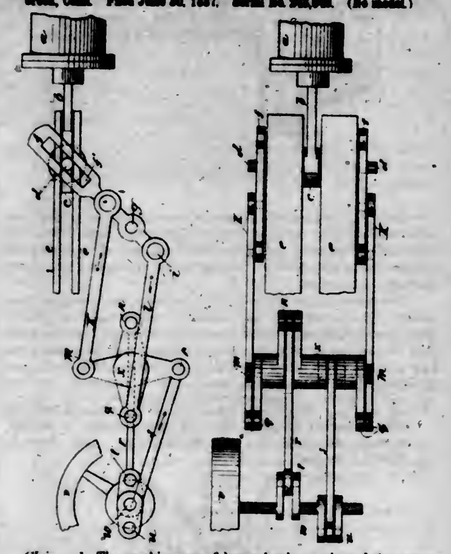
2. The combination, with an ordinary grade-sewer, of a closed receiver provided with an outlet-pipe extending above the ground to a height to attain a gravity flow, an air-relief pipe opening in the interior of said tank on a plane with the sewer, and self-acting caps closing the mouths of the sewer and air-relief pipe with an air-compressing main, as set forth.

3. The combination, with a closed receiver communicating with the sewer and provided with an elevated outlet-pipe, compressed-air pipe, and means for regulating the admission of sewage into said receiver, of a secondary closed tank communicating with the outlet-pipe, divided by a perforated diaphragm or grating, and provided with a discharge-orifice in the bottom, and an outlet-pipe, whereby the separation and discharge of the solid and fluid matters are effected, as described.

4. The combination, with a closed receptacle adapted to receive and discharge the sewage from an ordinary grade-sewer, of a tank communicating with said discharge-pipe, provided with a drainer or grating to separate the liquid from the solid matter, and ducts for the discharge of such matters, as and for the purpose set forth.

5. The combination, with a sewage-tank connected with a sewer-pipe, of a funnel-shaped opening and valve located in the bottom of said tank, a grating arranged within the tank, and a duct or opening above said grating communicating with another tank, whereby the lighter matter is separated and conveyed into another tank, as set forth.

6. In combination with the tank A, the tanks B and C, arranged to receive the delivery from said tank, with means for separating the solid from the fluid matter, and conduits for conveying the liquid to the final point of discharge, as set forth.



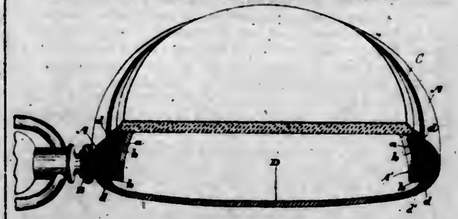
7. The combination, with the sewer-pipe *a*, of the receiver A, provided with the outlet-pipe *b*, air-relief pipe *d*, compressed-air pipe *e*, self-acting caps *k*, for closing the mouth of the sewer-pipe and air-relief pipe, and discharge-pipe *f*, having valve *g*, as and for the purpose set forth.

8. The separator C, divided into two compartments arranged to receive the delivery from the tank A by gravitation, and provided with an overflow, and a discharge-duct, as and for the purpose set forth.

9. The combination, with the tank B, having a funnel-shaped discharge or outlet, of the funnel-shaped sleeve *t'*, with arms *r'* and *s'*, having a pin-and-slot connection, and arm *v'* and lever *o'*, having a similar connection with gate-valve *q*, as set forth.

10. The combination, with a receiving-tank and its main discharge-pipe, of the connecting-pipe E, extending beneath the ground with branch connection F, and valve G, as and for the purpose set forth.

382,189. CRANK AND LEVER MOTION. WILLIAM A. PITT, Glenbrook, Conn. Filed June 30, 1887. Serial No. 243,043. (No model.)



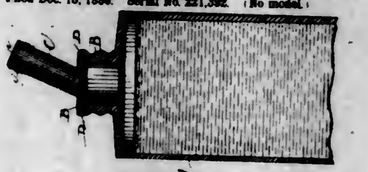
Claim.—1. The combination of levers having a pin-and-slot connection with the cross-head, rods connecting said levers with a set of cranks at right angles on the same shaft, and rods connecting another pair of cranks similarly mounted on the said shaft with cranks set on the same plane on the main driving-shaft, as and for the purpose set forth.

2. The combination of shaft *x*, cranks *m m*, *q q*, and *p n*, connecting-rods *k k l l*, levers *f f*, cranks *t u*, and connecting-rods *r s*, all arranged as and for the purpose set forth.

3. The combination of levers *f f*, cross-head *c*, moving in guideways *e*, cranks *m m* and *q q*, connecting-rods *k k l l*, cranks *n* and *p*, rods *r s*, and cranks *t u*, all arranged and operated as set forth.

4. The combination of cranks *m m* and *q q*, set at right angles on the same shaft, levers *f f*, connecting-rods *k k l l*, and the cranks *n p*, mounted on the same shaft at right angles to each other and to the cranks *m m* and *q q*, with cranks *t* and *u*, set on the same plane, shaft *w*, and connecting-rods *r* and *s*, as set forth.

382,190. WATCH-CASE. ROBERT J. QUIGLEY, Toronto, Ontario, Canada. Filed Oct. 27, 1887. Serial No. 253,568. (No model.)



Claim.—1. A watch-case center made wider than the base of its pendant, in combination with a movement-ring fitted in said center, and a bezel or back having a ring formed on it designed to fit into a recess made in the center, and a shoulder, *d'*, abutting against said movement-ring, substantially as and for the purpose specified.

2. The combination, with a watch-case center, A, and a movement-ring, A', fitted in said center, of a back or bezel having a ring, *a*, formed on it to fit into a recess formed in the center A, and a flange, *d*, to butt against the edge of the center A, and a shoulder, *d'*, abutting against said movement-ring, substantially as and for the purpose specified.

3. The combination, with the watch-case center A, formed with interior recess and shoulder *d'*, of the movement-ring fitted in the re-

com in said center and abutting against said shoulder, and a back having a shoulder, *d'*, abutting against the edge of the movement-ring, and a flange, *d*, abutting against the outer edge of the center, substantially as shown and described.

382,191. BOTTLE-STOPPER. WILLIAM H. REDINGTON, Chicago, Ill. Filed Dec. 13, 1886. Serial No. 221,392. (No model.)

Claim.—1. A stopper for bottles or other vessels, comprising a cap to be secured to the top of the vessel, a spout extending out from the cap at an angle, having a diameter at its outer end not less than the smallest diameter of its body, and means for closing the spout, substantially as described.

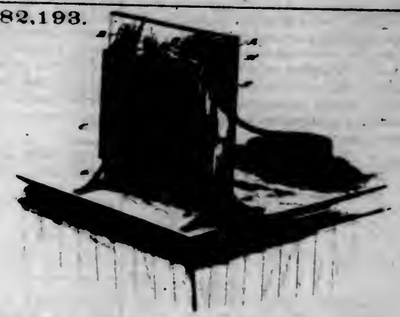
2. In combination with a bottle or other vessel, a stopper comprising a cap secured to the top thereof, a tubular spout of substantially the same diameter throughout its entire length extending out from the cap at an angle, whereby the liquid may be permitted to flow out without the aid of any additional vent or opening, and means for closing the end of the spout, substantially as described.

382,192. MEAT-CUTTING MACHINE. G. OSCAR RINMAN and JOHN ZIMMERMAN, Cincinnati, Ohio; said Rinman assignor to said Zimmerman. Filed Aug. 12, 1884. Renewed Feb. 1, 1888. Serial No. 262,666. (No model.)

Claim.—1. In a meat-cutting machine, the combination of a hopper, a horizontal-cylinder force-feed provided with radially-reciprocating arms D, and a rotary shaft carrying a series of cutting-knives below and in proximity to said cylinder, to cut the meat brought within range of the cutters by said arms, substantially as described.

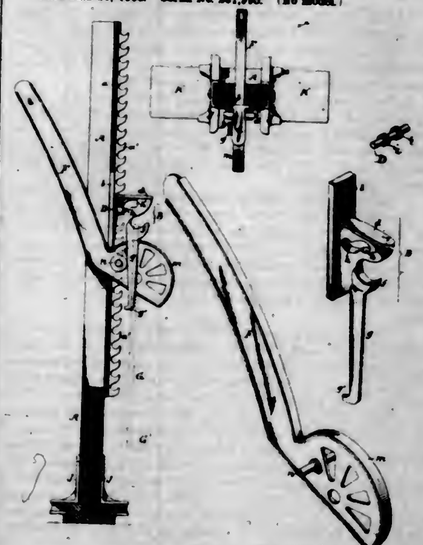
2. In a rotary meat, beef-fat, or lard cutting machine, the combination of a series of parallel cutting-knives, *k*, mounted on a rotating shaft, E, and a comb, *d*, adjustable laterally by set-screws, for the purpose of adjusting the relative cutting-paths of the knives at a greater or less distance from the sides of the teeth, substantially as and for the purpose specified.

3. In a rotary meat-cutting machine provided with combs *d*, adjustable laterally, the set-screws *f f'*, for producing such adjustment, in combination with the holding-screws *l l*, inserted through slotted openings permitting such adjustment, substantially as described.



4. In a rotary meat-cutting machine, the combination of the force-feed mechanism, consisting of shaft A, cylinder C, having slotted openings *a b c*, and arms D, provided with pivots *e e* and having beveled edges *h*, the hopper B, constructed with curved interior surfaces, as described, and having the grooves in the ends thereof, and adapted to carry the shaft A; with cylinder C thereon, and adjustable combs adapted to be shifted laterally in relation to the knives, substantially as and for the purpose specified.

5. In a rotary meat-cutting machine, the combination of the shaft E, carrying the cutting-knives *k*, force-feed cylinder C on the shaft A, provided with radially-reciprocating arms D, and means, as described, for keeping said arms in close proximity to the respective left and right hand sides of the hopper B, substantially as and for the purpose described.



6. In a rotary meat-cutting machine, the combination of the shaft E, carrying knives *k*, and the shaft A, with cylinder C, carrying arms D on the hopper B, so that the knives *k* will pass in close proximity to the surface of the cylinder C at the point where arms D have reached their greatest recession, the cylinder C so journaled that it shall be ahead of the cutting-knives *k* in the direction of rotation, for the purpose of assisting the feeding and cutting operations, substantially as described.

382,193. ROPE-MEASURING DEVICE. LEVI J. ROSS, Goodwin, Dak. Filed Oct. 6, 1887. Serial No. 251,657. (No model.)

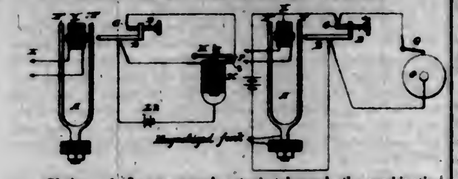
Claim.—In a device for measuring rope or cordage, the combination of the vertically-disposed supporting frame-work constructed to form inclosing-cases for the mechanism, as set forth and shown, the upper longitudinally-arranged shaft, carrying a centrally-situated worm and a small plain-faced wheel or roller, F, on one end thereof, a spring-actuated pressure-block mounted directly above the said wheel or roller and acting directly against the face thereof, the serrated disk D, mounted on a transverse shaft, *d*, and in direct connection with the worm on the upper longitudinal shaft, the dial-plate C, through which the transverse shaft *d* extends, provided with two sets of relatively-arranged figures indicative of feet and pounds, and an indicator, *i*, secured to the projecting end of the transverse shaft *d*, whereby—the roller translating motion to the upper longitudinal shaft, and the worm on the said shaft imparting said motion to the serrated disk which revolves the hand—the action is made positive and the measurement accurately registered, substantially as described.

382,194. LIFTING-JACK. SAMUEL Z. SCHWENK, Pottstown, Pa. Filed Jan. 26, 1888. Serial No. 261,993. (No model.)

Claim.—1. The combination of the standard and its rack, the cam-lever having a fulcrum-pin adapted to said rack, and a lifting-foot having a stem guided in the standard, and a curved base forming a bearing for the cam-lever, all substantially as specified.

2. The combination of the standard and its rack, the operating-lever having a fulcrum-pin adapted to said rack, and the lifting-foot having a depending bar serving as a stop and guide for said fulcrum-pin, all substantially as specified.

3. The combination of the standard and its rack, an operating-lever having a fulcrum adapted to said rack, and the lifting-foot having a depending bar with inturned lower end, whereby it serves as a stop, guide, and catch for the fulcrum-pin of the lever, all substantially as specified.



4. The combination of the standard and its rack, the operating-lever, the lifting-foot having an inclined slot, and a retaining-pin engaging with the teeth of the rack and free to slide in said slot, all substantially as specified.

5. The combination of the standard and its rack, the operating-lever, a lifting-foot having an inclined slot enlarged at the outer end, and a retaining-pin adapted to said slot and having opposite stop-shoulders, all substantially as specified.

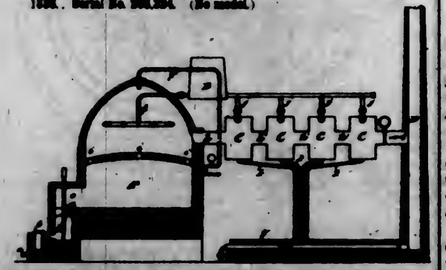
6. The combination of the standard and its rack, the operating-lever, the lifting-foot having an inclined slot forming a seat or pocket at the outer end, and the retaining-pin adapted to engage with the teeth of the rack, but free to slide in the slot and to enter the pocket at the outer end of the same, all substantially as specified.

7. The base-plate having a vertical groove for the reception of the vertical bar of the standard, and transverse and longitudinal grooves, each adapted for the reception of a base-bar, all substantially as specified.

382,195. TELEGRAPH-RECEIVER. CHARLES SELDEN, Baltimore, Md. Filed Nov. 15, 1887. Serial No. 255,947. (No model.)

Claim.—1. In a tone or harmonic telegraph, the combination, with a tuning-fork operated by the main current, of an independent set of contacts in a local circuit, a support for the contacts and adjusting devices for said support, substantially as described.

2. In a tone or harmonic telegraph, the combination, with a tuning-fork operated by the main current, of a support carrying a fixed contact-piece, a movable contact-piece also mounted in the support, a local circuit including the contacts, and adjusting-screws for the contacts, substantially as described.



3. In a tone or harmonic telegraph, the combination, with a tuning-fork operated by the main-line current, of an independent set of adjustable contacts included in a local circuit, and a signal-receiving instrument in the circuit, substantially as described.

4. In a tone or harmonic telegraph, the combination, with a tuning-fork and an independent set of contacts operated thereby, of a local circuit including the contacts in one branch, and an automatic receiving-instrument in another branch, substantially as described.

5. In a tone or harmonic telegraph, the combination of a tuning-fork operated by the main-line currents, a set of contacts in a local circuit operated by the fork, an automatic receiving style or finger in the local circuit, and a second style or finger in a secondary circuit to the primary, substantially as described.

6. In a tone or harmonic telegraph, the combination, with a tuning-fork having a certain rate of vibration and controlled by the main-line currents, of an independent set of contact devices controlling the local receiving-instruments and adjusting devices whereby the contacts may be arranged so as to be operated only when the fork vibrates normally, substantially as described.

382,196. FURNACE FOR REDUCING ALUMINUM. FREDERICK J. SEYBOTH, Findlay, Ohio. Filed Apr. 26, 1887. Renewed Mar. 24, 1888. Serial No. 268,394. (No model.)

Claim.—1. The combination of the reducing-chamber provided with means for supplying air, gas, and ores, the gas and vapor exit flue leading from the same, the heating-chamber for the blending and expansion of gases, the exit-flue leading from said chamber, the cooling-chamber, and the superposed chamber provided with a spraying device communicating with said cooling-chamber, all combined substantially as and for the purpose specified.

2. The combination of the reducing-chamber provided with means for supplying air, gas, and ores, the gas and vapor exit flue leading from the same into a chamber for the blending and expansion of gases, the said chamber, an exit-flue leading from said chamber, the cooling-chamber, the spraying-chamber communicating with said cooling-chamber, and a condenser provided with spraying device, all combined substantially as and for the purpose specified.

3. The combination of the reducing-chamber provided with means for supplying air, gas, and ores, the gas and vapor exit flue leading from the same, the heating-chamber, an exit-flue leading from said chamber, the cooling-chamber, the superposed chamber provided with spraying device, the condenser provided with spraying device, and discharge-pipes and evaporating-pan.

382,197. METHOD OF OBTAINING ALUMINA FROM CLAY. FREDERICK J. SEYBOTH, Findlay, Ohio, assignor to the American Aluminum Company, Detroit, Mich. Filed May 16, 1887. Serial No. 238,288. (Specimens.)

Claim.—1. The process of separating alumina from clay or aluminous earth, which consists in mixing the clay or earth with a deoxidizing agent and a flux, and with copper or other metal of greater specific and atomic weight than aluminum, heating the mixture to produce a mixture of finely-divided materials and oxides, and then cooling, condensing, and collecting the same, substantially as specified.

2. The process of separating alumina from clay or aluminous earth, which consists in mixing the clay or earth with a deoxidizing agent and a flux, and with copper or other metal of greater specific and atomic weight than aluminum, heating the mixture, cooling the mingled oxides that pass from the heating-chamber, separately condensing and collecting silica, and, finally, cooling and collecting alumina mingled with the other metallic oxides, substantially as specified.

382,198. PURIFICATION AND ALLOYING OF COPPER. FREDERICK J. SEYBOTH, Findlay, Ohio, assignor to the American Aluminum Company, Detroit, Mich. Filed May 16, 1887. Renewed Mar. 24, 1888. Serial No. 268,395. (No specimens.)

Claim.—1. The method of purifying metals, which consists in fusing one or more of them with a flux composed of phosphorus and fluor-spar, substantially as specified.

2. The method of purifying and alloying a metal, which consists in fusing it with a flux composed of phosphorus and fluor-spar, and with one or more metallic oxides in the presence of a deoxidizing agent, such as carbon, substantially as specified.

3. The method of purifying and alloying copper, which consists in fusing it with a flux composed of phosphorus and fluor-spar, and with the oxides of aluminum and zinc in the presence of a deoxidizing agent, such as carbon, substantially as set forth.

382,199. SUSPENDER-BUCKLE. CALVIN VOORHIS, New York, N. Y., assignor to himself and Abraham Shenfield, same place. Filed Feb. 10, 1888. Serial No. 263,573. (No model.)

Claim.—1. In a buckle, the combination, with the main plate A, having a transverse slot and loop, B, at its upper edge, through which the suspender-web or other material passes, and teeth 2 and eyes or journal *b* at lower edge, of a swinging loop, D, pivoted to said plate, so that the main bar of said swinging loop D is parallel with and adjacent to the points of said teeth, and through which loop the suspender-web or other material passes, substantially as set forth.

2. The plate A, having teeth and eyes or journals 5 at its lower edge, in combination with the loop D, having a cross-bar, 6, adjacent to the teeth 2, the ends of said cross-bar 6 passing through the eyes or journals *b* and bent or curved at 9 to form springs, and the loop B at the upper part of the plate A, substantially as set forth.

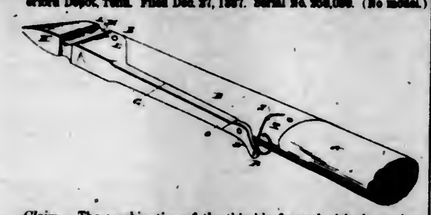
3. The plate A, having loop B at the upper edge, and teeth and eyes or bearings at the opposite edge, in combination with the loop D, which is curved to form spring 9, and suspended by the eyes or journal *b*, substantially as set forth.

382,200. NUT-LOCK. JOSEPH G. WARE, Marengo, Iowa, assignor of one-half to Joseph G. Krantz, same place. Filed Feb. 3, 1888. Serial No. 262,862. (No model.)

Claim.—1. A nut and bolt lock composed of a washer having an opening and a device, as a wedge, located opposite the opening, and

382,200.

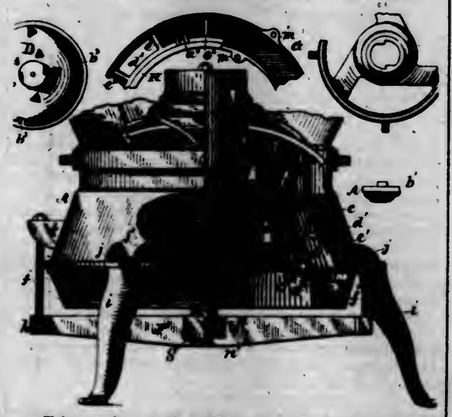
a split key adapted to be passed through the said opening and spread by the wedge, substantially as and for the purpose described.



2. The combination, with the lower washer adapted to interlock with the timber and the upper washer having an opening, of a wedge secured to the lower washer and having its edge located opposite the said opening and the split key adapted to be passed through the said opening and spread on the wedge, substantially as and for the purpose described.

3. The combination, with the lower washer adapted to interlock with the timber and the upper washer having an opening, of the key adapted to pass through said opening and lock the barr, the upper and the lower washer together, substantially as set forth.

4. The combination, with the lower washer having a wedge-block and the upper washer having an opening, of a pin to hold the opening and wedge in register, and the split key, substantially as described.



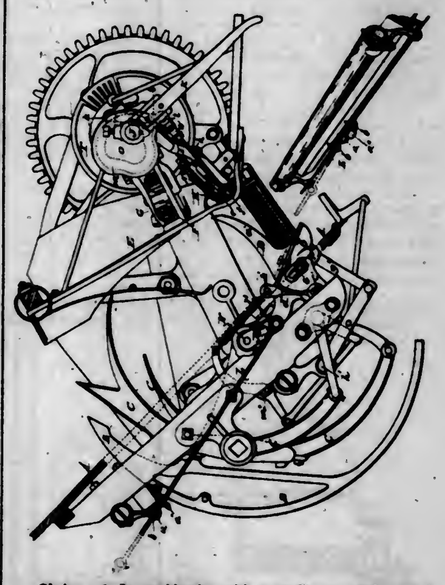
5. The combination, with the lower washer adapted to interlock with the timber and the series of wedge-shaped blocks, of the upper washer resting on the said blocks and provided with a series of openings opposite the ends of the wedges, the pin for holding the openings and wedge-blocks in register, and the split key, substantially as described, for the purpose specified.

382,201. HORSE-DETACHER. ABSALOM M. WITHERINGTON, Rutherford Depot, Tenn. Filed Dec. 27, 1887. Serial No. 259,090. (No model.)

Claim.—The combination of the thimble formed with the socket, the slanting shoulders, and the reduced outer end, and having the point or stop at its rear side, the pivoted end piece formed with the slanting recessed outer part, and the reduced inner rear end having the inclined shouldered extremity and the recess W, the centrally-pivoted catch having the shouldered inclined inner end, the spring, and the operating-cord, substantially as set forth.

382,202. GRINDING-MILL. JAMES S. WOODCOCK, New Lexington, Ohio. Filed Nov 26, 1887. Serial No. 256,400. (No model.)

Claim.—1. In a grinding-mill having the running burr composed of a burr section or sections attached to a dome-plate or cap, and suspended from the latter on a central spindle, the combination, with the inner top flange of the burr-section having the flat rectangular lugs projecting therefrom, of the dome-plate having the exterior horizontal flange and provided with depressions in its convex surface and the bolts connecting said dome-plate and burr-section, whereby the latter is suspended wholly from said dome-plate and both longitudinal and transverse strain upon said connecting-bolts prevented, substantially as hereinbefore set forth.



2. In a grinding-mill, the combination of a case, a stationary burr within the latter, and a running burr composed of the two frustum-shaped sections, the upper section having niches to form the inner projecting lugs, the lower section having the inner projecting proximate lugs, bolts connecting the lugs of the two sections, with vertical lugs on one section engaging recesses in the other section, and the dome-plate insertible from within said running burr and connected by the means described with the upper frustum-shaped section of the latter, substantially as set forth.

3. In a grinding-mill, a stationary barr, a running barr within the latter, composed of a burr section or sections, and a dome-plate insertible through said burr section or sections, and from which the latter are suspended with the means of attachment, substantially as described, for the purpose hereinbefore set forth.

4. In a grinding-mill, the combination, with the running barr, the fixed or stationary burr, and the case having an exterior bottom flange provided with holes for its attachment, of the annular meal-trough having the perforated lugs m' and the bolts d', securing said meal-trough, said stationary barr, and the case together, and a ring conveyer having radial blades located within said annular meal-trough, and having means thereon for connecting it with the running barr, said meal-trough being provided with a discharge-orifice, substantially as set forth.

5. The combination, with the annular meal-trough having the inner projecting top flange, the conveyer adapted to rotate within said annular meal-trough and having a top flange extending over the latter, and the spacing-clips secured to the flange of said meal-trough, each having a jaw extending over the flange of said conveyer, adapted to guide the latter and prevent its displacement, substantially as set forth.

382,208. GRAIN-BINDING MACHINE. CALVIN YOUNG, Auburn, assignor of one-half to D. M. Osborne & Company, New York, N. Y. Filed July 7, 1883. Renewed Oct. 14, 1887. Serial No. 252,318. (No model.)

Claim.—1. In combination with a needle-arm and a crank mounted on its shaft, a reciprocating cord-controlling arm mounted upon and actuated by said crank; as described.

2. In combination with the vibratory needle-arm, the crank M thereon, the reciprocating slack-arm L, and the fixed cord-guides, substantially as described.

3. The needle-arm, its rock-shaft, and the crank upon said shaft, in combination with the reciprocating slack-arm having an eye therein

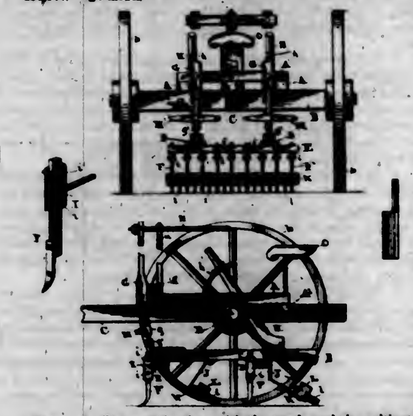
and mounted on said crank, and the fixed cord-guides arranged on opposite sides of said arm.

4. The cord-clamping disk provided with ratchet-teeth, in combination with the swinging arm f, the spring-actuated pawl thereon, the rod A, to operate said arm, the lever i, operating said rod, and the cam-wheel grooved in its side face and acting directly upon a stud or roller on the lever.

5. In combination with the vertically-swinging frame I, the operating-cam o, the lever i, the clamping-wheel mounted on the swinging frame I and provided with ratchet-teeth, the swinging arm, also mounted on said frame, the spring-actuated pawl mounted on said arm to turn the clamping-wheel, and the rod extending from said arm to the lever i, whereby an intermitting rotary motion is imparted to the clamping-disk, while at the same time it is permitted to rise and fall with the swinging frame.

6. In combination with a rotary tying-bill of the type herein shown and described, the rotary cord-clamping disk, the pawl-carrying arm to rotate the disk, the vibratory lever and its actuating-cam, and the rod A and the head o, threaded thereon, the two forming an adjustable connection between the lever and pawl-carrying arm, substantially as described, whereby the rotation of the clamping-disk may be accurately adjusted and the presentation of the cord to the tyer properly controlled.

7. In combination with the cord-clamping disk having ratchet-teeth, the pawl p, to prevent a retrograde motion, and the cord-clamping jaw or plate N, the two mounted on one and the same pivot.



8. The combination with the fixed standard or frame and the vertically-swinging frame I, having the cord-clamp thereon, an adjustable stop, substantially as described, to limit the vertical motion of the said frame.

9. In combination with the vibratory frame I, with the cord-clamp thereon, the fixed standard or frame, the stop S, to limit the motion of said frame, and the adjusting-nuts applied as described.

10. The combination of the vertically-swinging arm d', the plate e', united thereto by a pivot and slotted connection, and the compressor proper mounted upon said plate.

11. In a grain-binder, the combination of a rock-shaft, the binding-needle and the crank, both fixed on said shaft, and a reciprocating cord-controlling arm closely jointed to and moved in both directions by said crank.

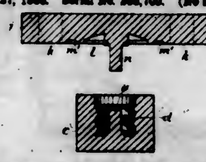
382,204. COMBINED HARROW, LEVELER, AND CULTIVATOR. PETER H. APPLEGATE, Kimball, Ind. Filed Jan. 3, 1888. Serial No. 259,577. (No model.)

Claim.—1. The combination, with the truck and the cultivator-frame, of the vertical levers G, pivoted to swing laterally and having their lower ends connected with and supporting the front end of the cultivator-frame, and the levers H, having their lower ends connected directly with and supporting the rear end of the frame, substantially as set forth, for the purpose described.

2. The combination, with the truck and the cultivator-frames, of the vertical levers united at their upper ends, the standard n, the hand-lever N, which guides the cultivators at the forward end instead of rear, the links pivotally connected with the lower ends of the levers and having a series of openings in their length, and the short chains for adjustably connecting the cultivator-frames with the links, substantially as and for the purpose described.

3. The combination, with the truck and the cultivator-frames provided with the earth-treating devices, of the levers H, having their lower ends connected directly with the frames, the levers G, mounted and united to move laterally together, the links g, having a series of openings in their length, the short chains g', and the whiffletrees applied to the links g and adjustable thereon, substantially as and for the purpose described.

4. The herein-described agricultural implement, composed of the truck, the adjustable seat, the cultivator-frames, the levers supporting the rear end of the cultivator-frames, the levers G, the standard n, the hand-lever N, the links g, having a series of perforations in their length, the whiffletrees adjustable on the links, the adjustable ground-openers, the brackets having slanting ends, the leveler-bars, the pulverizing-bars, and the pulverizing-teeth placed on the pulverizing-bars, the teeth of one bar coming opposite the spaces between the teeth of the other bar, substantially as described.



382,205. FAN. JAMES B. BAERMANN, New York, N. Y. Filed Nov. 12, 1887. Serial No. 254,998. (No model.)

Claim.—1. A folding fan composed of a series of folding arms, one of said arms being provided at its free end with a recessed offset adapted to receive one of the other of said arms when folded, a feather secured to said offset, and a feather secured to each of the other arms, substantially as described.

2. A folding fan composed of a series of folding arms, one of said arms being provided at its free end with a recessed offset, and another of said arms being provided with a recess made to correspond with the recess of said offset, a feather secured to said offset, and a feather secured to the free end of each of the other arms, substantially as set forth.

382,206. MANUFACTURE OF SCREW-STOPPERS. HENRY BARBET and JOHN J. VARLEY, London, England. Filed Dec. 17, 1886. Renewed Mar. 27, 1888. Serial No. 268,703. (No model.)

Claim.—1. A mold for the manufacture of screw-stoppers, consisting of the combination of a block or plate provided with a hole, (one or more,) as set forth, adapted to receive the hub, a middle plate having a hole for the heads of the stoppers, and a top or press plate, these parts being constructed and operated substantially as shown and described.

2. A mold for the manufacture of screw-stoppers with holes through them, consisting of a block or plate provided with holes, as set forth, adapted to receive a number of screwed hubs, the hub c and top plate, j, each having a central pin or core, and the middle plate having a hole for the head of the stopper, these parts being constructed and operated substantially as shown and described.

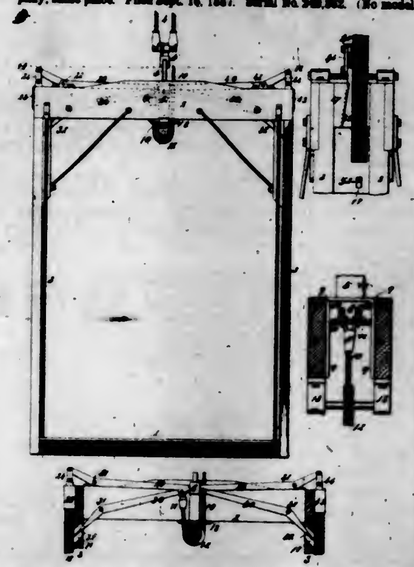
3. In molds for manufacturing screw-stoppers, the combination of the hub c, having a female screw-thread, and the plate e, adapted for forming the head of the stopper, and also for holding it while it is screwed out of the hub, these parts being constructed and operated substantially in the manner hereinbefore described.

4. In molds for manufacturing screw-stoppers, the combination, with the top plate, j, having the central pin, n, of the hub c, having the central pin, o, for the purpose of producing screw-stoppers with a central hole through them, substantially as described.

382,207. SPRING-SEAT. MARION J. BARROW, New Bloomfield, Mo. Filed Mar. 19, 1888. Serial No. 267,682. (No model.)

Claim.—1. The hereinbefore-described vehicle-seat, composed of the platform of slats of different lengths, the longer slats being united at their ends and the shorter slats being connected at their middle with the middle of the longer slats, and the seat supported at its ends

382,207.

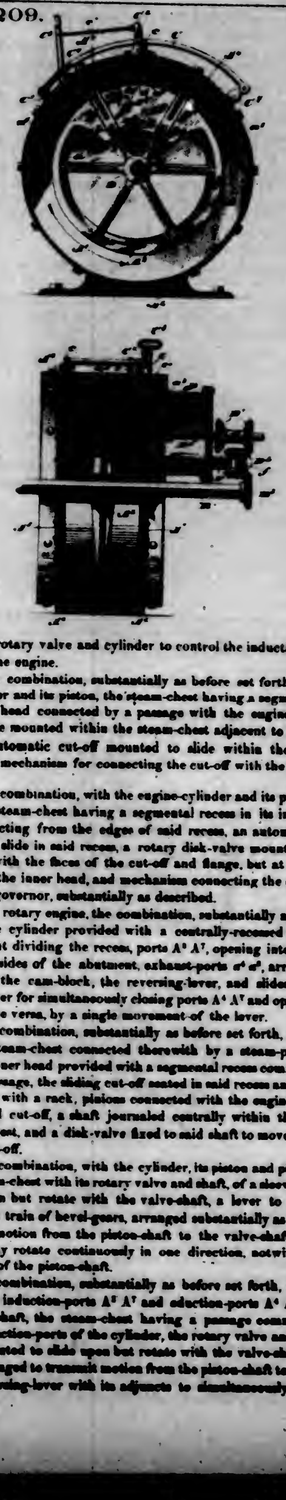


on the ends of the shorter slats, which slats are flexible and in the same plane with the longer slats, substantially as specified.

2. The herein-described platform for a vehicle-seat, composed of a series of slats of different lengths clamped together midway of their ends between cleats, and having the ends of the longer slats secured together by cleats, the slats being in the same plane, substantially as specified.

3. The combination, with the platform, composed of long and short slats arranged in the same plane, the short slats having openings at their ends, the middle cleats securing all the slats together, and the end cleats securing the long slats together only, of the seat, the bolts depending from the seat and adapted to enter the openings in the short slats, the blocks interposed between the seat and the short slats, and the stay-hook for holding the seat on the platform, substantially as specified.

382,208. SAFETY DEVICE FOR ELEVATORS. JOHN S. BRIGGS, St. Louis, Mo., assignor to the Smith, Briggs & Rankin Machine Company, same place. Filed Sept. 16, 1887. Serial No. 249,802. (No model.)



Claim.—1. The combination of the cage, movable block secured to the cage, hoisting-cable, and counterbalance-cable connected to the block, a double set of levers connected to the block and pivoted to the cage, wedges on the outer ends of one pair of the levers, prongs or points on the outer ends of the other set of levers, and uprights of the elevator-shaft, substantially as and for the purpose set forth.

2. The combination of the cage, movable block 6, cables 4 and 10, levers 20, 30, 40, and 50, pivoted to the cage, wedges 23 and 43, connected to the levers 20 and 40, projections 17 on the cage, levers 30 and 50, pivoted to the cage and having points 32 and 52 entering holes 18 in the sides of the cage, and uprights 16 of the elevator-shaft, substantially as and for the purpose set forth.

382,209. ROTARY ENGINE. AVERY W. BILLINGS and WILLIAM G. BILLINGS, Larned, assignors of one-third to Arthur T. Billings, Belmore, Kans. Filed Dec. 8, 1887. Serial No. 257,267. (No model.)

382,209.

Claim.—1. In a rotary engine, the combination, substantially as before set forth, of the engine-cylinder provided with a cam-block carrying an abutment, the piston, the steam-chest, ports for connecting the steam-chest with the cylinder at opposite sides of the abutment, eduction-ports arranged near the ends of the cam-block, a rotary valve within the steam-chest, and a slide-valve interposed between the rotary valve and cylinder to control the induction-ports for reversing the engine.

2. The combination, substantially as before set forth, of the engine-cylinder and its piston, the steam-chest having a segmental recess in its inner head connected by a passage with the engine-cylinder, a rotary valve mounted within the steam-chest adjacent to its recessed head, an automatic cut-off mounted to slide within the segmental recess, and mechanism for connecting the cut-off with the engine-governor.

3. The combination, with the engine-cylinder and its piston, of the cylindrical steam-chest having a segmental recess in its inner head, a flange projecting from the edges of said recess, an automatic cut-off mounted to slide in said recess, a rotary disk-valve mounted to move in contact with the faces of the cut-off and flange, but at a little distance from the inner head, and mechanism connecting the cut-off with the engine-governor, substantially as described.

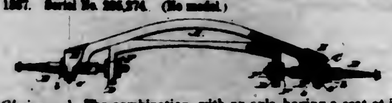
4. In a rotary engine, the combination, substantially as before set forth, of the cylinder provided with a centrally-recessed cam-block, the abutment dividing the recess, ports A^6 A^7, opening into the recess at opposite sides of the abutment, exhaust-ports a^4 a^5, arranged near the ends of the cam-block, the reversing-lever, and slides connected with said lever for simultaneously closing ports A^4 A^7 and opening ports A^5 A^6, or vice versa, by a single movement of the lever.

5. The combination, substantially as before set forth, of the cylinder, the steam-chest connected therewith by a steam-passage and having its inner head provided with a segmental recess communicating with said passage, the sliding cut-off seated in said recess and provided peripherally with a rack, pinions connected with the engine-governor to move said cut-off, a shaft journaled centrally within the heads of the steam-chest, and a disk-valve fixed to said shaft to move in contact with the cut-off.

6. The combination, with the cylinder, its piston and piston-shaft, and the steam-chest with its rotary valve and shaft, of a sleeve mounted to slide upon but rotate with the valve-shaft, a lever to move said sleeve, and a train of bevel-gears, arranged substantially as described, to transmit motion from the piston-shaft to the valve-shaft, whereby the valve may rotate continuously in one direction, notwithstanding the reversal of the piston-shaft.

7. The combination, substantially as before set forth, of the cylinder having induction-ports A^2 A^7 and eduction-ports A^4 A^5, the piston and its shaft, the steam-chest having a passage communicating with the induction-ports of the cylinder, the rotary valve and its shaft, a sleeve mounted to slide upon but rotate with the valve-shaft, a train of gears arranged to transmit motion from the piston-shaft to the valve-shaft, a reversing-lever with its adjuncts to simultaneously open and close two ports of the cylinder at one movement, and a lever to shift the sliding sleeve on the valve-shaft.

8. The combination, substantially as before set forth, of the cylinder having induction and exhaust ports, arranged as described, the pivoted yoke carrying a slide-valve at each end, the slide-valve C^2, the reversing-lever, and rods connecting the reversing-lever with the valve C^2 and with the yoke.



382,210. LAMP. HENRY A. BLAKE, Chicago, Ill., assignor to A. Henry Hadden, same place. Filed Oct. 24, 1887. Serial No. 253,173. (No model.)

Claim.—1. The combination of an oil-pot, A, a burner, B, and a wick raising and lowering device having a button, *c*, in frictional contact with the oil-pot, substantially as and for the purpose set forth.

2. The combination of an oil-pot, A, provided with a raised top, a burner, B, and a wick raising and lowering device, C, having a button, *c*, in frictional contact with the oil-pot, substantially as and for the purpose set forth.

382,211. WAGON-AXLE. NATHAN W. BENNER, Auburn, Tex., assignor of one-half to Wayne B. Trousdale, same place. Filed Nov. 15, 1887. Serial No. 255,274. (No model.)

Claim.—1. The combination, with an axle having a seat at its outer end and a cent located in from said outer end, of the spindle having its shank provided with a threaded inner end, and nuts turned on said inner end on opposite sides of the inner seat, by which the spindle may be adjusted to and held in any desired position, substantially as set forth.

2. The combination of the axle having seat-lug D arranged in from its ends and provided with the ears *c* depending from its opposite sides at its end, the spindle having its shank formed to fit between said ears and having its point threaded, the clip E, and the nuts F F, substantially as set forth.

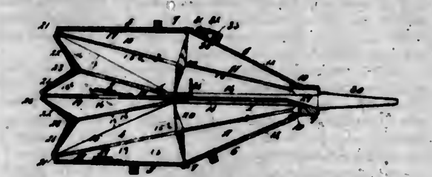
382,212. FRUIT-JAR FASTENING. WILLIAM BRAUN, Washingtonville, Ohio. Filed Mar. 12, 1888. Serial No. 267,002. (No model.)

Claim.—1. The combination, with a fruit-jar and its cover, of a bail, C, having coils *d d* and offsetting-loop *e*, the connecting bar or link *f* uniting the coils, and a roller, *g*, arranged upon the said loop portion, substantially as and for the purpose described.

2. The combination, with a fruit-jar, of a hemispherical cover, B, having channels *b b* and recesses *c c*, the bail C, provided with coils *d d* and loop *e*, connecting-bar *f* uniting the coils, and roller *g* arranged upon the loop portion, substantially as and for the purpose described.

382,213. HAY-STACKER. DAVID H. CAMPBELL, Denville, Ill. Filed Jan. 16, 1887. Serial No. 224,903. (No model.)

Claim.—1. The combination of the supporting frame-work, the vertically-arranged pole having an arm carrying sheaves at each end thereof, the brace-arms D^3, the longitudinally-arranged sectional shaft having gears at each end thereof, the gear on the lower end of the pole adapted to engage with the gear on one end of the longitudinal shaft, and the power-transmitting gear engaging with the gear on the opposite end thereof, the counter-shaft carrying a windlass, the sweep, the rope R, and the shifting-lever for connecting and disconnecting the several parts of the mechanism, whereby the same may be used together or independently, substantially as described.



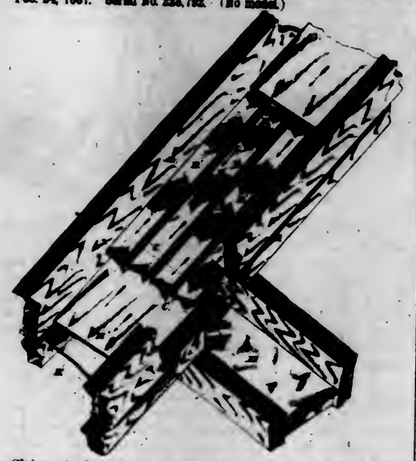
382,213.

2. The combination of the supporting frame-work, the vertically-arranged pole having an upper bifurcated end, the hinged sectional arm D^3, mounted in the upper end of the pole and carrying depending sheaves at its ends, the brace-arms, the longitudinal shaft connecting the gear at the base of the pole with the power-transmitting gear, as set forth, and the sweep, in connection with the extended end of the shaft of the power-transmitting gear, to which the power is attached for actuating the mechanism, as set forth, substantially as described.

3. The combination of the supporting frame-work, the pole, the hinged sectional arm D^3, pivotally mounted in the upper slotted end of the pole and carrying sheaves at its outer ends, the brace-arms D^4, secured at their upper bifurcated ends to the arm D^3 and at their lower ends to the pole by a wire, d^5, the longitudinal shaft adapted to be disconnected from the gear on the lower end of the said pole, the counter-shaft carrying a windlass and adapted to be unshipped from the power-gear, and the rope R, passing through the blocks on the frame and pole and over sheaves carried by the arm D^3, and through the upper slotted ends of the pole and its braces, substantially as described.

382,214. BELLOWS. FRANK GERSTER, St. Louis, Mo. Filed Aug. 8, 1887. Serial No. 246,494. (No model.)

Claim.—1. A bellows constructed with inclined forward top and bottom boards and horizontal rear top and bottom boards, the said boards being united, respectively, with each other by flexible joints and suitable valves, substantially as described.



2. In a bellows, the combination of the front top and bottom boards and the rear top and bottom boards, said boards being connected with each other respectively by flexible joints, a rigid center board extending the entire length of the inside of the bellows, a series of gore-shaped boards interposed between the top and bottom boards and secured in place by flexible joints, and the valves, substantially as described.

3. In a bellows, the combination of center board, 1, provided with valve 2, top and bottom boards, 3 6 5 6, secured together by flexible joints, nose 10, secured to sections 6 6 by flexible joints, nozzle on the nose, end boards, 22 24 22 24, secured to each other and to the center, top, and bottom boards, 5 5, by flexible joints, rearward side gore-shaped boards, 11 14 11 14, secured to each other and to the center, top, and bottom boards by flexible joints, rearward side gore-shaped boards, 15 15½ 16 16½ 15 15½ 16 16½, secured to each other and to the center, top, and bottom boards by flexible joints, flexible diamond-shaped pieces connecting forward boards, 11 14, and rear boards, 15 15½, below the center boards, and the forward boards, 11 14, and rear boards, 15 15½, above the center board, and flexible diamond-shaped pieces connecting rearward boards, 16 16½, to the end boards, 22 24, substantially as shown and described, and for the purpose set forth.

4. In combination with the bellows, made substantially as described, the lever 40, rock-bar 41, adjustable arms, and rods 44, as specified.

5. In a bellows, the combination, with the top and bottom, of a series of gore-shaped boards interposed between the same, the upper and lower most boards having their broad ends placed in a forward position, the center boards being arranged in an opposite position, said boards and top and bottom being united by flexible joints, and the valves, substantially as described.

382,215. **AUTOMATIC SLATE-PICKER.** ECKLEY A. COXE and SAMUEL SALMON, Drifton, Pa.; said Salmon assignor to said Coxe. Filed Feb. 24, 1887. Serial No. 228,732. (No model.)

Claim.—1. As a means of separating flat pieces of material from other pieces differently shaped, an inclined trough having the face over which the pieces slide inclined to one side, the abrupt face on the side toward which the other face inclines, and the continuous slot or opening in the abrupt face beginning at point near the lower end of the trough, substantially as and for the purpose specified.

2. As a means of separating flat pieces of material from pieces of other shapes, a trough having the face over which the pieces of material slide made sloping toward one side and a face toward which the first face slopes provided with a continuous slot beginning near the discharge end of the trough and increasing in size toward such end, substantially as and for the purpose set forth.

3. The screen for separating flat pieces of material from pieces of different shape, consisting of a series of troughs or valleys, each having a face inclined toward one side and an abrupt face toward which the other face is inclined, and having a slot in its abrupt face beginning near the discharge ends of the troughs and increasing in size toward such ends, substantially as and for the purpose shown.

4. In combination with a suitable guiding-chute for the material to be separated, the separator-screen consisting of the plate having the series of valleys or grooves saw-tooth-shaped in cross-section and provided with the slots in the sides of such valleys, beginning near the discharge ends of the valleys and increasing in size toward and to the ends thereof, substantially as and for the purpose shown.

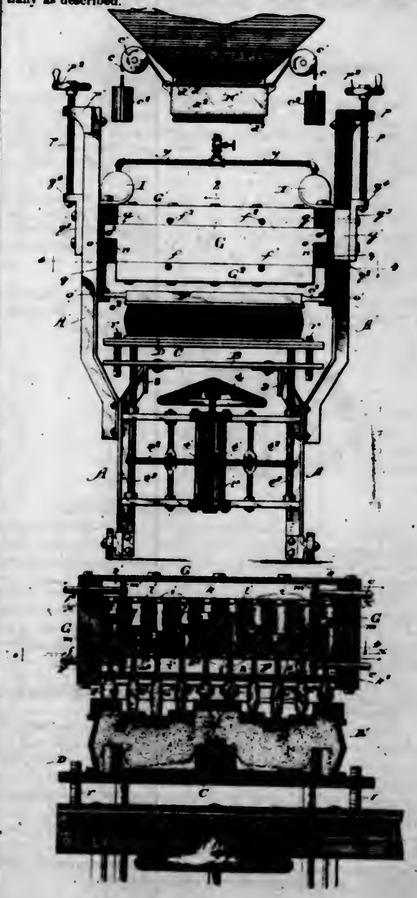
5. The plate for use in separating coal cast in one piece having the longitudinal faces inclined or pitching toward one side of the plate, the abrupt faces joining the lower sides of the inclined faces with the higher sides of the contiguous faces, the slots in the abrupt faces beginning near the ends thereof and increasing in size toward their ends, and the transverse bars or ribs on the under sides of the plate, substantially as and for the purpose shown.

6. In combination with the inclined plate having the longitudinal troughs or valleys saw-tooth-shaped in cross-section and the slots in the abrupt sides of the valleys beginning near the discharge end of the plate and increasing in size down to such end, a receiving-chute projecting under the end of the screen and made adjustable thereunder, substantially as and for the purpose set forth.

382,216. **TRACE-CARRIER.** EDWARD R. CROCKETT, Georgetown, Tex., assignor of one-half to J. H. Hodges, same place. Filed Dec. 14, 1887. Serial No. 257,993. (No model.)

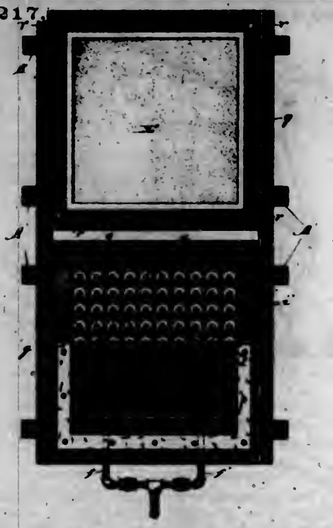
Claim.—1. The combination, with the buckle formed with the central cross-bar having the teeth and having the side hooks and the outwardly-projecting tongue at its lower end, of the hook-plate formed

382,216.



with the reduced upper ends and the hook at its lower end having the opposite slots, substantially as set forth.

2. The combination, with the buckle formed with the central cross-bar having the teeth and having the side hooks and the outwardly-projecting tongue formed with the transverse aperture at its lower end, of the hook-plate formed with the reduced upper ends and the hook at its lower end having the opposite slots, and the locking-key, substantially as set forth.



382,217. **SAND-MOLDING MACHINE.** JOHN R. DAVIES, Pullman, Ill. Filed Oct. 4, 1887. Serial No. 251,402. (No model.)

Claim.—1. In a sand-molding machine, the combination, with the frame, of a box having cylinders containing pistons, tamping-heads connected with the pistons, means for actuating the tamping-heads by fluid-pressure, and a wall within the box separating the cylinders into an inner and an outer non-intercommunicating series, whereby the tamping-heads of the outer series of cylinders may be actuated independently of those in the inner series to peen the sand around the edges in the flask, substantially as and for the purpose set forth.

2. In a sand-molding machine, the combination, with the frame, of a horizontally-sliding box, G, having cylinders *l*, containing pistons *h*, tamping-heads H, connected with the pistons, and means for actuating the tamping-heads by fluid-pressure to tamp the sand, substantially as described.

382,217.

3. In a sand-molding machine, the combination, with the frame, of a horizontally-sliding box, G, containing cylinders *l*, non-intercommunicating chambers *k* and *k'*, communicating, respectively, with the cylinders below them, and non-intercommunicating chambers k^3 and k^4, communicating, respectively, with the cylinders above them, pistons *h* in the said cylinders, tamping-heads H, connected with the said pistons, and fluid-pressure and exhaust pipes leading, respectively, to and from the said chambers, substantially as and for the purpose set forth.

4. In a sand-molding machine, the combination, with the frame, of a horizontally-sliding box, G, containing cylinders *l*, non-intercommunicating chambers *k* and *k'*, communicating, respectively, with the cylinders below them, and non-intercommunicating chambers k^3 and k^4, communicating, respectively, with the cylinders above them, fluid-pressure cylinders I, having their pistons connected with the box, and fluid-pressure and exhaust pipes leading, respectively, to and from the said chambers, substantially as and for the purpose set forth.

5. In a sand-molding machine, the combination of a frame carrying two flasks, E, a box supported to slide horizontally in the frame above the flasks, rammers carried by the said box, and means for actuating the rammers by fluid-pressure to tamp the sand in the flask below the said box, substantially as described.

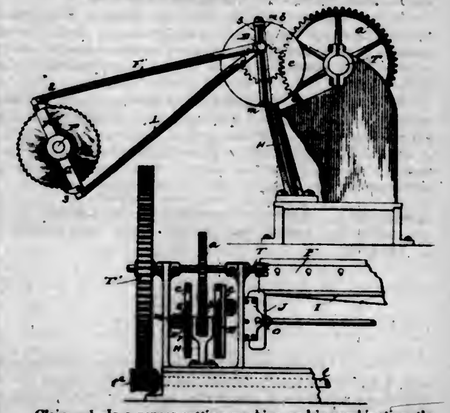
6. In a sand-molding machine, the combination, with the frame, of a vertically-adjustable horizontally-sliding box, G, having cylinders *l*, containing pistons *h*, tamping-heads H, connected with the pistons, and means for actuating the tamping-heads by fluid-pressure to tamp the sand, substantially as described.

7. In a sand-molding machine, the combination, with the frame, of a vertically-adjustable horizontally-sliding box, G, containing cylinders *l*, non-intercommunicating chambers *k* and *k'*, communicating, respectively, with the cylinders below them, and non-intercommunicating chambers k^3 and k^4, communicating, respectively, with the cylinders above them, pistons *h* in the said cylinders, tamping-heads H, connected with the said pistons, and fluid-pressure and exhaust pipes leading, respectively, to and from the said chambers, substantially as and for the purpose set forth.

8. In a sand-molding machine, the combination, with the frame, of a vertically-adjustable sliding box, G, containing cylinders *l*, non-intercommunicating chambers *k* and *k'*, communicating, respectively, with the cylinders below them, and non-intercommunicating chambers k^3 and k^4, communicating, respectively, with the cylinders above them, fluid-pressure cylinders I, having their pistons connected with the box, and fluid-pressure and exhaust pipes leading, respectively, to and from the said chambers, substantially as and for the purpose set forth.

9. In a sand-molding machine, the combination, with the frame, of a vertically-adjustable sliding box, G, containing cylinders *l*, non-intercommunicating chambers *k* and *k'*, communicating, respectively, with the cylinders below them, and non-intercommunicating chambers k^3 and k^4, communicating, respectively, with the cylinders above them, pistons *h* in the said cylinders having rods *h'* extending through the base of the box and carrying tamping-heads H, and flexible material, h^3, surrounding the rods between the tamping-heads and base of the box and secured to the said base, substantially as and for the purpose set forth.

10. In combination with a sand-molding machine, a hopper supported above the flask and having a slide-valve, *d*, in its spout, and a cap, K', supported by weighted cables *c* on pulleys to normally surround the spout, and having a valve, d^3, substantially as described.



382,218. **PNEUMATIC MUSTARD-POT.** MAX DIENERT, Dresden, Saxony, Germany. Filed Dec. 12, 1887. Serial No. 257,803. (No model.)

Claim.—1. The combination, with the mustard-pot having the perforated neck at its lower end and a removable elastic cover at its upper end, of a supporting-stand provided at its base with a projection to close the perforation in the neck, substantially as set forth.

2. As a new article of manufacture, a funnel or conical shaped pneumatic mustard-pot, consisting of the mustard-receptacle B, having an opening, O, at its point or smaller end, and provided with an elastic cover, such as D, for exerting pneumatic force, in combination with the elastic-cover attachment A R and exterior receptacle or holder, G, in the lower end of which is inserted a small pan, such as N, having the projection Z for closing the opening O, substantially as shown, and for the purpose set forth.

382,219. **VENEER-CUTTING MACHINE.** EDWIN DENNISON, Grand Rapids, Mich., assignor to Wm. T. Powers & Son, same place. Filed July 23, 1887. Serial No. 245,537. (No model.)

Claim.—1. In a veneer-cutting machine, and in combination, the holder, as I, for the material, the cutting-knife, means, substantially as described, for giving movement to the same, a driving-shaft, and adjustable connections from said shaft to the knife-moving mechanism, whereby the knife may be advanced against the work to a greater or less degree relative to the movement of the holder, substantially as described.

2. In combination, the knife, the crank-wheel, the pitman, and the screw for moving the connecting-point of said pitman toward and from the center of the crank-wheel, and mechanism for communicating the movement of the pitman to the knife, substantially as described.

3. In combination, the cutting-knife, the crank-wheel provided with a groove in its face, the crank-pin or stud adapted to move in said groove, the screw engaging said crank-pin, knife-moving mechanism, as E P O, and the pitman, substantially as described.

4. In combination, the knife, the crank-wheel, the adjustable pitman connected with said crank-wheel, whereby the stroke may be varied, the pawl-and-ratchet mechanism operated by the pitman, and the mechanism, substantially as described, for imparting the move-

ment of the ratchet mechanism to the knife, substantially as described.

5. In combination, the knife, the crank-wheel, the ratchet-wheel, the push and pull pawls, and the adjustable pitmen operating said pawls and causing them to act alternately upon the ratchet-wheels, and mechanism, substantially as described, for communicating the movement of the ratchet mechanism to the knife, substantially as described.

6. In combination, the knife, the crank-wheel, the ratchet-wheel, the push and pull pawls, the pitmen for operating the said pawls, and adjustable crank-pins, both of said pitmen being secured directly thereto, substantially as described.

7. In combination, the knife, the crank wheels or disks *c c*, the ratchet-wheels, the pawls, and the pitmen for operating said ratchet mechanism, the pitman of one crank-wheel being positioned a quarter-turn from the pitman of the other crank-wheel, substantially as described.

8. In combination, the knife, the shaft I, the driving-gear *a*, placed thereon, the supplemental shaft E, the pinion *b*, supported by said shaft and meshing with gear *a*, the disk *c* on said shaft, the mechanism, as E P O, for driving the knife, and adjustable connection between said mechanism and the disk, substantially as described.

382,220. ORNAMENTAL WIRE COIL. LEVI M. DEVORE, Freeport, Ill., assignor of one-half to Robert H. Wiles and Wallace Greene, both of same place. Filed July 28, 1887. Serial No. 244,963. (No model.)

Claim.—1. As a new article of manufacture, a non-circular wire coil having its successive turns or spirals permanently displaced in the direction of rotation about the coil's axis, whereby corresponding points upon successive turns of the coil form a spiral curve about the coil's axis.

2. As a new article of manufacture, a wire coil whose spirals, viewed singly in the direction of the coil's axis, are non-circular, each being displaced with reference to the preceding in the direction of rotation about the coil's axis, substantially as set forth.

3. A wire coil whose spirals, seen in the direction of the coil's axis, are non-circular, each spiral being permanently displaced with reference to the preceding in the direction of rotation about the coil's axis, and whose spirals vary in size or diameter, substantially as set forth.

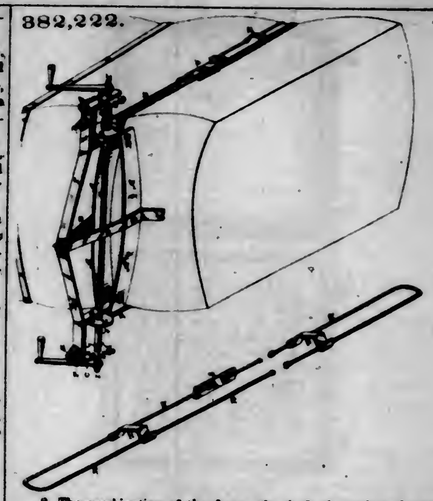
4. In combination with a wire coil of the form shown and described, a cord or rod passing within and along the axis of said coil and provided with knots or enlargements, substantially as set forth.

5. The combination, with a coil having spiral depressions in its surface, of a spirally-coiled rod adapted to advance by rotation along said depressions and engage the coil, substantially as set forth.

382,221. TEMPORARY PARTITION FOR CIGAR-BOXES. NAPOLEON DU BRUL, Cincinnati, Ohio. Filed Mar. 10, 1883. Serial No. 266,861. (No model.)

Claim.—1. A temporary partition for cigar-boxes, consisting of a back, 1, having a transverse arm, 2, and a horizontal flange, 3, said flange being provided with prongs 5 for insertion in the box, substantially as set forth.

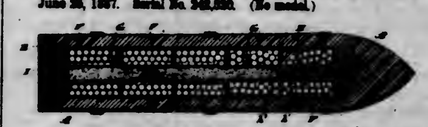
2. The combination, with the back 1, having an arm, 2, and horizontal flange 3, of prongs projecting from said flange and back, as set forth.



3. The combination, with the back 1 and arm 2, of the horizontal flange 3, and prongs 4 and 5, projecting downward from said back and flange for insertion into the bottom or upper edge of the box, respectively, as herein set forth.

4. The combination, with a cigar-box, of a temporary partition, A, consisting of the back 1, transverse arm 2, and flange 3, projecting at right angles from the back over the edge of the box, and having prongs 5 for insertion in the edge of the box, substantially as set forth.

382,222. MACHINE FOR PUTTING TIES ON BALES. WILLIAM R. DUNBAR, Waxahachie, Tex. Filed Jan. 23, 1888. Serial No. 261,603. (Model.)



Claim.—1. The combination of the side bars, the brace rising therefrom, the bar F, the reel-frames, the shaft which is journaled in the reel-frames, and the pawls and ratchets, with the tightening-ropes, which are passed around the bale, substantially as shown.

382,222.

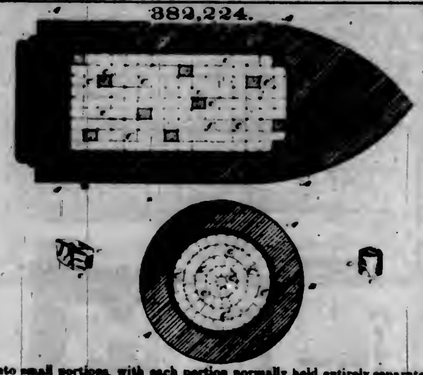
2. The combination of the frame, the shaft, the reels, and pawls and ratchets, with the ropes N, provided with the hooks, which have U-shaped shanks, the double rope, which is passed around the bale, and the U-shaped hooks, which are applied to the rope, substantially as described.

382,223. SHELL FOR EXPLOSIVES. JAMES W. GRAYDON, Washington, D. C., assignor, by mesne assignments, to the Graydon Dynamite Projectile Cartridge and High Explosive Company, same place. Filed June 28, 1887. Serial No. 242,830. (No model.)

Claim.—1. In an explosive shell, in combination with the explosive charge consisting of a number of pellets, each formed of a portion of high explosive wrapped in a flexible envelope, one or more partitions or divisions dividing the explosive charge up into several portions, each portion containing a number of the explosive pellets, substantially as and for the purpose specified.

2. In combination with the casing, a series of bodies of explosive within the casing, each made up of a number of small portions of high explosive inclosed in separate flexible envelopes, and divisions or partitions separating the several bodies of explosive from each other, substantially as and for the purpose shown.

3. In an explosive shell, in combination with the casing and the lining non-conductive of heat, the explosive charge composed of small portions of high explosive, each inclosed in a flexible envelope, and one or more transverse divisions separating the charge into several bodies, each body being composed of a mass of the enveloped portions of high explosive, substantially as and for the purposes described.



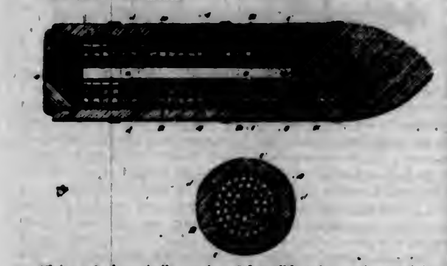
4. In an explosive shell, in combination with the casing and the explosive charge composed of pellets of high explosive, each provided with a flexible envelope to separate the explosive of the pellet from the explosive of the other pellets, divisions or partitions separating the charge into several bodies, each composed of a number of the pellets, and a fuse provided with sufficient explosive to shatter the envelopes of the pellets throughout the charge and ignite the whole charge, substantially as and for the purpose specified.

5. In an explosive shell, in combination with the casing having the charge-receiving chamber, one or more transverse partitions supported against movement within the chamber, and the bodies of explosive separated from each other by the partitions, each body consisting of a mass of small portions of high explosive inclosed in separate flexible envelopes, substantially as and for the purpose shown.

382,224. HIGH-EXPLOSIVE SHELL. JAMES W. GRAYDON, Washington, D. C., assignor to the Graydon Dynamite Projectile Cartridge and High Explosive Company, same place. Filed Feb. 15, 1888. Serial No. 264,082. (No model.)

Claim.—1. In a shell, the bursting-charge consisting of a mass of high explosive, which, both radially and longitudinally, is divided up

382,224.



into small portions, with each portion normally held entirely separate from the others, substantially as and for the purpose specified.

2. In a shell, the bursting-charge within the shell-casing, both radially and longitudinally divided up into a number of pellets, each consisting of dynamite inclosed in an inflexible envelope, substantially as and for the purpose shown.

3. In a shell, the shell-bursting charge divided up in all directions into small portions normally held separate from each other and arranged within the shell in a layer or layers, each layer containing several of the separate small portions of explosive, substantially as described.

4. In a shell, in combination with the shell-casing, the bursting-charge therein, which, both radially and longitudinally, is divided up in all directions into explosive pellets, each consisting of a small portion of high explosive inclosed in an envelope non-conductive of heat, substantially as and for the purpose described.

382,225. HIGH-EXPLOSIVE SHELL. JAMES W. GRAYDON, Washington, D. C., assignor to the Graydon Dynamite Projectile Cartridge and High Explosive Company, same place. Filed Feb. 15, 1888. Serial No. 264,084. (No model.)

Claim.—1. In a shell, a series of frangible tubes each containing a portion of the shell-bursting charge, with the contents of each tube divided up into small parts held normally separate from each other, substantially as and for the purpose specified.

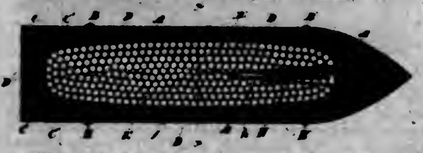
2. In a shell, in combination with the frangible tubes, each loaded with a charge of high explosive divided up into small portions by separating media, a fuse provided with a quantity of explosive to shatter such separating media and fire the whole shell-charge, substantially as and for the purpose shown.

3. In a shell, the bursting-charge composed of high-explosive pellets, in combination with a series of frangible tubes longitudinally arranged within the shell-chamber, each tube containing a number of the explosive pellets, substantially as and for the purpose described.

4. In a shell, longitudinal tubes packed side by side within the shell-chamber, each loaded with high-explosive pellets consisting of small portions of high explosive inclosed in rigid envelopes, substantially as and for the purpose described.

5. In a shell, in combination with the series of tubes in the shell-chamber, a series of high-explosive pellets in each tube supported by the walls of the tube against longitudinal movement therein, substantially as and for the purpose specified.

6. In a shell, tubes made of material non-conductive of heat, each inclosing a series of high-explosive pellets composed of portions of high explosive inclosed in envelopes, substantially as and for the purpose set forth.



7. In a shell, the longitudinal tubes of material non-conductive of heat arranged side by side within the shell-chamber, and each loaded with a number of high-explosive pellets consisting of small portions of explosive inclosed in envelopes, substantially as and for the purpose described.

8. In a shell, in combination with the series of longitudinal tubes packed side by side within the shell-chamber, the series of high-explosive pellets in each tube, each of such size as to fit the tube and composed of a small portion of dynamite inclosed in an envelope, and a fuse provided with a quantity of explosive to shatter the tubes and pellet-envelopes and fire the whole shell-charge, substantially as and for the purpose specified.

9. In a shell, in combination with the longitudinal tubes arranged parallel with each other and each loaded with a number of high-explosive pellets, a casing of material non-conductive of heat inclosing the bundle of tubes, substantially as and for the purpose shown.

10. In a shell, in combination with the shell-casing and the lining therein made non-conductive of heat, the series of longitudinal tubes arranged side by side within the shell-chamber, likewise made of material non-conductive of heat, and each loaded with high explosive separated into small portions by suitable dividing media, substantially as and for the purpose set forth.

382,226. SHELL. JAMES W. GRAYDON, Washington, D. C., assignor, by mesne assignments, to the Graydon Dynamite Projectile Cartridge and High Explosive Company, same place. Filed May 7, 1887. Renewed Feb. 15, 1888. Serial No. 264,142. (No model.)

Claim.—1. In an explosive shell, in combination with the shell-casing and the charge of explosive, one or more layers of material non-conductive of heat entirely inclosing the charge, substantially as and for the purpose shown.

2. In an explosive shell, in combination with the charge of explosive, a wrapping made of asbestos around the charge and entirely inclosing the same, substantially as and for the purpose described.

3. In combination with the casing of an explosive shell, a charge consisting of a number of pellets or packages made of small portions of high explosive, each portion inclosed by a flexible envelope and separated from the other portions only by a flexible medium, substantially as and for the purpose shown.

4. A shell loaded with a mass of rounded pellets, each pellet consisting of a portion of high explosive inclosed in a flexible wrapping or envelope, substantially as and for the purpose described.

5. In combination with a suitable casing, an explosive charge for shells and the like, consisting of portions of high explosive wrapped in paraffine-treated paper, substantially as and for the purpose specified.

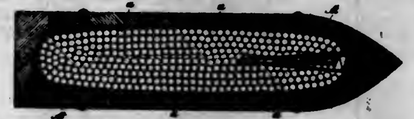
6. In an explosive shell, in combination with the charge made up of portions of high explosive inclosed in envelopes or wrappings, a fuse for firing the charge, provided with a quantity of explosive to shatter the envelopes of the separate portions of the shell-charge, substantially as and for the purpose set forth.

7. In an explosive shell, in combination with the shell-casing having the charge-chamber, the lining of material non-conductive of heat, and the pellets or packages of explosive inclosed in envelopes, substantially as and for the purpose shown and described.

8. In an explosive shell, in combination with the shell-casing having the charge-containing chamber, the lining non-conductive of heat and the bursting-charge made up of separate small portions of dynamite inclosed in wrappings or envelopes, substantially as and for the purpose specified.

9. In an explosive shell, in combination with the shell-casing having the charge-receiving chamber, the lining of asbestos within the same, the bursting-charge of dynamite separated into small portions, with each portion separately inclosed in an envelope, and a fuse provided with a charge of explosive to shatter the envelopes inclosing the portions of dynamite and fire the whole charge, substantially as and for the purpose shown.

382,227. CONTACT-FUSE FOR PROJECTILES. JAMES W. GRAYDON, Washington, D. C., assignor, by mesne assignments, to the Graydon Dynamite Projectile Cartridge and High Explosive Company, same place. Filed May 7, 1887. Renewed Feb. 15, 1888. Serial No. 264,145. (No model.)

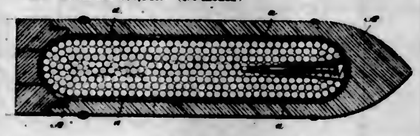


Claim.—1. A contact firing fuse for projectiles adapted to be put inside of and inclosed by the projectile-casing, and consisting of an outer casing, in combination with a tube sliding within the same, a primer on the tube, and a spring engaging the tube, so as to hold the primer-carrying end of the tube rearward, substantially as and for the purpose shown.

2. In a contact-fuse adapted to be placed within the chamber of an explosive projectile, the casing and the powder-containing tube sliding therein, in combination with the percussion-primer on the tube, and the spring engaging the tube and adapted to hold the same rearward in the casing, substantially as and for the purpose shown.

3. In combination with the funnel-shaped casing, the powder-containing tube, guided and adapted to slide longitudinally within the casing, the cap or percussion primer on the tube, and the spiral spring surrounding and engaging the tube, so as to hold the same rearward in the casing, substantially as and for the purpose set forth.

382,228. METHOD OF PREPARING EXPLOSIVES FOR USE. JAMES W. GRAYDON, Washington, D. C., assignor, by mesne assignments, to the Graydon Dynamite Projectile Cartridge and High Explosive Company, same place. Filed May 7, 1887. Renewed Feb. 20, 1888. Serial No. 264,652. (No specimens.)



Claim.—1. The method of preparing a cartridge of explosive, which consists in dividing the amount of explosive for the cartridge into small portions, inclosing each in an envelope to separate it entirely from the other portions, and packing the enveloped portions together to form the cartridge, substantially as and for the purpose described.

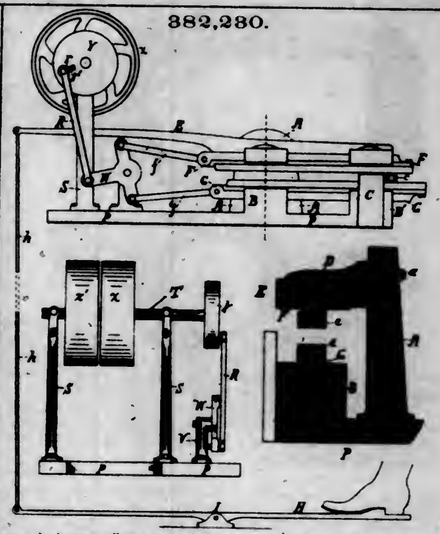
2. The method of preparing a cartridge of explosive for blasting and other purposes, which consists in separating the amount of explosive for the cartridge into small portions, inclosing each of the portions in a flexible envelope and packing the pellets so formed together, substantially as and for the purpose specified.

3. The method of preparing a charge of explosive for use, which consists in separating the mass of explosive into small portions and inclosing each of the said portions in a flexible envelope, so as to make a rounded pellet, substantially as and for the purpose shown.

382,229. EXPLOSIVE CHARGE. JAMES W. GRAYDON, Washington, D. C., assignor to the Graydon Dynamite Projectile Cartridge and High Explosive Company, same place. Original application filed May 7, 1887, Serial No. 264,652. Divided and this application filed Mar. 20, 1888. Serial No. 267,841. (No model.)

Claim.—1. An explosive charge consisting of a mass of rounded pellets, each made of a small portion of explosive inclosed in a flexible envelope, substantially as and for the purpose shown.

2. An explosive charge consisting of a number of small portions of high explosive separated from each other only by a flexible medium, each of such portions of explosive being entirely inclosed by a flexible envelope, substantially as and for the purpose set forth.



3. An explosive cartridge consisting of a mass of nitro-glycerine compound divided up into a number of small portions, each inclosed and separated entirely from the other by an envelope made impervious to the nitro-glycerine of the compound, such enveloped portions being packed together within a suitable envelope or casing to form the cartridge, substantially as and for the purpose described.

382,230. WHIP-BUTTON-ROLLING MACHINE. WATSON A. HEATH, Binghamton, assignor of two-thirds to Franklin L. Goodenough and Richard H. Randall, Windsor, N. Y. Filed Feb. 9, 1888. Serial No. 263,495. (No model.)

Claim.—1. A whip-button-rolling machine having parallel runners F and G, with dies *e e* upon their faces, said runners being driven always in opposite directions by means of the rock-shaft W, all constructed and operating substantially as shown and described.

2. The combination, in a whip-button-rolling machine, of a driving-shaft having crank-wheel Y, a rock-shaft W, parallel runners F and G, having changeable dies *e e* on their faces, a rocking sweep, E, carrying the upper runner, and treadle H, for regulating the pressure

382,230.

upon the button, all constructed and operating substantially as shown and described.

382,231. ELECTRIC IGNITING APPARATUS. LÉON HEM and RODOLPHE WEHRMANN, Brussels, Belgium. Filed Feb. 7, 1888. Serial No. 263,217. (No model.) Patented in Belgium Jan. 5, 1888, No. 80,503, and in England Jan. 19, 1888, No. 873.

Claim.—1. Electric igniting apparatus consisting of a casing or holder connected to the one pole of a generator of electricity and carrying an insulated contact-brush connected to the other pole of the generator of electricity, and an extinguisher, such casing being adapted for the reception of a lamp, and so arranged in conducting connection therewith that in withdrawing the lamp from the casing the wick-tube of the lamp makes electrical contact with the brush, producing sparks, whereby the lamp is ignited, substantially as herein described.

2. The combination, with a socket having an insulated contact-brush, and connections between said socket and brush, and suitable supply, of a lamp having a wick-holder adapted to complete circuit between said socket and brush, said wick-holder being insulated from the contact-brush except at its end, as and for the purpose set forth.

3. In an igniting apparatus, substantially as herein described, the combination, with the socket A, having insulated contact-brush M, extinguisher D, and spring C, of a lamp, O, having wick-tube Q, covered with insulation R for a portion of its length, adapted to slide in and out of said socket, and held in position by said spring C, as herein set forth.

4. The combination of a socket having an insulated contact-brush, said socket and brush being connected to the poles of a suitable supply, and a lamp for insertion in said socket, the wick-holder of which lamp is adapted to complete the circuit between said socket and brush, whereby the lamp is ignited.

382,232. SAFETY-PIN. HENRY C. HERR, Brooklyn, N. Y. Filed Jan. 20, 1888. Serial No. 261,265. (No model.)

Claim.—1. As a new article of manufacture, a safety-pin, A, having the point-guard *a* and the spiral head B, located between the ends and below the body of the pin, substantially as described.

2. As a new article of manufacture, a safety-pin, A, having the point-guard *a*, the spiral head B, and the end-protecting button C, substantially as described.

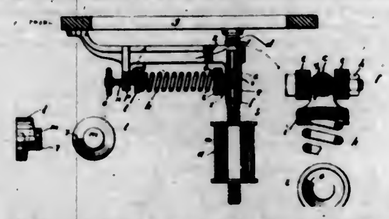
382,233. FENCE. THOMAS HOWE, Black Creek, Ohio. Filed Oct. 11, 1887. Serial No. 252,063. (No model.)

Claim.—In a fence, the combination, with the post and rails, the lower ones of which are rigidly secured to the post, of a wire doubled to form a loop at the bottom and then hooked in each end of stirrups H, to form seats for the remaining rails, the said wire being secured at its ends to the top of the post, substantially as and for the purpose set forth.

382,234. GLASS-CUTTING TABLE. ALONZO HOSMER, Orlando, Fla. Filed May 21, 1887. Serial No. 239,151. (No model.)

Claim.—1. A glass-cutter's table having an end, A', provided with feeding and gaging devices, and the other end, A^2, having a plain surface and straight-edged end upon which the glass may be broken, substantially as described.

2. In a glass-cutter's table, the combination, with the table, of a graduated side strip, and a feed-slide for moving the glass forward upon the said table to the line of cut, substantially as described.



3. In a glass-cutter's table, the combination, with the table A, of the graduated side strips, C, the cross-strip D, and a feed mechanism for sliding the side strips and cross-strips upon the table, substantially as described.

4. In a glass-cutter's table, the combination, with the table A, of the side strips, C, having the toothed racks upon their under sides, a cross-strip, D, and a cross-shaft, E, having gear-pinions F, to engage with the said toothed racks, and a handle for revolving the same, substantially as described.

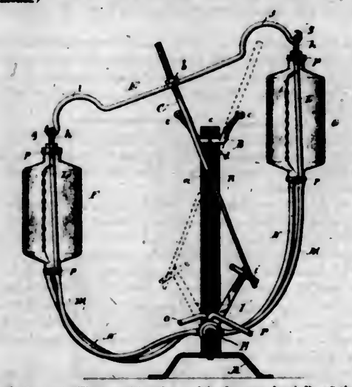
5. In a glass-cutter's table, the combination, with the board, of guide-plates B, having a rib, *b*, side plates, C, grooved to receive said rib *b*, and provided with a gage-plate upon one side and a toothed rack upon the other side, and a shaft carrying toothed wheels to engage said toothed rack, substantially as described.

6. In a glass-cutter's table, the combination, with the board A, of the side plates, C, having a toothed rack and graduated face, a cross-piece, D, and stops G, against which the straight-edge may be placed when the cut is made, substantially as described.

382,235. TILTING-CHAIR. JOSEPH W. KEMNA, Chicago, Ill., assignor to James W. Vail, trustee, Port Washington, Wis. Filed Sept. 15, 1884. Serial No. 143,149. (No model.)

Claim.—1. In tilting-chair irons, the combination, with the vertical screw-spindle and with the standard at the upper end thereof, of the spider-frame constructed to sustain the chair-seat, said spider-frame being suitably pivoted upon said standard and being provided with dependent yoke-like arms to snugly inclose the same, and having also an elongated slot therein, against the opposite faces of which the end of the standard projecting within said slot abuts above the pivotal point of the standard to limit the tilting movement, substantially as described.

2. In tilting-chair irons, the combination, with the vertical screw-spindle and with the standard at the upper part thereof, of the spider-frame constructed to sustain the chair-seat and suitably pivoted upon said standard, the pivotal bearing-plate and the bearing-nut, the coil-spring retained at its ends between said plate and nut, and the adjustable screw-rod to vary the tension of the spring, said several parts being arranged, substantially as described, whereby said coil-spring readjusts itself pivotally to the tilting movement, substantially as set forth.

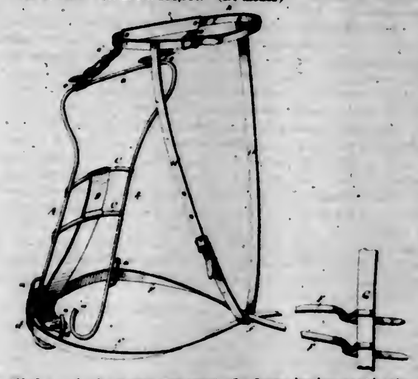


3. In tilting-chair irons, the combination, with the vertical screw-spindle *b*, having the standard *c* thereon, of the spider-frame *d*, constructed to sustain the chair-seat and suitably pivoted upon said standard, the pivot-plate *i*, provided with spiral-like face, the coil-spring *k*, resting at one end against said spiral-like face, the loosely-sustained bearing-nut *l*, having spiral-like face to receive the opposite end of said spring, and the adjusting-rod *n*, to vary the tension of the coil-spring, said rod being supported by an arm of the spider-frame, substantially as described.

4. In tilting-chair irons, the combination, with the spindle and with the standard at the upper end thereof, of the spider-frame constructed to sustain the chair-seat and suitably pivoted upon said standard, the sustaining-plate resting pivotally upon said standard, and the compression coil-spring having its end coil-face set against said pivot-plate and the opposite end adjustably sustained from an arm of the spider-frame, whereby the spring shifts radially during the tilting movement, substantially as described.

5. In tilting-chair irons, the combination, with the standard and with a spider-frame constructed to sustain the chair-seat and suitably pivoted to said standard, of an adjustable compression-spring for controlling the tilting movement of the spider, and a sustaining-plate for the end face of said spring, said plate resting against the standard and being provided with a projecting tongue, whereby it may be pivotally mounted in position, substantially as set forth.

6. In a tilting-chair iron, the combination, with the standard and with a spider-frame constructed to sustain the chair-seat and suitably pivoted to said standard, of a pivotal adjustable coil-spring for controlling the tilting movement of the spider, an adjusting-rod for the coiled spring, and a bearing-nut to seat the end of the spring, said nut having spiral-like face and being mounted upon the adjusting-rod, substantially as described.



382,236. LIQUID-FORCING APPARATUS. HENRY B. LYTLE, Webb's Mills, N. Y. Filed Nov. 14, 1887. Serial No. 255,113. (No model.)

Claim.—1. The combination, with the standard B, of the arm C, pivoted thereto near its upper end and extended upon opposite sides of its pivot and screw-threaded at its upper end, the cross-bar E on the upper end of said arm, curved near its ends, as at *f*, and formed with hooks *g*, the nut *h*, the water-chambers F G, suspended from said hooks, the valve, flexible connections between said chambers and valve, and the lever I of said valve formed with an elongated slot engaging the lower end of said arm C, substantially as and for the purpose specified.

2. The combination, with the base A, standard B, arm C, pivoted to said standard, the valve having ways, as described, and the water-chambers carried by said arm and connected with the ways of the valve, of the bracket D on the upper end of said standard and formed with arms *e*, serving as stops for the arm C, substantially as described.

382,237. **WEANING-MUZZLE FOR ANIMALS.** JOHN F. MILLER, Lee, assignor of one-half to Benjamin A. Linvill, White, Ind. Filed Oct. 5, 1887. Serial No. 251,597. (No model.)

Claim.—1. A weaner composed of a frame having nose-hooks, and a spring-plate secured at one end to the frame and having its other end provided with oppositely-disposed teeth, substantially as and for the purpose specified.

2. A weaner composed of side bars terminating at their lower ends in nose-hooks, the end bar connecting the upper ends of said side bars, the cross brace-rods, and the spring-plate secured at its upper end to the cross-rods and having its lower end curved outwardly, and inwardly terminating in teeth, and having exterior teeth, substantially as and for the purpose set forth.

3. A weaner composed of side bars having nose-hooks, and joined by an upper end bar, the cross brace-rods uniting the side bars, and the spring-plate having teeth or prongs arranged substantially at right angles to the plane of the frame, and having its upper end secured to said cross brace-rods, substantially as specified.

4. The combination, with the frame, having the spring-plate provided with inner and outer teeth, of the head-strap, and the short straps *c* and *c'*, buckled together for adjustably connecting the frame with the head-strap, substantially as specified.

5. The combination, with the frame, and the spring-plate having inner and outer teeth, of the head-strap, the strap F, and the side straps for supporting the strap F, substantially as and for the purpose described.

6. The herein shown and described weaner, composed of the frame having nose-hooks, the spring-plate having inner and outer teeth, the head-strap, the short straps connecting the head-strap with the frame, the strap F, and the side straps for supporting the strap F, substantially as set forth.

382,238. **STOCK-CAR.** WILLIAM H. MILLER, York, Pa., and NATHANIEL K. SMITH, Washington, D. C., assignors to the Kohler Improved Cattle Car Company, New York, N. Y. Filed Mar. 16, 1888. Serial No. 267,416. (No model.)

Claim.—1. The combination, with the car and the tracks, the latter being provided with recesses or depressions at intervals, of the stall-partitions adapted to travel upon said tracks and drop into the said depressions in the tracks, substantially as described.

2. The combination, with the car and the horizontal track in the upper part thereof, these tracks being provided at intervals with depressions in their upper edges, of stall-partitions provided with wheels at their upper ends adapted to travel upon the said tracks and drop into the recesses in the same, the stall-partitions being suspended from the tracks, substantially as described.

3. The combination of the car, the stationary tracks in the upper part thereof, these tracks being provided with depressions at intervals in their upper surfaces, the flanged wheels secured to axles and adapted to travel upon the said tracks and drop into the depressions in the same, and the stall-partitions suspended from the said axle and adapted to enter recesses in the floor of the car, substantially as specified.

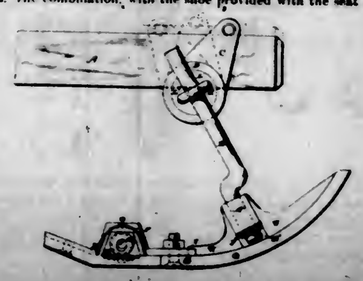
4. The combination of the car-body, the tracks secured in the upper part thereof, a stall-partition suspended from the said tracks by means of flanged wheels and consisting of the two vertical posts G, set some distance apart and having rigidly secured between them the middle stationary section, and the two swinging sections I, hinged to the said vertical rods and extending to the side of the car, substantially as described.

5. The combination of the car and the stationary tracks, these tracks being parallel with and in close proximity to the ceiling of the

382,238.

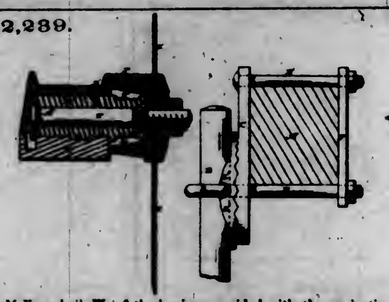
car, and the stall-partitions suspended from the said tracks by means of flanged wheels, the flanges of the said wheels extending into slots formed in the ceiling of the car, substantially as and for the purpose set forth.

6. The combination of the tracks provided with depressions in their upper surface, the pivoted bridge-pieces adapted to span the said depressions in the tracks, the flanged wheel adapted to travel upon the tracks and bridge-pieces, and the stall-partitions suspended from the said flanged wheels, substantially as described.



7. The combination, with the car-body, of a suspended stall-partition consisting of a middle stationary section and two vertical movable hinged sections, the latch-irons secured to the outer edges of the hinged sections, the double-inclined plates provided with recesses in their upper surfaces, into which the said latch-irons automatically drop, and thereby lock the hinged sections, and means for holding the latch-irons in their recesses, substantially as described.

8. In a stock-car, the combination, with the body, the parallel tracks provided with coincident depressions *a* in their upper surfaces, and the blocks *b*, secured to the ceiling of the car immediately over the said depressions in the tracks, of the flanged wheels adapted to travel upon the said tracks and drop into the depressions therein, and the stall-partitions suspended from the said flanged wheels, as and for the purpose described.



382,239. **ROLLING COLTER.** DEWITT A. MOON, Orlando, Fla. Filed Jan. 16, 1888. Serial No. 260,920. (No model.)

Claim.—1. The combination of the plow-beam, the bar attached to the beam at its upper end, and the shoe secured to the lower end of the bar, the shoe being widened at its front end and provided with a rearwardly-projecting portion, which extends along the outer side of the colter, for the purpose set forth, substantially as shown.

2. The combination, with the shoe provided with the seat N, re-

382,239.

cesses M Y, and rib W, of the boxing provided with the projections L and the cap bolted to the shoe, having the recess V, engaging the rib W, and the projection X, which fits in the recess Y in the shoe, whereby the boxing is rigidly and detachably secured to the shoe, substantially as specified.

3. The combination of the shoe, the boxing placed thereon, the cap bolted to the shoe, having the flange P, the headed spindle, hollow mandrel, the colter, the washer S, and the nut U, substantially as shown.

4. The combination of the shoe, the boxing having annular groove K, the cap bolted to the shoe, having the flange P, the spindle having a head upon its inner end and a screw-thread formed upon its outer end, the conical hollow mandrel, washer S, nut U, and the colter secured between the mandrel and the washer, substantially as set forth.

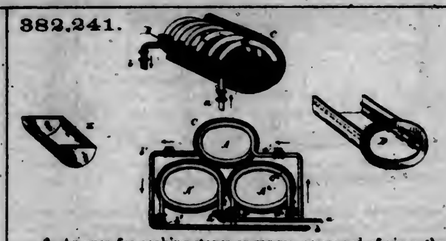
5. The combination of the shoe, the boxing having annular groove K and the flared or cut-away portion C', the headed and screw-threaded spindle T, having annular groove E', the cap having flange P, the conical hollow mandrel, the colter, washer S, and the nut U, substantially as specified.

6. In a clamp adapted to be secured to a plow-beam, the combination, with two clamping-plates placed upon opposite sides thereof, one of the plates having serrations, of an adjustable plate having serrations which engage the serrations made upon one of the clamping-plates, and having stops upon its outer face, a bolt passing through the clamping-plates at one end, and an eyebolt passing through the adjustable plate and clamping-plates at their opposite ends, and a bar which passes through the eyebolt, the two bolts being respectively above and below the beam, whereby the bar is clamped to the beam, substantially as described.

7. The shoe provided with the ribs W and the thimble A", supported by the ribs, for the reception of the bar B, and an opening between the under side of the thimble and the upper surface of the shoe, for the purpose described.

382,240. **CANT-HOOK.** CHRISTIAN BYGAARD, Oshkosh, Wis. Filed Jan. 25, 1888. Serial No. 262,021. (No model.)

Claim.—1. In a cant-hook, the combination of the handle, the hook, and the socket, with a grooved pike, the grooves being longitudinal and inclining upwardly to the plane of the socket, and with one of the projections of the pike upon the engaging side toward the hook, and a clip-brace forming a continuous slide or bearing and protecting the clip, substantially as shown, for the purpose specified.



2. In a cant-hook, the combination, with a handle, of a socket provided with a slot, the walls of the slot inclining outwardly at an angle with the face of the socket, and a screw passing through the slot and engaging the handle, the head of the screw bearing on the inclined walls of the slot, as and for the purpose set forth.

3. In a cant-hook or the like, a socket provided with a grooved pike, the edges of the grooves in said pike forming a substantially straight line with the body of the socket, whereby said socket presents a straight engaging face to a log, and the weight of the socket is minimized.

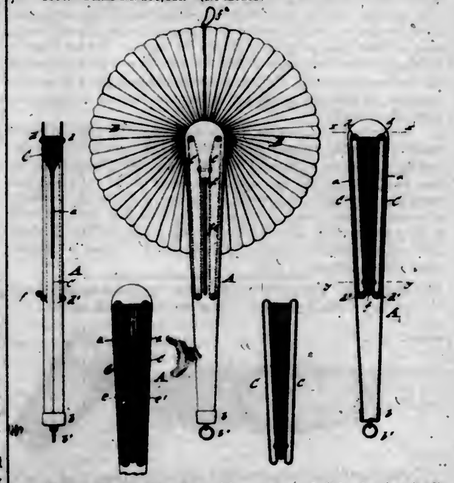
382,241. **COOKING STOVE AND RANGE.** WILLIAM E. PRALL, Washington, D. C., assignor, by mesne assignments, to the National Heating Company, New York, N. Y. Filed Oct. 11, 1887. Serial No. 252,057. (No model.)

Claim.—1. An oven for cooking stoves or ranges, composed of a coil of pipe adapted to the circulation of steam or hot water, the spaces between the coils being filled in with a heat-conducting material, substantially as shown and described.

382,241.

2. An oven for cooking stoves or ranges, composed of pipes, the space between the pipes being filled in with a heat-conducting material, and in combination with a covering of asbestus or equivalent substance, substantially as shown and described.

3. An oven for cooking stoves or ranges, composed of steam or hot-water circulating pipes, the space between the pipes in the lower half of the oven being filled in with heat-conducting material, substantially as shown and described.



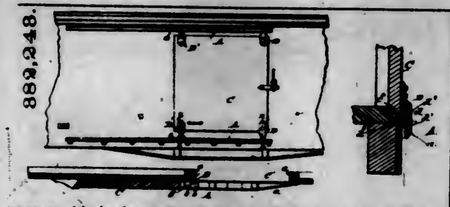
4. An oven for cooking stoves or ranges, composed of steam or hot-water circulating pipes, the space between the pipes in the lower half of the oven being filled in with heat-conducting material, in combination with a covering of asbestus or equivalent substance, substantially as shown and described.

5. An oven for cooking stoves or ranges, composed of steam or hot-water circulating pipes, constructed substantially as shown and described, in combination with a lining, D, provided with lugs or ways, substantially as and for the purposes set forth.

6. The combination, with a cooking stove or range, of an oven or ovens consisting of coils of pipe adapted to circulate steam or hot water, the space between the coils being filled with heat-conducting material, and the ovens surrounded with non-heat-conducting material and provided with pipes *a* and *b*, substantially as shown and described.

7. The combination, with the frame of a cooking stove or range, of a series of pipe-ovens, arranged together as shown, each being surrounded with non-heat-conducting material and opening on or through the face-plate of a stove or range, warming-ovens, as G and G', and boiler-tanks X X, substantially as shown and described.

382,242. **FAN.** MAX RUHR, New York, N. Y. Filed Dec. 30, 1887. Serial No. 258,446. (No model.)



Claim.—The combination, with a case or shell having longitudinal side slots, of a folding web in the same, endless bands applied to the end folds of the web, fixed guides applied to the case for guiding said endless bands and end folds, and a push device for moving the web out of the case and returning it into the same, substantially as set forth.

382,243. **CAR-DOOR.** THOMAS G. RUFFNER, Renovo, Pa. Filed Aug. 24, 1887. Serial No. 247,780. (No model.)

Claim.—1. The combination, with the car-door-supporting rail adapted to permit the forward edge of the door to pass to its place, of the switch having its one end at the upper edge standing out of

382,248.

contact with the door-supporting rail, while its inner end or portion is about in alignment with a plane touching the outside of the car-body, and the door shoes or bearings, of which a number travel upon the rails and their inclined portions, carrying the forward edge of the door to its place, while a number travel upon the switches, carrying the rear edge of the door to its place, substantially as set forth.

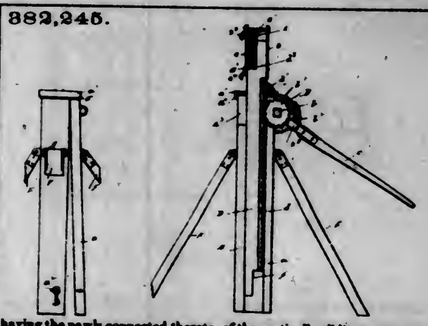
2. The combination, with the car-door rails having their forward ends inclined or deflected toward the forward edge of the doorway or opening, of the switches, each having a portion of its surface disposed about in alignment with a plane touching the outside of the car-body and about opposite the rear door-jamb, while its outer end is provided in its upper edge with a notch arranged close to the rail, and the door shoes or bearings, of which two travel upon the rails and their inclined portions carrying the forward edge of the door to its place, while the other two travel upon and are deflected inwardly, carrying the rear edge of the door to its place, substantially as set forth.

3. The combination, with the car-door-supporting rails having inclined portions extending to the forward or front edge of the doorway or jamb, of the switches, each having one end disposed about opposite the rear door-jamb and its outer end at the upper edge standing close to and parallel with the rails, while the lower portion of said end is tapered or converged toward and joins the rails, and the door bearings or shoes, each of which is provided with two spaced-apart arms or prongs, the inner prongs or arms of two of which are shorter than the outer prongs, while the inner prongs or arms of the other two bearings or shoes are longer than the outer ones, said switches and rails having each a notch or recess in its upper edge, substantially as set forth.

4. The combination, with the car-door-supporting rails and means adapted to deflect or carry the forward or front end of the door inwardly to its closed position, of the switches applied about opposite the rear door-jamb and provided at their outer ends in the upper edges with notches, and the door shoes or bearings, two of which comprise outer pivoted or swiveled portions having spaced-apart arms or prongs, said switches being adapted to permit the front or forward shoes or bearings to pass them and to deflect the rear shoes or bearings toward the doorway or opening, while the door-rails are provided with notches arranged contiguously to and just forward of the said switches, substantially as set forth.

5. The combination, with the car-door-supporting rails and means adapted to deflect or carry the forward or front end of the door inwardly to its closed position, of the switches applied about opposite the rear door-jamb and the door shoes or bearings, two of which comprise outer pivoted or swiveled portions having spaced-apart arms or prongs, of which the inner ones are longer than the outer ones, while the inner arms or prongs of the other shoes or bearings are shorter than the outer ones, said switches and rails having each a notch or recess in its upper edge, substantially as set forth.

382,244. ELASTIC BUCKLE-SHIELD. GEORGE O. STEBBINS, Brooklyn, N. Y. Filed Oct. 7, 1887. Serial No. 251,676. (No model.)



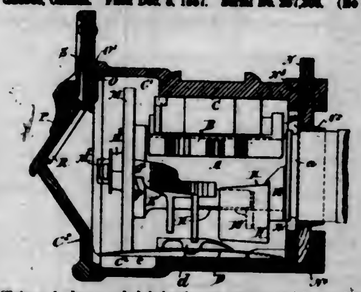
Claim.—1. The herein-described shield for buckles, made of rubber, whereby it is retained in position by the natural contraction of the material of which it is made, substantially as described.

2. The herein-described shield for buckles, made of rubber and having one end contracted, whereby it is retained in position by the natural contraction of the material of which it is made, substantially as described.

382,245. SCAFFOLD AND SHARING. NICHOLAS STABLER, Manitowoc, Wis. Filed Jan. 16, 1886. Serial No. 209,269. (No model.)

Claim.—1. The combination, with the casing or post having a removable front section and an opening in its rear wall, and the cap

382,245.



having the pawls connected thereto, of the vertically-sliding post or bar operated by a pinion and lever, and the extensible sections capable of being secured to said post or bar, substantially as shown and described.

2. The casing or post having the cap on its upper end, the sliding post or bar having a rack-bar on its front face, the single pawl *d'*, engaging said rack-bar, and the pawls secured to said cap and bearing against the sides of said post or bar, substantially as shown and described.

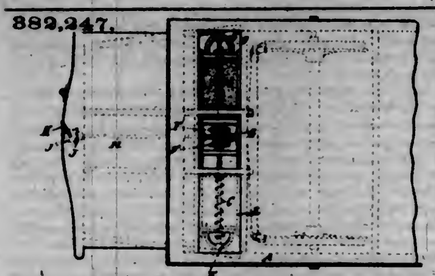
3. As an improvement in scaffolds, the casing or post having a removable front section, the sliding post or bar having a recessed lower end, and the extensible sections designed to be secured to said grooved end of the post or bar, substantially as shown, and for the purpose stated.

382,246. CAR-AXLE LUBRICATOR. SAMUEL VESSOT, Joliette, Quebec, Canada. Filed Dec. 5, 1887. Serial No. 257,208. (No model.)

Claim.—1. In an axle-lubricating apparatus, and in combination, the axle, a disk secured on end of same, loose springs carrying blocks and resting on bottom of axle-box, and a frame carried on such springs, said frame consisting of channeled side pieces with curved transverse bars connecting them, and cover-pieces on front ends with turned-down scraping-edges for taking the lubricant from the disk and discharging it into the channels in side pieces, as set forth.

2. In combination with a railway-car axle with disk mounted on its end and axle-box C, the frames E and K and compression-spring between them, all held between said disk and the shoulder of the axle, and loose springs introduced and resting on the bottom of the box to carry said frames and press them against the axle, as herein set forth.

3. The combination of the axle-box having chamber C, axle having groove *c*, disk mounted on end of axle, and channeled side frames supported on loose springs, all substantially as herein set forth.

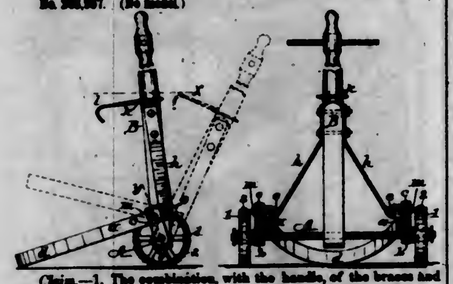


4. In combination with a car-axle and axle-box, the combination of a dust-guard with beveled circular opening, a curved strip of leather having its longest side nailed around said beveled opening and forming a conical projecting rim of somewhat smaller diameter than the axle and conforming closely thereto, and a belt-clamp joining the ends of the said strip of leather, the whole in combination with leather strips above and below opening, all as herein set forth.

382,247. SAND-BOX FOR STREET-CARS. WALTER V. H. WELSH, Troy, N. Y. Filed Jan. 5, 1888. Serial No. 259,893. (No model.)

Claim.—1. The combination, with a car, of a sand-tank, an outlet leading from the same, a feeder constructed to force the sand from the tank into and through the outlet, and means for giving motion to the feeder, substantially as described.

2. The combination, with a car, of a sand-receptacle, B, and a worm or conveyer, C, with means for giving motion to the worm, substantially as described.

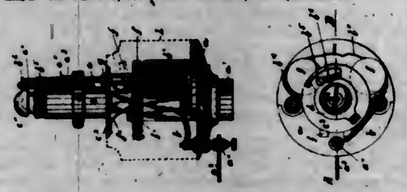


382,247.

3. The combination, with a car, of a pair of sand-receptacles worms running therein, bevel-wheels on the inner ends of said worms, a bevel-pinion gearing with both of said bevel-wheels, and means for giving motion to said bevel-pinion, substantially as described.

4. The combination, with a car, of a pair of sand-receptacles, B B, worms C C, running therein, bevel-wheels F F on the inner ends of said worms, a bevel-pinion, G, meshing with both of said wheels F, a shaft, H, carrying said pinion G, a bevel-wheel, J, on the front end of said shaft, a second bevel-wheel, J', meshing with said wheel J, a shaft, I, carrying said wheel J', and a crank, K, on the top of said shaft I, all substantially as shown and described.

382,248. HAND-TRUCK. JAMES H. ALEXANDER, Syracuse, N. Y., assignor to Charles H. Tryon, same place. Filed Feb. 14, 1888. Serial No. 263,987. (No model.)



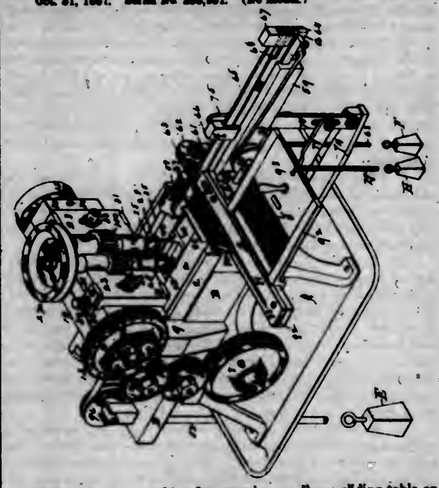
Claim.—1. The combination, with the handle, of the braces and nose *a*, constructed in one piece, and secured at their ends to the handle, substantially as described.

2. The nose and brace combined, consisting of a curved front, *d*, twists *c*, and cleats *b*, substantially as described.

3. The combination, with the axle and wheels and handle, of the posts *c*, secured to the axle, the nose *a*, mounted in the posts and curving outward therefrom, and the braces connecting the posts and handle, and the hook-ring *k* mounted upon the handle, substantially as described.

4. The combination, with the axle and wheels and handle, of the bracket provided with posts *c* and lugs 7, in which the axle is journaled, the nose *a*, hinged to the posts 3, and the braces *b*, connecting the posts and handle, and the hook-ring mounted upon the handle, substantially as described.

382,249. AUTOMATIC ELECTRIC GAS-BURNER. ELMER E. BAILEY, West Everett, assignor of one-half to William Sears, Malden, Mass. Filed Nov. 9, 1887. Serial No. 254,672. (No model.)



Claim.—1. In an automatic electric gas-burner, one or more electro-magnets electrically connected by means of a single wire to the stationary insulated electrode b^3, in combination with the movable ground-connected electrode *c'*, the stop-cock b', and armature *f*, substantially as and for the purpose set forth.

2. In an automatic electric gas-burner, the stop-cock b' and its block b, having recesses b^1 b^2, of varying depths, in combination with the movable rod *g*, pivoted to and actuated by the armature *f*, the pawl *h*, pivoted to said rod *g*, and the electrode *c'*, loosely connected to said rod *g* in such a manner that every alternate downward motion of said rod will cause the circuit to be broken between the electrodes b^3 *c'*, as and for the purpose set forth.

3. In an electric automatic gas-burner, the gas-pipe *c*, having stop-cock b', with recessed blocks b b^1 b^2, as described, and the stationary V-shaped projection c^4, combined with the movable armature *f*, the rod *g*, pivoted to and actuated by said armature, the pawl *h*, pivoted to the rod *g*, and having V-shaped recess h'' in its upper end, and the electrode *c'*, loosely connected to said rod *g*, in a manner as described, so that every alternate movement of the armature shall cause the circuit to be broken between the electrodes *c'* b^3, as set forth.

4. In an automatic electric gas-burner, the gas-pipe *c* and the stop-cock b', located therein, combined with the movable rod *g*, pivoted to the armature *f*, and having the set-screw g^4, for the purpose of retaining the stop-cock in place, as set forth.

382,250. NEEDLE-GROOVING MACHINE. JOHN BERRY, Springfield, Mass., assignor to the National Needle Company, same place. Filed Oct. 31, 1887. Serial No. 253,931. (No model.)

Claim.—1. In a machine for grooving needles, a sliding table on the bed of the machine, a cam and weight, substantially as described, for imparting a horizontal reciprocating motion to said table, and needle-clamping jaws secured to said table, combined with two needle holding and carrying fingers, substantially as described, supported opposite the end of said table, and a cam and a weight connected with said fingers, whereby they are given an endwise motion in one direction corresponding with that of said table and an endwise motion in the opposite direction, first corresponding with and then more rapid than that of said table, substantially as set forth.

2. In a needle-grooving machine, the herein-described needle-feeding devices, consisting of two needle-fingers capable of longitudinal reciprocating movements, having a pivoted connection, whereby their ends are separable to receive therebetween the shank of a needle, a spring to close said ends, a finger-lifter located at the side of said fingers, with which one thereof engages, whereby their needle-receiving ends are caused to open, combined with the table of the machine, having longitudinal reciprocating movements in like direction to said needle-fingers, and needle-clamping jaws attached to said table to receive a needle held by said fingers, substantially as set forth.

3. In a machine for grooving needles, mechanism for manipulating the needles, whereby they are taken one by one from a group thereof and presented to the groove-cutters, and after having been grooved are removed from said cutters, two needle-fingers capable of longitudinal reciprocating movements toward and from said cutters, having a pivoted connection, whereby their ends are separable to receive therebetween the shank of a needle, a spring to close said ends, a finger-lifter located at the side of said fingers to open their needle-receiving ends, a needle-receiver holding a group of needles by the side of and in a line with the direction of movement of said fingers, and a needle-follower moving said group toward the side of said fingers, substantially as set forth.

4. The needle-receiver having the internal longitudinal slot, 62, capable of receiving the shanks of the needles, and the slot *g*, com-

municating therewith, combined with a needle-table on which to place a group of needles in the plane of said slot *g*, and a needle-pusher capable of a sliding motion against said group, substantially as set forth.

5. The needle-receiver having an internal longitudinal slot, 82, capable of receiving the shanks of a group of needles whose points project from said slot, and a needle-follower, 84, having a movement in said slot against said shanks, combined with a gage-plate, 85, supported opposite the points of said needles, and a guide-plate, N, near said gage-plate, over whose upper edge the needles extend, substantially as set forth.

6. The needle-fingers capable of longitudinal reciprocating movements at right angles to the end of the gage-plate 85 and of holding a needle by its shank, combined with an ejector-slide, 87, supported on said plate and having an engagement with said fingers, whereby it is given a movement toward them, an ejector-arm attached to said slide, and a spring to move the slide from said fingers, substantially as set forth.

7. In combination, the needle-fingers, the needle-receiver 81, the needle-follower having a longitudinal movement in said receiver against a group of needles therein, whereby they are forced against said fingers, and the stop-arm 99, supported at the side of said fingers opposite that against which said needles are forced, substantially as set forth.

8. The needle-fingers capable of longitudinal reciprocating movements, having a pivoted connection, whereby their ends are separable to receive therebetween the shank of a needle, one of which fingers has thereon the finger-lifter cam 73, and a spring to close said ends, combined with the finger-lifter 69, pivoted to vibrate in a vertical plane at the side of said fingers and capable of engagement with said cam, and a spring acting against one side of said lifter, substantially as set forth.

9. The needle-fingers, the vibratory lever 75, pivoted by one end and having an engagement with said fingers, a cam on the main shaft, a slide-bar, 76, connected with said lever and having an engagement with said cam, and a weight, F, connected by a cord with said fingers, combined and operating substantially as set forth.

10. The table 2, capable of a longitudinal reciprocating movement on the grooving-machine, and the shaft 12, extending across said table and having a cam, 50, thereon, combined with a lever, 42, pivoted to said table, having a needle-clamp jaw pivoted thereto, a lever, 40, pivoted to said table by one end and engaging with one end of said first-named lever, a rock-bar, 35, having an end engaging with said lever 40 and having a laterally-extending wing, 36, a spring, 38, connected to said bar, and a vertically-moving bar, 48, having one end engaging with said wing and actuated by said cam, substantially as set forth.

11. In combination, a rotating cam, 50, a bar, 48, capable of a vertical movement and actuated in one direction by said cam, and the table 2, capable of a longitudinally-reciprocating movement under the end of said bar, combined with the rock-bar 35, having a wing, 36, thereon whose length is equal to or in excess of said table movement, and a flattened end, 39, a spring attached to said rock-bar and rocking said wing against the end of said vertical bar, the levers 40 and 42, pivoted on said table and actuated by said rock-bar, as described, the jaw 46, fixed on said table, the jaw 44, pivoted on lever 42, and a spring, 51, under said last-named lever, substantially as set forth.

12. The table 2, the lever 42, pivoted on said table, and the clamp-jaw 46, fixed thereon, combined with the clamp-jaw 44, pivotally attached to said lever, and the screw 47, adjustable vertically under the jaw-bearing end of the lever, all as set forth.

13. The cross-head 10, the shaft 12, extending across the machine in a line with said head, the blocks 30, capable of sliding horizontally on the cross-head, each having a stud, 22, connected thereto and extending toward the end of said shaft, and a spring interposed between said blocks to separate them, combined with a cam, substantially as described, on one or both ends of said shaft engaging with said stud to move one or both of said blocks toward the center of the cross-head, capable of having the extent of its cam-surface which acts on said stud elongated or shortened, and a cutter-shaft having a needle-grooving cutter attached thereto attached to each of said horizontally-sliding blocks, substantially as set forth.

14. The combination, with the bearing-blocks of the cutter-shaft of a needle-grooving machine, which blocks are capable of a reciprocating horizontal motion on the cross-head thereof, of a cam or cams rotating opposite the ends of said blocks and engaging them to cause the groove-cutters to approach each other, having bearing-faces of variable extent, as described, whereby a cutter is held in engagement with the needle during more or less of its movement past the cutter, substantially as set forth.

15. In combination, in a needle-grooving machine, the cross-head 10, the block 30, sliding on said head, the shaft 12, extending across the machine in a line with said head, and a cam, 15, attached to said shaft and engaging with said stud on said block, consisting of a disk, 21, and a ring, 20, encircling said disk, each having a cam-face thereon side by side and in the same plane, and capable of being rotated on or in the other, whereby the extent of said cam-faces is made variable, substantially as set forth.

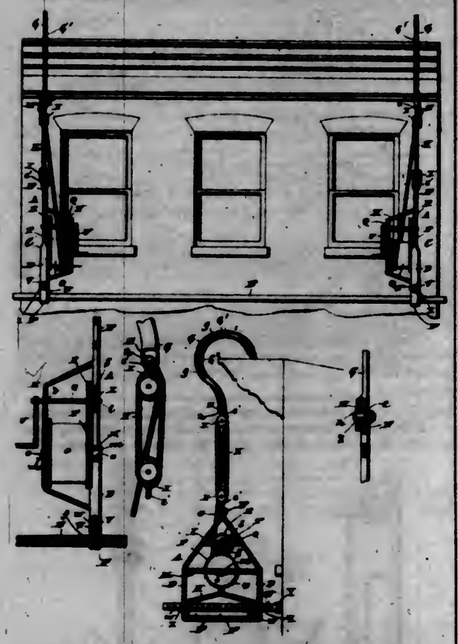
16. In a machine for grooving needles, the combination of the following elements, viz: a table having a longitudinal reciprocating movement on the machine, a fixed needle-clamp jaw on said table, two clamp-operating levers, and a rock-bar, as described, attached to said table, a second clamp-jaw pivoted on one of said levers, a cam to operate said levers, two cutter-shafts carrying grooving-cutters on opposite sides of said clamps, cams acting to move said cutters and shafts toward the clamps, and a spring to move them in the opposite direction, a longitudinally-slotted needle-receiver, as described, fixed opposite the end of said table at right angles to the movement thereof, having an internal slot to receive the shanks of the needles, a needle-follower moving in said receiver against said shanks, and needle-fingers, as described, having a reciprocating longitudinal movement at the end of said receiver opposite the ends of said clamp-jaws and in the line of the movement of said table, substantially as set forth.

382,251. **WASH-STAND BOWL.** NATHAN G. DEEM, Fairfax Court-House, Va., assignor, by direct and mesne assignments, to the Deal Furniture Improvement Company, Washington, D. C. Filed Oct. 5, 1887. Serial No. 251,698. (No model.)

Claim.—1. The combination, with a bowl having a discharge-opening in its bottom, of an adjustable elastic cover suspended outside of said bowl and swinging in approximately the plane of said opening, said cover being adapted, when in one position, to close said discharge-opening.

2. The combination, with a bowl having a discharge-opening in its bottom, of an elastic cover lying outside of said bowl and revolvable about a vertical axis, and an adjustable elastic support on which said cover is mounted, whereby said cover may be brought into position to close said discharge-opening, and may in such position be pressed against the bowl only by its own elastic force and that of said support.

3. The combination, with a bowl having a discharge-opening in its bottom, of an adjustable elastic cover lying outside of said bowl, and adapted when in one position to close said discharge-opening, and moving substantially in the plane of said opening, a longitudinal reciprocating rod attached to said cover and imparting its own reciprocal motion thereto, and means, substantially as shown and described, for imparting motion to said rod, substantially as and for the purpose set forth.



4. The combination, with a bowl having a discharge-opening in its bottom, of an elastic ball lying below said discharge-opening, a swinging rod on which said ball is mounted, the plane of motion of said rod being approximately tangent to said bowl, and means, substantially as shown and described, for actuating the free end of said rod and bringing said ball into or withdrawing it from a position immediately below and in contact with the walls of said opening, substantially as and for the purpose set forth.

5. The combination of the bowl B, having an opening, *b*, in its bottom, the rod *c*, swinging in a plane substantially perpendicular to the axis of said opening, the ball C, mounted on the free end of said rod, the guide D, and means, substantially as shown and described, for moving the free end of the rod *c*, substantially as and for the purpose set forth.

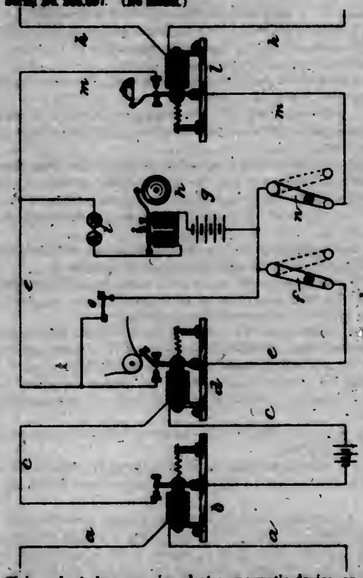
6. The combination of the bowl B, having the discharge-opening *b* in its bottom, the swinging rod *c*, oscillating in a plane intersecting the axis of said opening, and the elastic ball C, mounted thereon, the rotating rod H, and the lever G, rigidly mounted thereon, and the rod F, connecting the free end of the lever G with the free end of the rod *c*, whereby the rotation of the rod H actuates the free end of the rod *c*, substantially as and for the purpose set forth.

7. The combination, with the bowl B, having an opening, *b*, in its bottom, of the swinging rod *c*, oscillating about a vertical axis, the ball C, mounted thereon, the nut E, having cockets *e* in its walls, the rotating rod H and lever G, and the rod F, having one of its ends connected with the free end of the lever G, and provided at its opposite bifurcated end with inwardly-turned points entering the cockets *e* in the nut E, substantially as and for the purpose set forth.

382,252. **PAINTER'S STAGE.** CHARLES D. BOUTIN and WILLIAM H. CARPENTER, Camden, N. J. Filed Dec. 14, 1887. Serial No. 257,593. (No model.)

Claim.—1. In a stage, the combination of the hooks G G, the frames C C, depending from the hooks and having the horizontal supporting-bars F, the plank B, resting at its ends on the bars F, and the arms W W, attached to the frames and passing over the plank, substantially as and for the purpose specified.

2. In a stage, the combination, with the hooks, of the depending frames C, having supporting-bars F F, provided with spurs *f f* on their upper sides, the plank B, resting at its ends on the said bars and engaging the spurs, and the removable arms W W, attached to the frame and passing over the plank adjacent to the upper surface thereof, substantially as specified.



3. In a stage, the combination, with the hooks G G, of the frames C C, depending therefrom and having the side bars, D D, provided with aligned apertures V V, and the horizontal bars F F, the plank B, attached to the frame, the guide-arms W, arranged in the apertures V V and having the perforations *w w*, and the pins X X, engaging the perforations and bearing against the bars D D, substantially as specified.

4. In a stage, the combination of the hooks G, comprising the outer and inner bars, G' and G², converging to a point at their upper ends, the bracing-webs arranged at intervals between the said bars, and the apertured disk H, attached to the lower ends of the bars, the frames C C, comprising the converging side bars, D D, connected at their lower ends by the horizontal bars F, and the apertured disk E at the upper ends of the side bars, the plank B, resting at its ends on the horizontal bars F, the pulleys I I, having hooks *i i*, which are engaged in the apertured disks, the ropes K, passing through the pulleys, and the drums mounted on the frames C and adapted to wind or unwind the ropes, substantially as and for the purpose specified.

5. In a stage, the combination of the hooks G G, having pulleys I attached to their lower ends, the depending frames C C, having pulleys I attached to their upper ends, the inward-extending guide-arms W, attached to the frames and having rollers on their ends, and the hoisting devices mounted on the frames C and comprising the drums O, having peripheral series of gear-teeth, the gear-wheels R, meshing with the teeth on the drums and having a crank, U, attached thereto, the ratchet-wheels carried by the gear-wheels, the pawls engaging in the ratchet-wheels, and the ropes K, passing through the pulleys I I and attached at their lower ends to the said drums, substantially as specified.

6. In a stage, the combination, with the supporting-hooks having pulleys attached thereto and the plank-supporting frames having pulleys attached thereto, of the drums mounted on the said frames, the gear-wheels R, meshing with gear-teeth on the flanges of the drums, the ratchet-wheels carried by the said gear-wheels, the pawls mounted on the frames and engaging the said ratchet-wheels, the crank-arms connected to the gear-wheels, and the ropes K, attached to the drum and passing around the said pulleys, substantially as specified.

382,253. **FIRE-ALARM-SIGNAL CIRCUIT.** WILLIAM CARROLL, Chicago, Ill., assignor to John P. Barrett, same place. Filed Feb. 6, 1888. Serial No. 263,227. (No model.)

Claim.—1. A door-opening electro-magnetic device, an electric gong, and a battery in a wire common to two different local circuits, each of said local circuits containing a different switch, and each being mechanically independent of the other and connected through the circuit-closing points of a different relay, one of said relays being connected to be energized in unison with the signal sent over the joker-line of the system and the other of said relays being connected to be energized in unison with the signal sent over the gong-line of the system, in combination with said joker-line and gong-line, whereby the battery in said common wire may be closed to operate said door-opening electro-magnetic device and electric gong by signals sent over both the joker-line and the gong-line, the gong-line alone, or neither of said lines, according to the positions of the switches.

2. The combination, with two independent signal-circuits over which signals are sent in succession, of a relay or repeater in each of said circuits connected with local circuits, each local circuit including a switch, the switch in one circuit being independent of the switch in the other circuit, and a portion of said local circuits being common, the common portion including a local battery and a signal device, whereby when a signal is sent first over one signal-circuit the local circuit containing the relay of the other signal-circuit may be opened before the signal is sent over said second circuit.

3. The combination, with the two signal-circuits of a fire-alarm system, one of said signal-circuits, the joker-line, containing a relay in a register local circuit, of the register in a local circuit containing a switch and general-alarm-signal device, and the other of said signal-circuits, the gong-line, containing a bell connected up as a relay in a local circuit containing another switch, said switches being mechanically independent of said general-alarm-signal device, whereby the first signal sent over the joker-line may be received upon the register without operating the general-alarm device, while the signal subsequently sent over the gong-line may be allowed to operate the general alarm or not, at the will of the watchman, accordingly as he leaves the switch in the local circuit of the small bell of the gong-line closed, or opens the same after noting the first signal received upon the register.

382,254. SNOW-SKATE. PETER CHERADOT, Altoona, Pa. Filed May. 9, 1887. Serial No. 236,944. (No model.)

Claim.—1. A snow-skate having underneath a continuous groove, B, with parallel edges throughout its length and gradually shallower toward its ends, and ending flush with the surface of the skate at a distance from each end of the latter.

2. A snow-skate provided underneath with a continuous groove, B, having abrupt edges *b'*, as specified.

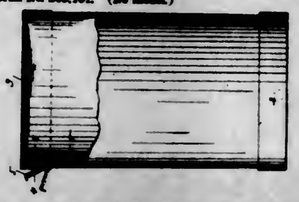
3. A snow-skate having its side edges rounded off at *b*, and provided underneath with a continuous groove, B, having abrupt edges *b'*, as set forth.

4. The combination of a snow-skate having its side edges rounded underneath at *b* and narrower above the rounded portion, in combination with the foot-strap C, made in two parts, secured to the said narrower portion and connected by the lace *c*, substantially as described.

5. In combination with the snow-skate A and the foot-strap C, the foot-plate D, provided with transverse corrugations *d*.

6. In combination with a snow-skate, the brake E, provided on its under side with projections or corrugations F and adapted to be attached to the skate, substantially as specified.

7. In combination with a snow-skate, the brake E, provided on its under side with projections or corrugations F, a friction-covering, *f*, above the said corrugations, and having the rigid end piece, *e*, and the hinged end piece, *e'*, conforming to the edge of the skate, and a spring or strap, *e²*, connecting the said pieces *e e'*, substantially as specified.



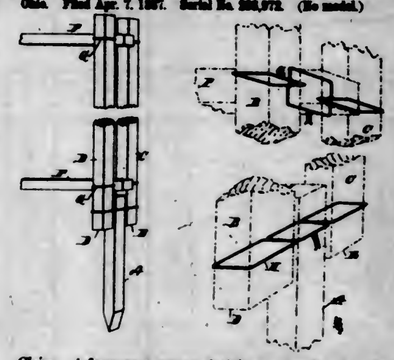
8. A snow-skate made in two or more detachable sections, substantially as specified.

9. In a snow-skate made in detachable main sections, the sub-sections interconnected by hinges M, to adapt them for folding together.

10. A snow-skate made in two main sections provided with angular end plates, J J', one of the said plates, J, having secured to it a bolt, K, and the other plate, J', having a bore or socket, *k*, and a pin or screw, L, to receive and retain the said bolt for securing the two sections together, substantially as specified.

11. In a skate made in sections, the sub-section made in two parts, having lugs *n* and connected by hinges M, in combination with a key or bolt, N, for securing the said sub-sections in the unfolded position, substantially as specified.

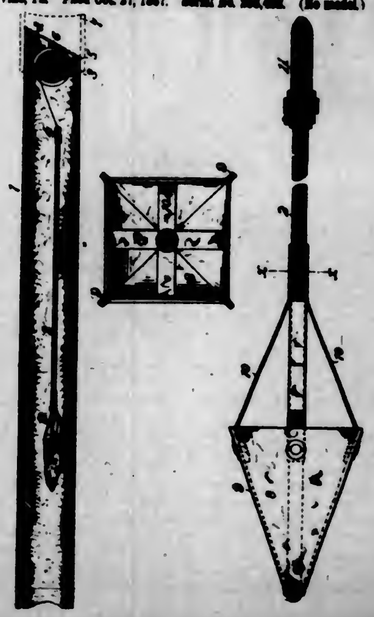
382,255. BIRD-FOOD HOLDER. HARRY F. BWABROOK, Worcester, Mass., assignor to Sarah B. Bwabrook, same place. Filed Feb. 24, 1888. Serial No. 265,101. (No model.)



Claim.—1. As an improved article of manufacture, a box or canister having an opening in its upper part provided with a hinged lip, and a removable cover provided with a corresponding opening, for the purpose stated, substantially as set forth.

2. The combination, with a box or canister having an opening in its upper part provided with a hinged lip adapted to be bent outwardly, of a removable cover to extend over the upper part of said box and inclose said lip, and provided with an opening to correspond with the opening in said box, to permit of the hinged lip being bent outward when desired, substantially as shown and described.

3. The combination, with the box 1, having an opening, 6, in its upper edge, and a lip, 4, hinged thereto to close said opening and adapted to be bent outwardly, of a cover, 3, having a turned-down edge, with an opening, 3', therein to fit over the top part of the box 1, for the purpose stated, substantially as shown and described.



4. The combination, with a box having an opening in its upper part, of a lip, 4, for closing said opening, and a piece of flexible material, 5, for hinging said lip to the box, the upper part of said material extending beyond the edge of said lip 4, to furnish means for drawing the same outward, substantially as shown and described.

382,256. FENCE-POST. SAMUEL W. PEARCE, near Northwood, Ohio. Filed Apr. 7, 1887. Serial No. 233,972. (No model.)

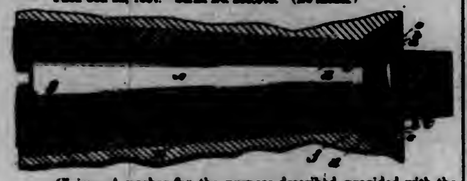
Claim.—A fence-post composed of the two parallel pieces B and C, the wire loop G, and the piece A, one end of the latter being inserted through the wire loop and turned end for end, as and for the purpose set forth.

382,257. ARROW FOR PASSING CORD THROUGH PIPE-LINES. JACOB GUTHER, Allegheny, assignor of one-half to Charles H. Miller, Pottsville, Pa. Filed Oct. 27, 1887. Serial No. 253,402. (No model.)

Claim.—1. The combination of a tapering-sided cup formed of flexible material, a shaft or arrow passing through said cup and secured to the apex thereof, said cup being suitably proportioned with reference to the diameter of the pipe in which it is to be used for passing freely through the pipe under ordinary hydrant-pressure, and means for attaching a cord to the opposite end of the arrow, substantially as set forth.

2. The combination of the pyramidally-shaped cup formed of flexible material, a shaft or arrow passing through said cup and secured at or near one end to the apex thereof, and means for attaching a cord to the opposite end, substantially as set forth.

3. The combination of a shaft or arrow, a pyramidally-shaped cup formed of triangular pieces of flexible material united to each other at their edges and at their apices to the shaft or arrow at or near one end thereof, and flexible stay-straps connecting the free edges of the cup to the shaft, substantially as set forth.



382,258. WHIP. PATRICK S. HARRINGTON, Cheyenne, Wyo., assignor to the Cheyenne Manufacturing Company, of Wyoming Territory. Filed Sept. 3, 1887. Serial No. 248,688. (No model.)

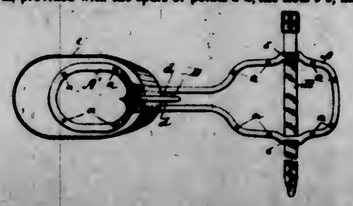
Claim.—1. The herein-described process of treating rawhide for covering whips, which consists in wetting the hide, heating the same, allowing it to sweat slowly, and then cutting the hide into strips, substantially as shown and described.

2. As an improvement in whips, the combination, with an elastic stock or core, of strips of rawhide prepared as herein described, and braided upon said stock, as set forth.

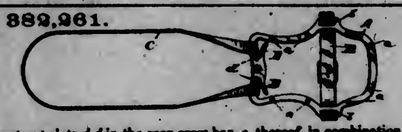
382,259. AXLE-WASHER. ISAAC HARRIS, Vincennes, Ind., assignor of one-half to H. W. Porter and C. M. Griffith, both of same place. Filed Oct. 22, 1887. Serial No. 253,093. (No model.)

Claim.—A washer for the purpose described, provided with the usual aperture to receive the axle-spindle, and its inner side having an annular flange of a diameter to embrace the said spindle and engage the outer end of a wheel-box, and its outer side having suitable means for fixing it to a nut, substantially as specified.

382,260. HEEL-PROTECTOR. FRANK J. HERRICK, New Britain, Conn., assignor to H. C. Hotin, same place. Filed Dec. 13, 1886. Serial No. 221,260. (No model.)



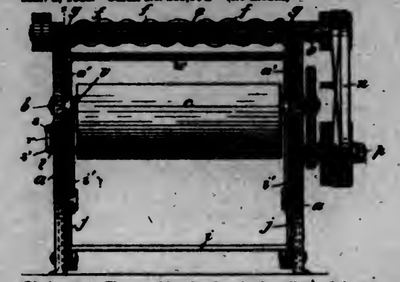
Claim.—1. The heel-protector herein described, consisting of a series of studs attached to or connected by a substantially-angular bar, and having a strengthening-bar, *c*, provided with a centering-spur or mold-rest, *d*, all substantially as described.



2. The within-described heel-protector, consisting of a series of hollow studs attached to or connected by a substantially-angular bar, and having a strengthening-bar, *c*, provided with a centering-spur or mold-rest, *d*, all substantially as described.

382,261. ICE-DOG. THOMAS S. HUTCHINSON, Saratoga Falls, N. Y., assignor to George A. Waller, same place. Filed Sept. 7, 1887. Serial No. 248,813. (No model.)

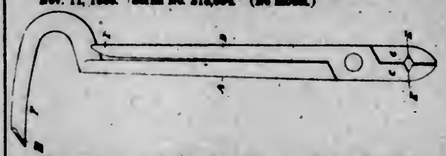
Claim.—The herein-described ice-dog, consisting of a plate or frame, A, provided with the spurs or points *a a*, the cleats *b b*, and the



382,261.

cut-out slots *d d* in the rear cross-bar, *c*, thereof, in combination with means for securing the same to the boot or shoe, substantially as and for the purpose set forth.

382,262. LEATHER-SCRAPING MACHINE. JAMES HOGGINSON, Salem, assignor of one-half to Charles F. Brown, Reading, Mass. Filed Mar. 2, 1888. Serial No. 265,904. (No model.)



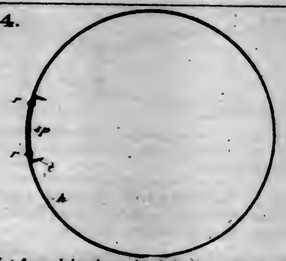
Claim.—1. The combination herein described of the segmental bed, mechanism for oscillating it, the clamp adapted to oscillate and arranged to co-operate with one edge of the bed in holding a skin, means for holding the bar against the edge of the bed, and a scraper adapted to act on a skin supported by the bed, as set forth.

2. The combination herein described of the segmental bed, means for oscillating it, the rotary scraping-roll movable toward and from the bed, means for raising and depressing said roll, the clamp adapted to oscillate and arranged to co-operate with one edge of the bed in holding a skin, and means for imparting a yielding pressure to said clamp when it is in operation, as set forth.

3. The combination of the segmental bed, the clamp, the springs pivoted to the arms of the clamp and provided with lefters *n'*, and the cams *n'* on the ends of the bed, whereby said springs are pressed against the clamp while the clamp and bed are holding a skin and released when the clamp is separated from the bed, as set forth.

382,263. HORSESHOER-PLIERS. SIMEON J. HUMILEY, New Haven, Conn., assignor of one-half to Patrick McDermott, same place. Filed Nov. 11, 1886. Serial No. 218,694. (No model.)

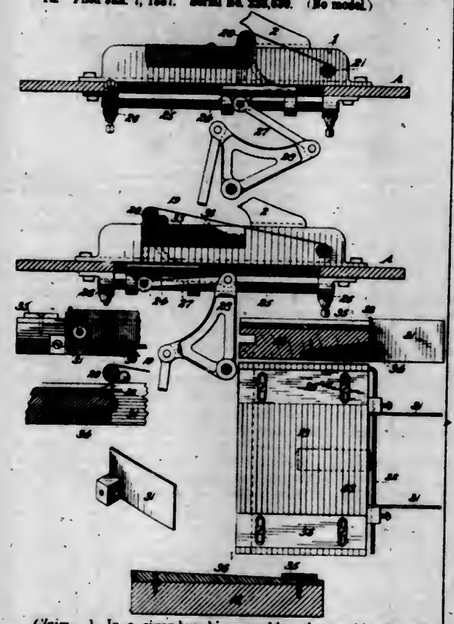
Claim.—1. A combined tool for cleaning and removing obstructions from horses' hoofs, consisting in two levers pivoted together and each provided with a jaw, one of the levers being provided at its opposite end with a hook bent inward toward the other lever and then outward, and the other lever being adapted to ride over and engage with the back of each hook at the point where the same offsets from the lever, of which it forms an extension, substantially as set forth.



2. A combined tool for cleaning and removing obstructions from horses' hoofs, consisting in two levers pivoted together and each provided with a jaw, one of the levers being provided at its opposite end with a hook bent inward toward the other lever and then outward, and the other lever being notched at its outer end to ride over and engage with the narrow back of the hook, which is oblong in cross-section, tapering from its inner end outward, and beveled and pointed at its outer end, substantially as set forth.

382,264. HOOP. JAMES LIGGIT, Haughville, assignor of one-half to Calvin G. Udell, North Indianapolis, Ind. Filed Feb. 18, 1888. Serial No. 264,627. (No model.)

Claim.—1. A hoop formed of a band of iron, its ends united by means of a plate having one or more spurs on its inner face, each spur-plate secured to the ends of the hoop by means of rivets, substantially as shown and described.



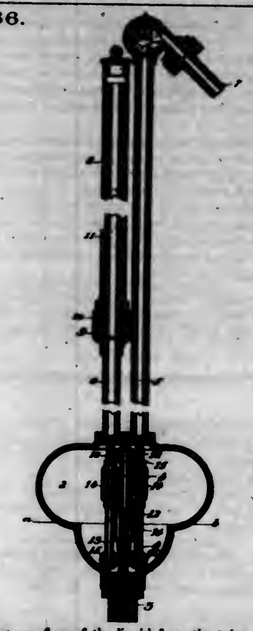
2. A hoop formed of a band of iron or similar material whose ends are united to a plate carrying spurs on its inner face, each plate

382,264.

lapping the joint formed by the ends of the hoop-band, with means for uniting the plate to the hoop, substantially as shown and described.

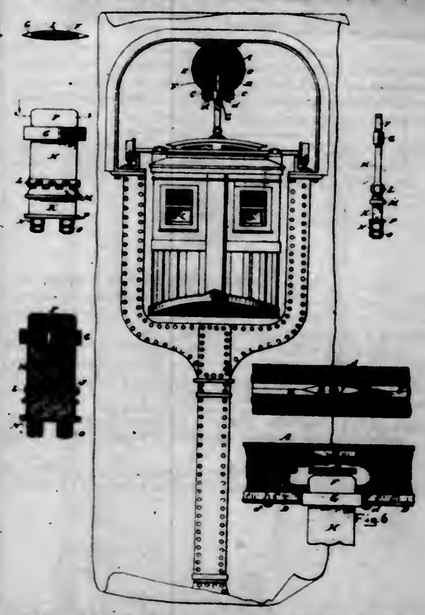
382,265. CIGAR-BUNCHING MACHINE. RALPH H. LOGAN and GEORGE H. CULLEY, Allegheny, assignors to John K. Collins, Clearfield, Pa. Filed Jan. 7, 1887. Serial No. 223,630. (No model.)

Claim.—1. In a cigar-bunching machine, the combination of a feed-hopper, a recessed cylinder mounted in the discharge end of the hopper, the recess in said cylinder being provided with interchangeable bottom and end plates, adjustable guide-plates below the cylinder, and bunching and binding mechanism consisting of a table, a movable roll, and an apron, substantially as set forth.



2. In a cigar-bunching machine, the combination of filler-feeding mechanism, a bunching-table, a movable bunching-roller, an apron passing over the table and roller, and a yielding stop-plate transverse of the table and arranged to hold the apron above the surface of the table, substantially as set forth.

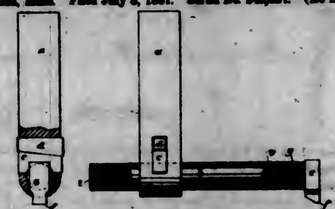
382,266. APPARATUS FOR TESTING PIPES. GEORGE W. LOTZ and JAMES M. DILLON, Wheeling, W. Va.; said Dillon assignor, by mesne assignments, to John A. Trimble, same place. Filed Jan. 10, 1888. Serial No. 260,232. (No model.)



Claim.—1. In an instrument for testing pipes, &c., wherein a vessel containing liquid and provided with an indicating-tube is connected with the pipes to be tested and with an air-compressing apparatus, the combination, with the said vessel, of the air-supply tube, the mouth of the said tube extending into the liquid, substantially as and for the purposes described.

2. In an instrument for testing pipes, &c., wherein a vessel containing liquid and provided with an indicating-tube is connected with the pipes to be tested and with an air-compressing apparatus, the combination, with the said vessel, of the air-supply tube, the mouth of the said tube extending into the liquid, and said tube having an enlargement to prevent overflow of the liquid from the tube, substantially as and for the purposes described.

382,266.

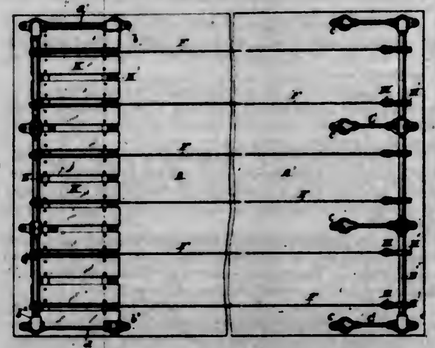


382,267. QUATERNARY YIELDING LEVER. THOMAS J. MAYALL, Reading, Mass.; Lucy A. Mayall executrix of said Thomas J. Mayall, deceased. Filed Aug. 26, 1887. Serial No. 247,927. (No model.)

Claim.—1. In combination with a car for the transportation of passengers or freight, the assembled devices, comprising a quaternary lever consisting of a flanged base-plate, K, adapted to be loosely united to an intermedial plate, H, the separating-plate G, and the locking-plate F, organized to coact with a pneumatic traveler, B, substantially as and for the purpose set forth.

2. In combination with the pneumatic tube A, having an aperture separably closed by an elastic sealing material, a separating-plate, G, constructed to discover said elastic material by its impact and to permit it to instantly reunite after said impact, so as to avoid the admission of air within said tube, in conjunction with the aggregated parts F H K, as previously described, and in the manner specified.

382,268. EXTENSION-TOOL FOR PLANERS. HENRY K. PORTER, Boston, assignor of one-half to Annie G. Porter and E. W. Porter, both of Chelsea, Mass. Filed July 5, 1887. Serial No. 243,397. (No model.)

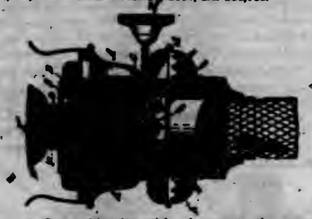


Claim.—1. A planer extension-tool having stock *a*, adapted to be locked in the tool-holding clamp of a planer and having a circular transverse passage therethrough near one end, cylindrical bar *b*, having axial and diversely threaded holes in its ends and fitted adjustably in said transverse passage in the stock, so that it may be adjusted both by rotation and lineal movement in the stock, and means, substantially as described, for rigidly locking the bar in the stock when adjusted therein, substantially as specified.

2. A metal-cutting tool formed with a body, a screw-threaded stem formed integrally with said body and with its axis at right angles to the longitudinal line of said body, and an operative cutting-edge formed upon said body with the line of said edge at right angles to the axis of said stem, substantially as specified.

3. An extension planer-tool formed of stock *a*, adapted to be locked in the tool-clamp of the planer, cylindrical bar *b*, fitted transversely and adjustably in said stock near one end thereof and having axial holes right and left hand threaded, and means, substantially as specified, for rigidly locking said bar in the stock when properly adjusted therein, and a cutter formed with a threaded stem fitted in said bar, a body to serve as a shoulder to abut against said bar, and an operative cutting-edge, all substantially as specified.

4. An extension planer-tool having a stock formed and adapted to be locked in the tool-clamp of the planer, a cylindrical bar fitted transversely and adjustably in said stock near one end thereof and axially threaded, and means, substantially as described, for locking said bar, and a cutter formed with a threaded stem fitted in said bar, with a body to abut against the end of the bar, and a cutting-point, substantially as specified.



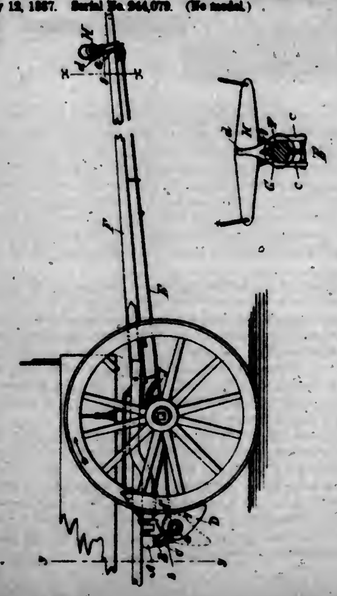
382,269. CLOTHES-DRIER. HENRY C. PRICE, New York, N. Y., assignor of one-third to J. Homer Hildreth, same place. Filed Mar. 24, 1887. Serial No. 232,294. (No model.)

Claim.—1. In an apparatus for drying clothes, the combination of the end frames having the top bars, E E', the series of independent pulleys H, all supported on the said bar E', the opposite series of independent pulleys G, the series of independent hinged levers arranged parallel to each other and all supported in common on the said bar E, the series of independent endless lines, respectively supported on the said pulleys and levers, and the series of independent fastening devices for the said levers, substantially as set forth.

2. In an apparatus for drying clothes, the combination, with the frame having the top horizontal bar, E and the lower horizontal bar, E', the endless lines, the pulleys G, and the levers I, hinged to the top bar E, of the fastening devices for the levers, having the hinged look-pieces J, connected to the said bar E', substantially as set forth.

382,270. CENTRAL-DRAFT LAMP AND BURNER. FRANK ESSEX, Meriden, Conn., assignor of one-half to Charles Standard Upton, New York, N. Y. Filed Dec. 20, 1886. Serial No. 222,125. (No model.) Patented in England Jan. 13, 1887, No. 600; in Belgium Jan. 17, 1887, No. 76,981, and in France Jan. 13, 1887, No. 180,908.

Claim.—1. In combination with a burner having a central-draft tube and a perforated cone or thimble at the top of said tube, a second perforated cone or thimble within the first, whereby an air-chamber is provided between the two cones, substantially as and for the purpose set forth.



2. In a burner having a central air-tube, the combination, with a cone or thimble at the top of said tube having an imperforate top and perforated sides, of a second cone or thimble within the first, having its sides perforated to supply air to the chamber between the two cones, substantially as and for the purpose set forth.

3. In a burner having a central air-tube, in combination with a cone or thimble at the top of said tube, perforated substantially as set forth, a second cone or thimble within the first and removable therefrom, and also perforated, substantially as set forth.

4. In combination with a burner having a central air-tube, a perforated cone or thimble fitting the upper end of the central air-tube, and an inner cone or thimble fitting inside the first cone or thimble, substantially as shown and described.

5. In a burner having a central air-tube, the combination, with a cone or thimble at the top of said air-tube having its sides perforated, for the purpose set forth, of a second cone or thimble within the first, and having in its sides perforations larger than those in the first cone or thimble, substantially as and for the purposes set forth.

382,271. WAGON-BRAKE. FRED RISS, Shapiro, Wis. Filed July 12, 1887. Serial No. 244,079. (No model.)

Claim.—1. In a vehicle-brake, the combination, with the shaft provided with brake-block levers or cranks at its ends, and with an arm arranged intermediately of and out of alignment with the said levers or cranks, of the power-applying rod connected to said arm and to a bifurcated lever pivoted upon the tongue or pole and adapted to be acted upon by the neck-yoke, and which bifurcated lever is provided with a stop at its rear acting upon the tongue or pole, substantially as set forth.

2. In a vehicle-brake, the combination, with the shaft provided with brake-block arms or cranks at its ends, and with an arm arranged intermediately of and out of alignment with the aforesaid arms or cranks, of the power-applying rod connected to said intermediate arm and to a bifurcated lever pivoted upon the tongue or pole and adapted to be acted upon by the neck-yoke, and which bifurcated lever is provided with a stop at its rear acting upon the tongue or pole, and the spring holding the faces of the brake-blocks out of contact with the wheels, said brake-blocks being eccentrically hung and adapted to have their faces turned away from the wheels as the team is backed, substantially as set forth.

382,272. INSULATING-JOINT. JAMES T. RUSH, New York, N. Y., assignor to Bergmann & Company, same place. Filed Mar. 5, 1887. Serial No. 229,818. (No model.)

Claim.—1. In an insulating-joint, the combination of two flanged tubes and a flexible insulating washer between them, one of the flanges and the flexible washer being turned at their edges over the other flange, whereby the two tubes are secured together and insulated from each other, substantially as set forth.

2. In an insulating-joint, the combination of two flanged tubes and a flexible insulating-washer between them having a central aperture, one of said flanges and the flexible washer being turned at their edges over the other flange, substantially as set forth.

3. In an insulating-joint, the combination of two flanged tubes, a metal washer and a flexible insulating-washer between them, one of the flanges being turned at its edges over the washers, and the other flange to hold the parts together.

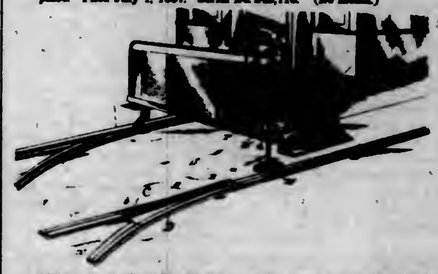
382,273. METHOD OF OBTAINING ALUMINA FROM CLAY. FREDERICK J. SEYBOUR, Findlay, Ohio. Filed Apr. 25, 1887. Serial No. 236,062. (Specimens.)

Claim.—1. The process of separating alumina from clay, kaolin, and other similar aluminous earths and reducing the same by mixing said substance with zinc, carbon, and a flux, and subjecting the same to the direct action of the products of combustion upon the charge, and driving the alumina, silica, and zinc in a finely-divided condition into a conduit or condenser, cooling and collecting the silica, subsequently cooling and collecting the mixed oxides of zinc and aluminum, and then reducing the oxides in a furnace in the presence of a deoxidizing agent and a metal such as zinc or aluminum, substantially as specified.

2. The process of separating alumina from clay, kaolin, and other similar aluminous earths and reducing the same by mixing said substance with zinc, carbon, and a flux, and subjecting the same to the direct action of the products of combustion upon the charge, and driving the alumina, silica, and zinc in a finely-divided condition into a conduit or condenser, cooling and collecting the silica, subsequently cooling and collecting the mixed oxides of zinc and aluminum, and then reducing the oxides in a furnace in the presence of a deoxidizing agent, substantially as specified.

3. The steps in the process of separating alumina from silica or clay to prepare the same for reduction, which consists in heating the silica and alumina with a flux and carbon and with zinc to about the vaporizing-point of the metal, in the manner specified, passing the finely-divided mixture thereby produced out of the heating-chamber, cooling and collecting the silica, then passing the oxides of zinc and aluminum to another conduit or chamber, and cooling and collecting them, substantially as specified.

382,274. TICKET-CLASP. JAMES L. SHAY, Bridgeport, Conn., assignor of one-half to Charles E. Thompson, same place. Filed Oct. 24, 1887. Serial No. 253,208. (No model.)



Claim.—1. A ticket-holder consisting of an attaching-plate having openings 8, a backwardly-turned spring-plate, 3, and a spring-plate, 2, projecting forward from the back over plate 3, and having guides which extend downward by the side of plate 3 and engage the openings in the attaching-plate, so that the ticket cannot be pushed out laterally.

2. A ticket-holder consisting of an attaching-plate having downwardly-turned ends curved inward to engage the top of the seat, a backwardly-turned lower plate, and a forwardly-turned upper plate curved upward at the edge, and having an opening, 11, and downwardly-turned guides, as and for the purpose set forth.

3. A ticket-holder consisting of an attaching-plate having openings 8, a backwardly-turned lower spring-plate, and a forwardly-turned upper spring-plate having guides at the sides which extend downward and engage said openings.

382,275. SWITCH FOR STREET-RAILWAYS. CHARLES F. SPENCER, Rochester, N. Y., assignor of one-half to Hobart F. Atkinson, same place. Filed July 1, 1887. Serial No. 243,110. (No model.)

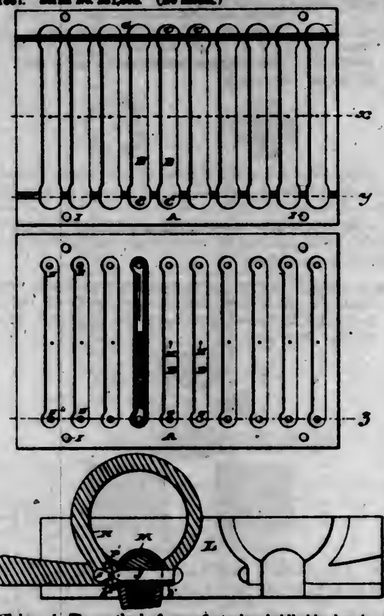
Claim.—1. A pivoted switch-tongue having a projection rigidly secured on its upper face, said projection being beveled or inclined at its end.

2. A pivoted switch-tongue large at one end and gradually tapering toward the opposite end, said tongue having a rib or projection rigidly secured on its upper face and extending longitudinally thereon, substantially as set forth.

3. The combination, with a pivoted switch-tongue, said tongue having a projection rigidly secured thereon, of a device located on a car adapted to shift said tongue by its contact with the projection, substantially as set forth.

4. The combination, with a rod mounted in the platform of a car and shear-plates yieldingly secured to the rod, of a pivoted switch-tongue, said tongue having a projection thereon adapted to be engaged by the shear-plates in shifting the tongue laterally, substantially as set forth.

5. A rod or standard that is adapted to be raised and rotated, having a toe to limit its rotary movement, an arch-plate perforated to engage the toe of the standard, and two spring-actuated shear-plates hinged to the rod or standard, substantially as set forth.



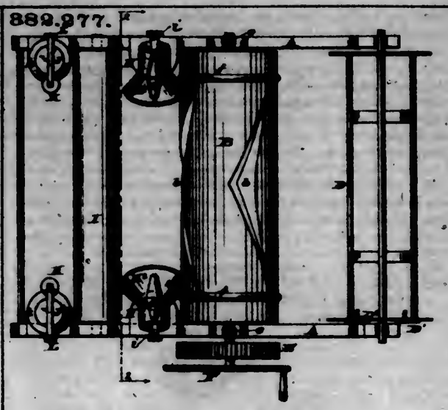
6. The combination, with a rod or standard that may be raised and rotated, an arch-plate provided with notches or holes, and an integral toe of the standard adapted to enter the holes in the arch-plate, of two hinged shear-plates, springs to support the shear-plates, and a tongue of a switch that is adapted to be moved sidewise at its point by the bearing upon it of the shear-plates, substantially as set forth.

7. A switch-shifting device consisting, essentially, of a rod or standard and a pointed shoe secured thereon, said rod or standard adapted to be turned to give the shoe a proper inclination.

8. A switch-shifting device consisting, essentially, of a rod or standard and shear-plates yieldingly secured thereto, substantially as set forth.

9. A switch-shifting device consisting, essentially, of a rotatable rod, a plate secured at one end thereof, and a pair of shear-plates pivoted to said plate, and springs located between the central plate and the free ends of the shear-plates and adapted to normally force the latter outward, substantially as set forth.

382,276. BRIDLE-BIT DIE AND THE METHOD OF MAKING BRIDLE-BITS. JAMES STARKEY, Newark, N. J., assignor to Edward H. Crane, Frederick Crane, and James Crane, all of same place. Filed Mar. 15, 1887. Serial No. 231,302. (No model.)



Claim.—1. The method of manufacturing bridle-bits herein described, which consists, essentially, in covering the mouth-core with rubber, arranging said covered core on pins in a die and subjecting the same to pressure to give form to the covering, withdrawing said covered core from said pins, and, finally, arranging said covered core in operative union with the cheek-pieces, substantially as set forth.

2. The die or mold for covering mouth-piece cores of bridle-bits, which consists of sections having concave grooves enlarged at the opposite ends, C C, and having pins in said enlarged portions, upon which the core of the mouth-piece may be arranged, and forming a perforation for the elastic covering for the cheek-piece, substantially as set forth.

3. The die for covering mouth-piece cores for bridle-bits, which consists of sections having grooves with enlarged opposite ends, the enlarged portions having pins E permanently secured to die-sections, substantially as set forth.

382,277. MACHINE FOR CORRUGATING AND EDGING SHEET METAL. HIRAM R. STARBUCK, Corning, N. Y., assignor to Victor Hatcher and Bertha Starbuck, both of same place. Filed Jan. 20, 1886. Serial No. 261,023. (No model.)

Claim.—1. In a machine having rolls for corrugating sheet metal for roofing, one of said rolls having circumferential ribs near its ends, and surface projections of angular or V form disposed at suitable distances apart between the said ribs, the other of said rolls having registering recesses, the arms of said projections tapering obliquely toward said circumferential ribs and terminating in points coincident with the surface of the roll, substantially as herein set forth.

2. In a machine for corrugating sheet metal, coacting rolls, one of which has surface projections of angular or V form, the other of said rolls having registering recesses, the said surface projections having their greatest width and projection at the middle of the length of the rolls and tapering therefrom in arms which terminate in points coincident with the surface of the rolls, substantially as described, and for the purpose specified.

3. In a machine for corrugating metal sheets for roofing, the rolls B and C, having surface registering projections and recesses in the middle of their lengths, the projections terminating in wide V-shaped arms, substantially as described, and registering circumferential ribs and grooves between the ends of the rolls and the termini of the oblique arms, the surfaces of the rolls between said registering parts being unbroken, substantially as described, for the purpose specified.

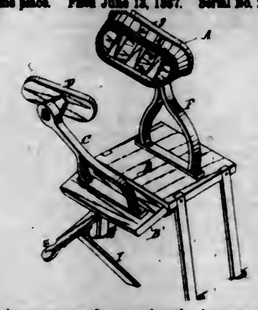
4. In a machine for corrugating and edging connected metal sheets for roofing, the combination of the rolls B and C, having surface registering projections and recesses in the middle of their lengths, the projections terminating in oblique arms, and registering circumferential ribs and grooves between the ends of the rolls and the ends of said surface projections, substantially as described, with rolls arranged in pairs and adapted to edge the connected sheets at the starting-lines made by the said circumferential ribs and grooves, whereby the strip is edged after it has been corrugated between such edge-starting lines.

5. The combination, in a sheet-metal corrugating and edging machine, of the rolls having surface registering projections and recesses and circumferential registering ribs and grooves, with preliminary edge-bending rolls having conical form and finishing edge-bending rolls having cylindrical form arranged to receive the sheet as it leaves the corrugating-rolls, substantially as described, for the purpose specified.

6. The combination of the corrugating-rolls having circumferential registering ribs and grooves near their ends, two pairs of bending-rolls registering with the ribs and grooves and consisting, respectively, each of an upper double-conical roll and a lower cylindro-conical roll, a guide-roller, and two pairs of vertically-journaled edging-rolls of cylindrical form registering with the conical rolls for corrugating and edging sheet metal, as described.

7. In a sheet-metal corrugating and edging machine, the combination, with the rolls B and C, having surface registering projections and recesses and circumferential ribs and grooves, of a roof and bending and edging rolls, arranged for operation substantially as described.

8. In a sheet-metal corrugating and edging machine, the combination of the lower roll, C, having V-shaped surface projections *a* and circumferential grooves *g*, and the upper roll having the V-shaped surface recesses *b* and the circumferential rib *f*, with the preliminary edge-bending rolls G H H² and the finishing edging-rolls J and K, the said upper corrugating-roll having the capacity to yield in relation to the lower roll, substantially as described, for the purpose specified.



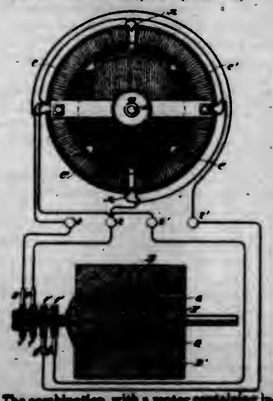
9. The combination, in a sheet-metal corrugating and edging machine, of the rolls B and C, having surface projections and recesses *a* and *b* and registering circumferential ribs and grooves near their ends, with bending and edging rolls arranged in pairs on each side of the

frame and carried by brackets adapted to be turned over out of the way, substantially as described, for the purpose specified.

10. In a machine for corrugating metal sheets for roofing, the rolls B and C, having registering circumferential ribs and grooves near their ends and intermediate registering projections and recesses which stand in oblique lines on the surface in the length of the roll, the said projections having their greatest surface projection at the middle of the length of the roll and extending therefrom to gradually terminate flush with the surface of the roll, as and for the purpose stated.

11. In a machine for corrugating metal sheets for roofing, the rolls B and C, having registering surface projections and recesses, the said projections being made widest and of the greatest surface projection at the middle of the length of the roll, and decrease in width and in surface projection in oblique arms, terminating in points coincident with the surface of the roll, as and for the purpose stated.

382,278. APPARATUS FOR MANUFACTURING BASKETS, &c. LEWIS STEVENS, Binghamton, N. Y., assignor of one-half to Benjamin F. Winfield, same place. Filed June 13, 1887. Serial No. 241,123. (No model.)

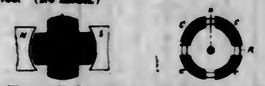


Claim.—1. An apparatus for securing the bottom to splint baskets or analogous articles, comprising a holder adapted to support the body of the article with the base of the latter projecting from the holder, in combination with a follower adapted to enter the said projecting portion of the body and provided with a hard-metal face around its edges, substantially as and for the purpose set forth.

2. An apparatus for manufacturing splint baskets or analogous articles, consisting of a pivoted form, over which to build the body of the said article, with the base of said body projecting from the form, in combination with a follower adapted to enter the projecting portion of said body and provided with a metal face around its edge, substantially as set forth and shown.

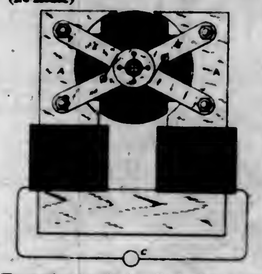
3. The apparatus for manufacturing splint baskets or analogous articles, consisting of the fixed post P, the form A, pivoted on said post axially at right angles thereto, the post C, arranged movably toward and from the fixed post, the follower D, pivoted on the movable post, and a prop adapted to support the latter post to hold the follower in proximity to the form on the stationary post, substantially as described and shown.

382,279. ELECTRO-MAGNETIC MOTOR. NIKOLA TESLA, New York, N. Y., assignor of one-half to Charles F. Peek, Englewood, N. J. Filed Nov. 30, 1887. Serial No. 256,061. (No model.)



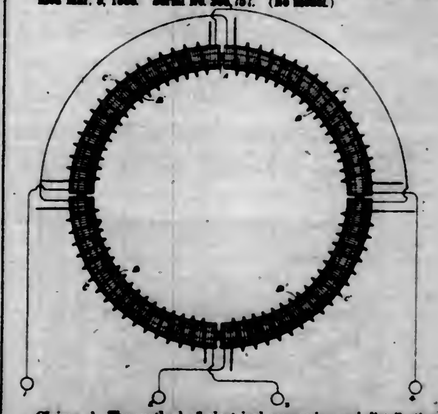
Claim.—1. The combination, with a motor containing independent inducing or energizing circuits and closed induced circuits, of an alternating-current generator having induced or generating circuits corresponding to and connected with the energizing-circuits of the motor, as set forth.

2. An electro-magnetic motor having its field-magnets wound with independent coils and its armature with independent closed coils, in combination with a source of alternating currents connected to the field-coils and capable of progressively shifting the poles of the field-magnet, as set forth.



3. A motor constructed with an annular field-magnet wound with independent coils and a cylindrical or disk armature wound with closed coils, in combination with a source of alternating currents connected with the field-magnet coils and acting to progressively shift or rotate the poles of the field, as herein set forth.

382,280. ELECTRICAL TRANSMISSION OF POWER. NIKOLA TESLA, New York, N. Y. Original application filed Oct. 12, 1887, Serial No. 252,132. Divided and this application filed Mar. 9, 1888. Serial No. 266,755. (No model.)

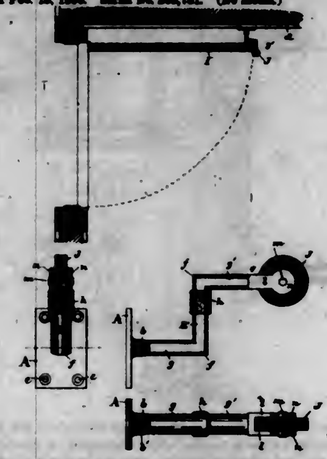


Claim.—The method herein described of electrically transmitting power, which consists in producing a continuously-progressive shifting of the polarities of either or both elements (the armature or field magnet or magnets) of a motor by developing alternating currents in independent circuits, including the magnetizing-coils of either or both elements, as herein set forth.

382,281. ELECTRICAL TRANSMISSION OF POWER. NIKOLA TESLA, New York, N. Y. Original application filed Nov. 30, 1887, Serial No. 256,562. Divided and this application filed Mar. 9, 1888. Serial No. 266,756. (No model.)

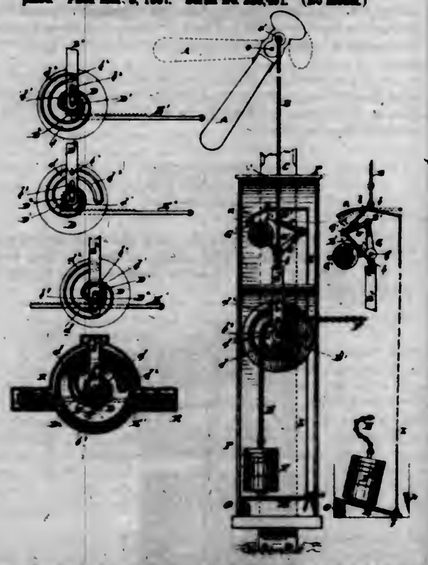
Claim.—The method herein described of transmitting power by electro-magnetic motors, which consists in continuously and progressively shifting the poles of one element of the motor by alternating currents and magnetizing the other element by a direct or continuous current, as set forth.

382,282. METHOD OF CONVERTING AND DISTRIBUTING ELECTRIC CURRENTS. NIKOLA TESLA, New York, N. Y. Original application filed Dec. 23, 1887, Serial No. 258,787. Divided and this application filed Mar. 9, 1888. Serial No. 266,757. (No model.)



Claim.—1. The method of electrical conversion and distribution herein described, which consists in continuously and progressively shift-

ing the points or line of maximum effect in an inductive field, and inducing thereby currents in the coils or convolutions of a circuit located within the inductive influence of said field, as herein set forth.

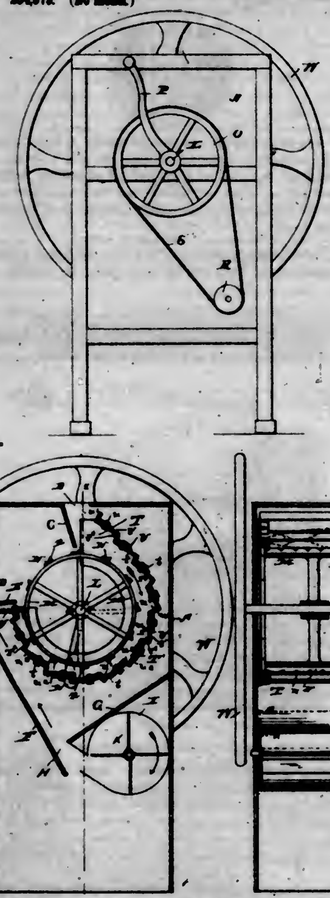


2. The method of electrical conversion and distribution herein described, which consists in generating in independent circuits producing an inductive field alternating currents in such order or manner as to produce by their conjoint effect a progressive shifting of the points of maximum effect of the field, and inducing thereby currents in the coils or convolutions of a circuit located within the inductive influence of the field, as set forth.

382,283. DOOR-CHECK. GERRAD THOMAS, Baltimore, Md., assignor of two-thirds to Werner Whelan and J. George Jung, both of same place. Filed Feb. 13, 1888. Serial No. 263,731. (No model.)

Claim.—The combined door stop and holder, comprising a stop-arm, E, having two right angles, *f*, the ends *g g* of which project in opposite directions, a base-plate, A, attached to one end, and a rubber roller, J, secured to the other end, as set forth.

382,284. DEVICE FOR ACTUATING RAILWAY-SIGNALS. JAMES J. THEISEN, Richmond, Ind., assignor to himself and John F. Miller, same place. Filed Mar. 5, 1887. Serial No. 229,691. (No model.)

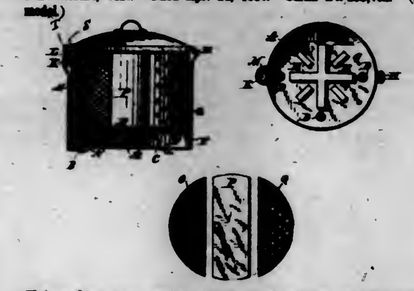


Claim.—1. As a device for actuating signals, switches, or switch-locks, the rotating disk D, having concentric circular slots *d' d²*, and spiral slot *d*, in combination with a connecting-rod having a stud adapted to enter and be guided by said slots and a slot adapted to pass over a projection of the disk's pivot, all substantially as and for the purpose specified.

2. In combination with a device for actuating a signal, substantially as specified, the safety device consisting of hinged links B' B', interposed in the connecting-rod B, the bell-crank lever G, the connecting-rod J, pivoted to one end of the bell-crank and to the joint *b'* of links B' B', the weight H, secured on the other arm of the bell-crank, the detaining clutch-lever K, and platform M, united by cord L, all combined, substantially as specified, so that the dropping of the weight F, secured to the actuating-connection of the signal, will release the clutch and permit the weighted bell-crank lever to draw the signal to "danger."

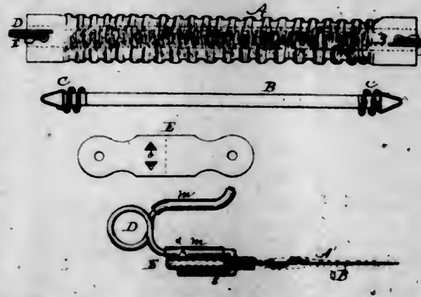
3. The combination of disk D, having grooves *d' d d²*, and sprocket-wheel D², the connecting-rod B, having stud *b²*, and hinged links B' B', the drive-chain E, having weight F, and the safety device consisting of the weighted bell-crank lever G, link J, clutch-lever K, connecting-cord L, and platform M, all substantially as and for the purpose specified.

382,285. MACHINE FOR SHUCKING AND SHELLING CORN. LOUIS R. WHITTEN, Fort Worth, assignor of one-fourth to Alfred Nuckle, Bobbin, Tex. Filed May 26, 1888. Renewed Nov. 7, 1887. Serial No. 254,579. (No model.)



Claim.—1. The concave comprising the end walls, T, having their outer edges provided with the serrations T², which have the long tangential sides *t'*, and the shorter sides, *t²*, arranged at an obtuse angle with relation to the sides *t'*, and the flanges *t* on the opposing sides of the end walls and projecting inwardly from the sides *t'* of the serrations, and the ribs U, secured on the said flanges to connect the end

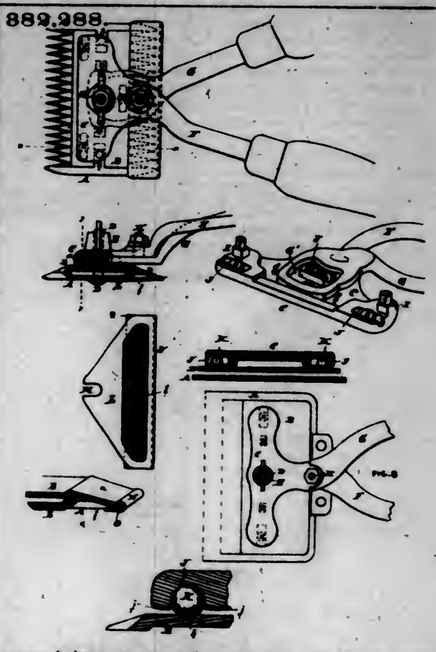
walls together, the said ribs being narrower than the said flanges to leave openings e² between the edges of the ribs, for the purpose set forth, substantially as described.



2. A corn shucking and shelling machine, comprising the cylinder and concave, the inclosing-case provided with the discharge-opening D for the shucks and cobs on one side, the board E, extending from the discharge end of the concave to the casing, and dividing the opening D into an upper and lower passage, the oppositely-inclined boards F and G, forming the bottom of the case, and having the opening H between their lower edges, and the blower to direct a current of air through the opening H up the board F, and out of the opening D below the board E, for the purpose set forth, substantially as described.

382,286. STEAM-COOKER. JOHN C. SMITH and LOREN B. SARGEN, Ballardsville, Ohio. Filed Apr. 21, 1887. Serial No. 235,702. (No model.)

Claim.—In a steam-cooker, the steam-chamber A, tube T, having port I for the admission of steam to the tube, and port L for the exit of steam therefrom, and the valve K, that indicates when sufficient steam for cooking is raised, and which rises high enough to allow extra pressure of steam to pass through the escape-port, as and for the purpose set forth.



382,287. CARRIAGE-CURTAIN FIXTURE. FOWLER A. BRANDENBURG, Vandalia, Ohio. Filed July 26, 1887. Serial No. 245,184. (No model.)

Claim.—1. A carriage-curtain fixture comprising an elastic strap held in the sheath or hem of the curtain, the fastener attached to the end thereof, the plate folded over said fastener, and the clasp with looped end, which passes through the plate and fastener to bind the same together, substantially as described.

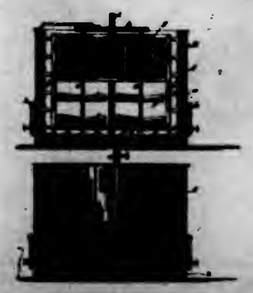
2. The wire fastener composed of an angular loop to embrace the folded end of the bow-clasp and parallel folds to engage an elastic strap, substantially as shown and described.

382,288. HAIR-CLIPPING MACHINE. LEWIS S. LEE, Philadelphia, Pa. Filed Mar. 31, 1887. Serial No. 233,116. (Model.)

Claim.—1. In a hair-clipping machine, the combination of the reversible cutters with a protecting-guard for the rear teeth, having its bottom open to allow of the ready discharge of any hair or other obstruction which might enter the teeth from above, substantially as described.

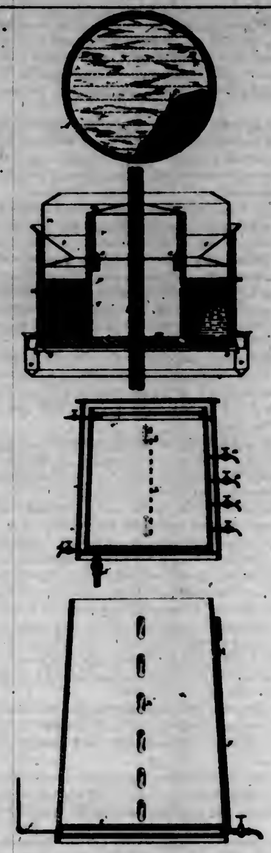
2. In a hair-clipping machine, the combination of the reversible cutters with a protecting-guard for the points of the rear teeth, provided with an elastic cushion arranged adjacent to the teeth, substantially as described.

3. In a hair-clipping machine, the combination of the reversible cutters with a protecting-guard for the points of the rear teeth, provided with an elastic cushion arranged adjacent to the teeth and made open on the bottom to allow of the passage of any hair, dirt, &c., which may find its way between the teeth, substantially as described.



4. In a hair-clipping machine, the combination of the reciprocating cutter, the stationary cap, and interposed ball or spherical bearings, with guides to hold the balls against lateral movement, but to allow of longitudinal movement with respect to both the cutter and cap.

5. In a hair-clipping machine, the combination of the reciprocating cutter, the cap having three longitudinal parallel grooves arranged out of line, so as to cover an extended area, loose balls or spheres in said grooves, a stationary cutting-plate, and a clamping-bolt extending through the cap between the said balls or spheres, and hence between their points of contact with the cutter and within the area between them.



6. The combination of the reciprocating cutter having two or more longitudinal grooves, *h*, the cap having two or more longitudinal grooves, J, and balls or spheres K, fitting into said grooves J and *h*, substantially as described.

REISSUES.

10,925. PROCESS OF MAKING SYRUP AND BEER FROM MAIZE. ALFRED R. FERRIS, Boston, Mass., assignor to Edward C. Potts, Troy, N. Y. Filed Apr. 19, 1886. Serial No. 199,423. Original No. 304,761, dated Aug. 19, 1884.

10,925.

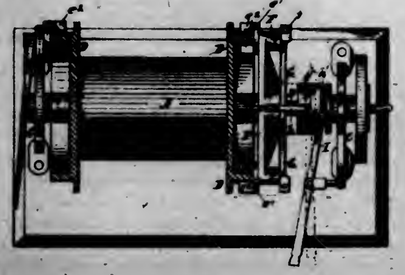
Claim.—1. The herein-described process for the manufacture of beer-wort and sirup from corn and malt, which consists in soaking the meal in water at a temperature a little below the point at which the albuminoids begin to coagulate; then adding a small percentage of malt; then raising the temperature slowly to the point at which starch dissolves and keeping the meal at this temperature for a sufficient time to render the constituents of the meal as soluble as possible by such treatment; then in a suitable separator separating the soluble portions, fine albuminous matter, &c., from the insoluble portions; then mashing with malt in the usual manner; then running it into a settling and conversion tub suitable for the purpose, keeping the mash at a substantially even temperature, thereby facilitating conversion and settling the fine insoluble matter by keeping the top portions of the mash as warm as or a little warmer than the lower portions; then drawing off the clear wort, boiling the same until coagulation is complete; then running the wort into the settling-tub, settling it as before, and drawing off the clear wort for further treatment, substantially as set forth.

2. In the manufacture of beer-wort and sirup from corn or maize, the herein-described method of making the necessary separation and conversion, which consists in soaking cornmeal in water at a temperature of about 150° Fahrenheit; then raising the temperature nearly to the heats at which the albuminoids begin to coagulate, (about 156° Fahrenheit;) then adding a small percentage of malt; then raising the temperature slowly up to the heats at which starch dissolves, (from about 165° Fahrenheit to the boiling-point;) then separating the starch and other soluble constituents of the meal from the insoluble portions; then mixing with malt to make the conversion, substantially as set forth.

3. In the manufacture of beer-wort and sirup, the herein-described process for liquefying and treating the starch and other soluble constituents of corn preparatory to converting the starch into saccharine extract by mixing it with malt, which consists in mixing a small proportion of malt (sufficient to liquefy the starch but not enough to effect its complete conversion) with the meal after it is softened and expanded by soaking, then raising the temperature of the mixture slowly up to the heats at which starch dissolves, (from 165° Fahrenheit to the boiling-point,) and then separating the starch and other soluble constituents from the insoluble matter before mixing them with malt to make the final and complete conversion, substantially as set forth.

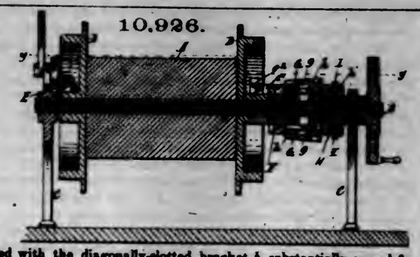
4. In the manufacture of beer-wort and sirup, the herein-described method of treating the residue which remains in the settling-tub after conversion and settling, and after the clear wort, &c., have been drawn off, which consists in separating from the said residue in a suitable separating-machine the liquid portion thereof, cooling the same to a temperature of from 50° to 70° Fahrenheit, and adding thereto Irish moss, gelatine, or other similar substance, as usually prepared for fining beer, thoroughly mixing the same, and in a suitable vessel passing a gas or atmospheric air through it, and after the mass is cleared drawing off, and then treating the clear portion in the same manner as the wort first drawn from the mash, as set forth.

5. The herein-described method of facilitating the settling of the fine insoluble matter of corn and malt mashes during and after conversion, which consists in surrounding the vessel containing the mash or wort on its entire sides and over the upper surface of the mash or wort by a circulating conductor of heat, of the same or a little higher temperature than the contents of the said vessel, substantially as shown and described, whereby the escape of heat from the sides and upper part of the mash or wort and the consequent circulation caused by unequal cooling are prevented, as set forth.



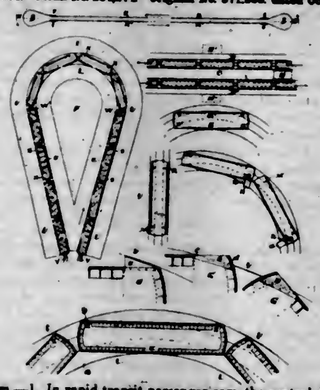
6. The hereinbefore-described process of separating the fine insoluble matters in corn and malt mashes from the extract or wort, which consists in treating it with a solution of Irish moss or gelatine and then subjecting the liquid to the action of gas or air, as specified.

10,926. FRICTION-CLUTCH. WILLIAM B. HAVENS, Denver, Colo., assignor to the Rotjan Wind Engine Company, Beloit, Wis. Filed Nov. 3, 1887. Serial No. 254,602. Original No. 330,613, dated Oct. 14, 1879.



Claim.—1. In a friction-clutch, the combination of a plate provided with shoes pivoted thereto, an arm rigidly attached to the main shaft and upon which said plate is journaled, and a lever or other equivalent means adapted to oscillate said plate and shoes, the latter being adapted to engage with the outer and inner sides of an annular rim secured to the body to be moved, substantially as described.

2. In a friction-clutch, the combination of the plate *c'*, provided with the shoes c^3 c^3, and secured to the rod *c*, journaled in the end of the arm F, in combination with the lever G, and sliding ring H, pro-



10,926.

vided with the diagonally-slotted bracket A, substantially as and for the purpose shown and described.

10,927. APPLIANCE FOR HANDLING RAPID-TRANSIT PASSENGER TRAFFIC. ARTHUR M. WELLINGTON, New York, N. Y. Filed Feb. 16, 1886. Serial No. 192,374. Original No. 371,866, dated Oct. 18, 1887.

Claim.—1. In rapid-transit passenger-cars, the central door, E, in combination with diagonally-opposite end doors or platforms, X, substantially as shown and described, and for the purpose described.

2. In rapid-transit passenger-cars, the middle doors, E E', in combination with end doors or platforms, X X, substantially as shown and described, and used for the purpose and in the manner described.

3. A rapid-transit passenger-car having diagonally-opposite exits and entrances, each at any one stop on one side only, in combination with a terminal receiving-platform, L, of horseshoe form, on one side of the track and a corresponding discharging-platform, U, on the other side, substantially as shown and described, and for the purpose described.

4. A rapid-transit passenger-car having diagonally-opposite exits and entrances, each at any one stop on one side only, in combination with a single central platform, C, and side platforms, D D', the one being for loading only and the other for unloading only, substantially as shown and described, and for the purpose described.

5. In rapid-transit passenger service, the combination, with passenger-cars having diagonally-opposite exits and entrances, each at any one stop on one side only, of the main tracks K K' and end loops, N B, substantially as shown and described, and for the purpose described.

6. In rapid-transit passenger service, the combination, with passenger-cars having diagonally-opposite exits and entrances, each at any one stop on one side only, of the main tracks K K', end loops, N B, and terminal platforms U L, substantially as shown and described, and for the purpose described.

7. In rapid-transit passenger service, the combination, with passenger-cars having diagonally-opposite exits and entrances, each at any one stop on one side only, of the main tracks K K', end loops, N B, and way-platforms C D D', substantially as shown and described, and for the purpose described.

8. The projecting triangular platform-plate O, in combination with station-platforms of slightly-varying height on straight lines and on curves, to permit the plate to ride over the one while running flush with the other, substantially as shown and described.

9. In rapid-transit passenger service, a terminal station, approximately of horseshoe form, having the tracks within it on which trains stop to unload passengers, and provided with landing-platforms on either side, at which the trains may stop, with front and rear of the train approximately opposite each other, and with the middle car of the train at or near the middle of the horseshoe, so as to accommodate a longer train than the station itself, substantially as set forth.

10. In rapid-transit passenger service, the combination of main tracks K K', loops or closed circuits N B, and semicircular or horseshoe station U L, having its landings for the middle car of trains at or near to the middle of the horseshoe, substantially as shown and described, and for the purpose described.

11. In rapid-transit passenger service, the combination of the main tracks K K', loops or closed circuits N B, terminal station U L, and way-station D C, substantially as shown and described, and for the purpose described.

12. In rapid-transit passenger service, the combination of the main tracks K K', closed circuit or loops N B, and way-station D C, substantially as shown and described, and for the purpose described.

NORRIS PETERS

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

COMMISSIONER'S DECISIONS.

EX PARTE MASON.

Decided February 28, 1888.

STATEMENT OF THE CASE.

The petition failed to refer to or identify the specification, and the oath accompanying the application contained the statement that the invention had not been patented to the applicant, "nor with his knowledge or consent in any foreign country," the words "to others" being omitted and the word "foreign" inserted before country.

1. PETITION.

Held that the petition was defective, and must be amended to contain a reference to the specification for a full disclosure of the alleged invention.

2. OATH.

The oath filed by applicant is indefinite and may be construed to mean that the invention has not been patented to applicant in any country, or to himself in any foreign country, or with his knowledge or consent in any foreign country.

3. MATERIAL DEPARTURES FROM THE RULES NOT PERMITTED.

If the rules are violated or departed from in one material particular, the practice would soon become lax in other particulars. The several requirements of the rule with regard to the oath must be enforced.

REFERENCE by Examiner.

ACOUSTIC TELEPHONE.

Application of Peter L. Mason filed October 7, 1887, No. 251,677.

Mr. W. H. Burridge for the applicant.

HALL, *Commissioner:*

This case is referred to the Commissioner on request of applicant by the examiner, who objects to the petition because it does not refer to or identify the specification as contemplated by the rules, and also because the oath forming part of the application does not conform to the requirements of the rules of the Office.

The petition omits any reference to the specification for a full disclosure of the alleged invention. It is evident that without such reference it is defective. No reason is shown why the omission may not be cured by the attorney without any trouble or delay, and I think the requirement should be insisted upon.

In regard to the oath, it will be seen that the rules require an applicant to state—

whether the invention has or has not been patented to himself or to others with his consent or knowledge in any country, and if it has been, the country or countries in which it has been so patented, * * * and that it has not been patented in any other country or countries than those mentioned, &c.

Instead of the phraseology required by the rules, applicant avers that the invention—

has not been patented to him nor with his knowledge or consent in any foreign country—

the words "to others" being omitted, and the word "foreign" being introduced before "country," the effect of which is to omit from his oath the statement whether or not a patent for the same invention has been issued to others in this country. Applicant's statement that it has not been patented to himself may be held to mean to himself in any country; but another construction of this language would authorize a meaning that it has not been patented to himself in any foreign country, nor with his knowledge or consent in any foreign country. It is evident that this language is far from a compliance with the rules. It may possibly put the applicant to some trouble or delay to file a proper oath, but the requirement is one which should be insisted upon. If a material variation, or, rather, violation, of the rule can be permitted in one particular, the practice would soon become very lax in others. Indeed attention has already been called to the fact that applicants do not strictly conform to the rule with regard to the several requirements of the oath, and it is time that objections of this character were enforced. I therefore affirm the action of the examiner.

EX PARTE ZABEL.

Decided April 10, 1888.

1. An applicant who in his application has elected, through mistake or ignorance, to prosecute claims for one invention must exercise diligence in presenting his amendment correcting such error, and this before the application has been examined and rejected.

2. The examiner was right in refusing to admit an amendment covering a distinct and separate invention from that originally retained and prosecuted to rejection. To enter and consider such an amendment would be to permit the applicant to secure examination of two distinct inventions for one fee.

ON petition.

MANIFOLD-COPYING PROCESS.

Application of Franz A. C. Zabel filed May 1, 1885, No. 164,990.

Mr. E. A. Brydges and *Mr. C. J. Gooch* for the applicant.

HALL, *Commissioner:*

The application in this case showed originally an apparatus and a process, and upon requirement applicant limited his claims to the apparatus. The application received consideration and rejection. Applicant thereafter sought to amend his application by striking out his claims for the apparatus and introducing claims for the process. As said by the examiner, up to the date of this last amendment—viz., November 4, 1887—the record shows that claims had been prosecuted for an apparatus by which the said process might be car-

ried out, although no intimate connection existed between the said process and the said apparatus. The examiner held that the two inventions were not interdependent and refused to enter the amendment for the reason that it constituted a departure and was, in fact, an attempt to introduce claims for a different invention from that originally prosecuted. From this refusal of the examiner the applicant has appealed to the Commissioner and insists that the retention of the claims for the apparatus originally was in the nature of a mistake, and he urges that the Office should be considerate of the rights of an applicant and allow him to correct errors and mistakes of that character by presenting claims to the invention he desires to patent.

It is well settled under the present practice in the Office that an applicant will not be allowed to claim two separate and distinct inventions in the same application, a practice which applies to applications for apparatus and process. I am not prepared to say, in case of an application showing process and apparatus, should it be made to clearly appear that the applicant had made an actual mistake in claiming one invention instead of the other, through his own ignorance or the lack of information on the part of his attorney, and should he present an amendment changing the claims from the apparatus to the process, accompanied by proper evidence, that such amendment and correction might not be allowed, if presented diligently and before the case had been examined by the Office; but to allow such a change to be made after the application has received examination would result in permitting a party to secure examination for two inventions for the one fee. Of course this cannot be allowed. It follows from these considerations that the applicant must be compelled to stand by his original election.

The action of the examiner is affirmed.

DECISIONS OF THE U. S. COURTS.

Supreme Court of the United States.

TILGHMAN *v.* PROCTOR *et al.* PROCTOR *et al. v.* TILGHMAN.

Decided March 19, 1888.

1. INTEREST IN COLLECTIONS NOT INVOLVING NECESSARILY INTEREST IN PATENT.

An interest in the net proceeds of collections for infringements of a patent does not necessarily involve an interest in the patent itself.

2. RULES FOR SETTLING GAINS AND PROFITS.

The infringer is liable for actual, not for possible, gains; for the fruits of the advantage which he derived from the use of the invention over that which he would have had in using other means then open to the public, and adequate to enable him to obtain an equally beneficial result.

3. SAME.

If there was no advantage in the use of the plaintiff's invention, there can be no decree for profits, and the plaintiff's only remedy is by action at law for damages.

4. SAME.

If the defendants gained an advantage by using the plaintiff's invention, that advantage is the measure of the profits to be accounted for, even if from other causes the business in which that invention was employed by the defendants did not result in profit.

5. SAME.

A court of equity will itself administer full relief by awarding as an equivalent or a substitute for legal damages a compensation computed and measured by the same rule that courts of equity apply in the case of a trustee who has wrongfully used the trust property to his own advantage.

6. SAME.

A court in equity will require an infringer to account for the gains and profits which he has made from the use of a patented invention instead of limiting the recovery to the amount of royalties paid to the patentee by third persons.

7. SAME.

Where the patent in suit had been adjudged invalid by this Court in a suit against another defendant, and subsequently in this suit the Court had adjudged the patent valid, the defendants must account for infringements committed after the date of the first adjudication that such patent was invalid.

8. SAME.

The plaintiff has the burden of proving the amount of profits the defendants have made by the use of his invention.

9. SAME.

As to the comparative expense of the old process, the cost at that the old process could not have been used at a less cost.

10. MASTER'S REPORT—PRESUMPTIONS SUPPORTING THE SAME.

In dealing with the exceptions to the master's report, his conclusions, depending upon the weighing of conflicting testimony, which the defendants used it, if at all, is not conclusive evidence have every reasonable presumption in their favor, and are not to be modified or set aside unless there clearly appears to have been error or mistake on his part.

11. INTEREST ON AMOUNT SETTLED—DATE OF SAME.

Interest should be allowed upon the amount found due the plaintiff by this Court from the date when the master's report was submitted to the court below.

APPEALS from the Circuit Court of the United States for the Southern District of Ohio.

Mr. George Harding and *Mr. Francis T. Chambers* for the appellant.

Mr. William M. Ramsey and *Mr. R. H. Parkinson* for the appellees.

Mr. Justice GRAY delivered the opinion of the Court.

This was a bill in equity, filed June 26, 1874, by Richard A. Tilghman against William Proctor and four others, copartners under the name of Proctor & Gamble, praying for an injunction, for an account of profits, and for damages for the infringement of letters patent originally granted to Tilghman for fourteen years from January 9, 1854, and afterward extended to January 9, 1875, for the process of manufacturing fat acids and glycerine from fatty bodies by the action of water at a high temperature and pressure.

The infringement complained of in this suit was from May 1, 1870, to January 8, 1875. Similar suits by this plaintiff against other defendants had been maintained by the Circuit Courts for the Southern Districts of Ohio and of New York in 1862 and 1864, respectively. (*Tilghman* v. *Werk*, 2 Fisher Pat. Cas., 229; *Tilghman* v. *Mitchell*, 2 Fisher Pat. Cas., 518.) In the suit in New York a final decree for an account of profits was entered by the circuit court on September 1, 1871. (*Tilghman* v. *Mitchell*, 9 Blatchford, 1, 18; S. C., 4 Fisher Pat. Cas., 599, 615.) On March 2, 1874, that decree was reversed in this Court by the opinion of four justices against three, two judges not sitting, upon the hypothesis that Tilghman's patent was limited to the apparatus therein described, and that the use of an apparatus similar to that used by the present defendants was not an infringement. (*Mitchell* v. *Tilghman*, 19 Wall., 287, 419, 421.)

In the case at bar the circuit court on December 2, 1874, following the decision of this Court in *Mitchell* v. *Tilghman*, made a decree dismissing the bill; but on appeal from that decree this Court, at October term, 1880, by a unanimous opinion overruled its decision in *Mitchell* v. *Tilghman*, and adjudged that Tilghman's patent was a valid one for a process, and not merely for the particular apparatus described in the specification; that that apparatus could be operated to produce a beneficial result; that the defendants had infringed the plaintiff's patent, and therefore that the decree of the circuit court be reversed and the case remanded, with directions to enter a decree for the plaintiff in conformity with that opinion. (*Tilghman* v. *Proctor*, 102 U. S., 707.) There is nothing in the record before us to induce any change or modification of the conclusions then announced.

By making a few extracts from that opinion the questions now before us will be better understood.

The patent in question relates to the treatment of fats and oils, and is for a process of separating their component parts, so as to render them better adapted to the uses of the arts. It was discovered by Chevreul, an eminent French chemist, as early as 1813, that ordinary fat, tallow, and oil are regular chemical compounds, consisting of a base, which has been termed glycerine, and of different acids, termed, generally, fat acids, but specifically stearic, margaric, and oleic acids. These acids, in combination severally with glycerine, form stearine, margarine, and oleine. They are found in different proportions in the various neutral fats and oils, stearine predominating in some, margarine in others, and oleine in others. When separated from their base, (glycerine,) they take up an equivalent of water, and are called free fat acids. In this state they are in a condition for being utilized in the arts. The stearic and margaric acids form a whitish semi-transparent hard substance, resembling spermaceti, which is manufactured into candles. They are separated from the oleic acid, which is a thin oily fluid, by hydrostatic or other powerful pressure, the oleine being used for manufacturing soap and other purposes. The base (glycerine) when purified has come to be quite a desirable article for many uses. (102 U. S., 708, 709.)

The substance of Tilghman's discovery and invention was thus summed up by the Court:

That the fat acids can be separated from glycerine without injury to the latter by the single and simple process of subjecting the neutral fat while in intimate mixture with water to a high degree of heat under sufficient pressure to prevent the water from being converted into steam without the employment of any alkali or sulphuric acid or other saponifying agent, the operation, even with the most solid fats, being capable of completion in a very few minutes when the heat applied is equal to that of melting lead, or 612° Fahrenheit, but requiring several hours when it is as low as 250° or 40.° Fahrenheit. The only conditions are, a constant and intimate commixture of the fat with the water, a high degree of heat, and a pressure sufficiently powerful to resist the conversion of the water into steam. The result is a decomposition of the fatty body into its elements of glycerine and fat acids, each element taking up the requisite equivalent of water essential to its separate existence, and the glycerine in solution separating itself from the fat acids by settling to the bottom when the mixed products are allowed to stand and cool. In this process a chemical change takes place in the fat in consequence of the presence of the water and the active influence of the heat and pressure upon the mixture. (Pages 712, 713.)

The Court spoke of the different forms of apparatus mentioned in Tilghman's patent or used by the defendants, as follows:

The apparatus described [in the patent] consists of a coil of iron pipe or other metallic tubing erected in an oven or furnace where it can be subjected to a high degree of heat, and through this pipe the mixture, (of nearly equal parts of fat and water,) made into an emulsion in a separate vessel by means of a rapidly-vibrating piston or dasher, is impelled by a force-pump in a nearly continuous current, with such regulated velocity as to subject it to the heat of the furnace for a proper length of time to produce the desired result, which time, when the furnace is heated to the temperature of 612° Fahrenheit, is only about ten minutes. The fat and water are kept from separating by the vertical position of the tubes, as well as by the constant movement of the current, and are prevented from being converted into steam by weighting the exit-valve by which the product is discharged into the receiving-vessel, so that none of it can escape except as it is expelled by the pulsations produced by the working of the force-pump. Before arriving at the exit-valve the pipe is passed, in a second coil, through an exterior vessel filled with water, by which the temperature of the product is reduced. After the product is discharged into the receiving-vessel it is allowed to stand and cool until the glycerine settles to the bottom and separates itself from the fat acids. The latter are then subjected to washing and hydraulic pressure in the usual way. (Pages 712, 713.)

It is evident that the passing of the mixture of fat and water through a heated coil of pipe standing in a furnace is only one of several ways in which the process may be applied. The patentee suggests it as what he conceived to be the best way, apparently because the result is produced with great rapidity and completeness. But other forms of apparatus, known and in public use at the time, can as well be employed without changing the process. A common digester or boiler can evidently be so used, provided proper means are employed to keep up the constant admixture of the water and fat, which is a sine qua non in the operation. (Pages 713, 730.)

The defendants use a boiler in which the charge of fat and other materials is placed and heated, and do not mix the fat and water in the manner pointed out in the specification of the patent, but, on the contrary, have inserted in the boiler a pump, which forces the water, as it settles to the bottom, upward to the top of the mass, and pours it upon the upper surface, whence it again finds its way down through the fat, thus keeping up a constant mixture. (Page 730.)

It was expressly decided that neither the form of the defendants' apparatus, nor the addition of lime, nor the use of steam, nor the applying of a lower degree of heat prevented their process from being an infringement of the plaintiff's patent. (Pages 730–733.)

The Court also said:

It is objected that the particular apparatus described in the patent for carrying the process into effect cannot be operated to produce any useful result. We have examined the evidence on this point, and are satisfied that it shows the objection to be unfounded. A recapitulation of this evidence is not necessary. The testimony of Tilghman himself, of Professor Booth, and of Mr. Wilson is directly to the point. (Page 730.)

In accordance with the judgment and mandate of this Court, the circuit court, in February, 1877, entered an interlocutory decree for the plaintiff, and referred the case to a master—

to ascertain and tax and state and report to the court an account of the gains, profits, savings, and advantages which the said defendants have received, or which have arisen or accrued to them, from infringing the said exclusive rights of the said complainant by the use of the process patented in the said letters patent, as well as the damages the said complainant has sustained thereby.

The master filed his report in August, 1884.

As to damages—

the master finds from the evidence that the complainant has derived no profit from the invention involved in this suit otherwise than by granting licenses to others to use the same. These licenses have been granted to all manufacturers desiring to use his process at a substantially uniform fee of twenty cents for each hundred pounds of fat treated, payable monthly. For several years the respondents held such a license from the complainant, but terminated the same, refusing to pay the stipulated license-fees after May 1, 1870, although continuing to use the process until the expiration of the patent on January 8, 1875.

The master further says:

The accompanying table A shows the quantity of fat treated by the respondents during each month of infringement, the license-fees therefor, and interest thereon to October 7, the first day of October term, 1884, making the whole amount of the complainant's damages herein $79,506.91.

As to the profits, gains, savings, and advantages which had accrued to the defendants, the master finds that what was known as "the lime-saponification process," which consisted in the manufacture of the fat into soap by the use of lime, and in the decomposition of that soap into fatty acids and glycerine by the aid of sulphuric acid, was more advantageous than any other process open to public use at the time in question, and reports the defendants' savings in lime and sulphuric acid, their gain in glycerine, their loss in fat acids produced, and their net gains and savings, as follows:

2,752,732 pounds of lime, at $3.3586 per hundred	$9,668 33
6,880,819 pounds of sulphuric acid, at $2.527 per hundred	173,863 13
Amount saved in chemicals	183,731 46
Amount gained on glycerine water	61,701 77
Total	244,433 23
Deducting loss in fatty acids, being 54 cents per hundred on 21,204,732 pounds of fat	114,991 76
Net gains and savings	129,441 47

In September, 1884, each party filed exceptions to

the master's report. The circuit court, in February, 1886, overruled all the exceptions, and entered a final decree for the plaintiff for $79,566.91, the amount of damages reported by the master, with simple interest added upon the license-fees from October 7, 1884, to February 4, 1886, making in all $83,275.21, and costs. From this decree both parties appealed to this Court.

At the hearing before the master a brother of the plaintiff, called as a witness in his behalf, testified on cross-examination that before this suit was brought the witness had acquired an interest in all license-fees and recoveries under the patent. No further question was asked or evidence offered by either party as to the nature or amount of that interest. The defendants contended before the master and at the argument here that the plaintiff could recover in this suit no more than his own share, and, having failed to prove the extent of his interest, was entitled to nominal damages only. It is a sufficient answer to this objection that it is not shown that any one but the plaintiff has any interest, legal or equitable, by assignment or otherwise, in the patent sued on, and that, as observed by Mr. Justice Strong, sitting in the circuit court—

an interest in the net proceeds of collections under a patent does not necessarily amount to legal ownership in the patent itself. It is plain, therefore, as the case appears, that there has been no want of joinder of the necessary parties. (*Jordan* v. *Dobson*, 4 Fisher Pat. Cas., 232, 236.)

The principal question of law now presented is as to the general rule that should govern the amount to be recovered. The defendants contend that the plaintiff, having established license-fees for the use of his patent, is not entitled to any gains and profits accruing to the defendants in excess of those fees. The plaintiff contends that, as the profits to be accounted for exceed the damages, he has the right, waiving the damages found by the master, to have a decree for profits.

In an action at law for the infringement of a patent the plaintiff can recover a verdict for only the actual damages which he has sustained, and the amount of such royalties or license-fees as he has been accustomed to receive from third persons for the use of the invention, with interest thereon from the time when they should have been paid by the defendants, is generally, though not always, taken as the measure of his damages; but the court may, whenever the circumstances of the case appear to require it, inflict vindictive or punitive damages by rendering judgment for not more than thrice the amount of the verdict. (Acts of July 4, 1836, c. 357, sec. 14, 5 Stat., 123; July 8, 1870, c. 230, sec. 59, 16 Stat., 207; Rev. Stat., sec. 4919; *Seymour* v. *McCormick*, 16 How., 480, 489; *New York* v. *Ransom*, 23 How., 487; *Suffolk Co.* v. *Hayden*, 3 Wall., 315; *Philp* v. *Nock*, 17 Wall., 460; *Packet Co.* v. *Sickles*, 19 Wall., 611, 617; *Burdell* v. *Denig*, 92 U. S., 716.)

But upon a bill in equity by the owner against infringers of a patent the plaintiff is entitled to recover the amount of gains and profits that the defendants have made by the use of his invention. This rule was established by a series of decisions under the patent act of 1836, which simply conferred upon the courts of the United States general equity jurisdiction, with the power to grant injunctions in cases arising under the patent laws. (Act of July 4, 1836, ch. 357, sec. 17, 5 Stat., 124; *Livingston* v. *Woodworth*, 15 How., 546; *Dean* v. *Mason*, 20 How., 198; *Rubber Co.* v. *Goodyear*, 9 Wall., 788; *Mowry* v. *Whitney*, 14 Wall., 620; *Littlefield* v. *Perry*, 21 Wall., 205, 220; *Mason* v. *Graham*, 23 Wall., 261; *Tremolo Patent*, 23 Wall., 518; *Cawood Patent*, 94 U. S., 695; *Mevs* v. *Conover*, October Term, 1876, 11 O. G., 1111;* *Elizabeth* v. *Pavement Co.*, 97 U. S., 126; *Root* v. *Railway Co.*, 105 U. S., 189.)

The reasons that have led to the adoption of this rule are that it comes nearer than any other to doing complete justice between the parties; that in equity the profits made by the infringer of a patent belong to the patentee and not to the infringer, and that it is inconsistent with the ordinary principles and practice of courts of chancery either on the one hand to permit the wrongdoer to profit by his own wrong, or on the other hand to make no allowance for the cost and expense of conducting his business, or to undertake to punish him by obliging him to pay more than a fair compensation to the person wronged.

The infringer is liable for actual, not for possible, gains. The profits, therefore, which he must account for are not those which he might reasonably have made, but those which he did make, by the use of the plaintiff's invention; or, in other words, the fruits of the advantage which he derived from the use of that invention over what he would have had in using other

* In *Mevs* v. *Conover*, which came from the Circuit Court of the United States for the Southern District of New York, and is reported at different stages below in 3 Fisher Pat. Cas., 258; 6 Fisher Pat. Cas., 508, and 11 Blatchford, 197, the opinion of this Court, not published in its official reports, but printed in the edition of the Lawyers' Co-Operative Publishing Company, (Bk. 22, p. 1068,) appears of record to have been delivered on March 12, 1877, by Mr. Justice Strong, as follows:

"The only errors assigned in this case are to the confirmation of the master's report, and they relate to the ascertainment of the profits which the defendant had made by his unauthorized use of the plaintiff's invention. That the machine employed by the defendant in splitting wood was an infringement of the plaintiff's patent is established by the decree which sent the case to the master, and no complaint is made of that; but it is contended the master erred in reporting 'there was saved to the defendant seventy-five cents per cord in the wood split by him and made into bundles.'

"In the ascertainment of profits made by an infringer of a patented invention the rule is a plain one. The profits are not all he made in the business in which he used the invention; but they are the worth of the advantage he obtained by such use, or, in other words, they are the fruits of that advantage. (*Mowry* v. *Whitney*, 14 Wall., 651.) We are not convinced that the rule declared in that case was not followed in this. The patented invention infringed by the defendant was a new and improved machine for splitting kindling-wood, and a distinguishing feature of it, perhaps the principal feature, was a device for the automatic feeding of the wood to the reciprocating splitting knives or cutters by a movable platform or apron carried forward by an endless chain. That device the defendant used, though it is said he used it in another machine, known as Green's. The evidence is full and uncontradicted that an advantage is gained in splitting kindling-wood by a machine with that device of at least seventy-five cents a cord over splitting it by hand or without that device. It was in harmony with this evidence the master reported and the court decreed. It is urged, however, that the Green machine, in which the defendant used the plaintiff's invention, was old and defective, and that no profits were actually received from such an use. But if such be the fact, if the defendant was a loser by splitting wood with the Green machine, his loss was less to the extent of seventy-five cents on each cord split than it would have been had he not used the patented invention. Such a result was equivalent to an equal gain, and it was rightly estimated as a part of the profits for which the infringer was responsible. These observations are sufficient for the present case. We notice, however, a suggestion made on behalf of the appellant, that since the decree in the circuit court the patentee has surrendered the patent upon which the decree was founded and obtained a reissue. This does not appear in the record, and if it did it would be immaterial. We have held that the surrender of a patent extinguishes it, and that after its surrender pending suits founded upon it fall with its extinguishment. The patent must remain unsurrendered, not only when a suit upon it is commenced, but at the time of trial and judgment. But a surrender after final judgment or decree can have no effect upon a right passed previously into judgment. After that there is nothing open for litigation. The right of the patentee then rests on his judgment or decree and not on his patent. The suggestion, therefore, cannot avail the appellant, and the decree of the circuit court must be affirmed.

"Decree affirmed."

means then open to the public and adequate to enable him to obtain an equally beneficial result. If there was no such advantage in his use of the plaintiff's invention, there can be no decree for profits, and the plaintiff's only remedy is by an action at law for damages; but if the defendant gained an advantage by using the plaintiff's invention, that advantage is the measure of the profits to be accounted for, even if from other causes the business in which that invention was employed by the defendant did not result in profits. If, for example, the unauthorized use by the defendant of a patented process produced a definite saving in the cost of manufacture, he must account to the patentee for the amount so saved. This application or corollary of the general rule is as well established as the rule itself. For instance, in the case of the Cawood patent for an improvement in a machine for repairing the crushed and exfoliated ends of railroad-iron, Mr. Justice Strong, in delivering judgment, said:

It has been argued that it would have been better for these defendants if, instead of repairing the crushed and exfoliated ends of the rails, they had cut off the ends and relaid the sound parts, or caused the rails to be rerolled. Experience, it is said, has proved that repairing worn-out ends of rails is not true economy, and hence it is inferred that the defendants have derived no profits from the use of the plaintiff's invention. This argument is plausible; but it is unsound. Assuming that experience has demonstrated what is claimed, the defendants undertook to repair their injured rails. They had the choice of repairing them on the common anvil or on the complainant's machine. By selecting the latter they saved a large part of what they must have expended in the use of the former. To that extent they had a positive advantage, growing out of their invasion of the complainant's patent. If their general business was unprofitable, it was the less so in consequence of their use of the plaintiff's property. They gained, therefore, to the extent that they saved themselves from loss. In settling an account between a patentee and an infringer of the patent the question is, not what profits the latter has made in his business or from his manner of conducting it, but what advantage has he derived from his use of the patented invention. (94 U. S. 710.)

In *Mevs* v. *Conover*, where the patent was for an improved machine for splitting kindling-wood, the same justice, delivering the opinion of the court, said:

It is urged, however, that the Green machine, in which the defendant used the plaintiff's invention, was old and defective, and that no profits were actually received from such an use. But if such be the fact, if the defendant was a loser by splitting wood with the Green machine, his loss was less to the extent of seventy-five cents on each cord split than it would have been had he not used the patented invention. Such a result was equivalent to an equal gain, and it was rightly estimated as a part of the profits for which the infringer was responsible. (11 O. G., 1112; ante, 5, note.)

In *Elizabeth* v. *Pavement Co.* Mr. Justice Bradley stated, as a general proposition that would hardly admit of dispute—

It is also clear that a patentee is entitled to recover the profits that have been actually realized from the use of his invention, although, from other causes, the general business of the defendant, in which the invention is employed, may not have resulted in profits—as where it is shown that the use of his invention produced a definite saving in the process of a manufacture. (97 U. S., 128, 139.)

In *Root* v. *Railway Co.* that statement was repeated, (105 U. S., 202, 208,) and in *Thomson* v. *Wooster*, (114 U. S., 104,) in which the patent was for an improved folding-guide for sewing-machines, Mr. Justice Bradley said:

It might have been a better financial operation to have bought of others or employed others to make the folded strips which they required, just as in the case of the Cawood patent the railroad company would have done better not to have mended the ends of their battered rails, but to have had them cut off; but as they chose to perform the operation they became responsible to the patentee for the advantage derived from using his machine. (114 U. S., 118.)

The general rule has been sometimes said to be based upon the theory that the infringer is converted into a trustee for the owner of the patent as regards the profits made by the use of his invention. But, as has been recently declared by this Court, upon an elaborate review of the cases in this country and in England, it is more strictly accurate to say that a court of equity which has acquired, upon some equitable ground, jurisdiction of a suit for the infringement of a patent will not send the plaintiff to a court of law to recover damages, but will itself administer full relief by awarding, as an equivalent or a substitute for legal damages, a compensation computed and measured by the same rule that courts of equity apply to the case of a trustee who has wrongfully used the trust property for his own advantage. (*Root* v. *Railway Co.*, 105 U. S., 189, 214, 215.)

The rule in equity of requiring an infringer to account for the gains and profits which he has made from the use of a patented invention, instead of limiting the recovery to the amount of royalties paid to the patentee by third persons, has been constantly upheld under the provision of the patent act of 1870, embodied in the Revised Statutes, which, beside re-enacting the grant of general equity jurisdiction in patent cases, further enacts that—

upon a decree being rendered in any such case for an infringement the complainant shall be entitled to recover, in addition to the profits to be accounted for by the defendant, the damages the complainant has sustained thereby, and the court shall assess the same or cause the same to be assessed under its direction, and the court shall have the same powers to increase the same in its discretion that are given by this act to increase the damages found by verdicts in actions upon the case—

and thus expressly affirms the defendant's liability to account for profits, as well as authorizes the court sitting in equity to award and to treble any damages that the plaintiff has sustained in excess of the defendant's profits. (Act of July 8, 1870, c. 230, sec. 55, 16 Stat., 206; Rev. Stat., sec. 4921; *Birdsall* v. *Coolidge*, 93 U. S., 64, 69; *Marsh* v. *Seymour*, 97 U. S., 348; *Root* v. *Railway Co.*, above cited; *Manufacturing Co.* v. *Cowing*, 105 U. S., 253; *Garretson* v. *Clark*, 111 U. S., 120; *Black* v. *Thorne*, 111 U. S., 122; *Birdsell* v. *Shaliol*, 112 U. S., 485, 488; *Thomson* v. *Wooster*, 114 U. S., 104.)

It was argued for the defendants that the limited construction given to Tilghman's patent by the decision of this Court in *Mitchell* v. *Tilghman* (19 Wall., 287) became a restriction upon the scope of the patent, and so remained until revoked, and therefore that the defendants in this suit should not be held liable for infringement for the time between the date of that decision and the expiration of the patent—that is to say, for the last ten months and six days of the period of more than four years and eight months during which the infringement lasted. But the injustice done to a patentee by an erroneous decision in a suit against one infringer will not justify a repetition of the injustice in another suit against distinct infringers in no way connected with the first one. The decision against Tilghman in his suit against Mitchell was binding as between those parties only, and, having been directly overruled by this court on full consideration in 102 U. S., 707, when the present case was first brought before it, affords no ground for not holding these defendants to account to Tilghman for all the profits, gains, and savings which they have made from the use of his invention during the whole period of their infringement.

We are then brought to a consideration of the ex-

ceptions taken to the master's report in matters of fact affecting the accuracy of his conclusions in respect to the amount of those profits, gains, and savings. In dealing with these exceptions the conclusions of the master, depending upon the weighing of conflicting testimony, have every reasonable presumption in their favor, and are not to be set aside or modified unless there clearly appears to have been error or mistake on his part. (*Medsker* v. *Bonebrake*, 108 U. S., 66: *Donnell* v. *Columbian Ins. Co.*, 2 Sumner, 366, 371; *Mason* v. *Crosby*, 3 Woodb. & Min,, 258, 269; *Paddock* v. *Commercial Ins. Co.*, 104 Mass., 521, 531; *Richards* v. *Todd*, 127 Mass., 167, 172.)

The master, as already stated, reports the amount of chemicals that the defendants have saved by using the plaintiff's invention as $9,868.33 in lime and $173,863.13 in sulphuric acid. If each of these two items is correct, he has made a mistake of $1,000 against the plaintiff in adding them together. But the plaintiff contends that a comparison of the report with the evidence shows that the actual saving in either item was greater.

The facts upon which the master bases his estimates of the savings in chemicals are stated in his report as follows:

After stating that at the time of the infringement by the defendants of the plaintiff's patent "the lime-saponification process was more advantageous than any other then in public use," he says:

By that process the neutral fat was converted into lime soap by boiling it in open tubs with lime. The water was then run off containing the glycerine, and the lime soap was treated with sulphuric acid, which combined with the lime, forming sulphate of lime, and released the fatty acids. Theoretically, 9⅓ pounds of lime and double that quantity of sulphuric acid for each hundred pounds of fat treated were sufficient to effect these results; but in practical operation manufacturers used from 12 to 14 pounds of lime per hundred, and from 2 to 3 pounds of acid for each pound of lime to insure perfect decomposition.

The respondents during the period of infringement treated the fat with water in closed digesters, adding one per cent. of lime and heating with steam at a pressure of 225 pounds for about nine and a half hours. Then they precipitated the lime by using 3 pounds of sulphuric acid for each pound of lime. As compared with the average amount of each employed in the old process, they saved 12 pounds of lime and 29⅝ pounds of sulphuric acid for each hundred pounds of fat treated.

Their books show that they thus treated 23,322,777 pounds of fat during the period in question, saving 2,798,733 pounds of lime and 6,880,219 pounds of sulphuric acid upon the basis above mentioned. The testimony shows the average cost of lime to have been $.353 per hundred pounds, and the average cost of the acid $2.537 per hundred.

It appears by the testimony of the defendants themselves that when they manufactured by the old process they used fourteen pounds of lime to each hundred pounds of fat treated, and three pounds of sulphuric acid to each pound of lime. It is contended by the plaintiff that that process, as used by the defendants, should be the standard of comparison in this suit, and that, according to the preponderance of evidence, the amount of lime, at least, so used by them was a necessity in that process. But the plaintiff has the burden of proving the amount of profits that the defendants have made by the use of his invention. (*Blake* v. *Robertson*, 94 U. S., 728; *Elizabeth* v. *Pavement Co.*, 97 U. S., 126, 139; *Dobson* v. *Hartford Carpet Co.*, 114 U. S., 439, 444, 445.) And the question to be determined is, as stated by Mr. Justice Strong in delivering judgment in *Mowry* v. *Whitney*—

What advantage did the defendant derive from using the complainant's invention over what he had in using other processes then open to the public and adequate to enable him to obtain an equally beneficial result. (14 Wall., 620, 651.)

In determining that question the expense of using the new process is doubtless to be ascertained by the manner in which the defendants have in fact conducted their business, and not by the manner in which they might have conducted it; but as to the comparative expense of the old process, the cost at which they used that process, if they did once use it, although strong evidence against them, because they may be presumed to have used it as economically as they could, is not conclusive evidence that the old process could not have been used at a less cost. To hold otherwise would be to hold infringers of a patent for a new process, who had ever used the old process, to a different measure of accounting from those who had never used the old process at all. In the former opinion the Court assumed, as the result of the evidence, that the saponifying process required twelve or fourteen per cent. of lime. (102 U. S., 731.) There being evidence that such was the amount of lime used by some manufacturers under the old process, as well as that the average use of sulphuric acid under that process was two and a half pounds to each pound of lime, we cannot say that the conclusion of the master ought to be set aside or modified as to either of these items.

The master finds that no material economy in operation has been secured by the change of process, and the testimony introduced by the plaintiff is not clear and decisive enough to overthrow his conclusion in this respect.

That part of the master's report which relates to the amount saved in glycerine water is as follows:

It appears from the evidence that the average density of glycerine water obtained in the old lime-saponification process was only 3½° Baumé, while that obtained from the digesters was from 3° to 3¼°. It also appears that the concentration of the latter to 15° cost $1.55 per barrel at the respondents' factory.

Assuming the cost of concentration to be in like proportion for each degree, it is claimed that concentration from 3½° to 3¼° would cost nearly $.94 per barrel, and the cost of such concentration is an item of gain and saving realized by the respondents by reason of the greater density of the glycerine water obtained from the digesters, for which they should be charged in this accounting. But there is no testimony establishing that the cost of concentration is in proportion to its degree, nor is it reasonable to assume such to be the fact. Indeed, it is apparent that the cost of concentrating a single degree would be much greater in proportion than a more extensive operation, while an additional degree of concentration in an extensive operation would affect the cost but little.

It appears in evidence that glycerine water was sold in the market at so much per barrel for each degree of density, and that the respondents sold it at the market price as it came from the digesters. It, however, required considerable concentration to prepare it for use, and they boiled it down to 15° for the purchasers, charging the cost thereof to them. Provided, as they were, with facilities for such work, the aditional cost of concentration from a still lower degree could not be great. The only witness whose testimony is directly in point says it would not be material. Besides, if paid by the purchaser, it would not affect the profits of the respondents.

But the evidence does show a larger yield of glycerine by the new process. While the old lime-saponification process was in use glycerine had no market value. Consequently no effort was made to secure it, and there is no direct testimony as to the best result that could be secured by careful treatment: but the testimony shows that the average density of the glycerine which ran to waste was 3½°, and that it was about equal in volume to the fat.

It is claimed that the same volume of glycerine water was drawn from the digesters, while its density was much greater; but the master finds from the evidence that the respondents used two charges of water, each half the bulk of the fat, the first charge drawn from the digesters being the glycerine water sold by them. There was consequently double the volume of glycerine water in the former process, which accounts in part for difference in density; but the comparison still shows considerable loss due to various causes, which is further increased by the additional concentration required, the average result of tests made in various degrees of concentration indicating that it requires about four and four-fifths barrels of 3½° to make one of 3°.

The accompanying table B shows the quantity and value of glycerine water obtained by the respondents from the digesters, and also the number of barrels concentrated to 3° that could be obtained from the fat treated by lime saponification, and the value thereof at market prices, the difference being the amount gained by reason of the greater yield of glycerine from the digesters—viz., $61,701.77.

As, according to the master's report and the whole evidence, the glycerine obtained by either process must, in order to be sold, be concentrated to 15°, and it is not shown how much, if anything, more it would cost to concentrate from 3° to 15° than from 3½° to 15°, and the purchaser in either case pays the cost of concentration to 15°, the plaintiff fails to show that anything should have been allowed for the cost of concentration. But the finding of the master, that in the new process "the respondents used two charges of water, each half the bulk of the fat, the first charge drawn from the digesters being the glycerine water sold by them," and "there was consequently double the volume of glycerine water in the former process," as well as the corresponding statement in his Table B, that the amount of glycerine water obtained by the new process was 65,312 barrels, while the amount that would have been obtained under the old process would have been 130,624 (misprinted in the record 134,634) barrels, is quite inconsistent with the sworn answer to the bill and with the testimony of the defendants.

The answer states that in the tank were placed fat and water in equal quantities, and that during the operation the first charge of water was drawn off and a second charge of water introduced.

The defendant James N. Gamble testified that the barrels of glycerine obtained under the new process were forty-gallon barrels, containing, as he estimated, 330 pounds, and to the question—

Can you state what amount of water was used in each charge in the process as carried on from 1870 to 1875?

answered—

I cannot state positively from recollection of what was absolutely used. My recollection was, however, that it was in each charge about fifty per cent. of the fat, and this recollection is confirmed by the amount of glycerine water obtained.

The amount of glycerine water obtained, as stated by the master from the defendants' books, was 65,312 barrels, which, at 330 pounds each, is 21,552,960 pounds. This is not half, but 92.4 per cent. of 23,322,777, the number of pounds of fat treated by the defendants, as ascertained by the master from their books, and perhaps a somewhat, but not much, less proportion in bulk.

As to the old process, the defendant, William A. Proctor, who was a member of the firm while they were using it, testified as follows:

64. Q. The saponifying-tubs were large enough to contain about double the quantity of fat you put in them, I understand?—A. They were.

65. Q. About how much water was put into these tubs along with the fat?—A. A little less than the volume of the fat, so that the vats were almost full. It was calculated that the condensed steam would supply water enough to keep them full.

66. Q. When the cooking of the mass in the saponifying-tubs was completed, the tubs were about full of lime, soap, and water, I understand?—A. They were not full, there being space enough to allow for the boiling of the water without excessive flashing out. That was all. The water in the vat when the operation was through was about equal to the bulk of the fat that had been put in.

Upon this testimony, as the whole of the glycerine could hardly have been separated from the mass of lime soap by merely drawing off, it may safely be concluded that the amount of glycerine-water obtained under the old process, which the witness speaks of as "about equal to the bulk of the fat that had been put in," was not more than 90 per cent. of the fat treated, and that there was no substantial difference in this particular between the results of the two processes. It is therefore clear that the old process would produce only one-half the amount of glycerine reported by the master and stated in Table B, and that the sum of $61,701.77, at which the master has arrived by deducting from $103,143.06, the value of 65,312 barrels of glycerine water obtained under the new process, $41,441.26, the value of 130,624 barrels, as obtainable under the old process, must be increased by adding half of the amount deducted, or $30,720.63.

The findings of the master, upon which he bases his conclusion of the amount of loss of fatty acids in using the plaintiff's invention as compared with the old process, are shown by the following extracts from his report:

It does not appear that saponification by water alone in such digesters [as the defendants used] had been regularly employed by any one; but the testimony shows that [those who tried to do so under licenses from the plaintiff] all became satisfied that a satisfactory result could not be secured by that process alone, and found it necessary to employ some additional agency to secure complete saponification at safe pressures within reasonable time.

During the period of this accounting the respondents used one per cent. of lime and a second charge of water, completing the process in about nine and a half hours at a pressure of about 225 pounds. With these two modifications, both of which are shown by the evidence to be efficient, a good quality of fatty acids was obtained, though not fully equal to that obtained by lime saponification.

The fatty-acid product obtained by the respondents, operating in their digesters for nine and a half hours at an average pressure of two hundred and twenty-five pounds, by the action of water alone, was inferior in value to the product of lime saponification.

The experiments made pending the hearing before the master at two hundred and twenty-five pounds pressure, without lime or change of water, yielded products containing an average of 92.5 per cent. of fatty acids.

As compared with the result of lime saponification, the experiments at 225 pounds pressure show a loss of 6 pounds of free fatty acids for each hundred pounds of fat treated, and an admixture of undecomposed fat seriously affecting the value of the product. The fatty acids were worth at least 9 cents per pound, making the direct loss of fatty acids not less than 54 cents upon each hundred pounds of fat treated.

There is no testimony from which the master can determine to what extent the value of fatty acids actually obtained was affected by the admixture of undecomposed fat, and no allowance has been made therefor.

During the period of infringement the respondents treated 23,322,777 pounds of fat in their digesters with one per cent. of lime. The evidence shows that 11⅛ pounds of lime completely saponify 100 pounds of fat in close digesters under pressure—

and—

in the process employed by the respondents 2,088,084 pounds of the fat treated by them were converted into lime soap by the action of lime, and 21,234,753 pounds were converted into a fatty-acid mixture, containing 92.5 per cent. of free fatty acids, by the action of water, the further decomposition of such mixture being effected by modifications of the complainant's process.

Upon comparing the master's report with the evidence we are unable to accept his conclusion upon this part of the case.

Much of the testimony on which he chiefly relies was in the record upon which the case had been previously heard before this Court, having been introduced to support the objection that the particular apparatus described in the plaintiff's patent for carrying the process into effect could not be operated to produce any useful result, of which the Court then said:

We have examined the evidence on this point and are satisfied that it shows the objection to be unfounded. (102 U. S., 730.)

Under these circumstances the master appears to us to have given too much weight to this, as contrasted with the other testimony in the original record, although it is quite true, as argued by the defendants, that the question of the practical economy of the patented process, as compared either with older processes or with the subsequent modifications used by the defendants, is distinct from the questions of utility and infringement heretofore determined.

The testimony of experts since taken and the tables of experiments made by them pending the hearing before the master are quite unsatisfactory, for rea-

sons fully set forth in the brief for the plaintiff, which it would take too much space to recapitulate.

Apart from these considerations, and even assuming that the master is right in reporting that the modifications of using one per cent. of lime and two charges of water, made by the defendants in the plaintiff's process, are shown to have been efficient, and that the defendants in accounting with the plaintiff for the profits made by them from the use of his invention are entitled to be allowed for the effect of such modifications, the evidence wholly fails to support the master's conclusion, that in the use of the plaintiff's process, without addition of lime or change of water, as compared with the lime-saponification process, there is a loss of six pounds of free fatty acids for each hundred pounds of fat treated, or to show that there has been any loss of free fatty acids which affects the value of the product.

The master's conclusion is based upon the finding that the product of the patented process without modification contains only ninety-two and one-half per cent. of free fatty acids, and upon the hypothesis that the product of the old process contained ninety-eight and one-half per cent. But there is no proof whatever that there was any such difference in the result of the two processes, or that the product of the old process contained ninety-eight and one-half per cent of fatty acid. No chemical analysis of the product of the old process appears to have been made. The defendants' own experts testify that the highest possible amount of fat acid in pure tallow is only ninety-five and a fraction per cent; and two of the defendants, as well as Ropes, one of the witnesses on whom the master relies, and Verdin, a partner of Mitchell, testify that in using the old process the whole average product was ninety-five per cent. of the amount of fat treated.

The testimony of one of the defendants, James Gamble, who had been forty years in the business, and was examined as a witness in their behalf, clearly exhibits his general impression as a practical manufacturer, not only that the product of the old process was not more than ninety-five per cent. of fatty acid, but also that there was no comparative loss of fatty acid by Tilghman's process. On cross-examination he testified as follows:

14. Q. Was there more or less fatty acid obtained by the old process used by you prior to 1856 than by the process used by you since 1870?—A. I think there would be no difference if the fatty acid from the tank in the new process is well settled; but it won't settle as well as in the old. In actual practice there is more weight in the product of the new process, as it contains more sediment, than from the old; but I think the amount of fatty acids in each is the same.

Upon the direct examination being resumed, he further testified:

16. Q. Do you know how many pounds of fatty acids were practically produced from 100 pounds of fat treated by the old saponification process used by you prior to 1856?—A. We always made a calculation of 95 pounds; but I cannot say more than that.

17. Q. Do you know how many pounds of fatty acids were practically produced from 100 pounds of fat treated by the process used by you from 1870 to 1875?—A. We calculated the same.

18. Q. Was this calculation or estimate founded upon any tests made by your firm or under their direction?—A. No, sir; I do not think a test practicable. It is no more than guess-work.

19. Q. So far as you have any actual knowledge there may have been a difference in the weight of fatty acids produced from 100 pounds of fat treated by the old saponification process and the process as used by you from 1870 to 1875, may there not?—A. I think when we have examined and find the lime all clear of the acids the product in each case must be the same, except as to the sediment remaining in the tank-stock.

The great preponderance of the evidence is to the effect that the product of the plaintiff's process, using water alone and all at one time, would contain as much as ninety-five per cent. of free fatty acids. Even the defendants' principal expert, in an experiment testified to by him and stated in his table, obtained that proportion by the use of equal quantities of water and of fat, without lime or change of water, under a treatment for nine hours at 225 pounds of pressure. Moreover, the real question is not of the exact quantity of fatty acid, as proved by chemical tests, contained in the two products, but whether the one is as good as the other for use in the manufacture of candles. The defendants' testimony shows that manufacturers always test the fitness of the product for that use by pressure with the thumb, and never by chemical analysis; and upon all the evidence there can be no doubt that a difference between ninety-five and ninety-two and one-half per cent. in the proportion of fatty acids does not affect the commercial or practical value of the product. From these considerations it follows that nothing is to be deducted for a loss in fatty acids, and that to the amount of $182,731.46 saved in chemicals, and $61,701.77 gained in glycerine water, as reported by the master, there is to be added $1,000 for his mistake in adding up the items of chemicals, and $20,720.63 for his error in computing the amount of glycerine water, making a total amount of $266,153.86. This result is arrived at by taking the amount of savings in chemicals, as found by the master, which the defendants produced no evidence to control, and which is less than such savings if computed by the standard of their own use under the two processes; then adding the amount gained in glycerine water, as appearing by the facts stated in the master's report or testified to by the defendants themselves, correcting only a clear error in the master's computation, and rejecting the deduction made by the master on account of a supposed loss of fatty acids in using the plaintiff's invention as compared with the old process, because the evidence returned with the master's report is quite inconsistent with the theory that there was any loss in this respect.

The only exception of any importance not disposed of or rendered immaterial by what has been already said is the exception of the plaintiff to the refusal of the master to allow interest on profits before the date of his report.

If the question thus presented were a new one, it would require grave consideration; but by a uniform current of decisions of this Court, beginning thirty years ago, the profits allowed in equity for the injury that a patentee has sustained by the infringement of his patent have been considered as a measure of unliquidated damages, which, as a general rule and in the absence of special circumstances, do not bear interest until after their amount has been judicially ascertained, and the provision introduced in the patent act of 1870 regulating the subject of profits and damages made no mention of interest, and has not been understood to affect the rule as previously announced. (*Silsby* v. *Foote*, 20 How., 378, 387; *Mowry* v. *Whitney*, 14 Wall., 620, 651; *Littlefield* v. *Perry*, 21 Wall., 205, 229; act of July 8, 1870, c. 230, sec. 55, 16 Stat., 206; Rev. Stat., sec. 4921; *Parks* v. *Booth*, 102 U. S., 96, 106; *Railway Co.* v. *Root*, 105 U. S., 189, 198, 200, 204; *Illinois Central Railroad* v. *Turrell*, 110 U. S., 301, 308.) Nothing is shown to take this case out of the general rule. At the time of the infringement the fundamental questions of the validity and extent of Tilghman's patent were in earnest controversy and of uncertain issue. Interest should therefore be allowed, as in *Illinois Central Railroad* v. *Turrell*, just cited, only from the day when the master's report was submitted to the court, (which appears by the terms of his report and of the decree below to have been October 7, 1884,) upon the amount shown to be due by that report and the accompanying evidence.

Decree reversed, and case remanded to the circuit court, with directions to enter a decree for the plaintiff for the sum of $266,153.86, with interest from October 7, 1884, and costs.

The Chief Justice dissented.

Mr. Justice Matthews did not sit in this case or take any part in the decision.

Fraudulent Practices by Attorneys.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., April 16, 1888.

The attention of this Office having frequently been called to circulars and communications of persons pretending to have access to the records of this Bureau, and claiming to possess information of the pendency of applications for patents, notice is hereby given the public that all such persons in so advertising themselves are acting under false representations and are guilty of unprofessional conduct, and should not be entitled to credit.

The Office has also received information that certain attorneys disbarred from practice under section 487 of the Revised Statutes are continuing to prosecute applications for patents under the names of other persons.

Hereafter a list will be published in the OFFICIAL GAZETTE containing the names and addresses of all such persons, and the public warned against employing them or intrusting applications or interests to their charge.

BENTON J. HALL, *Commissioner.*

The Office has information that *Messrs. Horn & Son, No. 606 Eleventh street, Northwest, Washington, D. C.*, have been guilty of the practices set forth in the first paragraph of the above notice, and that *Isaac S. McGiehan, No. 155 Broadway, New York*, a disbarred attorney, has been practicing under the name of *Alexander Melhado.*

Order No. 477.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., May 3, 1888.

The establishment of the following sub-classes in Division III is hereby directed:

Metallurgy—
- Melting-furnaces—
  - Tank-furnaces,
  - Pot-furnaces,
  - Glass-pots.
- Regenerators—
  - Discontinuous or single-surface,
  - Continuous or double-surface.
- Blast-furnaces—
  - Bells,
  - Tuyeres.
- Coating with metal—
  - Iron oxides.

BENTON J. HALL,
Commissioner.

Notice.—Models in Rejected or Abandoned Cases.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., March 9, 1888.

Notice is hereby given to inventors and the public that a large number of models is in the custody of this Office, which were received between the years 1870 and 1886, many of which have never become a part of the records of this Office. All such models and all models belonging to rejected or abandoned applications will be sold or otherwise disposed of under the provisions of section 485 of the Revised Statutes unless removed in sixty days from the date hereof.

Institutions of learning in good standing may, after the expiration of the time above limited, on written application, make selection before the day of public sale of models remaining unclaimed. The expense of removal or transportation of these models must be borne by the applicants or institutions of learning.

BENTON J. HALL,
Commissioner.

Notice.

UNITED STATES PATENT OFFICE,
Washington, D. C., April 18, 1888.

To expedite the distribution of the mail in this Office, and to insure the prompt and certain delivery of communications to the divisions and officials having charge of the matters to which they relate, attorneys and correspondents are respectfully requested to enter upon the upper left-hand corner of amendments and other communications, if known to them, the number of the room and the name of the examiner or designation of the division to which the communication should be sent.

BENTON J. HALL,
Commissioner of Patents.

Issue of May 8, 1888.

DESIGNS.

18,299.—CLOCK-DIAL.—*Archibald Bannatyne*, Waterbury, Conn., assignor to *The Waterbury Clock Company*, same place. Application filed May 3, 1887. Serial No. 237,014. Term of patent 7 years.

18,300.—CHEWING-GUM.—*William D. Chase*, Hackensack, N. J. Application filed March 22, 1888. Serial No. 268,183. Term of patent 3½ years.

18,301.—ORNAMENTAL BORDER FOR GLASSWARE, &c.—*Thomas G. Hawkes*, Corning, N. Y. Application filed March 17, 1888. Serial No. 267,566. Term of patent 7 years.

18,302.—COOKING-STOVE.—*Edward J. King*, Rochester, N. Y., assignor to *The Co-Operative Foundry Company*, same place. Application filed March 29, 1888. Serial No. 268,877. Term of patent 7 years.

18,303.—EXHIBIT FOR SHOE-LACES.—*William Paton*, Johnstone, county of Renfrew, Scotland. Application filed July 13, 1887. Serial No. 244,206. Term of patent 14 years.

18,304.—COOKING-STOVE.—*John A. Price*, Scranton, Pa. Application filed March 21, 1888. Serial No. 268,015. Term of patent 14 years.

18,305.—LADY'S COSTUME.—*Jennie Sheils*, New York, N. Y., assignor to *The Butterick Publishing Company, (Limited,)* same place. Application filed April 2, 1888. Serial No. 269,379. Term of patent 3½ years.

LABELS.

5,584.—Title: "ROMAN CEMENT."—*Llewelyn Crowther*, Laurel, Md. Application filed March 23, 1888.

5,585.—Title: "THE SIOUX INDIAN ANTIDOTE." (FOR A MEDICINE.)—*E. Gomer Davies*, De Smet, Dak. Ter. Application filed March 29, 1888.

5,586.—Title: "THE BOSTON FEEDER." (FOR NURSING BOTTLES.)—*Dean, Foster & Co.*, Boston, Mass. Application filed April 13, 1888.

5,587.—Title: "MRS C. DORMAN'S OINTMENT."—*Charity Dorman*, Van Ettenville, N. Y. Application filed November 28, 1887.

5,588.—Title: "THE FEATHER WEIGHT." (FOR DRESS SHIELDS.)—*Isaac B. Kleinert*, New York, N. Y. Application filed February 25, 1888. (Trade-Mark Registered.)

5,589.—Title: "KLEINERT'S CELEBRATED INDESTRUCTIBLE." (FOR DRESS SHIELDS.)—*Isaac B. Kleinert*, New York, N. Y. Application filed February 27, 1888. (Trade-Mark Registered.)

5,590.—Title: "BALTIMORE BRAND CRAB-MEAT."—*Mary V. Smith*, Baltimore, Md. Application filed April 12, 1888.

DISCLAIMER.

202,429.—*Henry W. Johns*, New York, N. Y. IMPROVEMENT IN BOILER-COVERINGS. Patent dated August 8, 1882. Disclaimer filed May 1, 1888, by the patentee, and the assignee, *The H. W. Johns Manufacturing Company*.

Enter their disclaimer to "that part of the subject-matter of the specification and claims 1, 2, and 3 of said letters patent, which, being embraced in the general language of the following paragraph, to wit—

"'In carrying out my invention I make use of, as the insulator B, asbestus in the form of a cement.'

"Includes as within the invention the use of asbestus cement, as the insulator or cushion B, referred to in said specification and claims."

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upward are registered under the act of March 3, 1881.]

15,417.—PURGATIVE PILLS.—*Acrumen & Son*, Fordyce, Ark. Application filed March 27, 1888. Used since June 27, 1887.
"The words 'PURGATIVE PEAS.'"

15,418.—MEDICINAL OIL OR LINIMENT.—*Acrumen & Son*, Fordyce, Ark. Application filed March 27, 1888. Used since February 23, 1888.
"The word 'EUREKA.'"

15,419.—TOILET PREPARATIONS.—*Jesse Ascough*, Handsworth, near Birmingham, county of Stafford, England. Application filed February 17, 1888. Used since 1876.
"The representation of a borax crystal."

15,420.—SALT.—*John Corbett*, Stoke Prior Salt Works, near Bromsgrove, county of Worcester, and London, England. Application filed March 20, 1888. Used since August 13, 1860.
"The representation of an elephant."

15,421.—SALT.—*John Corbett*, Stoke Prior Salt Works, near Bromsgrove, county of Worcester, and London, England. Application filed March 20, 1888. Used since September 6, 1869.
"The words 'CORBETT'S WORCESTERSHIRE SALT.'"

15,422.—TABLE AND DAIRY SALT.—*Diamond Crystal Salt Company*, St. Clair, Mich. Application filed March 17, 1888. Used since November 1, 1886.
"The word 'DIAMOND.'"

15,423.—BITTERS.—*Durant & Co.*, Trinidad, British West Indies. Application filed February 24, 1888. Used since MAY, 1887.
"The autograph signature of Peter Arthur Ramsey, the representation of a packing-box, bottles resting upon the box, and the words 'RAMSEY'S TRINIDAD AROMATIC BITTERS.'"

15,424.—SHOE POLISH OR DRESSING.—*Eclipse Cement Co.*, Philadelphia, Pa. Application filed November 14, 1887. Used since September 1, 1887.
"The figure of a barrel."

15,425.—WATCHES.—*Elgin National Watch Company*, Chicago, Ill. Application filed April 2, 1888. Used since December 31, 1871.
"The words 'OLD FATHER TIME.'"

15,426.—WATCHES.—*Elgin National Watch Company*, Chicago, Ill. Application filed April 2, 1888. Used since December 31, 1871.
"The words 'FATHER TIME.'"

15,427.—WATCHES.—*Elgin National Watch Company*, Chicago, Ill. Application filed April 2, 1888. Used since December 31, 1871.
"The words 'OLD TIME.'"

15,428.—SMOKING AND CHEWING TOBACCO.—*Fishburne Bros.*, Roanoke, Va. Application filed February 29, 1888. Used since May 1, 1874.
"The words 'SMOKERS' CHOICE.'"

15,429.—SHOES FOR MEN, MISSES, LADIES, AND CHILDREN.—*C. Gotzian & Company*, St. Paul, Minn. Application filed February 28, 1888. Used since February 1, 1865.
"The representation of the face of Abraham Lincoln and the seal of Minnesota."

15,430.—LIQUID SHOE-DRESSING.—*Robert F. S. Heath*, Camden, N. J. Application filed April 2, 1888. Used since January 1, 1888.
"The words 'SOCIETY SHOE-DRESSING.'"

15,431.—METALLIC TABLE-WARE, BOTH HOLLOW AND FLAT.—*The Holmes & Edwards Silver Company*, West Stratford, Conn. Application filed March 27, 1888. Used since January 1, 1887.
"A monogram of the letters 'H' and 'E.'"

15,432.—METALLIC TABLE-WARE, BOTH HOLLOW AND FLAT.—*The Holmes & Edwards Silver Company*, West Stratford, Conn. Application filed March 27, 1888. Used since January 1, 1888.
"The representation of a Maltese cross.'"

15,433.—LIQUID MEDICINE FOR THE EAR.—*J. D. House & Co.*, New York, N. Y. Application filed March 20, 1888. Used since March 1, 1888.
"The words 'AURAL CARBOL.'"

15,434.—LINIMENT.—*Walter J. Hughes*, Minneapolis, Minn. Application filed December 21, 1887. Used since January 1, 1864.
"The words 'ANODYNE OIL' and the representation of a star and circle."

15,435.—LAUNDRY-STARCH.—*Johnson & Jefferson*, New Haven, Conn. Application filed March 9, 1888. Used since February 1, 1888.
"The word 'CHALLENGE.'"

15,436.—DRESS-SHIELDS.—*Isaac B. Kleinert*, New York, N. Y. Application filed February 25, 1888. Used since August 15, 1883.
"The words 'FEATHER WEIGHT.'"

15,437.—ALBUMEN PAPER FOR PHOTOGRAPHIC PURPOSES.—*John A. Knorr*, New York, N. Y. Application filed March 10, 1888. Used since March 7, 1888.
"The figure of a diamond inclosing the letter 'D.'"

15,438.—CERTAIN ANÆSTHETIC COMPOUND.—*Urial K. Mayo*, Boston, Mass. Application filed March 26, 1888. Used since March 8, 1888.
"The words 'BOSTON VEGETABLE VAPOR.'"

15,439.—CALIFORNIA OLIVE-OIL.—*Merriman Manufacturing Company*, Oakland, Cal. Application filed April 12, 1888. Used since February 1, 1888.
"The word 'ALPHA.'"

15,440.—SPOONS, FORKS, LADLES, &c.—*G. I. Mix & Co.*, Yalesville, Conn. Application filed November 30, 1887. Used since May 2, 1882.
"The words 'THE COLUMBIA.'"

15,441.—STEAM OR HOT-WATER RADIATORS.—*Pierce Steam Heating Co.*, Buffalo, N. Y. Application filed March 23, 1888. Used since April, 1888.
"The word 'IDEAL.'"

15,442.—LINIMENTS.—*Francis H. Read*, Smithborough, Mass. Application filed March 21, 1888. Used since March 1, 1888.
"The word 'ANCHORHOLD.'"

15,443.—PILLS.—*Scotch Oats Humane Company*, New York, N. Y. Application filed March 23, 1888. Used since November 1, 1887.
"The word 'BOSHEE.'"

15,444.—HOUSE AND CASTOR POWDERS.—*Spencer & Brown*, Greenville, Texas. Application filed February 23, 1888. Used since May 23, 1883.
"The words 'PLANTER'S "OLD TIME"' and the representation of the head and bust of a man."

15,445.—SELF-RAISING FLOUR.—*A. H. Sinkler & Co.*, New Orleans, La. Application filed March 16, 1888. Used since January 15, 1883.
"The words 'RED HOT' and the representation of a loaf of bread."

15,446.—PRESERVED CORN AND SUCCOTASH.—*Tuthill & Stoddard*, Camden, N. Y. Application filed March 16, 1888. Used since April 1, 1887.
"The words 'PURE GOLD' in connection with the representation of an ear of corn with the grain partially exposed and a bee on the wing."

15,447.—SPRINGLESS, GREATEST, AND GREATEST SPRINGLESS.—*G. P. Swinburne & Co.*, St. Andrew's Hill, London, England. Application filed March 19, 1888. Used since November 24, 1887.
"The word 'SWINBURNE.'"

15,448.—SPRINGLESS, GREATEST, AND GREATEST SPRINGLESS.—*G. P. Swinburne & Co.*, St. Andrew's Hill, London, England. Application filed March 19, 1888. Used since November 24, 1887.
"The fac-simile signature 'G. P. SWINBURNE.'"

15,449.—PREPARATION OF QUININE.—*Loretta Barton Weld*, Falmouth, Mass. Application filed March 19, 1888. Used since February, 1888.
"The word 'QUINQUINA.'"

15,450.—PREPARATION OF QUININE.—*Loretta Barton Weld*, Falmouth, Mass. Application filed March 19, 1888. Used since February, 1888.
"The word 'ALQUINIA.'"

15,451.—CORSET.—*Wadsell, Tatum & Co.*, New York, N. Y. Application filed March 24, 1888. Used since November 1, 1887.
"The word 'PRINCESS.'"

15,452.—WATCHES.—*Elgin National Watch Company*, Chicago, Ill. Application filed April 2, 1888. Used since December 31, 1871.
"The conventional representation of 'OLD TIME.'"

PATENTS

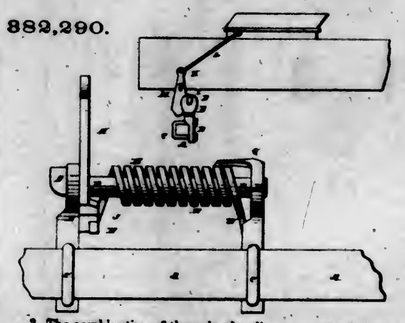
GRANTED MAY 8, 1888.

382,289. STEAM-WASHER. JORDAN W. BALLARD, Wilmington, Ohio. Filed Jan. 24, 1887. Serial No. 225,492. (No model.)

Claim.—1. In a steam-washer, the combination, with a revoluble perforated cylinder for operating the clothes by rotation and agitation, of a steam-generator having a reservoir or tank above it, a U-shaped pipe and cock in the latter communicating with both tank and generator, the latter being provided with holes coincident with lines of holes in said cylinder, and said tank having a slushing-pipe coincident with the middle line of holes, regulated by a stop-cock, and a drip-water chamber separated from said generator and having an opening under said cylinder extending from side to side of the case of said steam-washer, substantially as and for the purpose hereinbefore set forth.

2. In a steam-washer, the combination, with the case having a steam-generator, and a feed-water tank above the latter having a discharge-cock leading therefrom, of a clothes-cylinder provided with holes coincident with discharge-holes in said steam-generator and with said discharge-cock, said cylinder having the inclined or diagonal ribs diverging from the middle line of said cylinder and from the middle line of holes coincident with said discharge-cock, and said case provided with a drip-water chamber beneath said cylinder adapted to receive the waste water from the latter, and both feed-water tank and drip-water chamber being provided with outlet-pipes and stop-cocks in the same, substantially as set forth.

3. In a steam-washer, the combination, with the steam-generator provided with the discharge-holes $c' c'$, of a revoluble clothes-cylinder having holes c coincident with said discharge-holes, and diagonal ribs diverging from the middle line of the cylinder provided with holes therein for receiving and conducting the steam, and for the purpose described, substantially as hereinbefore set forth.

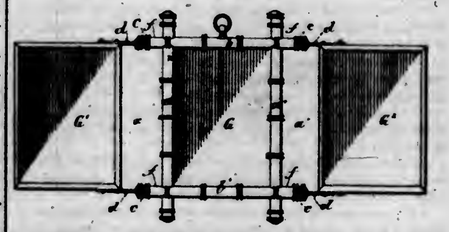


4. In a steam-washer, the combination, with the generator having steam-discharge holes, and the water-tank above said generator having a discharge-cock, of the inclosed clothes-cylinder having holes coincident with the holes in the generator and with the discharge-cock of the water-tank, tubular diagonal ribs in said cylinder, also perforated with holes, a hollow journal at one end of said cylinder for escape of excess or waste steam, and the drip-water chamber having an opening in the top, as and for the purpose hereinbefore set forth.

382,290. WAGON-SPRING. MIRIAM BALES, Pleasant Prairie, Wis. Filed July 20, 1887. Serial No. 245,080. (No model.)

Claim.—1. The combination of the wagon-axles, the springs mounted thereon, the levers connected to the springs, the wagon-body secured to the levers, the seat, and the rods L, connecting the seat with the levers, substantially as specified.

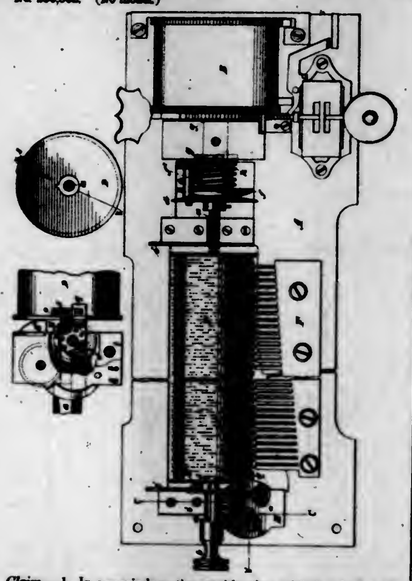
2. The combination, with the axle, of the clip-arms, the spring coiled around the said rod and having one end connected to one of the clip-arms, the lever having a notched offset, I, engaging the rod D, and having one end of the spring secured to its lower end, and the wagon-body and seat having independent connections with the lever, as set forth.



382,290.

3. The combination of the axle, the clip-arms secured thereto, one of said clip-arms being provided with the notch F, and the inwardly-projecting cap or flange G, the rod D, secured between the clip-arms, the spring coiled around the rod D, and having one end fitted in the notch F, and the lever fulcrumed on the rod D and adapted to be secured to the wagon-body and seat, and having one end of the spring secured to its lower end, substantially as set forth.

4. The combination of the axle, the clip-arms secured thereto, the rod D, secured between said clip-arms, the lever fulcrumed on said rod and provided with the lugs J at its lower end, the spring coiled around the rod D, and having one end secured to one of the clip-arms and its other end fitted between and secured to the lugs J of the lever, and the wagon-body and seat having independent connections with the lever, substantially as set forth.



382,291. MIRROR. JACQUES BAY, Paris, France. Filed July 30, 1887. Serial No. 245,671. (No model.)

Claim.—1. In a folding mirror, the combination of the three glasses G G' G², frame $a\ a'\ b\ b'$ on glass G, the movable glasses G' G², having extending-rods $d\ d$, and the frame $a\ a'\ b\ b'$, having links $c\ c$, to which the rods $d\ d$ are attached, whereby glasses of restricted dimensions can be greatly extended from and swung in front of the center glass to permit all parts of the head to be seen, substantially as described.

2. In a folding mirror, the combination of the three glasses G G' G², frame $a\ a'\ b\ b'$ on glass G, said frame having immovable extensions, pivoted links $c\ c$, carried by said extensions, extension-rods $d\ d$, pivotally connected to the glasses G' G², the rods $d\ d$ being also attached to the links $c\ c$, whereby glasses of restricted dimensions can be greatly extended from the center glass and swung in front thereof, and whereby also one of the movable glasses may be folded over the center glass so as to serve as a single looking-glass, substantially as herein shown and described.

382,292. MUSIC-BOX. LOUIS CAMPICHE, St. Croix, Switzerland, assignor to Mermod Freres, same place. Filed Nov. 30, 1887. Serial No. 256,362. (No model.)

Claim.—1. In a music-box, the combination, with the shaft *a*, pin-barrel D, rigid thereon, and disk *d* on the shaft *a*, of the driving-shaft *g*, movable disk *f*, and spring *h*, all arranged for operation substantially as specified.

2. In a music-box, the pin-barrel D and means for driving said barrel, in combination with the cam E, for shifting the pin-barrel, and means, substantially as described, for locking and releasing said cam E as the pin-barrel rotates, as specified.

3. The combination of the pin-barrel D and means for driving it, with the barrel-shifting cam E, spring *q*, adapted to lock said cam, and prong *s* on the pin-barrel for raising the spring *q* and unlocking said cam, substantially as described.

4. In a music-box, the combination, with the cam E, for shifting a pin-barrel, of a lever or bolt, G, for locking the cam, substantially as set forth.

5. In a music-box, the combination, with the cam E, for shifting a pin-barrel, and spur-wheel *t*, driven by said cam, of a lever, G, adapted to engage the wheel *t*, to lock the cam, substantially as described.

6. The combination of the cam E, shaft *j*, wheel *t*, having recesses *u*, and lever G, having a projection, *v*, adapted to enter a recess, *u*, to lock the wheel *t*, substantially as described.

7. In a music-box, the combination, with a pin-barrel and a cam, E, for shifting same, of an index actuated by said cam, substantially as described.

8. In a music-box, the cam E, for shifting a pin-barrel, and wheel *t*, driven by said cam, combined with the index-wheel I, driven by the wheel *t*, substantially as described.

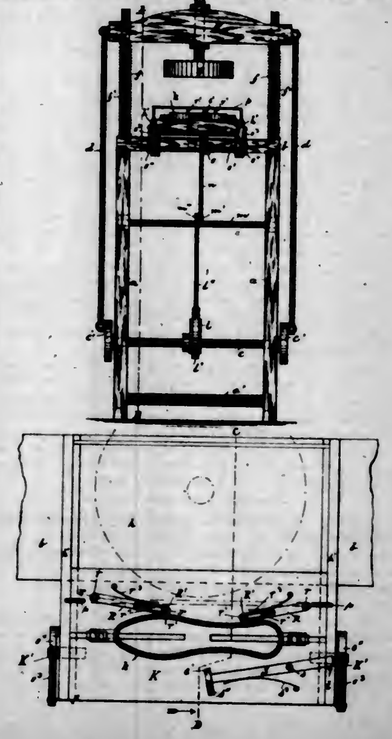
9. In a music-box, the combination of the barrel-shifting cam E, shaft *j*, spur-wheel *t*, and spur-wheel I, having an index thereon, all arranged so that as the cam E turns, the index-wheel I will also be turned to denote the tune being played, substantially as described.

10. The combination, with the pin-barrel D, having notch *e*, of the cam E, adapted to engage said notch to shift the barrel, and with the shaft *j*, secured to and extending beyond said cam and journaled in a block, *l*, whereby the cam E can be turned by hand to shift the barrel to the desired tune, substantially as described.

11. The longitudinally-adjustable pin-barrel mounted upon the shaft *a*, in combination with spring-pressure block *l*, slotted supports *i i*, and guide b^9 on one of said supports *i*, substantially as herein shown and described.

382,293. CARRIAGE-TOP SPRING. SHEPARD W. CATELY, Cortland, N. Y., assignor of one-half to Alice M. Etling, same place. Filed Jan. 23, 1888. Serial No. 261,968. (No model.)

Claim.—1. A coil-spring for the arms of carriage-seat rails, having on its inner end a hook to prevent the inner end of the coil from



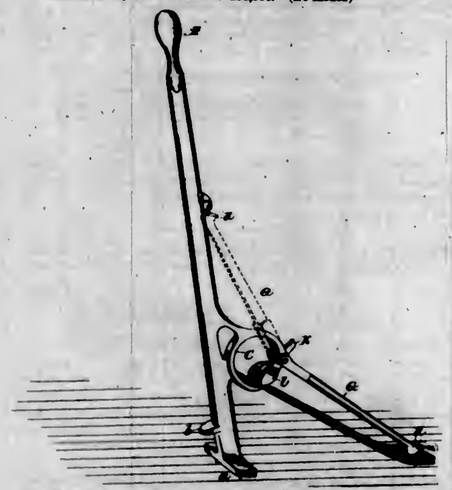
turning, and on its outer end a hook integral with the coil, adapted to fit over the vertical brace of the top, as set forth.

2. A coil-spring for the arms of carriage-seat rails, having hooks on its ends at right angles to and integral with the spring and on a line with the length of the coil, the hooks on the inner end fitting over the seat-rail and the hooks on the outer end fitting over the brace of the top, as and for the purpose set forth.

3. The combination, with a seat-rail having laterally-extending arms with top braces attached thereto, of coil-springs on said arms, having hooks on their ends integral therewith, the hooks on their inner ends adapted to fit over the seat-rail and hooks on their outer ends adapted to fit over the brace of the top, as set forth.

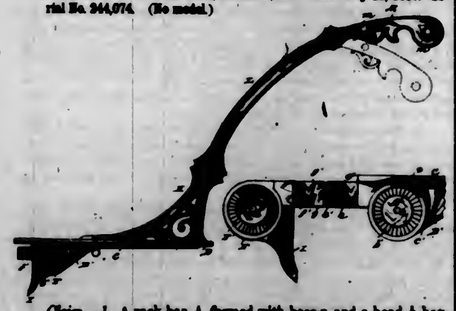
382,294. DRIVING-OUT MACHINE FOR BOOT OR SHOE SOLES. WILLIAM O. CRIM and GEORGE A. CLOUGH, Jr., Beverly, Mass. Filed Feb. 24, 1888. Serial No. 265,122. (No model.)

Claim.—1. In a sole-cutting machine, the vertically-reciprocating block *g* and the horizontally-movable carrier K, in combination with the connecting mechanism from the rotary shaft *c*, consisting of the eccentric *l*, the rod *l'*, having slot *P* in its upper end, the rock-lever *m'* and its pin *m''*, the link *n*, the rock-shaft *o'*, having lever *o* connected to said link *n*, and levers o^2 o^3, connected to the carrier K by means of the links o^3 o^4, substantially as and for the purpose set forth.



382,294.

2. In a sole-cutting machine, the movable die-carrier K and its die *k*, in combination with the sole centering and holding device, consisting of the spring-pressed pins *r' r'*, arranged on the adjustable levers R R, and the spring-pressed pin *r*, arranged on the spring-pressed lever S, substantially as and for the purpose set forth.

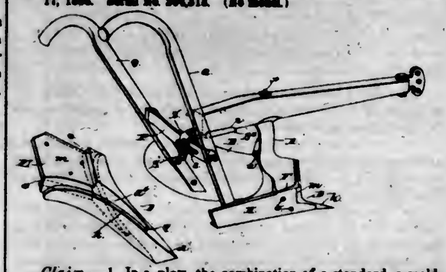


3. The reciprocating die-carrier K and its die *k*, in combination with the vertically-yielding pins *r' r'*, and the vertically-yielding pin *r*, mounted on the spring-pressed lever S, and the stationary pin or projection *t*, for automatically withdrawing the said pin *r* from the die *k* in placing or removing the sole on and from the die, as set forth.

382,295. CARPET-STRETCHER. LEWIS R. DEY, Camden, N. J. Filed Dec. 17, 1887. Serial No. 258,138. (No model.)

Claim.—In a carpet-stretcher, the combination, with the lever A, having the fastening device *f*, of the clutch C, and the brace G, hinged to the clutch and adapted to be swung up and secured by the fastening *f*, substantially as described.

382,296. BRACKET OR SUPPORT FOR SHELVES, DESKS, AND TABLES. CARLOS ROSEMEYER, St. Louis, Mo. Filed July 13, 1887. Serial No. 244,074. (No model.)



Claim.—1. A rack-bar, A, formed with bosses, and a head, *b*, having teeth A' upon its rear face to conceal the same behind the head, substantially as and for the purposes set forth.

2. The combination, with a rack-bar, A, having a base, *a*, and provided with a head, *b*, formed with teeth A' upon its rear face, of a bracket formed with rearwardly-extending lugs provided with right-angled extensions formed with teeth adapted to engage the teeth of said rack-bar, substantially as described.

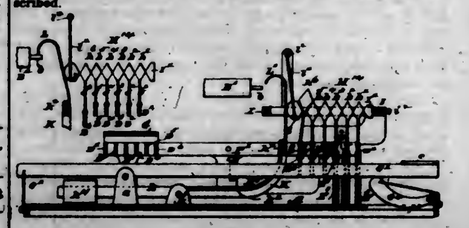
3. The combination, with a rack-bar, A, having a base, *a*, and provided with a head, *b*, formed with teeth A' upon its rear face, of a bracket formed with teeth engaging the teeth of the rack-bar, and a depending arm, I, as shown, on said bracket, for the purpose of disengaging said bracket and bar, substantially as described.

4. The bracket consisting of the main piece B', formed with ratchet-disk, the disk B'', formed with toothed jaw and fitting on one side of said main piece, the disk F, formed with ratchet-face and toothed jaw and fitting against the ratchet-disk of said main piece, and means for adjustably securing said parts together, substantially as and for the purpose specified.

382,297. PLOW. JOSEPH H. FRY, Washington, D. C. Filed Feb. 17, 1888. Serial No. 264,312. (No model.)

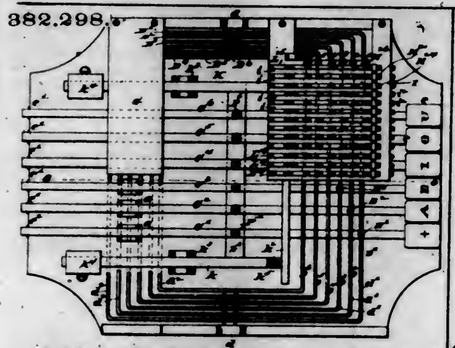
Claim.—1. In a plow, the combination of a standard, a mold-board secured to the standard and having its lower edge cut away and provided with a recess, *b*, a point secured to the standard and recessed to receive the front edge of the mold-board and provided with the grooves d' d^3, and a wing having plane upper and lower edges, and having its ends inclined in opposite directions, and provided with tongues engaging, respectively, the recess *b* and the angle formed by the mold-board and the point, as set forth.

2. The combination, with the mold-board, of the standard having said board secured thereto, the forward edge of said standard being recessed in its lower portion to leave vertical portions of the board to project therefrom, and a reversible point provided with opposite working-faces having a common edge and furnished on opposite sides with bearing portions or grooves d' d^3, to bear against the projecting portions of the mold-board, as set forth.



3. The combination, with the standard provided with the horizontal shoulders F F' and the mold-board secured to the standard, of the reversible point having the shoulders *e* and the recessed portions d' d^3, and the landside having its end provided with the shoulder *n* and the recess *j*, to engage the shouldered and recessed portion of the point, as set forth.

4. The combination of the beam, the handles, the brace-bar adjustably secured to the handles and having a longitudinal slot, a bracket having a horizontal portion provided with ribs *t*, fitted to the beam, and having a vertical slotted portion overlapping the brace-bar, an angle-plate bearing against the bracket, and the brace-bar and bolts securing the parts together, as set forth.



5. The combination of the handles, the brace-bar P, adjustably secured thereto and having a longitudinal slot, *s*, and flange *r*, an angle-bracket, S, having a horizontal portion, S^2, for the beam, and a vertical slotted portion, S', overlapping the brace-bar, an angle-plate, T, resting against the brace-bar and the horizontal portion S^2 of the bracket, and suitable securing-bolts, as specified.

382,298. DEVICE FOR OPERATING A SET OF LEVERS. HERVEY D. GAMBS, Chicago, Ill. Filed July 18, 1883. Renewed Apr. 20, 1887. Serial No. 236,533. (No model.)

Claim.—1. The wedges *k'* to k^5, inclusive, in combination with abutment I', block *l*, and hook L in guide-plate I, substantially as described.

382,298.

2. A file of wedges, K' to K^5, inclusive, in combination with a set of frames, D' to D^5, inclusive, jointed together, substantially as and for the purpose specified.

3. The combination of a file of wedges, K' to K^5, inclusive, an abutment for the file to press against, and a movable block to be moved by the file when the wedges move into line, substantially as described.

4. The combination of a file of wedges, K' to K^5, inclusive, an abutment for the file to press against, a movable block, substantially as described, to be moved by the file when the wedges move into line, and means, substantially as described, for moving the wedges into and out of line.

5. The combination of a file of wedges, K' to K^5, inclusive, each of which is adapted to be moved into and out of line with the other wedges of the file, and means for moving the various wedges of the file into and out of line, for the purpose described.

6. The combination of a series of files of wedges marked K' to K^5, inclusive, abutments for the various files to bear against, and a series of movable blocks, substantially as described, to be moved respectively by the files as the wedges of the respective files come into line.

7. The combination of the series of files of wedges K' to K^5, inclusive, the abutments I', the blocks l, shanks J' to J^5, inclusive, and the frames D' to D^5, inclusive, substantially as described.

8. The combination of keys C' to C^5, inclusive, frames D' to D^5, inclusive, shanks J' to J^5, inclusive, and the series of files of wedges K' to K^5, inclusive, substantially as described.

9. The combination of keys C' to C^5, inclusive, the adjustable studs E' to E^5, inclusive, and the frames D' to D^5, inclusive, substantially as described.

10. The combination, with the guide-plate I and the series of files H' to H^5, inclusive, of movable wedges, substantially as described.

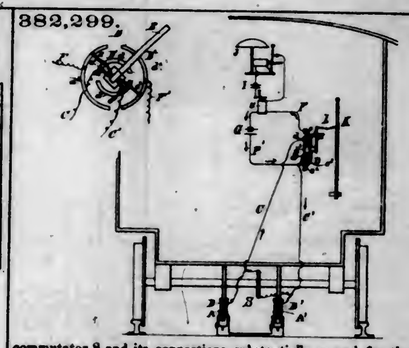
11. The combination of the rocking frame K, and the hooks L' L^5, &c., to operate the levers or keys of a machine, substantially as described.

12. The combination of the keys C' to C^5, inclusive, and frame K, provided with its spring-hooks, substantially as described.

13. In combination with the series of files of wedges H' to H^5, inclusive, the adjustable abutments I' to I^5, as and for the purpose described.

14. The combination of the file of wedges K' to K^5, inclusive, the movable block l, and the hook L, to operate the levers or keys of a machine, substantially as described.

15. The combination of a file of wedges, H, composed of wedges K' to K^5, inclusive, and frames D' to D^5, inclusive, connected with the wedges by shanks of different lengths, as and for the purpose described.

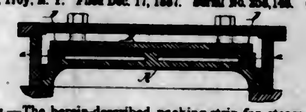


382,299. ELECTRIC RAILWAY-SIGNAL. DUNCAN H. GREEN, Covington, Ky. Filed July 25, 1887. Serial No. 245,203. (No model.)

Claim.—1. The combination of the conductors A A', brushes B B', wires C C', connecting the brushes to the two segments of the ring D', the ring D', made in two insulated sections, lever E, provided with arms e e' and e^3 e^4, wires F F', battery G, electro-magnet H, and bell J in a circuit operated by the electro-magnet H, substantially as and for the purposes specified.

2. The combination of conductors A A', brushes B B', wires C C', a reversing-switch, wires F F', battery G, electro-magnet H, and bell J and battery I in a circuit operated by the electro-magnet H, substantially as and for the purposes set forth.

3. The combination of conductors A A', brushes B B', wires C C', a reversing-switch, wires F F', battery G, electro-magnet H, and bell J and battery I in a circuit operated by the electro-magnet H, and



382,299.

commutator S and its connections, substantially as and for the purposes specified.

4. The combination of the rings D' D^5, each divided into two sections insulated from each other, and lever E, provided with arms e' e^3 e^4, substantially as and for the purposes specified.

382,300. PACKING FOR BALANCED VALVES. HIRAM G. HARNEY, Troy, N. Y. Filed Dec. 17, 1887. Serial No. 258,146. (No model.)

Claim.—The herein-described packing-strip for steam and other balanced slide-valves, the same consisting of a cast-metal exterior and a wrought-metal core united therewith, substantially in the manner and for the purposes set forth.

382,301. TANK-SUPPLY-REGULATING VALVE. PETER HANSEN, Chicago, Ill. Filed Oct. 26, 1887. Serial No. 253,312. (No model.)

Claim.—1. The combination, with a supply tank or reservoir and its supply-pipe having a bent end, d, and a valve-seat, d', consisting of the end of said pipe, of a float, a float valve-lever operated by said float, a valve-sleeve fitting loosely and exteriorly the bent end of said supply-pipe and projecting through a socket or opening in said lever, said valve-sleeve being provided with lugs or projections f^3, bearing against said lever, and with an internal central bridge and an elastic valve resting upon said bridge, substantially as specified.

2. The combination, with a supply-pipe having a bent end, the extremity of which constitutes the valve-seat, of a float valve-lever and a pendent valve-sleeve pivotally connected to said lever and fitting loosely and exteriorly the bent end of said pipe, and provided with an internal valve adapted to bear against said valve-seat, the pivotal connection between said pendent valve-sleeve and lever being above said valve-seat, substantially as specified.

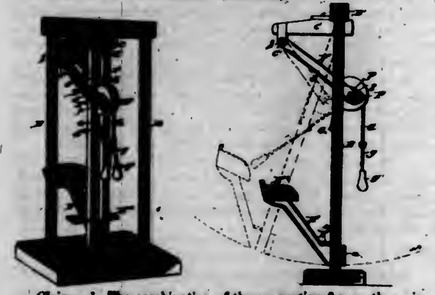
3. The combination of supply-pipe D, having bent ends d, with valve-sleeve F surrounding the bent end of said supply-pipe, float valve-lever C, having a socket or opening, c', for the end of said valve-sleeve, bridge f, rubber valve f', pins f^3, and bearing-lugs f^3, substantially as specified.

4. The combination of supply-pipe D, having bent ends d, with valve-sleeve F, surrounding the bent end of said supply-pipe, float valve-lever C, having a socket or opening, c', for the end of said valve-sleeve, said valve-sleeve being provided with an internal bridge, f, having a pin, f^3, and rubber valve f', resting on said bridge and held in place by said pin, and said lever C having a cam or stop projection, c^4, on its end adapted to limit the movement of said lever, substantially as specified.

382,302. ALBUM-CLASP. THEODORE M. HAM, New York, N. Y. Filed Feb. 20, 1888. Serial No. 265,672. (No model.)

Claim.—1. In an album-clasp, the combination of the spring-reg-

382,302.



ulated extension element, and levers C and D, constructed and operating in the manner and for the purpose described.

2. In an adjustable album-clasp, the following elements in combination, an extension device and springs to actuate the same, levers C and D, engaging with said device and provided with finger-rests e, and an actuating-spring, p, for said levers, substantially as described.

3. In the herein-described adjustable album-clasp, the casing A thereof, with recesses k and k' in its sides, whereby the levers C and D may be pressed inward, as and for the purpose described.

4. In an adjustable album-clasp with recessed casing, levers C and D, combined with said recessed casing and spanning the same, whereby the outline of the casing is preserved by said levers when they are in a state of rest, as and for the purpose described.

382,303. SWING. JAMES D. HATE, MOUNT MORRIS, Ill. Filed Sept. 13, 1887. Serial No. 249,492. (No model.)

Claim.—1. The combination of the supporting-frame, the swinging frame D, hung therein and composed of parallel bars d united together, the swinging hanger F, the pulley P, carried by said hanger and having the disks p bearing on the bars d, the seat carried by the frame D, and the rope secured to said frame and passing around the pulley P, as set forth.

2. The combination of the supporting-frame, the swinging frame D, hung therein and composed of parallel bars d united together, the swinging hanger F, the pulley P, carried by said hanger and having the disks p bearing on the bars d, the seat carried by the frame D, and the rope secured to the frame D, passing around the pulley P, and provided with one or more grips, g', as set forth.

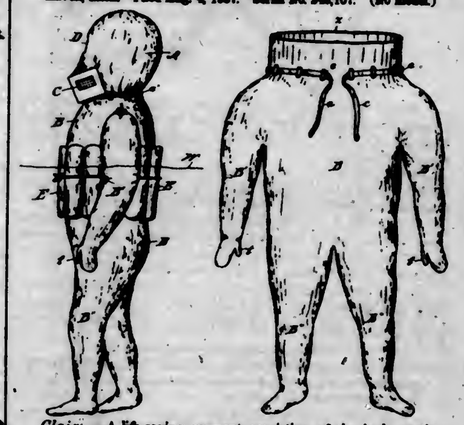
3. The combination of the supporting-frame, the open swinging frame D, having the central apertured block d^3, the hanger F, the pulley P, carried by said hanger and having the disks p, the cord G, secured to the frame D, passing over the pulley P, and having the ends g, provided with the grips g', the arm E, having the weighted extension e, the seat E', and the foot-rest E^2, substantially as described.

382,304. HARROW. EDWARD W. HENDERSON, Geneva, N. Y. Filed Sept. 7, 1887. Serial No. 249,099. (No model.)

Claim.—1. A harrow-tooth provided with one or more holes for receiving the fastening-bolt, in combination with a harrow-frame, and a fastening-bolt having an inclined head, whereby only an edge bears along the tooth at some distance from the hole, substantially as set forth.

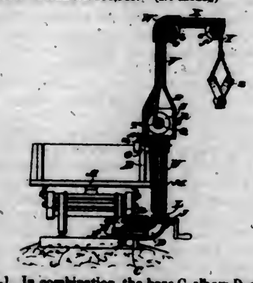
2. In a harrow, a fastening-bolt having its head inclined so as to bear only along one edge and at some distance from the hole in which it is inserted, in combination with a curved harrow-tooth provided with a graduated series of attachment holes, substantially as described.

382,305. BELT-FASTENER. HENRY C. HESS, Williamsville, N. Y. Filed Mar. 10, 1888. Serial No. 266,992. (No model.)



382,305.

Claim.—1. A belt for machinery having its ends united by a series of dovetail portions interlocked together and secured by a binding-piece surrounding the interlocked portions of the belt, substantially as described.



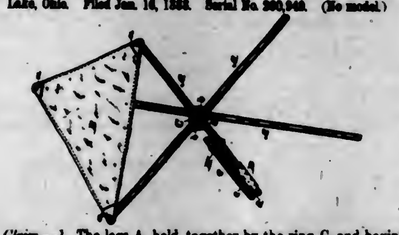
2. In a machinery belt, the combination of the portion A, having a series of dovetail portions, 3, and openings 2 with the portion B, provided with a series of corresponding dovetail portions, 7, and openings 6, the whole interlocked together and secured with a binding-wire, substantially as described.

382,306. LIFE-SAVING GARMENT. GEORGE A. HILER, Grand Haven, Mich. Filed Aug. 4, 1887. Serial No. 246,107. (No model.)

Claim.—A life-saving garment consisting of the body portion made of impervious material, and having legs, arms, and neckband formed integral therewith, and a gathering-cord for said neckband, in combination with the head part or protector having the transparent plate D, the series of perforated plates, the apron F, located back of said perforated plates, having its lower edge only attached to said protector, and the gathering-cord d', located at the lower end of said protector, whereby the lower end of the protector is bound to the upper end of the body portion, substantially as and for the purpose specified.

382,307. PORTABLE CRANE. JOHN A. HUTH, Bayard, Ohio. Filed Oct. 27, 1887. Serial No. 253,515. (No model.)

Claim.—1. In combination, the base C, elbow D, clamp G, vertical portion L, pipe M, and arms N, said base and clamp adapted to grasp the rail, and said arms the top of the car, substantially as set forth.



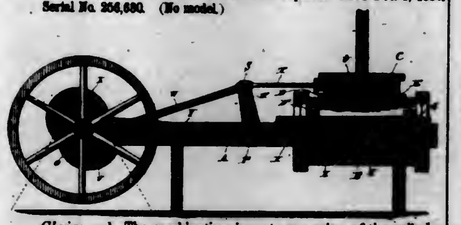
2. The herein-described support for the swinging crane, consisting, essentially, of the lower portion, D, provided with a clamp to engage the rail and with an upwardly-extending pipe-section, L, and an upper portion, M, having a free vertical movement on the lower por-

tion and provided with arms to engage the car, substantially as set forth.

3. The crane consisting, essentially, of the housing P, downwardly-projected pipe U, upwardly-projected pipe, V, elbow W, having depending lugs *d*, sheave *c*, supported in said lugs, outwardly-projected pipe-bar X, a sheave mounted thereon, a winding-shaft, Q, means for rotating the shaft, and rope Y, passed over the sheave and around the shaft, substantially as set forth.

4. In combination, the hollow crane forming a housing for the lifting-rope, a downwardly-projected pipe-section, U, and an extensible support on which the pipe-section U is mounted, the said support being provided with a clamp to engage the rail and with arms to engage the car, substantially as set forth.

382,308. COMBINED CANE AND CHAIR. JOHN H. KANEBEB, Lake, Ohio. Filed Jan. 16, 1888. Serial No. 260,949. (No model.)



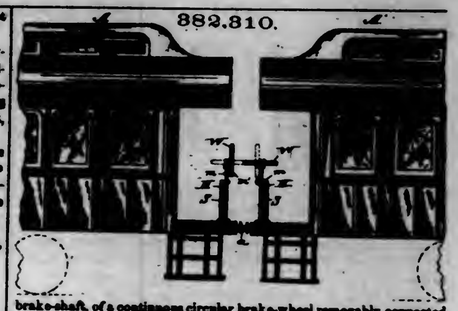
Claim.—1. The legs A, held together by the ring C, and having attached to the top or upper ends of said legs the seat B, the hinged extension leg or stick, and the ferrule D, substantially as and for the purpose set forth.

2. The legs A, held together by the ring C, and having attached to their top or upper ends the seat B, the cover E, and the detachable head or knob G, substantially as and for the purpose set forth.

3. The legs A, held together and having attached to their top or upper ends the seat B, the strengthening corners or patches *a*, sewed to said seat, the cover E, the knob G, the extension leg or stick *c*, and the ferrule D, substantially as and for the purpose specified.

4. The legs A, held together and having attached to their top or upper ends the seat B, the hinged leg or stick *c*, the ring C, the staples *b*, the ferrule D, and the pin *e*, substantially as and for the purpose set forth.

382,309. STEAM-ENGINE. WILLIAM K. KIGHT, Kossuth, Mo., assignor of one-fifth to J. A. Bohnert, same place. Filed Dec. 1, 1887. Serial No. 256,690. (No model.)



Claim.—1. The combination, in a steam-engine, of the cylinder having the steam-chest and the inlet-ports communicating with the steam-chest near the center thereof, and with the cylinder near the ends thereof, the exhaust-pipes F G projecting transversely from the ends of the cylinder, and having the exhaust-ports, the slide-valve U, arranged in the steam-chest and adapted to alternately uncover the inlet-ports, and the exhaust slide-valve I, secured to the exhaust-pipes, and having the ports K, adapted to alternately register with the exhaust-ports, substantially as described.

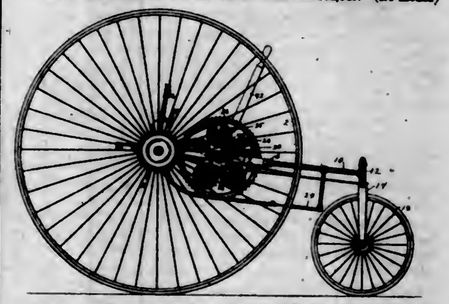
2. The combination, in a steam-engine, of the cylinder having the steam-chest, and the inlet-ports communicating with the steam-chest near the center thereof, and with the cylinder near the ends thereof, the exhaust-pipes F G, projecting transversely from the ends of the cylinder and having the exhaust-ports, the slide-valve U, arranged in the steam-chest and adapted to alternately uncover the inlet-ports, the exhaust slide-valve I, secured in the exhaust-pipes, and having the ports K adapted to alternately register with the exhaust-ports, the driving-shaft having the eccentrics V X, the pitman Y, connecting the latter with the valve I, the rocking arm R, connected to the valve U, and the pitman connecting said arm to the eccentric V, substantially as described.

382,310. CAR-BRAKE. ANDREW KILPATRICK, Morton, Pa. Filed Feb. 25, 1888. Serial No. 265,226. (No model.)

Claim.—1. In a railway-car brake, the combination, with the

382,310.

brake-shaft, of a continuous circular brake-wheel removably connected therewith and adapted to be turned into a vertical position thereon, with one portion of the wheel above and one portion below the point of connection with said shaft, substantially as set forth.



2. In a railway-car brake, the combination, with the brake-shaft, of a brake-wheel mounted and having a vertical sliding movement on said shaft, and also hinged thereon and adapted, when elevated, to be turned into a vertical position, substantially as set forth.

3. In a railway-car brake, the combination, with the brake-shaft having a recess, of a brake-wheel mounted and having a vertical sliding movement on said shaft, provided with a stop engaging said recess to limit such movement, the wheel being adapted to be turned into a vertical position, substantially as set forth.

4. In a railway-car brake, the combination, with the brake-shaft tapered at its upper end and provided with a recess, of a brake-wheel fitting said tapered end and provided with a stop engaging said recess to limit the vertical movement of the wheel, the wheel being adapted to be turned into a vertical position, substantially as set forth.

5. In a railway-car brake, the combination with the brake-shaft having the shoulder *r'*, of the wheel having a stop in line therewith, vertically movable on the shaft, adapted to be turned into vertical position, and having its center of gravity when in such position beyond its point of support.

382,311. LOCOMOTIVE-VELOCIPEDE. BRYANT W. ADEIS, Minneapolis, Minn. Filed Jan. 23, 1888. Serial No. 261,612. (No model.)

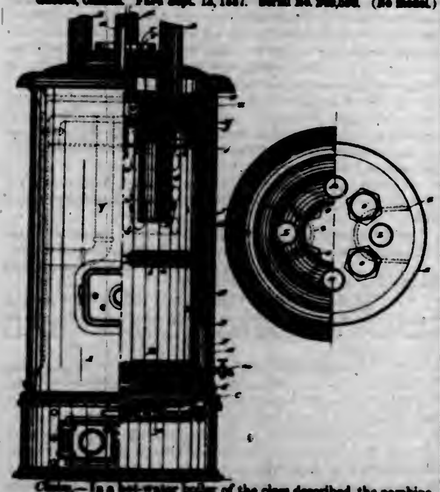
Claim.—1. In a motor of the class described, the combination, with the driving-shaft, of a revolving case or frame connected to and operating said driving-shaft, a series of springs mounted upon shafts or spindles journaled in said case, and a series of gear-wheels upon said spindles and meshing with a central and relatively-stationary gear, whereby the action of the springs will be exerted to revolve the said case or frame about its axis, substantially as described.

2. The combination, in a vehicle of the class described, with the driving-shaft and the spring-actuated frame or case connected with and revolving said driving-shaft, of the central shaft about which the said frame revolves, a lever attached to and arranged to operate said shaft, a gear also attached to said central shaft, and a series of gears located about and meshing with said central gear and secured to the spindles of the actuating-springs, whereby by operating the lever and revolving the central shaft the spindles of the springs are revolved and the springs rewound, substantially as described.

3. The combination, in a vehicle of the class described, with the driving-shaft 4, and the gear 27, secured thereto, of the gear 26, revolving about the shaft 32 and meshing with the gear 27, a gear, 40, upon the shaft 32, the gears 38, mounted upon spindles journaled in the plate or gear 26, and common to and meshing with the gear 40, the springs 34, attached to the gear 26 and to the spindles and exerting pressure to revolve said spindles, and means, as a ratchet, 46, for retaining the shaft 32 in a stationary position in order that the springs 34 may exert their power to revolve the gear 26, substantially in the manner and for the purpose described.

4. In a vehicle of the class described, the combination, with the spring-propelling device consisting of the series of springs held in a revolving case or frame, the spindles of said spring being provided with a gear meshing with a central and independent gear upon a shaft, 32, and the locking device consisting of a ratchet secured to the shaft 32, and a pawl secured to the revolving case, whereby when the said pawl engages the ratchet the shaft 32 and the gear attached thereto will be locked to and caused to revolve with the said case and the action of the springs will be suspended, substantially as described.

5. In a vehicle of the class described, the combination, with the spring-propelling device, consisting of the springs 34, the spindles 36, upon which the said springs are mounted, the gears 38, secured to said spindles, and the gear 40, secured upon the central shaft, 32, and meshing with the gears 38, of the ratchet 46, secured to the shaft 32, the pawl 60, secured to the revolving frame or case, the spring 62 for holding said pawl in suspension, and a device, as the finger 64, operated by a suitable latch, 66, to force the pawl into engagement with the ratchet, substantially as described.

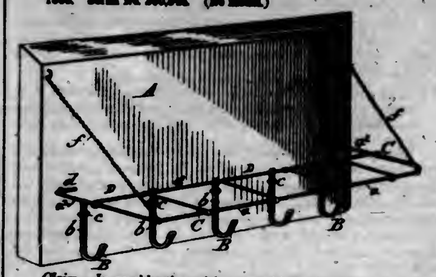


382,312. KNOCKDOWN BOX. CHARLES I. LOEWOOD, Philadelphia, Pa. Filed Mar. 3, 1888. Serial No. 265,932. (No model.)

Claim.—1. A blank for knockdown boxes, creased upon the lines *w w'* parallel to the edges, slotted from opposite sides along the lines *w'* to the lines *w* to form flaps *f*, with outwardly-projecting tongues *e d* at the end of each flap, and with slots *g h* adjacent to each slit, the slot *g* being parallel to the outer edge and the slot *h* at an angle thereto, substantially as set forth.

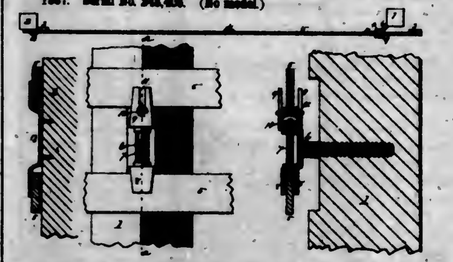
2. A knockdown paper box having in opposite sides slots *g* adjacent and parallel to the edge of each sides, and slots *h*, each at an angle to the adjacent slot *g*, and with terminal flaps *f* on the other sides of the box, each flap having at the outer ends two upwardly-projecting tongues, *e d*, substantially as set forth.

382,313. HOT-WATER BOILER. BOSTON S. MANBY, Montreal, Quebec, Canada. Filed Sept. 12, 1887. Serial No. 249,580. (No model.)



Claim.—In a hot-water boiler of the class described, the combination, with the three concentric envelopes D E G, of the top returning pipes, I, bringing the cold water along the outer envelope, D, to cool it down, casting B, pocket Z, and exit-pipes M M, as above described, and for the purposes set forth.

382,314. EVAPORATING-PAN. HIRAM MATHEWS, Wayne, and HENRY HILL, Greater Cross Roads, Ohio. Filed Dec. 3, 1887. Serial No. 256,576. (No model.)

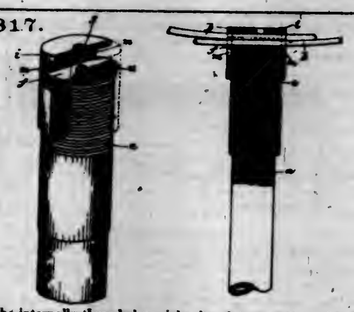


Claim.—The combination of the furnace M, constructed as herein shown and described, and the pans B, provided with central division-walls, F, and handles H, with tubes G G', connecting adjacent pans and telescoping to form conduits between the pans for the passage of the syrup, and serving as axes by means of which each pan may be tilted independently of or simultaneously with the others, said division-walls F having perforations aligning with the tubes G G', all substantially as shown and described.

382,315. COMBINED HAT AND COAT RACK. ROBERT I. MCARTHUR, Albert Lea, Minn. Filed Feb. 13, 1887. Renewed Jan. 12, 1888. Serial No. 260,544. (No model.)

Claim.—In combination with a portable back, A, having clothes-hooks and provided with the eyes or staples *d*, the hat-shelf having the ends of its supporting-arms *e* bent and inserted through the said eyes and provided with a stay rod or wire, *c'*, attached at each end to the said arms in position to allow the hat-rim space D, and the stays *f*, each of which is attached at one end to the upper portion of the supporting-back and at the other end to the forward portion of the hinged shelf, substantially as and for the purposes described.

382,316. GATE. DANIEL MCCARTY, Harlem, Ill. Filed Aug. 31, 1887. Serial No. 248,403. (No model.)



Claim.—1. The herein-described gate-hinge, consisting, essentially, of the yoke provided with its shank for securing it to a post, the pintle extending through the arms of the yoke and having a pair of jaws formed on one end to embrace the edge of a rail, a pair of jaws secured to the opposite end of the pintle, and a roller journaled between the jaws to support the gate, substantially as set forth.

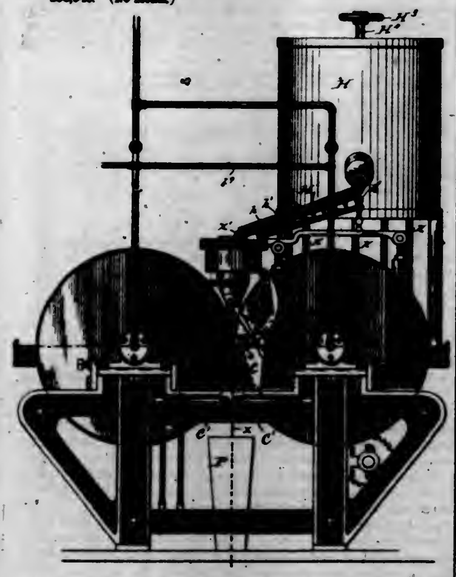
2. The herein-described gate-hinge, consisting, essentially, of the yoke having a screw-threaded shank for securing it to the post, the said yoke being provided with a pair of perforated arms, the pintle extending through the arms of the yoke, the pintle having a pair of jaws at one end, and a pair of slotted jaws secured to the other end of the pintle and carrying a roller in the slots, substantially as set forth.

382,317. LANDING-NET. GEORGE W. MCCLINTOCK, Quincy, Mass. Filed Mar. 19, 1888. Serial No. 267,949. (No model.)

Claim.—1. The net-frame-holding device consisting of the ferrule *e*, externally screw-threaded, the shoe *f*, pivotally secured to the for-

382,317.

rule, and the internally-threaded cap *i*, having slots *m m* to receive the ends of the frame-strip, as set forth.



2. The combination of the externally screw-threaded ferrule, the shoe pivotally secured to the ferrule, and the cap having the strip-receiving slots *m m*, and engaged, substantially as described, with the pivoted shoe, whereby the removal of the cap from the ferrule is prevented, as set forth.

3. The combination of the externally-threaded ferrule, the internally-threaded cap having the slots *m m*, and the shoe *f*, pivotally secured to the head of the ferrule and projecting at its ends into the slots *m m*, as set forth.

382,318. ETCHING GLASS. ERNST EISENLOHR, New York, N. Y., assignor to Jesse H. Lippincott, same place, and Herman Schulze-Berge, Rochester, Pa. Filed Jan. 3, 1888. Serial No. 259,633. (No specimens.)

Claim.—The improved process of etching glass, porcelain, and similar materials hereinbefore set forth, by stamping a design upon the surface of such material with a sticky compound of rosin and fatty oil, then spreading said unstamped portion of said surface with a pulverized hydrofluorate of ammonia containing a portion of free hydrofluoric acid, and lastly subjecting the work to the action of slightly-warmed moist air, all substantially as and for the purpose set forth.

382,319. APPARATUS FOR MAKING SHEET METAL. ERWIN HORTEN and JOHN G. HOGREN, Maywood, assignors to said Erwin Horten, and Oliver W. Horton, Chicago, Ill. Filed Dec. 27, 1887. Serial No. 258,940. (No model.)

Claim.—1. The apparatus or machine for manufacturing sheet metal, consisting in a pair of smooth revolving chilling rollers or wheels with a space between their peripheries at their meeting-line equal to the thickness of the sheet metal to be produced and a pouring nozzle or vessel having a discharge opening or slot at its lower end or bottom directly above and extending parallel to said space between the peripheries of said rollers, so that the stream of molten metal issuing from said pouring nozzle or vessel may flow in a direction tangential to both said rollers, substantially as specified.

2. The combination, with two revolving chilling-rollers, of a pouring-nozzle above and between them and means for driving or revolving said rollers at a greater surface speed than the velocity of the flowing stream of molten metal, substantially as specified.

3. The combination, with a pouring nozzle or vessel having a long narrow discharge-opening, of a pair of chilling-rollers revolving with a space between them equal to the thickness of the metal sheet to be produced and at a sufficient surface speed in respect to the space between the rollers, the size of the discharge-opening, and the velocity of the flowing stream of molten metal so that the molten metal cannot collect above and between the rollers, substantially as specified.

4. The combination, with a pair of revolving rollers, of a pouring nozzle or vessel above and between them and a heater for heating said vessel, substantially as specified.

5. The combination, with a pair of revolving rollers, of a pouring nozzle or vessel above and between them, a heater for heating said vessel, and a capsible or vessel for holding molten metal, and a pipe or conductor leading therefrom to said pouring vessel or nozzle, substantially as specified.

6. The combination, with a pair of revolving rollers, of a pouring nozzle or vessel above and between them, a heater for heating said vessel, a crucible or vessel for holding molten metal, a pipe or conductor leading therefrom to said pouring vessel or nozzle, and a heater for heating said pipe or conductor, substantially as specified.

7. The combination, with a pair of revolving rollers, of a pouring nozzle or vessel above and between them and a heater for heating said vessel, said heater consisting of gas-burners, substantially as specified.

8. The combination of a pair of revolving wheels or rollers having a space between them equal to the thickness of the metal to be produced, a pouring nozzle or vessel, and a crucible connected with said pouring nozzle or vessel, substantially as specified.

9. The combination, with a pouring-nozzle having a long narrow discharge slot or opening, of a pair of hollow revolving rollers or wheels having a space between their peripheries at their meeting-line, into which the stream of molten metal issuing from said pouring-nozzle is directed, said wheels revolving at an equal or greater surface speed than the velocity of said flowing stream of molten metal, the shafts of said wheels or rollers being hollow and communicating at one end with an inlet water-pipe and at the other with an outlet water-pipe, substantially as specified.

10. The combination, with a pouring-nozzle having a long narrow discharge slot or opening, of a pair of hollow revolving rollers or wheels having a space between their peripheries at their meeting-line, into which the stream of molten metal issuing from said pouring-nozzle is directed, said wheels revolving at an equal or greater surface speed than the velocity of said flowing stream of molten metal, the shafts of said wheels or rollers being hollow and communicating at one end with an inlet water-pipe and at the other with an outlet water-pipe, the inlet water-pipe communicating with the interior of the roller near its center and the outlet near its periphery, substantially as specified.

11. The combination, with a pair of revolving chilling wheels or rollers, of a pouring nozzle or vessel above and between them, one or both of said wheels or rollers being mounted on adjustable bearings to regulate the thickness of the sheet metal produced, substantially as specified.

12. The combination, with a pair of revolving rollers, of an adjustable pouring-nozzle above and between them, substantially as specified.

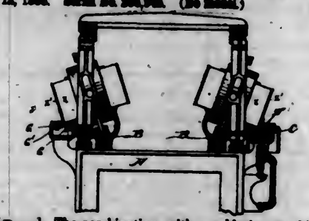
13. The combination of a pair of revolving wheels or rollers, B B, pouring nozzle or vessel D, having discharge-openings *d*, and support F for said vessel mounted on one or more adjusting-screws, substantially as specified.

14. The combination, with the revolving rollers B B, of pouring-nozzle D above and between them, having discharge-opening *d* at its lower end, support F, and four adjusting-screws, *f f' f² f³*, substantially as specified.

15. The combination, with revolving rollers B B, of pouring nozzle or vessel D above and between them and made of a curved or wedging shape to permit the lower end of said nozzle to project down near the meeting-line of said revolving rollers, substantially as specified.

16. The combination, with revolving rollers B B, of pouring nozzle or vessel D, located above and between them, a gas, or other heater for projection of flame against said pouring nozzle or vessel, and a hood, as D', surrounding said vessel to confine the heat, substantially as specified.

17. The combination, with revolving rollers B B, of pouring nozzle or vessel D, having discharge slot or opening *d* at its lower end, and a valve or gate, *d'*, to regulate the discharge-orifice, and an adjusting handle or lever for said valve, substantially as specified.



18. The combination, with revolving rollers B B, of pouring nozzle or vessel D, having discharge slot or opening *d* at its lower end, and a valve or gate, *d'*, to regulate the discharge-orifice, and an adjusting handle or lever for said valve, arc R, sliding block *e*, and adjusting-screw *e'*, substantially as specified.

19. The combination, with a pair of revolving rollers, B B, of a pouring nozzle or vessel, D, above and between the same, and a discharge-chute, N, below said rollers, substantially as specified.

20. The combination of a pair of revolving rollers having smooth unflanged peripheries, and having a space between them equal to the thickness of the sheet metal to be produced, with a pouring nozzle or vessel located above and between said rollers, whereby any inequality in the flow of the metal in respect to the velocity of the revolving wheels is compensated for by variations in the width of the strip of sheet metal produced and the sheet metal made of uniform thickness, substantially as specified.

21. The combination, with a pair of revolving wheels or rollers having smooth and unflanged peripheries, of a pouring-nozzle above and between them provided with a valve or gate for regulating the size of the issuing stream, whereby sheet-metal strips of different widths may be produced on the same machine, substantially as specified.

382,320. CAN-SOLDERING MACHINE. ERWIN HORTEN, Maywood, assignor to himself and Oliver W. Horton, Chicago, Ill. Filed Mar. 12, 1888. Serial No. 266,945. (No model.)

Claim.—1. The combination, with a soldering-machine and its can-carrier, of a flux-tank and a pair of long flux-applying brushes revolving in the flux contained in said tank and arranged parallel to the path of the can as it advances in said carrier, the revolution of the brush being transverse to the direction of movement of the can in the carrier, substantially as specified.

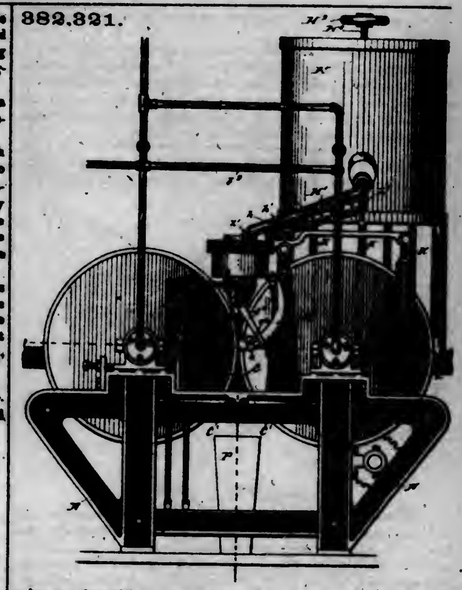
2. The combination, with a can-carrier, of a flux-tank and a long flux-applying brush revolving in the flux and arranged parallel to the path of the can as it advances in the carrier, the revolution of the brush being transverse to the direction of movement of the can in the carrier, substantially as specified.

3. The combination, with a can-carrier adapted to revolve the can as it advances, of a long revolving flux-applying brush parallel to the path of the revolving can as it revolves and advances in said carrier, the revolution of the brush being transverse to the direction of movement of the can in the carrier, substantially as specified.

4. The combination, with a can-carrier, of a pair of long revolving wipers parallel to the path of the can as it advances in said carrier, substantially as specified.

5. The combination, with a can-carrier, of a long revolving wiper parallel to the path of said can-carrier, substantially as specified.

6. The combination of a solder bath, a carrier device for revolving and advancing the can, and a long cylindrical revolving wiper, substantially as specified.



7. The combination, with a solder bath, a can-carrier adapted to advance and revolve the cans, and a pair of long revolving wipers parallel to the path of said carrier, substantially as specified.

382,321. MANUFACTURE OF SHEET METAL. ERWIN HORTEN and JOHN G. HOGREN, Maywood, assignors to said Erwin Horten, and Oliver W. Horten, Chicago, Ill. Original application filed Dec. 27, 1887, Serial No. 258,940. Divided and this application filed Mar. 12, 1888. Serial No. 266,962. (No model.)

Claim.—1. The process or improvement in the art of manufacturing sheet metal in continuous strips, consisting in pouring molten metal in a continuous unbroken stream between two rollers or wheels revolving together with a space between them equal to the thickness of the sheet metal to be produced, and at a sufficiently great surface speed to offer no obstruction to the flowing stream of molten metal, and thus pass the same between the rollers as fast as it flows and without permitting the molten metal to collect in a body above and between the rollers, substantially as specified.

2. The process or improvement in the art of manufacturing sheet metal, consisting in pouring molten metal in a thin wide flat stream between and in contact with two smooth revolving chilling-rollers, and in a direction tangential to both said rollers, and while said rollers revolve together with a space between them equal to the thickness of the sheet metal to be produced and at a surface speed equal to or exceeding the velocity of the flowing stream of molten metal, substantially as specified.

382,321.

382,322. DETERGENT. CHARLES G. PARSONS, Hempstead, N. Y., assignor to Julia M. Parsons, same place. Filed Sept. 14, 1886. Serial No. 213,582. (No specimens.)

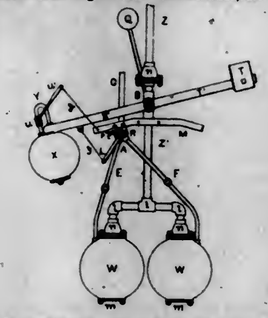
Claim.—1. A detergent compound containing an ammoniacal salt and one or more alkaline or equivalent substances to set free the ammonia, in which compound the loss or waste of ammonia is prevented during manufacture and until use by a coating of protecting material placed between the granules or particles of the ammoniacal salt and the alkaline or other ingredients of the compound which might cause decomposition of said salt, substantially as set forth.

2. A detergent compound containing an ammoniacal salt, one or more saponaceous bodies, and sufficient additional alkaline or equivalent substance or substances to set free the ammonia, in which compound the loss or waste of ammonia is prevented during manufacture and until use by a coating of protecting material placed between the granules or particles of the ammoniacal salt and the alkaline or other ingredients of the compound which might cause decomposition of said salt, substantially as set forth.

3. A cake of ammoniacal soap containing a soap-powder, a granulated or powdered ammoniacal salt, and sufficient additional alkaline or equivalent substance or substances to set free the ammonia, and a protecting compound to prevent loss of ammonia during manufacture and until use, the whole mixed together and then formed into a cake or block, substantially as set forth.

4. A detergent compound containing a soap-powder and ammoniacal salt and sufficient additional alkaline or equivalent substance or substances to set free the ammonia, in which compound the loss of ammonia is prevented during manufacture and until use by a coating of protecting material placed between the granules or particles of the ammoniacal salt and the alkaline or other ingredient of the compound which might cause decomposition of said salt, substantially as set forth.

382,323. DETERGENT. CHARLES G. PARSONS, Hempstead, N. Y., assignor to Julia M. Parsons, same place. Filed Sept. 20, 1887. Serial No. 250,163. (No specimens.)



Claim.—1. A detergent compound containing an ammoniacal salt and one or more saponaceous bodies, in which compound the loss of ammonia is prevented during manufacture and until use by a coating of protecting material placed between the granules or particles of the ammoniacal salt and the saponaceous bodies, substantially as set forth.

2. A cake of ammoniacal soap containing a soap, a granulated or powdered ammoniacal salt, and a coating of protecting material placed between the granules or particles of the ammoniacal salt and the soap to prevent loss thereof during manufacture and until use, the whole

mixed together and then formed into a cake or block, substantially as set forth.

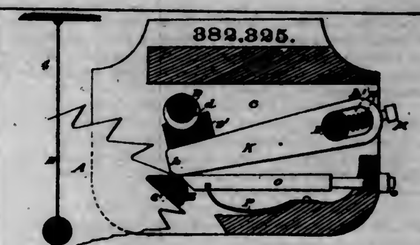
3. A detergent compound containing a soap-powder and an ammoniacal salt, in which compound the loss of ammonia is prevented during manufacture and until use by a coating of protecting material placed between the granules or particles of the ammoniacal salt and the alkaline or other ingredients of the compound, which might cause decomposition of said salt, substantially as set forth.

382,324. PNEUMATIC WATER-ELEVATOR. THOMAS O. PERRY, Tecumseh, Mich. Filed Aug. 26, 1886. Serial No. 211,383. (No model.)

Claim.—1. In combination with a submerged water-chamber and discharge-pipe leading therefrom, having at a point higher than the level of the water in which said chamber is submerged an extending arm which forms a part of the course of discharge of the water through said pipe, and which is adapted to oscillate up and down and which comprises a float-chamber, an air-duct leading into said submerged chamber, a revolving valve controlling the passage of compressed air through said duct and alternately admitting and excluding the same, and suitable connections whereby the oscillating arm of the water-discharge pipe actuates said valve, substantially as and for the purpose set forth.

2. In combination with a pair of submerged chambers, discharge-ducts leading therefrom, respectively, and the common discharge-pipe into which the said ducts communicate, said discharge-pipe having at a point higher than the level of the water in which the said chambers are submerged an extending arm forming a part of the water-course through said discharge-pipe, and adapted to oscillate up and down and comprising a float-chamber, two air-ducts leading into the submerged chambers, respectively, a revolving valve at the junction of such ducts, admitting compressed air to the said chambers alternately, and suitable connections whereby the oscillating arm of the water-discharge pipe actuates the revolving valve, substantially as set forth.

3. In a pneumatic water-elevator, the water-way having an extending arm forming part of the water-course, adapted to oscillate up and down and comprising a float-chamber, in combination with a pair of submerged water-chambers, air-ducts opening into them, a revolving air-valve at the junction of said ducts, and a ratchet-wheel and pawl actuated by the oscillation of the float-chamber, whereby the valve is rotated so as to feed each duct alternately, substantially as set forth.



4. In a pneumatic water-elevator, in combination with the water-way Z', stop-arm M, rigid with said water-way, the water-way Z, and the casting B, forming the connection between the water-ways Z' and Z, the water-ways S and S', hinged to the casting B, the float-chamber X at the junction of the water-ways S and S', an air-passage, Y, service-cock *u*, and link *y'*, substantially as and for the purpose set forth.

5. In a pneumatic water-elevator, a pair of submerged water-chambers, a common water-way, Z, leading therefrom, the stop-arm M, rigid on said water-way, an extending arm comprising the water-ways S S', hinged to the casting B, the float-chamber X at the end of said arm, air-ducts opening into the water-chambers, a revolving air-valve at the junction of said ducts, a ratchet-wheel and pawl actuated by the oscillation of the float-chamber, the air-rest *y*, service-cock *u*, and link *y'*, all combined substantially as and for the purpose set forth.

382,325. SAW-TOOTH SWAGE. JAMES R. REEDER, Cheboygan, Mich. Filed Nov. 18, 1887. Serial No. 255,894. (No model.)

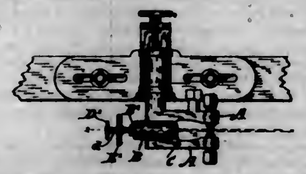
Claim.—1. In a tooth-swage for circular saws, the combination, with the clamping-jaws F F', of an anvil, E, having the flat top face, *e*, and the inclined bottom face, *e'*, to hold the tooth while being swaged, as set forth.

2. The combination, with the anvil and clamping-jaws, of the rear pivoted swage, K, having the front end, *k*, to draw out the point of the tooth, and the spring-actuated tooth-stop under said swage, as shown and described.

3. The combination, with a frame, C, of the cammed and hand-levered shaft D, the rear pivoted swage, K, the spring tooth-stop O, the anvil E, and the jaws F F', all constructed and arranged, substantially as and for the purpose specified.

4. The swage and tooth-stop provided with means, substantially as described, by which they may be correspondingly adjusted more or less forward toward the anvil, as shown and described.

382,326. DRAFT-EQUALIZER. DANIEL H. RINGLAND, Washington, D. C. Filed Oct. 31, 1887. Serial No. 253,847. (No model.)

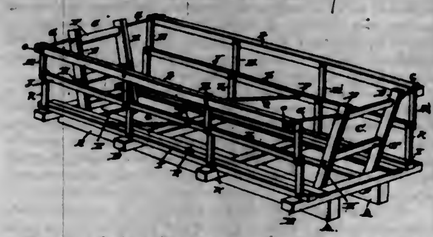


Claim.—1. In a draft-equalizer, the hollow tube or pipe A, screw-threaded at each end for attachment to the correspondingly screw-threaded eyes of the bolts C, and provided with the sliding sleeve-hooks *c*, and breeching-hook B, in combination with the sliding rod F and the traction appliances, substantially as and for the purpose specified.

2. In a draft-equalizer, the hollow tube or pipe A, secured to the eyes of the bolts C and provided with the sliding rod F, hook E, and sliding sleeve-hook *c*, in combination with the traction appliances, substantially in the manner and for the purpose specified.

3. In a draft-equalizer composed of a sliding rod connected to the collar of the harness and to the singletree, the hollow tube A, adapted to receive the said sliding rod and provided with a sliding sleeve-hook, *c*, and breeching-hook E, substantially as and for the purpose specified.

382,327. SAW-JOINTER. DAN C. ROSEBURY, Madison, Ind., assignor to R. C. Atkins & Company, of Indiana. Filed July 30, 1887. Serial No. 245,694. (No model.)



Claim.—1. The combination, in a jointer for jointing circular saws, of a casing, an operating part with which the saw comes in contact, a rod rigidly secured to said operating part, by which the same may be turned in its casing, and a hollow screw-threaded rod surrounding the first rod loosely and passing through a screw-threaded bearing, whereby said operating part may be drawn back and forth or revolved, each operation being independent of the other, substantially as set forth.

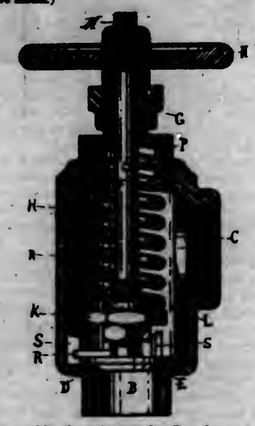
2. The combination, in a saw-jointer, of the tubular casing B, the emery or other operating part C therein, the rod D, rigidly secured to said part C and extending to outside the casing, and the hollow screw-threaded rod E, surrounding said rod D between collars or sleeves thereon, and passing through a screw-threaded bearing on said casing, substantially as set forth.

3. The combination, in a saw-jointer, of the part C, mounted to be rotated and adjusted longitudinally, and the means for accomplishing said rotation and said longitudinal adjustment each independent of the other, substantially as set forth.

4. The combination, with the operating part C of a saw-jointer, of a rod, D, rigidly secured thereto, a screw-threaded hollow rod, E, surrounding said rod D, and sleeves or collars *d* and *d'* on said rod D, between which the hollow screw-threaded rod E is placed and operates, each of said rods D and E being provided with hand-wheels, substantially as set forth.

382,328. HAY-RACK. DE WITT C. ROOT, Eureka, Kans. Filed Jan. 20, 1888. Serial No. 261,894. (No model.)

Claim.—1. A hay-rack comprising a base and extensible frames secured to the sides thereof, substantially as set forth.

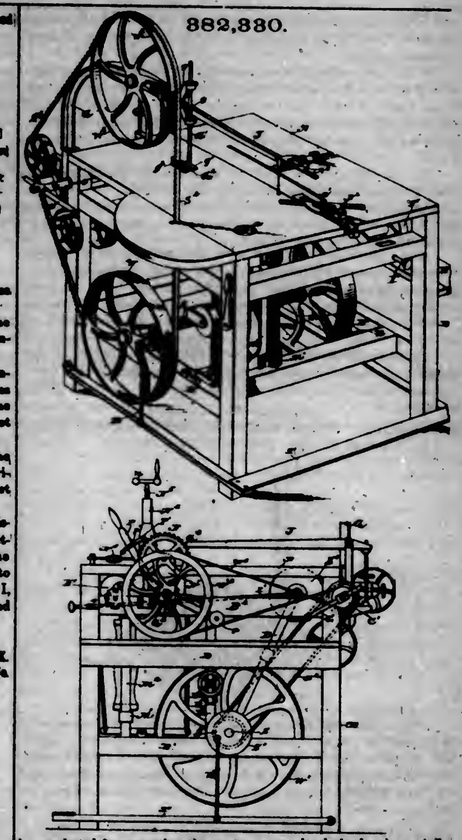


2. A hay-rack comprising a base, extensible frames secured to the sides thereof, and hook-braces secured to the base and adapted to engage the extensible frames when they are raised, as set forth.

3. A hay-rack comprising a base having the keepers R, the extensible side frames secured to the sides of the base, and the hook-braces secured to the base and adapted to engage the frames when the same are raised, and when they are lowered to engage the keepers R, as set forth.

4. A hay-rack comprising a base and the folding frames on the sides thereof, the said frames consisting of a series of vertical and horizontal bars pivoted to each other and to the base, substantially as set forth.

5. The improved hay-rack herein described and shown, comprising the beams A, the transverse beams B, secured thereto and projecting beyond the same, the standards pivoted to the beams A, and the folding side frames, the said frames consisting of the bars I, secured to the projecting ends of the beams B, the bars K, pivoted to the bar I, the bar J, pivoted to the bars K, the bars M, pivoted to the bar J, and the bar N, pivoted to the bars M, substantially as specified.



382,329. COMBINED RELIEF-VALVE AND CYLINDER-COCK. JAMES A. SEYMOUR, Auburn, N. Y. Filed Mar. 21, 1887. Serial No. 231,797. (No model.)

Claim.—The combination of the valve E, valve-seat D, spring H, and valve-stem F, provided with one screw-thread within the body of the valve and another outside thereof, the former having a set-nut, K, upon it, and the latter having a threaded hand-wheel, N, upon it, whereby the valve E may be raised and set at any desired point above its seat, so that it may operate either as a relief-valve or as a cock at will.

382,330. WOOD-WORKING MACHINE. EMILE W. SCHOCKEL, Saxonburg, Pa. Filed June 11, 1887. Serial No. 241,039. (No model.)

Claim.—1. In a wood-working machine, the combination of the hollow sleeve or shaft C, extending transversely across the machine, with the short shafts *c*, adjustably mounted in connection with said sleeve or shaft C, the handles *c'*, adjustably connected to the short shafts *c*, and the sprocket-wheel C' on the sleeve or shaft C, and chain belt C², adapted to be connected to the sprocket-wheel C, and also to the main shaft of the machine, whereby hand or foot power may

be employed for operating the parts, as may be desired, substantially as described.

2. In a wood-working machine, the standards M³, the molder-frame M, and the sectional boxes M', encircling the standards and having the sections connected by screws, whereby, when the screws are tightened, the boxes are brought closer together to produce a clamping effect and clamp the boxes at any point of the standards, as set forth.

3. The combination, with the main shaft S, of the swinging frame I, the circular saw S⁴, mounted in the upper end of said frame above the beam B, as herein set forth, the draw-rod I', connected to the upper part of the frame I, and the clamping device *i*, whereby, when the saw is not in use and is a position of rest, it is thrown back and supported on the top portion of the beam B³, and when drawn into position for use is permanently held by the device *i* clamping the draw-rod I', substantially as described.

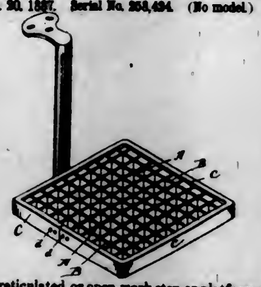
4. The combination of the hinged table D, the folding bracket *d*, said parts being mounted in connection with an independent standard, D', the standard D³, the bolt *d*³, passing through the standard D' and encircling the standard D³, and the clamping-nut D⁴, engaging the bolt *d*³, substantially as described.

5. In combination with the rounder F, having the apertured disk F', the disk B⁴, entirely separate from the rounder, and attached to the frame on the side opposite the rounder and adjusted to correspond with the rounder, as set forth.

6. The combination, with the beam B³, of the disk F, having the apertured disk F', held within a circular recess formed in said disk F, and the disk B⁴, mounted in the beam B³, on the side opposite to the disk F, and having peripheral slots constructed therein of varying sizes, which, when adjusted, are in alignment with the varying-sized apertures in the disk F, substantially as described.

7. In the feed herein described, the combination of the vertical frame N', having the horizontal extension N², the screw-threaded standard N³, by means of which the frame entire is vertically adjust-

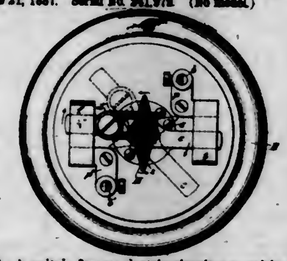
able, and the adjustable link N^4, connected at one end to the horizontal extension N^3 and at the other end to the top of the table A, substantially as described.



8. In combination with the shaft S', the handle or lever P, pivoted at an intermediate point on the said shaft, a pulley, *p*, at one end of the handle or lever, the stud or pin *p'*, carried by the other end of the lever, and the serrated retaining-sector P', pivoted upon the frame of the machine and engaging the pin *p'* of the handle or lever, as set forth.

9. In combination with the main shaft S, the swinging arm I, sleeved thereon, and adapted to swing from one side to the other, and carrying the saw S^4, the draw-rod I', connected to the frame I, to swing the frame from side to side, and the hook-bolt *i*, encircling the draw-rod and clamping the same, as set forth.

10. In combination with the horizontal shaft S^3, receiving motion from the main shaft and carrying the feeding-disk S^4, the supporting-frame for the shaft comprising the vertical portion N^2 and the horizontal portion N^3, the former being vertically adjustable and the latter being also adjustable, so as to raise or lower the feeding-disk, as set forth.



11. In combination with the standard D^4, the standard D', the hinged table carried by the latter, and the clamping-bolt d^3, encircling the standard D^4 and locked to the standard D', by the nut D^5, as set forth.

382,331. STEP OR PLATFORM. FRANK H. STANWOOD, Chicago, Ill. Filed Dec. 20, 1887. Serial No. 258,494. (No model.)

Claim.—The reticulated or open-work step or platform consisting of a support or hanger, a stiff frame secured to the support or hanger, and separate strips of sheet or like thin sharp-edged metal forming the tread and arranged edgewise in and supported by said frame without being welded to or made integral therewith, substantially as set forth.

382,332. SWITCH FOR ELECTRIC CIRCUITS. CLARENCE G. STERLING, Hartford, Conn., assignor to Charles R. Dustin, same place. Filed June 21, 1887. Serial No. 241,978. (No model.)

Claim.—1. A switch for an electric circuit, comprising the following: a spindle having a cut-away portion to form a cam, a circuit-controlling bar loosely swiveled about said spindle, a spring mounted upon said bar at one side of the spindle bearing upon said cam, and circuit-terminals arranged in co-operative proximity to said circuit-controlling bar.

2. A switch for an electric circuit, consisting of a cam, a circuit-controlling bar, a spring mounted upon said bar to one side of its pivot, bearing upon said cam and actuating said bar when the cam is operated, and circuit-terminals arranged in co-operative proximity to the aforesaid bar.

3. The combination, in an electrical switch, of a spindle having a cut-away portion constituting a cam with a handle upon its outer end, a circuit-controlling bar loosely swiveled about said spindle, a bifurcated spring secured to the latter to one side of its pivot and bearing upon the cam portion of the spindle, and circuit-terminals arranged in co-operative proximity to said circuit-controlling bar.

4. The combination, in an electrical switch, of a spindle having a cut-away portion constituting a cam with a handle upon its outer end, a circuit-controlling bar loosely swiveled about said spindle, a bifurcated spring secured to the latter to one side of its pivot and bearing upon the cam portion of the spindle, circuit-terminals arranged in co-operative proximity to said circuit-controlling bar, and a base upon which the above is mounted having a plate for journaling the spindle carrying limiting-stops for the bar.

5. A switch for an electric circuit, comprising the following: a spindle having a cut-away portion to form a cam, a circuit-controlling bar loosely swiveled about said spindle, a spring mounted upon said bar at one side of the spindle bearing upon said cam, means for journaling said spindle, a pin upon the same co-operating therewith for preventing it from being turned backward, and circuit-terminals arranged in co-operative proximity to said circuit-controlling bar.

6. The combination, in an electrical switch, of a spindle having a cut-away portion constituting a cam with a handle upon its outer end, a circuit-controlling bar loosely swiveled about said spindle, a bifurcated spring secured to the latter to one side of its pivot and bearing upon the cam portion of the spindle, circuit-terminals arranged in co-operative proximity to said circuit-controlling bar, and a base upon which the above is mounted having a plate for journaling the spindle carrying limiting-stops for the bar, and a pin upon said spindle taking into a slot in said plate for preventing the spindle from being turned backward.

7. The combination of the base B, a spindle, E, swiveled in a plate set in said base, a pin, *a*, upon the spindle E, taking into a slot in said plate for limiting the play of the spindle, a circuit-controlling bar, *c*, loosely swung about the spindle, a bifurcated spring, S, fast thereto, a cam portion, A, of said spindle, upon which the latter bears, a handle, H, upon the outer end of the spindle for manual operation, circuit-terminals *t t'*, limiting-stops *s s*, and a casing, C.

382,333. SWITCH FOR ELECTRIC CIRCUITS. CLARENCE G. STERLING, Hartford, Conn., assignor to Charles R. Dustin, same place. Filed June 21, 1887. Serial No. 241,980. (No model.)

Claim.—1. A switch for electric circuits embodying, essentially, a movable elastic spring, an operating device fast to one end of said spring, a vibratory lock for holding it at the other end in either of two positions, a circuit-governor controlled by said spring, and electric terminals in the path of said circuit-governor.

2. A switch for electric circuits, consisting of a movable elastic spring, a circuit-controller governed thereby, electric terminals in the path of the latter, a vibratory lock for holding said spring in either of two positions to keep the circuit-controller between said terminals or away from the same, and an operating device secured to and supporting the other end of said spring.

3. The combination, in a switch for electric circuits, of an elastic spring having a slot in it, an operating device attached to one end thereof having means for actuating it, a device for holding the other end near the slot in either of two positions, a circuit-governor controlled by the spring, two electric terminals arranged adjacent thereto, all arranged and combined, whereby the holding device will pass through the slot and liberate the spring when the operating device is actuated and control the circuit, as set forth.

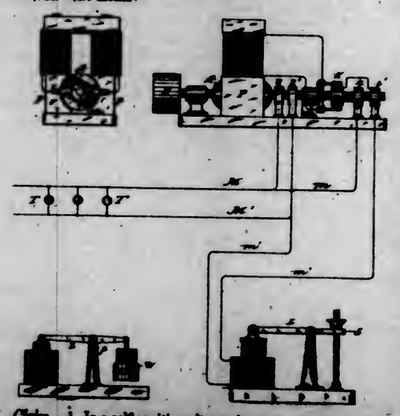
4. The combination, in an electric switch, of an elastic spring, as E, a movable device, as F, for holding the same at one end, an operating device attached to the other end, a circuit-governor, as *d*, controlled by the spring, and two electric terminals, as *t t'*, arranged adjacent to the latter.

5. The combination, in an electric switch, of an elastic spring, as E, having a slot in it, a device, as F, for holding it at one end near the slot, an operating device, as B, attached to the other end, a circuit-governor, as *d*, carried by the spring, and two electric terminals, as *t t'*, arranged adjacent to the latter.

6. The combination, in an electric switch, of an elastic spring, as E, having a slot in it, a spring, as F, fastened at its center for holding it at one end near the slot, a double crank, as B, attached to the other end for operating the same, a circuit-governor, as *d*, carried by the spring E, and two electric terminals, as *t t'*, arranged adjacent thereto.

7. The combination, in an electric switch, of an elastic spring, as E, having a slot in it, a spring, as F, fastened at its center for holding it at one end near the slot, a double crank, as B, attached to the other end for operating the same, having a handle, D, upon the outer end thereof for manual operation, stops, as *s s'*, for limiting the play of said crank, a circuit-governor, as *d*, carried by the spring E, and two electric terminals, as *t t'*, arranged adjacent thereto.

382,334. ADJUSTABLE PACKING FOR STUFFING-BOXES. PETER THOMSEN, HILMI H. HANSEN, and WILLIAM B. HANSEN, Chicago, Ill., assignors, by direct and mesne assignments, to A. C. Calkins, trustee, same place. Filed Dec. 17, 1887. Serial No. 258,376. (No model.)



Claim.—1. The combination, with the stuffing-box and its packing, and with the rod or stem extending through said box, of the inner and outer segmental sleeves intermediate said rod and packing, each sleeve consisting of separate sections having upright conical conforming taper at the meeting surfaces of the sleeves, substantially as described.

2. The combination, with the stuffing-box and its packing, and with the rod or stem extending through said box, of the inner and outer segmental sleeves intermediate said rod and packing, each sleeve consisting of separate sections having upright conical conforming taper at the meeting surfaces of the sleeves, the outer sleeve-sections being provided with internal shoulders to rest the segments of the inner sleeve, substantially as described.

3. The combination, with the stuffing-box A', of an adjustable packing, comprising an inner sleeve formed of separate segments or sections and an outer sleeve formed of separate segments or sections arranged to break joint with the segments of the inner sleeve, and having exteriorly-tapering surfaces and suitable packing between the wall of the stuffing-box A' and the surfaces of the outer sleeve, substantially as described.

4. The combination, with the stuffing-box A', of the adjustable packing, comprising an inner sleeve formed of separate segments D, an outer sleeve formed of separate segments E, the diameter of said outer sleeve being less than the interior diameter of the stuffing-box, a series of packing-rings, F, placed in the space between the outer sleeve and the stuffing-box, and a packing-ring, F', placed around the piston at the outer ends of the segments D and E, substantially as described.

382,335. ALTERNATING-CURRENT DYNAMO-ELECTRIC MACHINE. ELIHU THOMSON, Lynn, Mass., assignor to the Thomson-Houston Electric Company, of Connecticut. Filed Dec. 27, 1886. Serial No. 222,562. (No model.)

Claim.—1. In a self-exciting alternating-current generator, a commutator for rectifying the current taken from the machine to the exciting coil or circuit, in combination with a reactive coil in the connection to the commutator, as and for the purpose described.

2. The combination, with the armature supplying alternating currents to mains, of a field-exciting coil or circuit connected with a branch, a commutator in said branch, and a reactive coil between the commutator and the mains.

3. The combination, with the main carrying alternating currents, of a branch, a commutator for rectifying the currents in the branch, and a reactive coil between the commutator and mains, as and for the purpose described.

4. The combination, with the branch supplied with current from a main carrying alternating currents or their equivalent, as described, of a commutator in the branch, and a reactive coil provided with means for adjusting its self-induction or reaction, as and for the purpose described.

5. The combination, with the reactive coil and core on an alternating or other vibratory current circuit, of a counterbalancing-retractor, whereby the immersion of the core in the coils may be stationary with a normal flow of current, and may be increased on an increase of current, so as to automatically adjust the reaction to the strength of the alternations or vibrations, as and for the purpose described.

6. The combination, with the alternating-current main, of the branch containing a commutator, a reactive coil in said branch between the main and commutator, and a main-circuit coil combined with the reactive coil in inductive relation thereto, as and for the purpose described.

7. The combination, with a reactive coil in the alternating-current branch, of a compensating coil in a circuit from which the branch is derived, as and for the purpose described.

8. The combination, with an alternating current dynamo having a field-coil in a branch or derived circuit, of a self-inductive coil in said branch, whereby a field-coil of comparatively low resistance may be employed.

9. The combination, with a commutator connected with a source of alternating currents or their equivalent, as described, of a reactive coil in the commutator-connection, as and for the purpose described.

10. The combination, with an alternating-current dynamo whose field is sustained by the action of current on a branch, of a commutator for rectifying the currents that are used to excite the field, and a compound reactive coil, part of the winding of which is traversed by the branch current and a part by the main current.

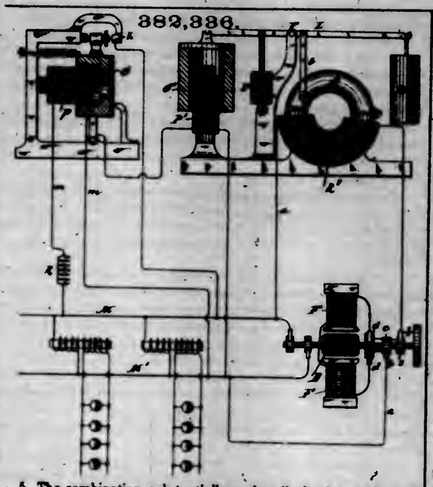
11. The combination of the field-circuit of a dynamo-machine and a commutator for said field-circuit, with a reactive coil in an alternating-current circuit to said commutator and a source of alternating current, the rapidity of the alternations in which is dependent on the speed of the dynamo, increasing and decreasing with such speed, for the purpose of automatically varying the current in the field-circuit to compensate for differences of potential developed at different speeds by regulating the strength of the field magnetism.

12. The combination, with a dynamo-machine, of an alternating-current source delivering alternating currents whose rapidity varies with the speed of the machine, and a reactive coil in the connection between said source and the wires or connections which deliver field-exciting energy to the machine, as and for the purpose described.

13. A compound or differential reactive coil placed on an alternating-current circuit and having one portion, G, wound and adjusted, as described, so as to tend to overcome the effect of the self-induction in the other or active portion.

14. In an alternating-current dynamo, a field-sustaining branch from the main containing a reactive coil, in combination with a compensating main-circuit coil, as and for the purpose described.

382,336. ALTERNATING-CURRENT REGULATOR. ELIHU THOMSON, Lynn, Mass. Filed Mar. 30, 1887. Serial No. 232,941. (No model.)



Claim.—1. The combination, with a reactive coil having means whereby the closure of its magnetic circuit may be varied, of a controlling mechanism responsive to variations in the strength of an alternating current.

2. The combination, with a reactive coil placed in an alternating-current circuit, of an adjustable armature, and a controlling device consisting of a coil in which alternating currents flow, and a closed circuit-conductor in which induced currents of high self-induction are set up by the alternating currents, as and for the purpose described.

3. The combination with a device in which a repulsive action is set up by the operation of alternating currents, as described, of a motor mechanism controlled thereby, and a reactive coil having means operated by said motor mechanism whereby its magnetic circuit may be variably closed.

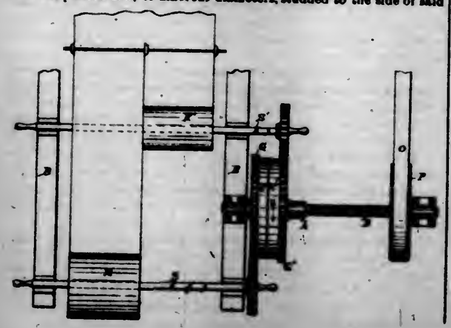
4. The combination, with an alternating-current dynamo, of an adjustable reactive coil in an alternating-current circuit, and controlling devices for governing the counter electro-motive force of the reactive coil, said controlling devices being connected with and responsive to variations of electrical condition in the alternating circuit supplied from the dynamo.

382,336.

5. The combination, substantially as described, of a reactive coil in an alternating-current circuit, a movable armature, and an actuating device consisting of a coil having connections to an alternating-current source, and a conductor in which currents of high self-induction are set up to produce the repulsive action, as described, that shall operate upon the movable armature.

6. The combination, with an alternating-current dynamo, of a field-coil connected to the armature of said dynamo, a reactive coil in the connection to the field-coil having means whereby its counter electro-motive force may be governed, a motor mechanism for operating the adjusting device, and a controller electro-magnet, P, connected to the alternating-current circuit of the dynamo.

7. The combination, with an alternating-current dynamo, of a field-magnet coil connected to the armature, a commutator in said connection, a reactive coil having an adjustable armature for varying the counter electro-motive force in said connection, and a motor-magnet and controller-magnet connected to the alternating-current main and governing the connection of said motor-magnet with said main.



8. The combination, with an alternating-current branch or circuit, *a*, of a reactive coil having means whereby its counter electro-motive force may be adjusted, a motor mechanism for effecting an adjustment, and a controlling device in which a variable repulsive effect is set up by the action of alternating currents derived from the source supplying the circuit of branch *a*.

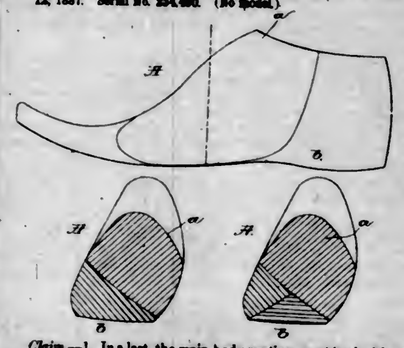
9. The combination, with a reactive coil in an alternating circuit or branch, of means for varying the magnetic closure of the magnetic circuit or core on which said coil is wound.

10. The combination, with a circuit or portion of circuit, *m*, and a magnet-coil in said circuit, of an artificial resistance whose amount is large compared with that of the coil, and which is of proper character, as described, to have an approximately constant resistance, as described, while the resistance of the coil varies.

382,337. COMPENSATING GEAR. THOMAS TUCKER, Marseilles, Ill. Filed Jan. 16, 1888. Serial No. 260,951. (No model.)

Claim.—1. The combination of shaft D, weighted disk L, secured theron, pinions E J, of different diameters, studded to the side of said

382,337.



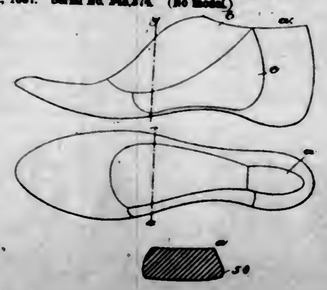
disk on the opposite side from its weight, gear G, sleeved loosely on said shaft and having the gear F secured on its inwardly-extending hub V, and gear G', having the internal gear, A, substantially as and for the purpose set forth.

2. The combination of gear-wheel G, having the gear-wheel F and flange C, gear-wheel G', having the flange C, and internal gear, A, shaft D, having said gears G G' sleeved loosely thereon, disk L, secured on said shaft between said gears G G', and the idler-pinions E J, studded to the side of said disk and connecting said gears G G', substantially as and for the purpose set forth.

3. In the compensating gear shown and described, the combination of gear-wheel G, having the gear F on its interior hub, the gear G', having the internal gear, A, and idler-pinions E J, connecting said gears G G', the gear F and idler-pinion E, with which it meshes, being relatively of the same proportional diameter as the idler-pinion J and internal gear, A, with which it meshes, substantially as and for the purpose set forth.

4. In a compensating gear, in combination with a shaft, a pair of equal spur-gears loosely sleeved thereon, a spur-gear of less diameter on one of said equal gears, an internal gear within the rim or flange of its fellow equal gear, a disk secured on said shaft between said equal gears, and a pair of connected idler-pinions studded to said disk and arranged to connect the interior gears of said equal gears in the manner substantially as and for the purpose specified.

382,338. LAST. J. STANLEY TURNER, Rockland, Mass. Filed Apr. 12, 1887. Serial No. 234,690. (No model.)

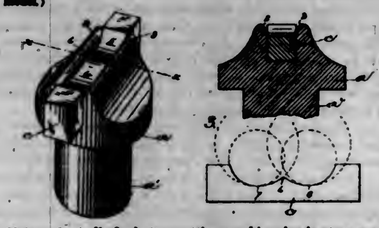


Claim.—1. In a last, the main body portion, combined with a last-block cut from the main body portion upon the inner or long-shank side thereof, substantially as and for the purposes specified.

2. In a last, the main body portion, combined with a last-block cut from the side of the main body portion on a line at an angle with relation to the plane of the bottom of the last, the said dividing-line upon the long-shank side of the last substantially coinciding with the bottom of the last, as set forth.

3. A last having a displaceable portion at its long-shank side, to operate as and for the purposes set forth.

382,339. LAST. J. STANLEY TURNER, Rockland, Mass. Filed Aug. 31, 1887. Serial No. 248,274. (No model.)

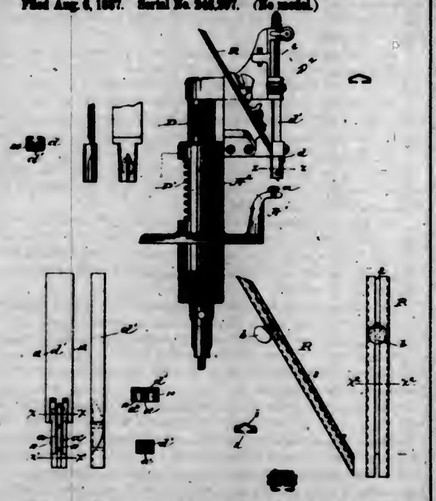


Claim.—1. In a last, the main body or sole portion *a* and the block *b*, as described, combined with the auxiliary portion *c*, substantially as and for the purposes specified.

2. In a last, the main body *a* and the block, combined with the auxiliary portion cut from the long-shank side of the main body beneath the block and attached to a component part of the last, substantially as described.

3. A last having the material or portion removed at the instep portion mainly upon the long-shank side, and also having an additional portion removed upon the long-shank side to present the space 50, substantially as described.

382,340. DIE FOR BUTTON-SETTING MACHINES. JOHN H. VINTON, Boston, Mass., assignor to the Pearmaker Novelty Company, Grand Rapids, Mich. Filed Dec. 21, 1886. Serial No. 222,166. (No model.)



Claim.—1. A die for button-setting machines having two concave clinching-concavities in line with each other, the bottom of each concavity presenting a smooth clinching-surface formed by the union or conjoining of the arcs of two circles of different diameters, leaving a defined edge, as 6, between the two concavities to operate, all substantially as described.

2. The anvil-block *a*, slotted diametrically and having the beveled edges 2 3, combined with a die cut away upon its upper side to form two concaved clinching-surfaces, substantially as described.

3. The anvil-block *a*, slotted diametrically, combined with the die cut away upon its upper side to present two concaved clinching-surfaces, the side walls of the slot in the anvil-block and the curved clinching-surface taken together forming concavities with parallel sides, substantially as described.

382,341. BUTTON-SETTING MACHINE. JOHN H. VINTON, Boston, Mass., assignor to the Pearmaker Novelty Company, Grand Rapids, Mich. Filed Aug. 6, 1887. Serial No. 246,297. (No model.)

Claim.—1. In a button-setting machine, the herein-described one-piece sheet-metal raceway or guide slotted at one side at 2, and bulged outwardly at its other side opposite the said slot, substantially as described.

2. The herein-described one-piece sheet-metal raceway or guide slotted at its under side, as at 2, and outwardly bulged at its other side for the reception and passage of the eye of the button, and provided at each side the said slot and bulge with a narrow space to receive, embrace, and guide the legs of the staple, compelling it to travel in a substantially direct course through the raceway and preventing it from tipping up in said raceway or guide, thereby obviating the entrance of the crown of the staple on which the button hangs into the slot 2, substantially as described.

3. The herein-described sheet-metal raceway or guide slotted at its under side and bulged outwardly at its upper side, opposite and to cover the said slot 2, the inner side walls of the said raceway or guide being separated for a distance sufficient to just receive them and act as guides for the outer sides of the legs of the staples, substantially as described.

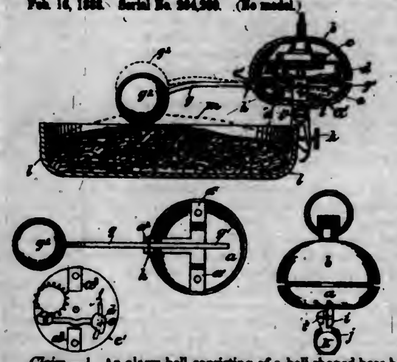
4. In a button-setting machine, the herein-described sheet-metal raceway or guide, slotted at one side at 2, and bulged outwardly at its other side opposite the said slot, combined with a staple-carrier to receive the staples from said raceway, substantially as described.

5. In a button-setting machine, the herein-described sheet-metal raceway or guide, slotted at its under side at 2 to permit the button to be suspended by the staple-fastening therein below the said raceway, and bulged outwardly at its other side opposite the said slot, combined with a carrier-guide grooved to form a saddle, the said saddle being also grooved longitudinally, substantially as described.

6. In a button-setting machine, the herein-described sheet-metal raceway or guide, slotted longitudinally at one side, as at 2, and bulged outwardly at its other side opposite the said slot, combined with a shank or bar and staple-carrier having grooves 10 for the reception of the points of the staple after leaving the raceway or guide, substantially as described.

7. In a button-setting machine, the herein-described sheet-metal raceway or guide, slotted longitudinally at its under side, as at 2, and bulged outwardly at its other side opposite the said slot, and the shank or bar *d'* and staple-carrier, combined with an anvil and driver, to operate all substantially as described.

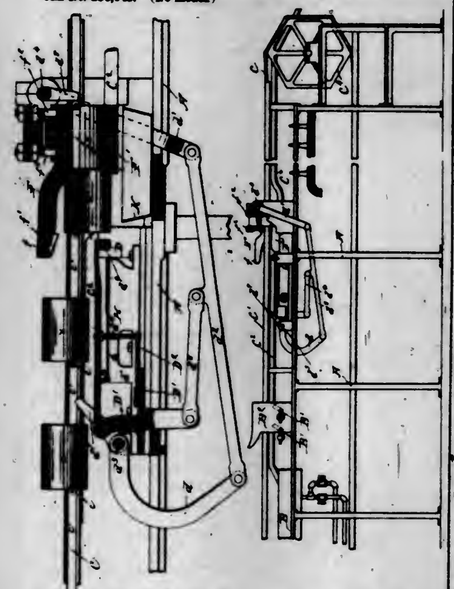
382,342. BUTTON-FASTENER. CYRUS H. VERMILYE, Orange, assignor to Egbert Ahlers and George D. Paul, both of Newark, N. J. Filed Jan. 14, 1888. Serial No. 260,790. (No model.)



Claim.—1. The button-fastener herein described, having a flat disk perforated centrally and provided with an elastic spring-bow wing having an ovate slot that intersects with its converging end the central orifice of the disk, substantially as set forth.

2. In the button-fastener herein described, the combination, with a centrally-perforated disk, of an ovate bow-spring provided with an ovate perforation leading into the central perforation of the disk and adapted to have a spring engagement with a grooved button-shank, substantially as set forth.

3. In a button-fastener, the combination, with a centrally-perforated disk, of an integral bow-spring provided with an ovate perforation opening into the central perforation of the disk, and a slot communicating with said central perforation, substantially as set forth.



382,343. ALARM-BELL. ROBERT J. WHITSON, Chicago, Ill. Filed Feb. 16, 1888. Serial No. 264,269. (No model.)

Claim.—1. An alarm-bell consisting of a bell-shaped base having an exterior supporting-leg, *i*, and marginal fulcrum *h*, provided with a lever, *c*, having arm *f'* at one end and float *g'* at other end of said lever, and internal bearings, *d'*, on said base, in combination with an alarm-bell mechanism mounted on said internal bearings, *d'*, actuating a hammer provided with a pin extending below its base-plate *c* and engaging with the arm *f'*, said base-plate having lugs *c'* secured to said bearing *d'*, substantially as specified.

2. An alarm-bell consisting of a bell-shaped base having an exterior lug, *i*, holding a clamp, *j*, and a marginal fulcrum, *h*, carrying a lever, *g*, having at one end an arm, *g'*, and at the other end a float, g^2, and internal bearings, *a'*, in combination with an alarm-bell mechanism mounted on said internal lugs, actuating a hammer provided with a pin extending below the base-plate of the alarm mechanism and engaging with the arm *g'*, said base-plate having lugs a^2 secured to said internal bearings, *a'*, substantially as specified.

382,844. MACHINE FOR SOLDERING SIDE SEAMS OF CANS. ALFRED B. WILLCOX and EDWIN HORTON, Maywood, assignors to said Horton, and Oliver W. Horton, Chicago, Ill. Filed Dec. 27, 1887. Serial No. 258,943. (No model.)

Claim.—1. The combination, in a soldering-machine, of a continuously-moving can-carrier with a reciprocating inside wiper for wiping the inside of the seam while the can is being moved in the carrier, substantially as specified.

2. The combination, in a soldering-machine, of a continuously-moving can-carrier with a reciprocating wiper and a clamp device for holding the can to resist the action of the wiper, substantially as specified.

3. The combination of a can-carrier having receptacles to receive the can longitudinally of the direction of movement of the carrier, means for deflecting or inclining the path of the can as it is carried by said carrier, and an inside reciprocating wiper adapted to enter the can, substantially as specified.

4. In a soldering-machine, the combination, with a solder bath, of a can-carrier chain, a track for said carrier, a guideway or track for the can, having a deflected portion, and an inside reciprocating wiper entering the can at the deflected portion thereof, substantially as specified.

5. In a soldering-machine, the combination, with a solder bath, of a continuously-moving can-carrier chain, a track for said carrier, a guideway or track for the can, having a deflected portion, and an inside reciprocating wiper entering the can at the deflected portion thereof, and mechanism for giving the wiper a quicker motion than that of the can-carrier, substantially as specified.

6. In a soldering-machine, the combination, with a solder bath, of a continuously-moving can-carrier chain, a track for said carrier, a guideway or track for the can, having a deflected portion, and an inside reciprocating wiper entering the can at the deflected portion thereof, and mechanism for giving the wiper a quicker motion than that of the can-carrier, said motion-giving mechanism consisting in a pair of levers operated by the can-carrier and connected with said wiper, substantially as specified.

7. The combination, in a soldering-machine, of a can-carrier, a movable wiper, a lever projecting in the path of the carrier and connected with said wiper, whereby the wiper is moved bodily along and in contact with the seam of the can to be wiped by the movement of the carrier, substantially as specified.

8. The combination, in a soldering-machine, of a can-carrier, a movable wiper, a pair of operating-levers projecting in the path of said carrier, a pivotal link connecting said levers, a cross-head and a link connecting said cross-head and pivotal link, substantially as specified.

9. The combination, in a soldering-machine, of a can-carrier, a pivoted and reciprocating wiper, D, and a cam or track for guiding the free or wiping end of said wiper, substantially as specified.

10. The combination, in a soldering-machine, of a can-carrier, a pivoted and reciprocating wiper, D, and a cam or track for guiding the free or wiping end of said wiper, said carrier or track having a raised portion to lift the wiper from the seam as the wiper moves in one direction and a lower portion to guide the wiper against the seam as it moves in the opposite direction, substantially as specified.

11. The combination, in a soldering-machine, of a can-carrier, a pivoted reciprocating wiper, D, and a cam or track for guiding the free or wiping end of said wiper, said cam or track having a raised portion to lift the wiper from the seam as the wiper moves in one direction and a low portion to guide the wiper against the seam as it moves in the opposite direction, said wiper being furnished with a laterally-sliding guide pin or roller, and said cam or track being furnished with an incline at one end for sliding said guide-pin from the high to the low track, substantially as specified.

12. The combination, in a soldering-machine, of a can-carrier, a pivotal reciprocating wiper, D, and a cam or track for guiding the free or wiping end of said wiper, said cam or track having a raised portion to lift the wiper from the seam as the wiper moves in one direction and a low portion to guide the wiper against the seam as it moves in the opposite direction, and a spring to force the wiper against the seam, substantially as specified.

13. The combination, in a soldering-machine, of a continuously-moving can-carrier, a movable wiper, and a pair of wiper-operating levers, having short arms projecting in the path of said carrier and long arms connected with said wiper, whereby the wiper is moved faster than the carrier, substantially as specified.

14. The combination, with a can-carrier chain, of a movable wiper and a pair of wiper-operating levers, both having arms projecting in the path of said carrier-chain near the wiper and relatively near the link of the chain carrying the can being operated upon by the wiper, so that the slack in or wear of the links of the chain will not materially affect the operation of the wiper in its proper order or time, substantially as specified.

15. The combination, with a link-chain can-carrier, of a reciprocating wiper and device for holding or guiding the can to resist the action of the wiper, substantially as specified.

16. The combination, with a can-carrier, of a movable wiper and a stationary can holding or guiding device into or through which the can is carried by the carrier to resist the action of the wiper, substantially as specified.

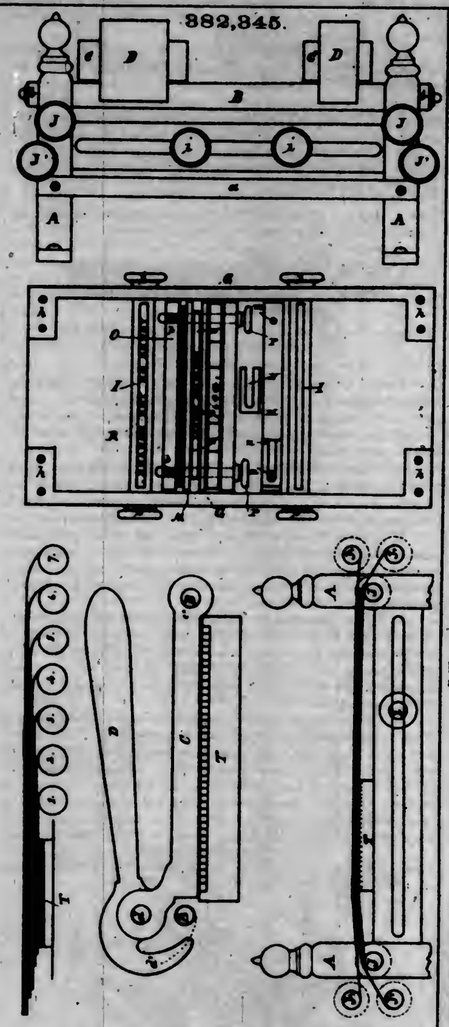
17. The combination, with a continuously-moving can-carrier, of a reciprocating-wiper and a stationary can-holding device through which the can is drawn by the carrier, substantially as specified.

18. The combination, with a link-chain can-carrier, of a reciprocating wiper and a stationary can-holding device having a slot or opening for the can-carrier to pass through, substantially as specified.

19. The combination, with a can-carrier, of an inside reciprocating wiper, means for inclining or deflecting the path of the can carried by said carrier, and a can-holding device to resist the action of the wiper, substantially as specified.

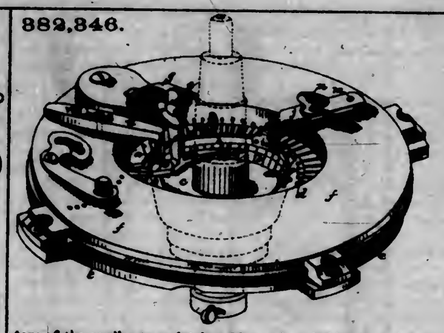
20. The combination, in a soldering-machine, of a track or guideway along which the can is carried, having a deflected portion, with an inside reciprocating wiper entering and reciprocating inside the can while the same is at such deflected portion of said track or guideway, substantially as specified.

21. The combination, in a soldering-machine, of a track or guideway along which the can is carried, having a deflected portion, with an inside reciprocating wiper entering and reciprocating inside the can while the same is at such deflected portion of said track or guideway, and a can holding or guiding hood to resist the action of the wiper, substantially as specified.



22. The combination, in a soldering-machine, of a track or guideway along which the can is carried, having a deflected portion, with an inside reciprocating wiper entering and reciprocating inside the can while the same is at such deflected portion of said track or guideway, a continuously-moving can-carrier, and means for reciprocating said wiper with a faster motion than that of the carrier, substantially as specified.

382,845. PRINTING-PRESS. THOMAS D. WORRALL, Lynn, Mass. Filed Jan. 20, 1887. Serial No. 224,962. (No model.)

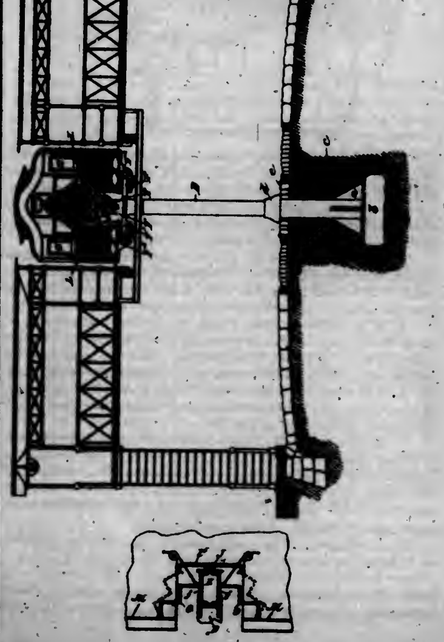


Claim.—1. The combination, with the type-bed, of a platen, pivoted, substantially as described, so as to be capable of lateral as well as vertical movement.

2. The combination, with the type-bed, of a series of independently-pivoted platens.

382,845.

382,846.



tops of the needles to maintain said guard or holder in position, as aforesaid, said shank being provided with holes, as described, a pin in the cam-plate entering one of said holes, and a set-screw passing through the other of said holes, whereby the guard or holder may always be set in proper position, substantially as described.

2. The combination, with the radial needles and their bed and the cam-plate, of the arm *g*, a latch guard or holder, *e*, provided with the slotted shank *p*, thumb-screw *r'*, for adjustably securing said latch-guard and its shank to said arm, yarn-guide *s*, having an angular shank, *t u*, securing-screw *v*, and adjusting-screw *x*, as set forth.

3. The combination, with the radial needles and their bed, the cam-plate, the yarn-guide and its shank, of an adjusting-screw in said shank bearing at its lower end on said cam-plate, and an attaching-screw passing through said shank and into said cam-plate to secure the yarn-guide to said cam-plate, as set forth.

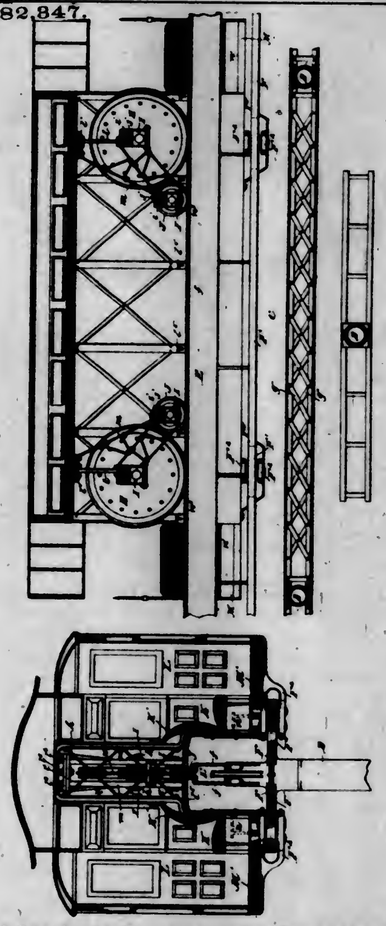
382,847. ELEVATED STREET-RAILWAY SYSTEM. JAMES W. ADAMS, Chicago, Ill. Filed Nov. 30, 1887. Serial No. 256,393. (No model.)

Claim.—1. In a railway-car, the combination of the car-wheel, a pivot-connection between said car-wheel and the body of the car, and a steering-wheel, substantially as described.

3. The combination, with the type-bed, of a series of independently-pivoted and laterally-movable platens.

4. The combination, with the pivoted platen and adjustable bed, of the operating-lever pivoted directly to the platen, and the cross-rod extending the whole length of the press-frame, the lever engaging the rod after the manner of a wedge.

5. In combination with the bed and platen a series of holders furnished with saturated paper or strips, the strips being of different colors, whereby several impressions in one or more colors may be made at once.



6. In combination, the slotted bed-frame and the laterally-adjustable type-holders.

7. The type-holder composed of perforated bars, interposed slotted adjustable and interchangeable strips corresponding to the thickness of the type, and the clamping or locking-up screws.

382,848. KNITTING-MACHINE. ERMAN G. YOUNG, Washington, D. C. Filed Mar. 21, 1887. Serial No. 231,893. (No model.)

Claim.—1. The combination, with the cam-plate, the cylinder and cylinder-needles, and means for operating them, of a latch guard or holder consisting of a curved finger extending around in close proximity to the latch-point of the needles being raised and lowered, said guard or holder being provided with a shank extending out over the

382,347.

2. In an elevated-railway system, a single-rail track and parallel guide-rails below said track, in combination with a car supported on said single track by a car-wheel, between which and the car there is a pivot-connection, a steering-wheel, a rigid connection between said wheel and the car-wheel support, and horizontal guide-wheels bearing against the parallel tracks, substantially as described.

3. In an elevated-railway system, a single-rail track having at stations steps secured thereto, in combination with a car the floor of which is in a plane below said track, said car being provided with steps providing access to said track, substantially as described.

4. In an elevated-railway system, a single-rail track having secured thereto steps in differing planes, in combination with a car the floor of which is in a plane below said track, said car being provided with steps providing access to said track, substantially as described.

5. In an elevated-railway system, the main and single rail track, in combination with a bridge-section track forming an incline in said main track, substantially as described.

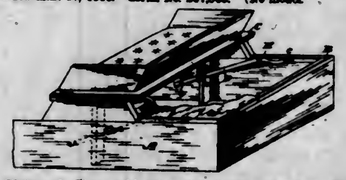
6. An elevated-railway system consisting of a track way composed of a single-rail track and two parallel rails on each side of and in a plane below the same, mounted upon posts above the streetway, and cars guided by wheels horizontally engaging said parallel rails and supported by car-wheels swiveled to said cars and directed by steering-wheels, substantially as shown and described.

7. An elevated-railway system consisting of a track way composed of a single-rail track and two parallel rails on each side of and in a plane below the same, mounted upon posts above the streetway, said track way and posts being without trussing, cars guided by wheels horizontally engaging said parallel rails and supported by car-wheels swiveled to said cars and directed by steering-wheels, substantially as shown and described.

8. In an elevated-railway system, a track way composed of a single-rail track, two parallel rails on each side of and in a plane below the same, posts supporting said track way above the streetway, said track-way and posts being without trussing, cars provided with guide-wheels engaging said parallel rails and supported by swiveled wheels directed by steering-wheels, opposing stations on each side of said track way having platforms on a plane below the supporting track-rail, and revolving switches at the intersection of cross-tracks, all substantially as shown and described.

382,348. BEAM-CALIPERS. CHARLES E. BILLINGS, Hartford, Conn. Filed Mar. 6, 1888. Serial No. 266,235. (No model.)

Claim.—1. In a caliper-square, a beam consisting of two longitudinally-grooved parallel rods and a graduated plate having one edge let into the groove of one of said rods and having an opposite edge let into the groove of the other of said rods, substantially as and for the purpose specified.



2. A beam consisting of two parallel grooved rods and an intermediate graduated plate which is let into the grooves of said rods, in combination with a sliding jaw having two parallel perforations, which are connected by a slot, substantially as and for the purpose specified.

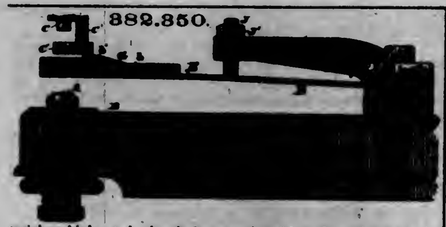
3. A beam consisting of two parallel rods and an intermediate plate having two opposite edges let into said rods, in combination with a stationary jaw upon said beam and a split sliding jaw having a perforation for each of said rods and having a slot for said plate, substantially as and for the purpose specified.

4. A beam consisting of two parallel grooved rods and an intermediate plate whose edges are held in the grooves of said rods, in combination with a stationary jaw and with a split sliding jaw and a split adjusting-slide, which are severally provided with clamping-screws and with a connecting-screw adjustment, substantially as and for the purpose specified.

5. A beam consisting of two parallel rods and a graduated plate whose opposite edges are let into said rods, respectively, a stationary jaw, which is secured to said beam, an adjustable jaw, which is split and provided with a clamping-screw, and is perforated, slotted, and adapted to slide upon said rods, and a split adjusting-slide, which is similarly perforated, slotted, and provided with a clamping-screw, in combination with a connecting-screw, and a spring and nut, which work upon said screw, substantially as and for the purpose specified.

382,349. BUGGY-BOOT. PHILIP BURKE, New Philadelphia, Ohio. Filed Mar. 17, 1888. Serial No. 267,563. (No model.)

Claim.—1. The combination of the body A, the frame B, provided with the pivoted bars D, the springs E, and means for automatically locking the frame B either up or down, substantially as and for the purpose specified.

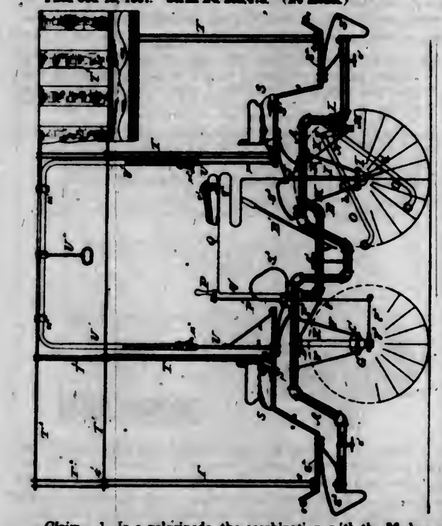


2. The frame B, provided with the bars D and spring-plates *c*, the springs E, and means for automatically locking the frame B either up or down, substantially as and for the purpose specified.

3. The combination of the hinged frame B, the bars D, provided with the lips or extensions *d*, the notches *e* and *f*, and the staples or hooks *b*, substantially as and for the purpose set forth.

382,350. RIVET-SETTING MACHINE. WILLIAM C. BRAY, Newton, Mass. Filed Dec. 12, 1887. Serial No. 258,258. (No model.)

Claim.—1. In a machine for uniting two articles or pieces of material by rivets, the combination herein described, with a fixed anvil for supporting one of the articles or pieces of material and upsetting a rivet when driven, and a vertically-reciprocating setting-plunger for driving the rivet, of a spring-arm, one end of which is firmly secured to the frame of the machine, while its other or free end is provided with a suitable receptacle for holding the other article or piece of material, and is located, when in its normal position, above the upper surface of said anvil, and constructed and arranged to be depressed by the downward movement of the setting-plunger, to bring the article or piece of material supported thereby into contact with the material to which it is to be secured by the rivet when upset upon said fixed anvil.



382,350.

2. In a machine for uniting two articles or pieces of material by rivets, the combination herein described, with a fixed anvil for supporting one of the articles or pieces of material, a vertically-reciprocating rivet-setting plunger, and a rivet-holding device, of a spring-arm, one end of which is secured to the frame of the machine, while its other or free end is provided with a suitable receptacle for holding the other article or piece of material, and is located, when in its normal position, between said rivet-holding device and the upper surface of the anvil, and constructed and arranged to be depressed to bring the article or piece of material supported thereby into contact with the material to which it is to be secured.

3. In a machine for uniting two articles or pieces of material by riveting, the combination herein described, with a fixed anvil for supporting one of said articles or pieces of material, and a vertically-reciprocating rivet-setting plunger, of a yielding support, which, in its normal position, is located above the upper surface of said anvil, and which is provided with one or more receptacles of a suitable shape to receive a buckle or clasp and hold it in position while it is being depressed by the setting-plunger to bring it into contact with the material to which it is to be secured.

382,351. VELOCIPEDE. MATTHEW A. CHERRY, Washington, D. C. Filed Oct. 15, 1887. Serial No. 252,473. (No model.)

Claim.—1. In a velocipede, the combination, with the M-shaped tubular frame A, of the bolster C, the cross-bar D, the frame E, the bearings I and rods I', and the cross-bar J, substantially as set forth.

2. In a velocipede, the combination, with the M-shaped tubular frame A, of the seats S, platforms S', foot-rests S², and the springs S³, substantially as set forth.

3. In a velocipede, the combination, with the cranked axle H, of the rod M, the forks N, loosely hung on said rod and provided with two or more perforations, *a*, and the treadles O, pivoted in said forks and having the bearings *c* and pedals *c'*, substantially as set forth.

4. In a velocipede, the combination, with the M-shaped frame A, of the bolster C, cross-bar D, and frame E, the front axle, C, turning on the bolster C, the frame F², the vertical shaft journaled in bearings on said frame and having at its upper end the handles and at its lower end the cross-bar, and the links connecting said cross-bar with the front axle, substantially as set forth.

5. In a velocipede, the combination, with the M-shaped tubular side frame, A, of the frame F², the cross-bar J, and the bar Q, carrying the seat and having a spring portion, *q'*, and downwardly-extending ends passing through slots in frame F² and cross-bar J, and adjustably secured thereto, substantially as set forth.

6. In a velocipede, the seat R, composed of a strip of metal turned upward and over at each end and provided with open heads, the leather saddle *r*, secured to said heads, and the cushion *r'*, secured to said saddle, substantially as set forth.

7. The method of making a velocipede-seat frame, which consists in slitting a portion of each end of a strip of metal, bending the two parts of the slitted portion into a ring and welding the ends together, and then turning each of said ends up and over until the rings lie in a plane parallel with the main portion of the strip and a few inches above the same, substantially as set forth.

8. The combination, with a velocipede, of the uprights T, hinged at their lower ends, the side rods, T', the rafters T², and the ridge-pole T³, substantially as set forth.

9. The combination, with a velocipede, of the crossed uprights T, hinged at the lower end, the side rods, T', the rafters T², and ridge-pole T³, the standards U, and the sliding tubes U', attached to the ridge-pole T³, substantially as set forth.

10. In a velocipede, the combination, with the fork N, treadle O, and crank A, of a spring-pusher, V, pivoted to the treadle, and a rod, W, connecting the middle of the pusher with the fork N, substantially as set forth.

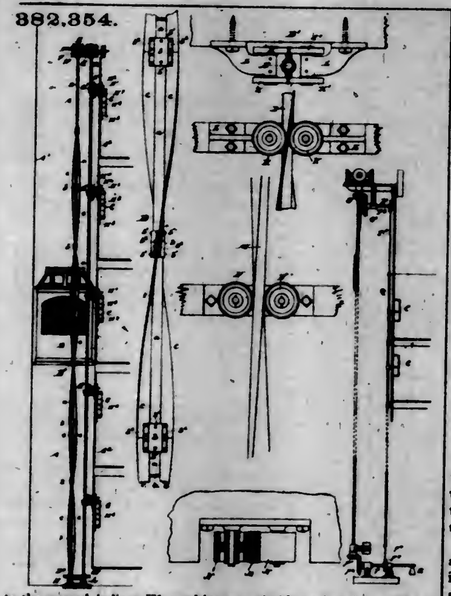
382,352. MANUFACTURE OF SHEET-IRON. ISAAC R. CRANE, Camden, Ohio. Filed Feb. 4, 1888. Serial No. 262,994. (No specimens.)

Claim.—An improvement in the manufacture of polished sheet-iron, consisting in the introduction into the package made up for either heating or heating and hammering of a number of sheets of larger dimensions than the average alternated with the smaller ones.

382,353. WHIFFLETREE-SPRING. EDWARD C. CORBIN, South Evanston, Ill., assignor to the Evans Spring Company, of New York. Filed Oct. 14, 1886. Renewed Oct. 10, 1887. Serial No. 251,980. (No model.)

Claim.—1. In a draft attachment for vehicles, the combination, with the tubular frame secured to the tongue or cross-bar and inclosing the spiral spring, having the compressing-rod extending through its interior, provided with a nut or washer at its rear end adapted to slide within the frame and a clevis on its front end, of the slotted plate extending forward beyond the frame and provided on its under side with the downward-projecting ribs, forming a track or recess for the head of the clevis-bolt, substantially as specified.

2. In a draft-equalizer for vehicles, the combination, with the cross-bar of the shafts, of the tubular frame adapted to inclose the spiral spring and its compressing-rod, having a horizontal and a vertical flange at its front end cast integral therewith, and provided with suitable bolt-openings whereby it may be secured to said cross-bar, substantially as and for the purpose specified.



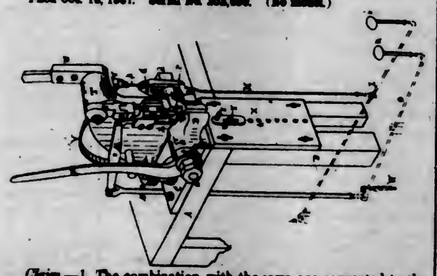
3. In a draft attachment for vehicles, the combination, with the tubular spring-frame having the horizontal and the vertical flanges at its front end, of the spiral spring, the spring-compressing rod having a nut or washer at its rear end and a clevis at its front end, and the slotted front extension-plate adapted to receive the end of the clevis-bolt, substantially as and for the purpose described.

4. In a draft attachment for vehicles, the combination, with the spring-frame having the vertical and the horizontal attaching-flanges at its front end, of the interior spiral spring, the spring-compressing rod having a clevis secured to its front end, and the slotted front extension-plate provided with a recess on its under side for the head of the clevis-bolt, substantially as and for the purpose described.

382,354. ELEVATOR-INDICATOR. HENRY REHRAUER, Mount Vernon, N. Y., assignor to himself, and the Crane Elevator Company of Illinois, Chicago, Ill. Filed Nov. 5, 1887. Serial No. 254,565. (No model.)

Claim.—1. The combination, with an elevator platform or car, B, of a vertical screw-shaft, D, and mechanical connections therefrom

382,354.



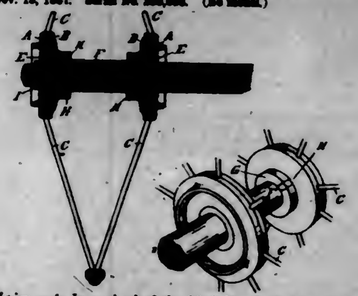
to the several indices H^2, working on suitable scales, the car being fitted with means, as the rollers N N, to act on and turn the screw-shaft and its connections as it ascends and descends, substantially as herein specified.

2. In an elevator-indicator, the upright shaft D, simply guided at the bottom, in combination with anti-friction rollers E, supporting its weight at or near the top, the associated shaft G, gearing G^2 H^2, and with the car B, provided with rollers N N, and indicator-index H^2, arranged for joint operation, as herein specified.

3. In an elevator-indicator, in combination with the car B and rollers N N, carried thereon, the shaft D, made in sections, united by couplings *b b*, and the helical flanges b^2 b^2, the latter being riveted or otherwise secured to the couplings in the required helical positions, substantially as herein specified.

382,355. UPSETTING-MACHINE. PETER GIBSON, Toledo, Ohio. Filed Oct. 18, 1887. Serial No. 252,689. (No model.)

Claim.—1. The combination, with the jaws, one connected to the other by a bolt, as described, and each formed with a boss through which the confining-bolt passes, of a slotted wedge straddling said bolt and operating on one of said jaws, and a lever having a head acting on the other jaw, substantially as and for the purpose specified.



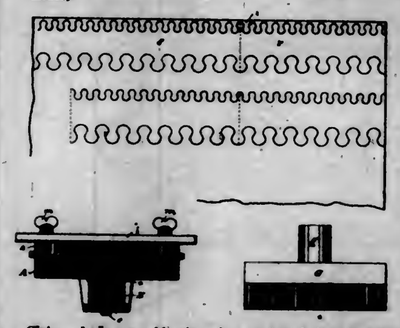
2. The combination, with the jaws, one connected to the other by a bolt, as described, and each formed with a boss through which the confining-bolt passes, and a spring interposed between said jaws, of a slotted wedge straddling said bolt and operating on one of said jaws, and a lever having a head acting on the other jaw, substantially as and for the purpose specified.

3. In a device for the purposes described, the combination, with a clamping device having two movable jaws, a wedge operated by a treadle-lever, and a retracting-spring, of a lever having a wedge-shaped head, substantially as and for the purposes specified.

4. The combination, in a device for the purposes described, with a clamping device having two movable jaws, and a pruner-foot operated by a treadle-lever, of a retracting-spring arranged between said jaws, substantially as and for the purposes specified.

5. The combination, in a device for the purposes described, with a clamping device having two movable jaws, of a plate having a vertical series of holes therein, and a stub-axle in vertical line with the interval between said jaws, substantially as and for the purposes set forth.

382,356. VEHICLE-WHEEL. PETER GIBSON, Toledo, Ohio. Filed Nov. 18, 1887. Serial No. 255,693. (No model.)



Claim.—1. In a wheel of the kind described, the combination, with two pairs of spoke-clamping disks, of notched collars formed upon the inner disk of each pair, and a skein, upon the outer ends of which these pairs of disks are sleeved and provided with lugs engaging into the notches of the collars of the disk, substantially as described.

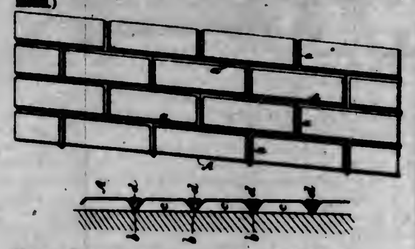
2. The combination of two pairs of spoke-clamping disks, A B, a wheel of the kind described, notched collars G, formed upon the inner disk, and the skein F, upon the outer end of which the disks A B are sleeved, and provided with wedge-shaped lugs H, engaging into the notches of the collars G, substantially as described.

3. The combination of two pairs of spoke-clamping disks, A B, a wheel of the kind described, notched collars G, formed upon the inner disk, the skein F, upon the outer ends of which the disks A B are sleeved, lugs H, formed upon the skein and engaging into the notches of the collars G, one or more ribs, I, formed upon the inner face of the skein, and an axle provided with the corresponding recesses engaging with an inwardly-projecting rib of the skein, substantially as and for the purposes described.

382,357. PUNCH AND DIE. EMIL P. GUSTAFF and DUANE H. GLEASON, Brooklyn, assignors to the E. P. Gleason Manufacturing Company, New York, N. Y. Filed Feb. 6, 1886. Serial No. 260,576. (No model.)

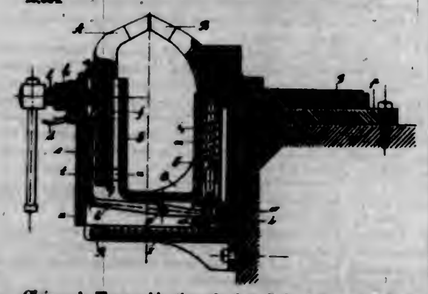
Claim.—1. In a combination of a punch and die adapted to operate conjointly with each other, in which the figure forming the outline of the face of the punch are precisely the same in shape and size as the figure forming the cavity outline of the die-face, a die, the cavity outline of which is formed with cutting-edges on two diametrically-opposite sides, and with depressions from the die-face that render the edges of the other two sides of the die-cavity inoperative as cutting-edges, substantially as described.

2. A piercing and shearing punch having cutting-edges on its two sides which conform to the lines of figures that are precisely of the same size and shape as the spaces that occur between them, and a die-plate adapted to operate conjointly with the same, and which has the portion of its face upon which the cutting-edge is formed raised above the portion of its face which has no cutting-edge, in combination with a gage-bar, as *i*, and suitable means for holding the same in position, substantially in the manner and for the purpose described.



3. The following parts: a punch, as G, a die, as B, each having the characteristics described, bed-plate, as A, and bar, as C, with its guiding-shank *c*, plunger *b*, spring E, and stirrup D, when combined and arranged in the manner and for the purpose set forth.

382,358. PLATE FOR STORAGE-BATTERIES. CHARLES D. P. GIBBS, New York, N. Y. Filed Dec. 30, 1887. Serial No. 259,212. (No model.)

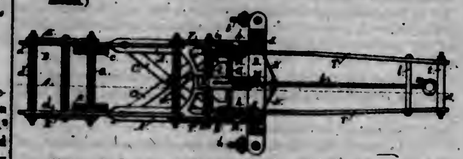


Claim.—The method described of producing plates for storage-batteries by forming them with closed or nearly-closed boxes A' on one face, adapted to be accessible to the acid, and open boxes A^2 opposite thereto, with cavities a between, next depositing a limited quantity of the active material in such cavities, then nearly closing the open boxes, and finally flattening both sets of boxes and compressing and confining the active material between them, while allowing access for the acid thereto, as herein specified.

382,359. FACING FOR WALLS OF BUILDINGS. ALFRED M. HARMS, Pekin, Ill. Filed Feb. 7, 1888. Serial No. 263,373. (No model.)

Claim.—The combination, with a building-wall, B, of the metallic facing A, provided with the transverse grooves *c*, filled with fire-proof material *d*, representing the face view of a brick or stone wall, the said facing having the inward projections *b*, adapted to hold the plane portions of the facing away from the wall to form the air-spaces *c*, substantially as and for the purposes described.

382,360. VISE. CARL J. HERMANN, Bielefeld, Westphalia, Prussia, Germany. Filed Dec. 7, 1886. Serial No. 220,262. (Model.) Patented in Germany Nov. 11, 1886, No. 40,326; in Austria-Hungary Nov. 13, 1886, No. 44,026 and No. 9,611; in France Nov. 20, 1886, No. 180,606; in Belgium Nov. 20, 1886, No. 76,440, and in England Dec. 1, 1886, No. 15,694.

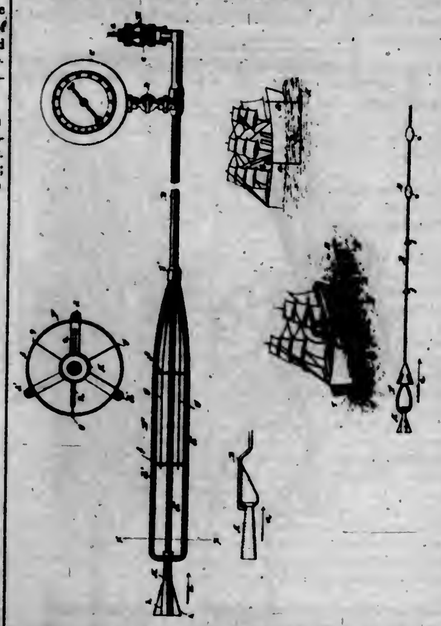


Claim.—1. The combination of a jaw, B, having a socket in the frame thereof and a rack, *s*, in said socket, with an arm, S, having an extension guided in said socket, a tooth in said extension adapted to gear with said rack, lever mechanism for lifting said tooth, and a jaw, A, adjustable in said arm in a direction to and from said jaw B, for the purpose set forth.

2. The combination, of a jaw, B, having a socket in the frame thereof and a rack, *s*, in said socket, with an arm, S, having an extension guided in said socket, a tooth in said extension adapted to gear with said rack, a spring for holding said tooth in engagement, bell-crank lever A, rod *c*, and lever *d*, for raising said tooth, a removable jaw, A, adjustable in said arm S in a direction to and from said jaw B, and screw-spindle *l*, for adjustment of said jaw A, in the manner set forth.

3. The combination of a jaw, B, a base, P, integral therewith, a socket in said base, an arm, S, having an extension movable in said socket, a jaw, A, in said arm, and means for relative adjustment of jaws A and B, with a spindle, O, on said base P, ribs *v* on said base, plate G, ribs *v'* on said plate, spring F, and nut M, for the purpose set forth.

382,361. STOVE-TRUCK. JOHN K. HESS and JOHN G. DELBRUGE, Elizabethtown, Pa. Filed Feb. 16, 1888. Serial No. 264,201. (No model.)



Claim.—1. In a truck, the combination, with the frame, the platform, and the pivotally-connecting posts, the front posts being provided with lips, as specified, of the spring-thills, and a device whereby they may be disconnected from the lips, substantially as and for the purpose specified.

2. In a truck, the combination, with the frame, the platform, and the pivotally-connecting posts, the front posts being provided with lips, as specified, of thills for engaging said lips, and a hook attached to said front posts and engaging with the frame, and a device for simultaneously disengaging the thills and hook from the lips and frame, respectively, substantially as specified.

3. In a truck, the combination, with the frame, the platform, the connecting-posts, the front posts being provided with lips, as specified, the hook for grasping the front of the frame, and spring-thills for engaging said lips, of springs connecting the hook and thills with the rod L, whereby said hook and thills may be simultaneously disengaged from said frame and lips, respectively, substantially as and for the purpose specified.

382,362. SHIP'S LOG. WILLIAM S. HOSS, U. S. Navy. Filed Apr. 14, 1887. Serial No. 235,262. (No model.)

Claim.—1. In a ship's log, the combination of a vacuum-tube, indicator, and relief-valve for clearing the tube of water, substantially as described.

2. In a ship's log, the combination of a vacuum-instrument, a

tube, an indicator, and a relief-valve for clearing the tube of water, substantially as described.

3. In a ship's log, the combination of a vacuum-instrument, a tube, an indicator, throttling device, and a relief-valve for clearing the tube of water, substantially as described.

4. In a ship's log, the combination of a vacuum-tube, indicator, and a relief-valve provided with a stem to be operated by hand for clearing the tube of water, substantially as described.

5. In a ship's log, the combination of a vacuum-instrument consisting of an open-ended tube and a guard supported in front thereof, substantially as described.

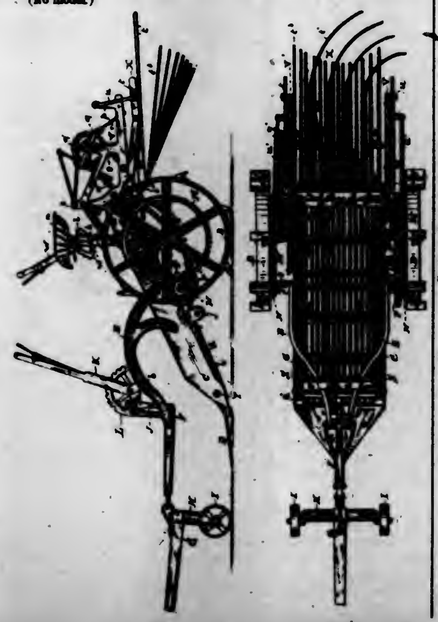
6. In a ship's log, the combination of a vacuum-instrument consisting of an open-ended tube, its tube, and a guard supported in front of said instrument and connected with said tube, substantially as described.

7. In a ship's log, the combination of a vacuum-instrument consisting of an open-ended tube, its tube, and a guard supported in front of said instrument and connected both to the instrument and to the tube, substantially as described.

8. In a ship's log, the combination of a vacuum-instrument and a guard composed of a series of rigid pieces, one of which is a tube communicating with the instrument, substantially as described.

9. In a ship's log, the combination of a vacuum-instrument, its tube, and a guard composed of a series of rigid pieces, one of which is a tube communicating with the instrument, and all connected together at one end with said tube, substantially as described.

10. A vacuum-instrument for a ship's log, consisting of an open-ended tube provided with a conical guard projecting in front of its mouth, substantially as described.



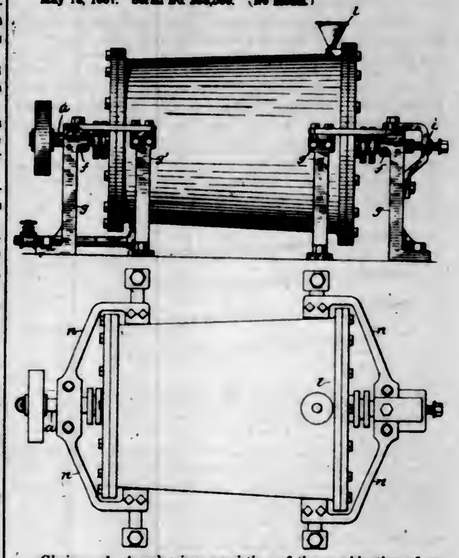
11. A vacuum-instrument for a ship's log, consisting of an open-ended tube provided with a conical guard projecting in front of its mouth and open so as not to interrupt the passage of water thereto, substantially as described.

12. A vacuum-instrument for a ship's log, consisting of an open-ended tube provided with a guard projecting in front thereof and having guard-wires *g*, substantially as described.

13. In a ship's log, the combination of a vacuum-instrument provided with a guard in front of its mouth, its tube, and vanes for keeping the instrument in a horizontal position and bringing it to the surface at low speeds, substantially as described.

14. In a ship's log, the combination of a vacuum-instrument consisting of an open-ended tube provided with a guard, its tube, and vanes for keeping the instrument in a horizontal position, substantially as described.

382,363. COMBINED POTATO DIGGER AND SEPARATOR. ISAAC W. HOOVER, Avery, Ohio. Filed Aug. 29, 1887. Serial No. 248,302. (No model.)



Claim.—1. In a potato digger and separator, the elevator S, consisting of the endless link belts *d*, and angular cross-bars *e*, provided with pins to move in between the spaces of the rack U, underlying said elevator S, substantially as described, and for the purpose set forth.

2. The combination of the arms E, provided with bosses *v*, the lever F, pivotally connected with said bosses, the braces *w*, and the bolt *x*, uniting them with said arms and lever, substantially as shown and set forth.

3. In combination with the potato digger and separator combined, the truck I, lever F, and braces *w*, pivotally attached with the arms E and lever K, substantially as described, and for the purpose specified.

382,364. PULVERIZER. AUGUSTUS JAMESON, Elizabeth, N. J., assignor of one-half to William A. Lottimer, New York, N. Y. Filed May 18, 1887. Serial No. 238,502. (No model.)

Claim.—1. A pulverizer consisting of the combination of an inner perforated rotatable cone, open at one end and closed at the other, an outer concentric fixed cone having a receiving-opening in the upper part of its larger end and an exit-opening in the lower part of its smaller end, and means for regulating the distance between the outer surface of the inner cone and the inner surface of the outer cone, the closed end of the inner cone being its smaller end, substantially as and for the purpose described.

2. In a pulverizer, the combination of a rotatable shaft, an inner cone fixed to said shaft containing openings, the said cone being closed at its smaller end and open at its larger end, an outer cone loose upon and concentric with said shaft, a screw pressing lengthwise upon said shaft, the said shaft being adjustable lengthwise, the said outer cone having a receiving-opening in the upper portion of its larger end and an adjustable exit-opening in the lower part of its smaller end, substantially as and for the purpose described.

382,365. BACK-BAND. HENRY C. JOHNSON, El Dorado, Ark. Filed Feb. 21, 1888. Serial No. 264,712. (No model.)

Claim.—1. A back-band hook having the longitudinal bars 1 and 2, end bars 3, tongues 4, having spaces 8 and 9, arms 5, extending downwardly, uniting in a point, said point turning up into a hook, 6, substantially as shown and described.

2. The combination, with the back-band hook, as described, of the webbing 7, said webbing passing under bar 1; thence outwardly through space 8, over tongues 4, spaces 9, and lower bar, 2; thence upwardly against the inner face of said bar 2; thence outwardly through spaces 9 and over the tongues 4; thence inwardly through

382,366.

spaces 8; then its lower end hangs downwardly against the inner face of said back-band hook below the arms 5 and hook 6, substantially as shown and described.

382,366. GLOVE-FASTENER. ROUTH J. KRAUSSE, Boston, Mass., assignor to the International Fastening Company, Portland, Me. Filed Nov. 26, 1887. Serial No. 256,203. (No model.)

Claim.—1. A flexible button member consisting of a struck-up stud, A, provided with spring-ears *b b* and having a flat unbroken base, in combination with a collet, B, embracing the base, a flanged eyelet, C, and a washer, D, substantially as and for the purposes described.

2. An inflexible button-hole member consisting of a cover, E, secured upon the upper side of the fabric and having a central opening, in combination with a cup, F, secured on the under side of the fabric, provided with an upwardly-projecting tubular portion, *c*, and having an inflexible contracted smooth circular mouth, whereby a flexible button member only may be inserted and held therein, substantially as described.

3. A flexible button member consisting of the spring-eared stud A, the collet B, the eyelet C, and the washer D, having the annular central edge, *f*, substantially as described.

4. In a fastener, an inflexible button-hole member consisting of a cover and a rounded cup, in combination with a flexible button member consisting of a spring-eared stud, an eyelet, a collet, and a washer, substantially as and for the purposes described.

382,367. DESIGNATION-BADGE. RICHARD H. LEE, Altoona, Dak. Filed June 1, 1887. Serial No. 239,967. (No model.)

Claim.—1. In a badge, the combination, with the plate formed with suitable openings, of a layer of fabric covering the face of said plate, and characters provided with tangs adapted to pass through said fabric and the openings in said plate and to be clinched upon the rear face of the plate, substantially as and for the purpose set forth.

2. The combination, with the plate B, having a frame, A, and formed with slots *b*, of the detachable fabric C, covering the face of said plate, and the characters D, provided with tangs *d*, adapted to pass through the fabric and the slots *b* and to be clinched upon the back of the plate, substantially as and for the purpose set forth.

382,368. PROCESS OF REFINING DEXTRINE. CONRAD HENRY MATTHIESSEN and JOSEPH KRIEGER, Chicago, Ill. Filed Nov. 1, 1887. Serial No. 253,905. (No specimens.)

Claim.—The process of refining commercial dextrine herein described, which consists in first causing a watery solution of commercial dextrine to ferment until the sugar originally present has been destroyed, and in then neutralizing the solution and filtering and concentrating it in the ordinary manner.

382,369. METHOD OF PRODUCING UNCOLORED AND COLORED PHOTOGRAPHIC IMPRESSIONS. JOHN J. H. MAYALL, Southwick, County of Sussex, England. Filed July 28, 1887. Serial No. 245,261. (No specimens.) Patented in England Apr. 5, 1887, No. 5,089; in France May 2, 1887, No. 183,445; in Belgium May 10, 1887, No. 77,266; in Denmark May 20, 1887; in Italy July 5, 1887, No. 21,751; in Spain Aug. 1, 1887, No. 7,033, and in Norway Oct. 12, 1887, No. 606.

Claim.—1. The method of producing uncolored photographic impressions, consisting of a bath to first soak the paper in composed of gelatine and lactate of iron; a bath to float the paper on composed of albumen, chloride of sodium, bromide of potassium, glacial acetic acid, and a derivative of silex; a sensitizing-bath composed of nitrate of silver, nitrate of soda, and free ammonia; the means for rendering the film slightly alkaline, consisting of fumigating the paper in an atmosphere of ammonia, and a weak solution of sulphuric acid to soak the print in to expel all traces of the hyposulphite, in about the proportions stated and as described.

2. The method of producing colored photographic impressions, consisting of a bath to first soak the paper in composed of gelatine and lactate of iron; a bath to float the paper on composed of albumen, chloride of sodium, bromide of potassium, glacial acetic acid, a derivative of silex, and coloring-matter previously dissolved in a mixture of alcohol and meconin; a sensitizing-bath composed of nitrate of silver, nitrate of soda, and free ammonia; the means for rendering the films slightly alkaline, consisting of fumigating the paper in an atmosphere of ammonia, a weak solution of sulphuric acid to soak the print in to expel all traces of the hyposulphite, attaching the print in a moist state on a sheet of glass or skeleton frame, face uppermost, and when dry dabbing on coloring-matter previously prepared with phenic acid, silicate of potash, and silicate of potash in alcohol; the means for rendering the paper impervious to moisture, consisting of the application of white wax, paraffine, or camphor to frost and back of the paper; the means for setting the color consisting of an atmosphere charged with a weak alcoholic solution of salicylic acid, derivative of silex, paraffine, or a preparation of fluorine, dissolved in alcohol, sprayed over the pictures, and afterward applying finely-powdered soluble glass, and the means for finishing the picture, consisting of a plate of glass coated with collodion mixed with salicylic acid, and when dry recoated with gelatine and salicylic acid, moistening the print with a mixture of hydrocarbon and salicylic acid, laying the print upon the prepared surface of the glass, face downward, well pressed down, and allowed to dry in a warm atmosphere, all substantially as hereinbefore described.

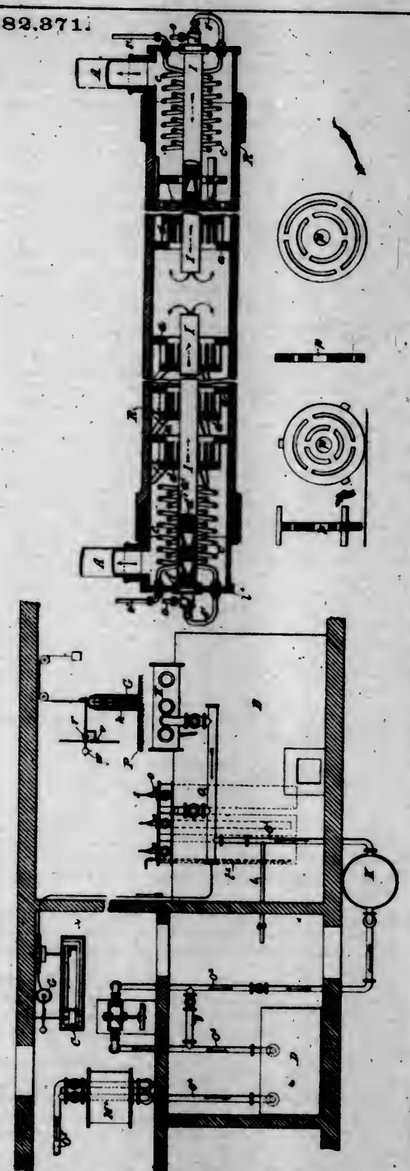
3. In the method of producing photographic impressions, the means for preparing the paper consisting of the combination of a bath to first soak the paper in, composed of gelatine and lactate of iron, and a bath to float the paper on, composed of albumen, chloride of sodium, bromide of potassium, glacial acetic acid, and a derivative of silex or hydrocarbon, in about the proportions stated.

382,370. PLANT-PROTECTOR. JOSEPH W. MCCALL, Kansas City, Mo. Filed May 24, 1886. Serial No. 203,132. (No model.)

Claim.—A colery-shield having a tubular body portion, A, of an interior diameter approximating the desired diameter of the mass of plant-stems over which it is to be placed, and having its lower edge flaring and sharpened, as at *a*, substantially as and for the purposes set forth.

382,371. APPARATUS FOR THE MANUFACTURE OF GAS. ARTHUR G. MELHUISH, Redhill, County of Surrey, England. Filed Aug. 23, 1887. Serial No. 247,696. (No model.) Patented in England Sept. 20, 1887, No. 12,340.

Claim.—1. In apparatus for the manufacture of gas from fluid hydrocarbons, the combination, with a double-mouthed retort, of two ingression-pipes, one extending from each end of the retort into its central portion for discharging opposing streams of fluid against each other and causing uniform mixture thereof.



2. In apparatus for the manufacture of gas from fluid hydrocarbons, the combination, with a retort and its inwardly-extending ingression-pipe, of a complement of deflecting and impact devices provided with alternating annuluses and disks arranged in the retort, whereby gaseous fluids discharged within the retort are deflected against numerous heated surfaces for better combining and fixing them.

3. In apparatus for the manufacture of gas from fluid hydrocarbons, the combination, with a retort and an ingression-pipe extending into it, of a steam-superheater coiled about and connecting with the ingression-pipe, for the purposes set forth.

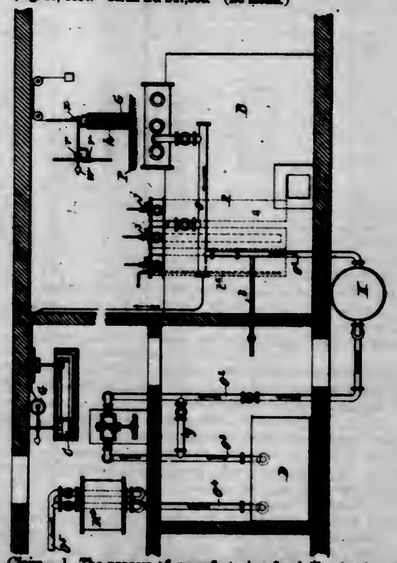
4. In apparatus for manufacturing gas from fluid hydrocarbons, the combination, with a retort, of an apparatus consisting of an ingression-pipe extending into such retort, a steam-superheater, an injector connecting with the superheater and the ingression-pipe, and deflecting and impact devices disposed around the ingression-pipe, substantially as herein described.

5. In apparatus for the manufacture of gas from fluid hydrocarbons, the combination, with a retort and its inwardly-extending ingression-pipe, of deflecting and impact devices consisting of a large number of auxiliary surfaces systematically disposed and arranged, whereby the passing current of fluid is repeatedly broken up and at

382,371.

combination with an inwardly-extending ingression-pipe, also fitted internally with deflecting and impact devices, and a fluid-supply pipe connecting with the ingression-pipe, whereby the gas-making fluids are first heated and intimately mixed and then discharged into the retort and against its heated deflecting-surfaces for conversion into a fixed gas.

9. In combination with a retort, a connected steam and oil injector, a connected induction-pipe for supplying a diluting fluid, an exhauster and motor connecting with the gas-outlet pipe, whereby steam and oil supplied to the retort are decomposed and a diluting agent is mixed with the resulting gas and the mixture drawn off without injurious decomposition, as described.



10. In combination with a retort, a connected steam and oil injector, an exhauster connecting with the outlet-pipe of such retort, a motor for operating the exhauster, and a governor for regulating and controlling the action of the exhauster and motor, whereby gas of a uniform quality may be made and withdrawn from the retort in regulated quantities independent of the rate of feed of the gas-making fluids, and of variations in the temperature of the retort.

11. In apparatus for the manufacture of gas from fluid hydrocarbons, the retort R, fitted with deflecting and impact devices *a d d*, in combination with a connected exhauster, E, and motor, substantially as herein described, whereby the gas is subjected to extended heating-surfaces and better fixed at reduced pressure and temperature, and obstructive deposits thereby prevented.

12. In apparatus for manufacturing gas, a retort, R, fitted with deflecting and impact devices *a d*, in combination with an exhauster, E, and motor, and a governor, G, substantially as herein described, whereby gas-making fluids are drawn into the retort in automatically-regulated quantities, the resulting gas is subjected to extended heating-surfaces and better fixed at reduced pressure and temperature, and is drawn off from the retort without injurious decomposition.

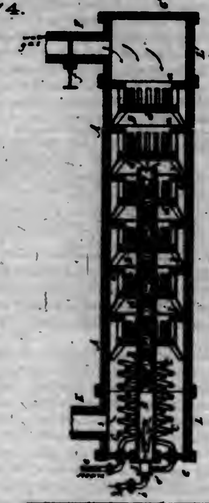
13. In apparatus for making gas from steam and fluid hydrocarbons, the combination, with a retort and its inwardly-extending ingression-pipe, of a complement of deflectors placed in the retort about the ingression-pipe, a steam and oil supply-pipe connecting with the ingression-pipe, a pipe for supplying a diluting fluid connecting with the retort, a connected exhauster, a motor for operating the exhauster, and a governor for regulating and controlling the action of the motor and exhauster, whereby the gas-making fluids are drawn into the retort and its eduction-pipe in automatically-regulated quantities, the vapors and gases generated subjected to extended heating-surfaces and better fixed at reduced pressure and temperature, and the fixed gas drawn off from the retort without injurious decomposition.

382,372. PROCESS OF MANUFACTURING GAS FROM OIL AND STEAM. ARTHUR G. MILNES, Redhill, County of Surrey, England. Filed Aug. 26, 1887. Serial No. 247,802. (No model.)

Claim.—1. The process of manufacturing fixed illuminating-gas which consists in admitting steam and hydrocarbon fluid into a suitable retort, and therein subjecting them to gaseous thermolysis under a constantly-maintained and uniformly-controlled partial vacuum or reduced pressure, whereby a uniform quality of gas is produced, as described.

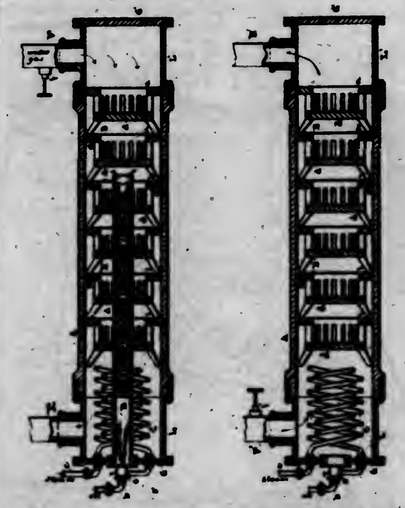
2. The process of manufacturing fixed illuminating-gas which consists in subjecting hydrocarbon fluid to gaseous thermolysis in a suitable retort under the influence of a uniform constantly maintained and controlled partial vacuum or reduced pressure, and at the same time admitting an induced current of air, hydrogen, or water-gas for the purpose of dilution or of chemically influencing the gas in process of manufacture, whereby a uniform quality of gas of any desired candle-power is produced, as described.

382,373. PROCESS OF MAKING COAL-GAS. ARTHUR G. MILNES, Redhill, County of Surrey, England. Filed Aug. 26, 1887. Serial No. 247,800. (No model.) Patented in England Feb. 10, 1883, No. 2,070.



Claim.—The process of manufacturing gas which consists in distilling coal, shale, or similar material, and during the early stages of distillation passing the distillate, composed of condensable tarry vapors and gas containing an excess of rich hydrocarbons, together with an added supply of superheated steam, into a heated chamber and therein causing their mutual decomposition, so that the excess of carbon shall be combined with the oxygen and hydrogen of the steam and the whole converted into a fixed gas of the desired candle-power, and then during the latter stages of distillation enriching the thin gaseous distillate which is deficient in illuminants with injected hydrocarbons and converting the mixture into a fixed gas by passage through the heated fixing-chamber, whereby the products of the coal are fully utilized and an increased volume of fixed illuminating-gas produced.

382,374. PROCESS OF MANUFACTURING GAS. ARTHUR G. MILNES, Redhill, County of Surrey, England. Filed Oct. 20, 1887. Serial No. 253,747. (No model.)



Claim.—1. The process of manufacturing gas which consists in first injecting steam and hydrocarbon oil into a heated chamber or retort and therein vaporizing the oil, thoroughly mixing the vapor with steam and highly heating the mixture, then heating hydrogen or water gas in a separate chamber and mixing it while hot with the heated mixture of oil-vapors and steam, and causing decomposition and recomposition by passing the mixture by direct impact in contact with numerous heated deflecting-surfaces till it is converted into a fixed gas.

2. The process of manufacturing gas which consists in injecting steam and hydrocarbon oil in regulated quantities into a heated chamber or retort and therein vaporizing the oil, thoroughly mixing the vapor with steam and highly heating the mixture, admitting a regulated quantity of hydrogen or water gas into a retort, heating it and mixing it while hot with the highly-heated mixture of oil-vapors and steam, and causing decomposition and recomposition by passing the mixture by direct impact in contact with numerous heated deflecting-surfaces till it is converted into a fixed gas.

382,374.

382,375. APPARATUS FOR THE MANUFACTURE OF GAS. ARTHUR G. MILNES, Redhill, County of Surrey, England. Filed Dec. 5, 1887. Serial No. 257,041. (No model.)

Claim.—1. In combination with a retort, an ingression-pipe or smaller internal retort extending from the front end of the outer retort, a steam and oil injector connecting with such internal retort, a gas-supply pipe connecting with the rear end, and a gas-eduction pipe connecting with the front end of the outer retort, for the purpose described.

2. In combination with a retort, an ingression-pipe or smaller internal retort extending inward from its front end, a steam and oil injector connecting with such internal retort, a series of deflecting and impact devices arranged in the outer retort and supporting the inner retort, a pipe for supplying water-gas connecting with the rear end, and a gas-eduction pipe connecting with the front end of the outer retort, for the purpose described.

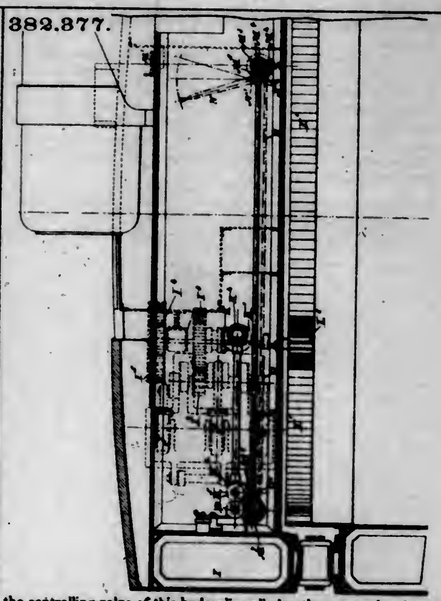
3. In combination with a retort, a steam-superheating coil, a steam and oil injector connecting with the coil and discharging into the retort, a series of deflecting and impact devices arranged in the retort, a gas-supply pipe, and a gas take-off pipe connecting with opposite ends of the retort, for the purpose described.

4. In combination with a retort, a gas-supply connecting with its

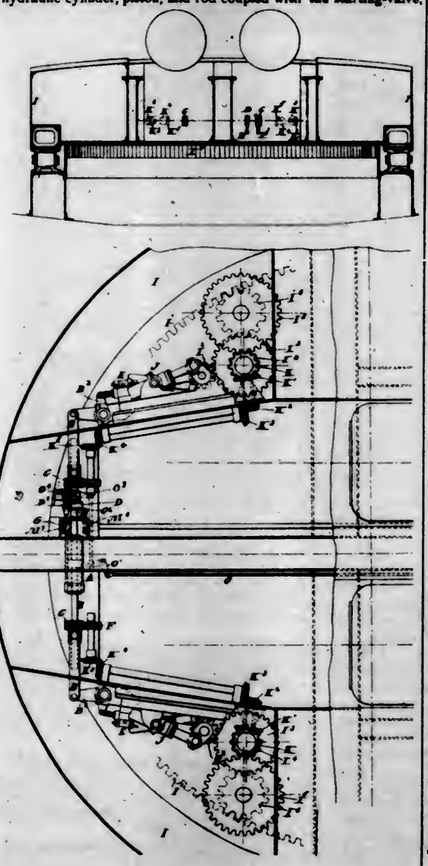
rear end, a gas-eduction pipe leading from its front end, an ingression-pipe or small internal retort extending inward from its front end, a steam and oil injector connecting with such ingression-pipe, and deflecting and impact devices placed in the outer retort around the ingression-pipe and between its discharge end and the rear end of the retort, whereby the inflowing gas is first heated in contact with such devices, and then combined and fixed with the heated steam and oil-vapors flowing from the ingression-pipe, as described.

382,376. HYDRAULIC CEMENT. JOHN MURPHY, Columbus, Ohio. Filed Feb. 23, 1888. Serial No. 264,964. (No specimens.)

Brief.—Improvement on Letters Patent No. 347,367, dated August 17, 1886, to John Murphy and Nathaniel W. Lord.



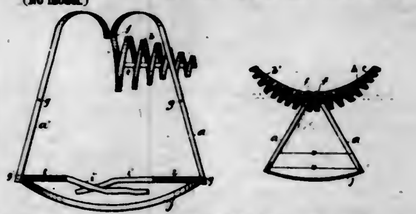
Claim.—A Portland or hydraulic cement composed of limestone, furnace-slag, and clay, which ingredients are mixed, burned, and then reduced to powder, substantially as described.



382,377. MEANS FOR CONTROLLING HYDRAULIC APPARATUS FOR TRAINING HEAVY GUNS. CHARLES H. MURRAY, Newcastle-upon-Tyne, England, assignor to W. G. Armstrong, Mitchell & Co., (Limited,) same place. Filed June 15, 1887. Serial No. 241,380. (No model.) Patented in Italy Dec. 31, 1886, No. 20,756.

Claim.—1. The combination, consisting of a turret or gun-platform, a hydraulic engine geared therewith, the starting-valve of the said engine, a hydraulic cylinder, piston, and rod coupled with the starting-valve, the controlling-valve of this hydraulic cylinder, the nut on the piston-rod and coupled with the controlling-valve, which nut can be turned by hand-gear, and the other nut on the rod coupled with the starting-valve of the engine and also geared with the engine, the whole combined and operating substantially as described.

2. The combination, consisting of a turret or gun-platform, a hydraulic engine geared therewith, the starting-valve of the said engine, a hydraulic cylinder, piston, and rod coupled with the starting-valve,



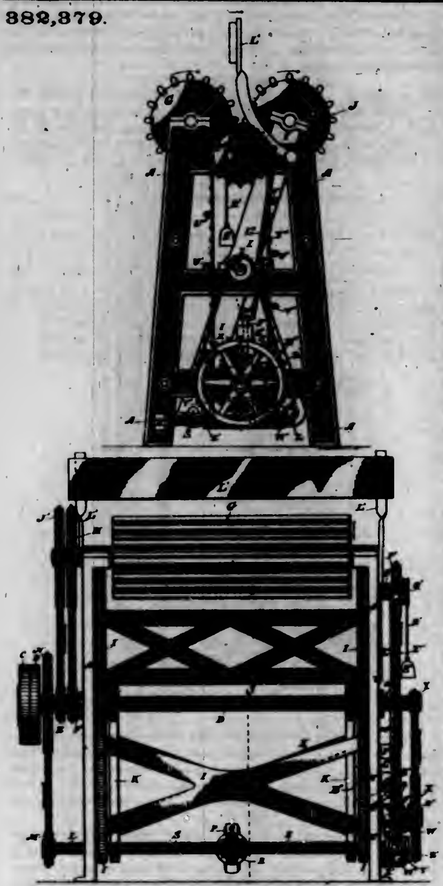
382,377.

the controlling-valve of this hydraulic cylinder, the nut on the piston-rod and coupled with the controlling-valve, the hand-gear for turning this nut from a distance, the other nut on the rod coupled with the starting-valve of the engine and also geared with the engine, and the clutch and its gear for locking the nuts together, the whole combined and operating substantially as described.

382,378. BUSTLE. CHARLOTTE O'DAY, Denver, Colo., assignor to Charlotte Alair, same place. Filed Aug. 10, 1887. Serial No. 246,580. (No model.)

Claim.—In a bustle attachment for dresses, the double sections consisting of the cone-shaped spirals *b* and *b'* and outwardly and downwardly curved back braces, *a* and *a'*, pivoted to the inner ends of the respective spirals, in combination with the contracting-tapes, substantially as described.

382,379. MACHINE FOR HARDENING HATS. SYDNEY C. PALMER, South Norwalk, Conn., assignor to Ellen M. Palmer, same place. Filed June 15, 1887. Serial No. 241,383. (No model.)



Claim.—1. In a hat-hardening machine, two rolls journaled side by side, the bearings of one roll being fixed and the bearings of the other being vibratory, whereby during the revolution of the rolls against the hat the latter is subjected to a series of compressions, substantially as set forth.

2. In a hat-hardening machine, a hardening-roll journaled in stationary bearings, in combination with a similar roll journaled in horizontal juxtaposition to the first-named roll and adapted to be vibrated toward and from the latter, substantially as specified.

3. In a hat-hardening machine, two hardening-rolls arranged in horizontal juxtaposition, one of said rolls being adapted to revolve within fixed and stationary bearings, the other roll being journaled within a vibratory frame, whereby the hat is subjected to two operations—namely, revolution and periodical compression—substantially as set forth.

4. In a hat-hardening machine, a stationary roll, in combination with a movable roll adapted to have a slight reciprocatory movement during the operation on the hat-roll, substantially as set forth.

382,379.

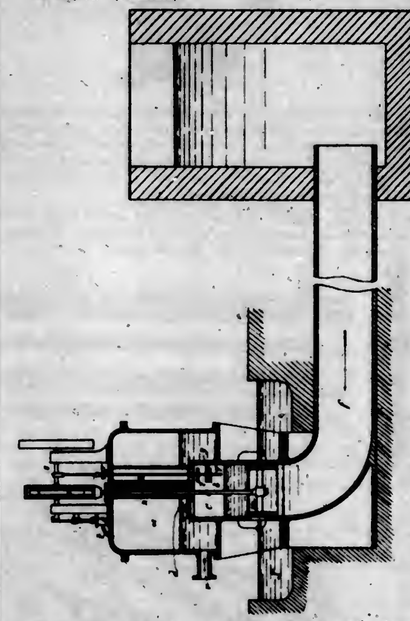
5. In a hat-hardening machine, the stationary roll journaled in the frame of the machine, in combination with the movable roll journaled at the top of a pivoted and swinging frame, a jog-frame pivoted eccentric with the pivotal point of the swinging frame, a short shaft having bearings within the jog-frame, and a compound eccentric secured on said shaft and adapted to act against the swinging frame, substantially as set forth.

6. In combination with the swinging and jog frames, a shaft extending through the jog-frame and having mounted thereon a compound eccentric, a strap around said eccentric, a strap connected to the swinging frame, a screw-bolt connecting said straps, and a sprocket-wheel mounted on said shaft and belted to the primary motive power, substantially as and for the purpose set forth.

7. In combination with the swinging and jog frames connected together, as described, a lever pivoted to the jog-frame and extending loosely through a bearing in the machine-frame, and a trip-bar pivoted to said lever and adapted to drop by gravity into locking abutment with the machine-frame, substantially as set forth.

8. In a hat-hardening machine, the combination, with the rolls and the means for operating the same against the hat-roll, of tripping mechanism consisting of a chain carried by wheels independent of the motive power, a trip-pin adjustably attached to said chain, a trip-bar which locks the hardening-rolls in operative position, and means for interlocking said tripping mechanism with the motive power, whereby said pin is forced by the travel of the chain against the trip-bar, thereby allowing the separation of the rolls, substantially as set forth.

9. In combination with the trip-bearing chain carried by wheels independent of the motive power and mechanism for connecting said wheels and power, means, as a weight and rope, adapted by gravity to revolve said wheels in a reverse direction, and thereby restore the trip-pin to its normal position, substantially as set forth.



10. In a machine, as described, a sprocket-wheel having a clutch formed with its hub adapted to engage with a similar clutch carried by the motive power, in combination with means, as a weighted striker and a yoke operated thereby, for engaging said clutches, the striker adapted to be restored to its normal position by the swinging movement of the jog-frame, whereby the yoke is operated to disengage the clutch and motive power, thereby allowing the jog-frame and trip-bearing chain to return to their normal positions, substantially as set forth.

11. The sprocket-wheels carrying the tripper and mounted on shafts independent of the motive power, said wheels arranged one above the other, the upper wheel mounted on fixed bearings and having rigidly secured thereto a drum around which is coiled a rope with a weight at the free end, and the lower wheel secured on a hub which has a sidewise play on its shaft, in combination with a sprocket-wheel mounted on fixed bearings on the lower shaft, the hub of said sprocket adapted to be interlocked with the hub of the adjacent trip-carrying wheel, the primary motive power connected to said sprocket, and means for engaging and disengaging said hubs at predetermined times, whereby the operation of the tripping mechanism is determined, substantially as set forth.

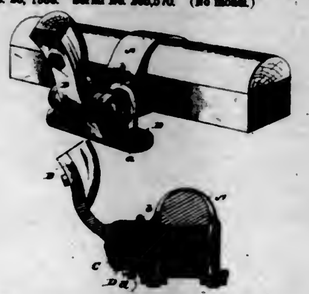
12. In combination with the sprocket-wheels carrying the tripper and mounted on shafts, as described, the yoke pivoted to the machine-frame and attached at one end to the loose hub of the lower of said wheels, the primary shaft, a sprocket mounted on the same shaft with the lower trip-bearing sprocket and adapted to be engaged with the loose hub of the latter, and means for forcing said yoke to one side, whereby said loose hub is interlocked with that of the adjacent sprocket, substantially as set forth.

13. In combination with the trip-bearing sprocket-wheel mounted loosely on its shaft and the pivoted yoke attached to the hub of said wheel and adapted to be forced to one side, whereby the latter is engaged with the motive power, means dependent upon the jog-frame for automatically restoring said yoke to its normal position, whereby the tripping mechanism is disengaged from the motive power, substantially as set forth and specified.

382,380. HYDRAULIC APPARATUS FOR RAISING WATER, &c. HOWARD D. PEARSALL, London, England. Filed Mar. 10, 1886. Serial No. 194,713. (No model.)

Claim.—1. In hydraulic rams, the combination, with a flow-pipe and main valve, of a receiver, *c*, into which some of the water from the flow-pipe flows during the closing of the main valve, the receiver having a passage, *h*, through which air enters it and also escapes from it during the closing of the main valve, and a valve, *i*, in receiver *c* opening inwardly to close the passage *h*.

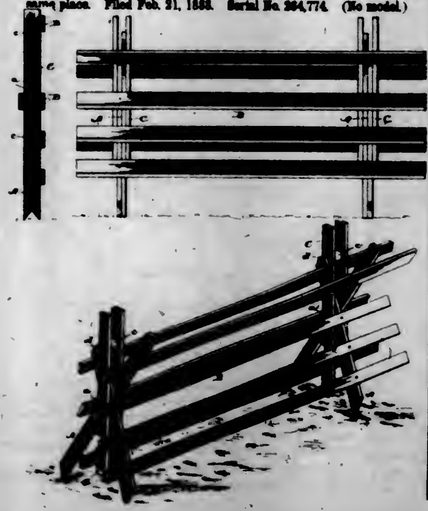
2. In hydraulic rams, the combination, with a flow-pipe and main



valve, of a receiver, *c*, into which some of the water from the flow-pipe flows during the closing of the main valve, the receiver having a passage, *h*, through which air enters it and also escapes from it during the closing of the main valve, a valve, *i*, closing the passage *h*, and a float, *b*.

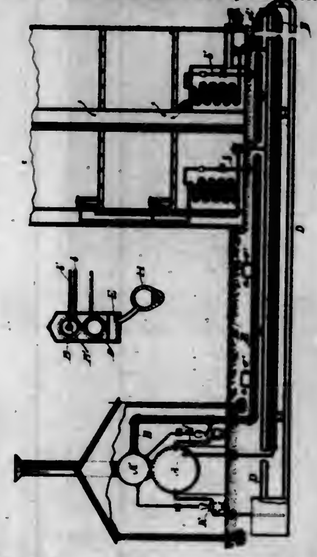
3. In hydraulic rams, the combination, with a flow-pipe and main valve, of a receiver, *c*, into which some of the water from the flow-pipe flows during the closing of the main valve, the receiver having a passage, *h*, through which air enters it and also escapes from it during the closing of the main valve, a valve, *i*, closing the passage *h*, a float, *b*, and a screw, *g*, by which the distance of the float from the top of receiver *c* is varied at will.

4. In hydraulic rams, the combination of a flow-pipe, an air-vessel, *e*, a single valve, *m*, acting as main and waste valve, a valve-rod, *l*, and a motor, *A*, operatively connected with the valve-rod and actuated by the fluid under pressure in the air-vessel.



5. In hydraulic rams, the combination, with flow-pipe, main valve *m*, and an air-vessel, of a receiver, *c*, into which some of the water from the flow-pipe flows during the closing of the main valve, the receiver having a passage, *h*, through which air enters, and also escapes from said receiver during the closing of the main valve, a valve, *i*, closing the passage *h*, and a float, *b*, a screw, *g*, by which the distance of the float from the top of the receiver is varied at will, and a valve-rod, *l*, driven by a motor, *A*, actuated by the fluid under pressure in the air-vessel *e*.

382,381. THILL-COUPLING. AARON B. PERRIN, Topeka, Kans. Filed Feb. 28, 1888. Serial No. 265,570. (No model.)



Claim.—The combination, with a thill-coupling, of an anti-rattler consisting of a plate perforated near opposite ends, a rubber bearing thereon and adapted to bear against the thill-eye, and the threaded rods passing through the said plate and having their upper ends hooked to engage the lugs of the shackle, and nuts for securing the rods to the said plate, substantially as specified.

382,382. FENCE. ANDREW J. PITTS and GEORGE W. PITTS, De Armanville, Ala., assignors of one-half to J. G. Hudson and C. C. Hudson, same place. Filed Feb. 21, 1888. Serial No. 264,774. (No model.)

Claim.—The combination, with the pivoted supporting-braces, the rails, and the supplementary rails, of posts pivoted to said braces and having slots for the reception of said supplementary rails, substantially as described.

382,383. MEANS FOR SUPPLYING HEAT AND POWER TO LARGE DISTRICTS OF BUILDINGS. WILLIAM R. PRALL, Washington, D. C., assignor to the National Heating Company, New York, N. Y. Filed Jan. 21, 1888. Serial No. 261,468. (No model.) Patented in England July 23, 1879, No. 2,907, and in Germany Jan. 27, 1880, No. 12,888.

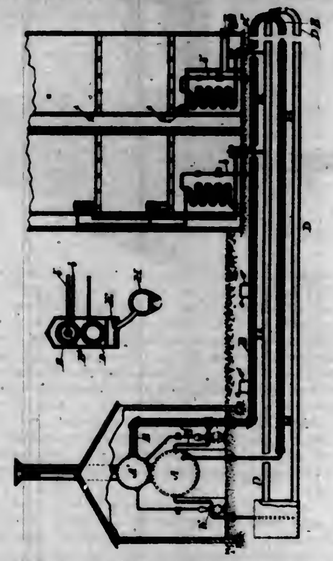
Claim.—1. In a central-station heat and power system, the combination of a heater, a superheated water main or pipe extending from and returning to the heater, a steam-main contiguous to the water-main, means for introducing steam into said steam-main, and means for causing a circulation in the water-main, substantially as shown and described.

2. In a central-station heat and power system, the combination of a heater, a superheated water-pipe extending from and returning to the heater, a steam-main contiguous to the water-pipe, the steam-main being in communication with the heater and with the water-pipe, and a radiator or other means for utilizing the steam in communication with the steam-main.

3. In a central-station heat and power system, the combination of a heater, a superheated water-pipe extending from and returning to the heater, a force-pump connected with said pipe, a steam-main contiguous to said pipe, means for introducing steam into said main, a radiator or other means for utilizing the steam in communication with said main, and means for returning the water of condensation to the heater.

4. In a central-station heat and power system, the combination of a heater, a superheated water-pipe leading from and returning to the heater, a steam-main contiguous to the water-pipe in communication with the heater and with the water-pipe, a radiator or other means for utilizing the steam, a return-pipe in communication with the heater for returning the water of condensation to the heater, and pipes forming communications between the steam-main and return-pipe, substantially as shown and described.

5. In a central-station heat and power system, the combination of a heater, a superheated water-pipe and steam-main, one of which is placed within the other, the steam-main being in communication with the heater and superheated water-pipe, and a radiator or other means for utilizing the steam, substantially as shown and described.



6. In a central-station heat and power system, the combination of a heater, a superheated water-pipe leading from and returning to the heater, a steam-main contiguous to said pipe, means for introducing steam into said main, and radiators or other means for utilizing the steam and hot water in communication with both the steam-main and water-pipe, substantially as shown and described.

7. In a central-station heat and power system, the combination of a heater, a superheated water-pipe extending from and returning to the heater, a steam-main contiguous to said water-pipe, means for introducing steam into said main, radiators or other means for utilizing the steam and hot water in communication with both the steam-main and hot-water pipes, and a system of return-pipes in communication with the heater, substantially as shown and described.

8. In a central-station heat and power system, the combination of a heater, a superheated water-pipe extending from and returning to the heater, a steam-main contiguous to the water-pipe, and in communication therewith a radiator or other means for utilizing the steam, and means for returning the water of condensation to the heater.

9. In a steam and hot-water heat and power system, the combination of a heater, a superheated water-pipe extending from and returning to the heater, a steam chamber or main in proximity to the water-main and in communication with the heater and the water-pipe, and a radiator or other means for utilizing the steam in communication with the steam-main, substantially as shown and described.

382,384. METHOD OF SUPPLYING HEAT AND POWER TO LARGE DISTRICTS OF BUILDINGS. WILLIAM R. PRALL, Washington, D. C., assignor to the National Heating Company, New York, N. Y. Filed Jan. 21, 1888. Serial No. 261,469. (No model.) Patented in England July 23, 1879, No. 2,907, and in Germany Jan. 27, 1880, No. 12,888.

Claim.—1. The herein-described method of supplying heat and power to large districts of buildings in cities and towns, in which superheated water and steam are used as heat and power conveying mediums, which consists in superheating water and generating steam at a central station, conveying each contiguously throughout the district, and extracting a portion of either of the heat and power conveying mediums at points where the same is required.

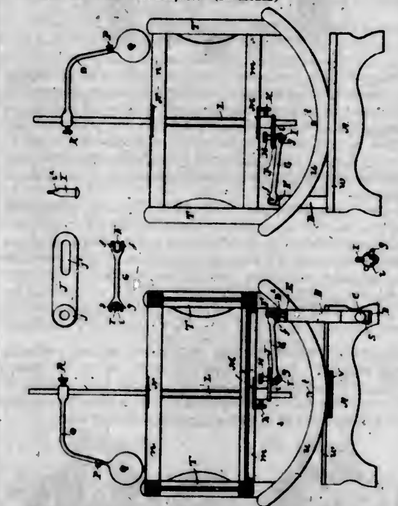
2. The herein-described method of supplying heat and power, in which steam and superheated water are used as heat-conveying mediums, which consists in superheating water and generating steam, conveying them, one within the other, throughout the district where heat and power are required, extracting a portion of the heat and power conveying medium at the points where the same is required, and returning the same to the heater after it has been employed for said purposes.

3. The herein-described method of supplying heat and power, which consists in superheating water and generating steam, conveying the steam and water contiguously to the point where heat or power is required, and extracting a portion of the steam for heat or power purposes, substantially as shown and described.

4. The herein-described method of supplying heat and power, which consists in superheating water and generating steam, conveying the steam and water separately and contiguously to the point where heat or power is required, extracting a portion of the steam for heat or power purposes, and returning the water of condensation to the heater.

5. The herein-described method of supplying heat and power to large districts of buildings in cities and towns, which consists in superheating water and generating steam, conveying each contiguously throughout the district, and extracting portions of the water and mingling them with the steam at points along the route, and extracting the steam where heat or power is required.

6. The method of supplying heat and power herein described to large districts of buildings in cities and towns, which consists in superheating water and conveying it throughout the district, extracting a portion of the superheated water whereby steam is formed, conveying the steam so formed contiguously to the superheated water, extracting a further portion of the superheated water and commingling it with the steam previously formed, and utilizing the steam for heat or power purposes where required.

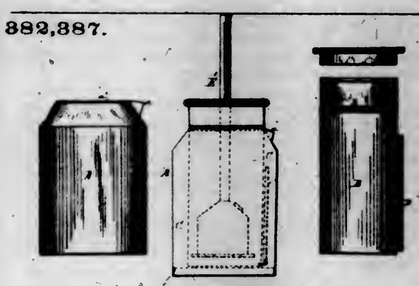


382,385. RAIL FOR STREET-RAILWAYS AND CHAIR. ISAAC H. RANDALL, Boston, Mass. Filed Aug. 2, 1886. Serial No. 209,332. (No model.)

Claim.—1. A chair for a railway-rail provided with a base, *g*, standard *h*, and seat composed of vertical part or block *i* and horizontal flanges *j*, substantially as and for the purpose set forth.

2. In combination with two meeting rails, each provided with two vertical webs, *c c*, a chair, B, provided with a base, *g*, standard *h*, and seat composed of a tie-block, *i*, and flanges *j*, substantially as set forth.

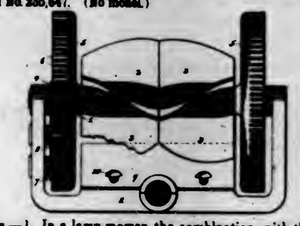
382,386. PAN ATTACHMENT FOR CRADLES. JOHN RAE, Belleville, Ill., assignor of one-half to A. F. Klotzbach, same place. Filed Mar. 31, 1887. Serial No. 233,119. (No model.)



Claim.—1. The combination of the stationary support of a cradle, a standard secured thereto, a pin, F, on top of said standard, a cradle, a vertical rod, L, pivoted thereto and having an arm carrying a fan, a crank upon said rod, a pin, I, adjustably secured to said crank, and a rod, G, connecting the pins F and I, substantially as and for the purpose described.

2. The combination of the stationary support of a cradle, a screw-tapped plate, B, secured thereto and having a leg, S, a standard having a notch to receive said lug and a thumb-screw, and a pivot-pin, F, on top of said standard, with a vertical rod mounted upon the cradle and a fan secured thereto, a crank adjustably retained upon said rod, a connecting-rod, and a pin uniting it adjustably to said crank, substantially as and for the purpose described.

382,387. CHURN. JOHN RICHARDS, Fort Worth, Tex., assignor of two-thirds to Ruff J. Reese and J. B. Sinclair, same place. Filed July 5, 1887. Serial No. 243,266. (No model.)

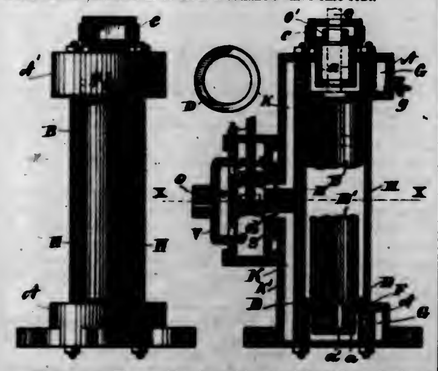


Claim.—The combination of the inner shell or cream-receptacle having the pipe D formed therewith, and with the ring near its upper end, the outer shell having its upper end contracted to engage the ring

382,387.

of the cream-receptacle and inclose the pipe, and provided with the side opening, *a*, at its upper end, and a valve located in the pipe D to open and close by the action of the dasher moving in the cream-cylinder, substantially as set forth.

382,388. LAWN-MOWER. CHARLES F. RITCHEL, Bridgeport, Conn., assignor to J. A. Burke, New York County, N. Y. Filed Apr. 21, 1887. Serial No. 235,647. (No model.)

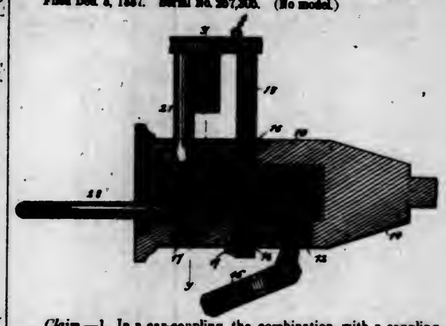


Claim.—1. In a lawn-mower, the combination, with the straight-edged stationary cutter adjustably secured to the lower portion of the frame, of the rotary cutters arranged upon the cutter-shaft and adapted to impinge against the stationary cutter, said rotary cutters being made, the one in the form of a section of a right-hand spiral and the other in the form of a left-hand spiral, the ends of said cutters being arranged to abut at the center of the cutter-shaft, substantially as set forth.

2. The combination, with the yoke-shaped frame, of the shaft journaled in the ends thereof and carrying the cutters, which latter are made, the one in the shape of a section of a right-hand spiral and the other in the shape of a left-hand spiral and abutting at the center of the cutter-shaft, the drivers journaled near the ends of the cutter-shaft, the straight-edged stationary cutter adjustably secured to the lower portion of the frame, and the gears 4 7 8, arranged between the internally-geared driver and the cutter-shaft, substantially as set forth.

382,389. CYLINDER FOR HYDRAULIC MOTORS. WILLIAM ROSS, Troy, N. Y. Filed June 9, 1887. Serial No. 240,701. (No model.)

Brief.—Two cylinder-heads containing air-chambers, so bolted together that different-sized cylinders may be held in place between the same, and so extended as to form a common valve-case seat.



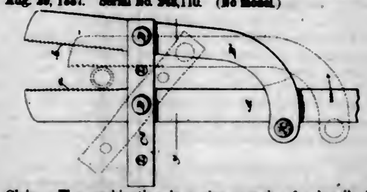
Claim.—1. The combination, with a straight unflanged tube or cylinder, of tube-supporting end covers or heads linked together, each being provided with a valve-case seat, and duct leading from said seat to a cylinder-port, said seats being arranged in alignment and forming together a seat for a common valve-case, substantially as described, and for the purposes set forth.

2. The combination, with a straight unflanged tube or cylinder, of detachably-connected end-supporting covers or heads, each provided with a cylinder-port leading to a valve-case seat, and a fixed guide-flange, substantially as described, and for the purposes set forth.

3. The combination, with a straight unflanged tube or cylinder, of detachably-connected end-supporting covers or heads, each provided with a cylinder-port leading to a valve-case seat, and a fixed guide-flange and a detachable guide-ring, substantially as described, and for the purposes set forth.

4. The combination, with a cylinder-tube, of tube-supporting end covers or heads linked together, each head being a single piece of metal cast with a valve-case seat, and an air-chamber opening into a duct leading from one end of said tube to said valve-case seat, substantially as described, and for the purposes set forth.

382,390. CAR-COUPLING. LUTHER B. SAMPSON, Rochester, N. H. Filed Dec. 8, 1887. Serial No. 257,305. (No model.)



Claim.—1. In a car-coupling, the combination, with a coupling-pin and a guide-rod connected thereto, of a sliding grip for engaging the said rod and holding the coupling-pin elevated, and a weighted lever pivoted at the rear of the grip in engagement therewith and actuating said grip, substantially as herein shown and described.

2. In a car-coupling, the combination, with a coupling-pin and a guide-rod connected thereto, provided with a longitudinal slot near its lower extremity, of a sliding grip provided with an integral transverse tongue centrally upon its outer face, and a weighted lever pivoted at the rear of the grip in engagement therewith and actuating said grip, substantially as shown and described, whereby when the pin and guide-rod are elevated the lever will force the grip-tongue to enter the slot in the guide-rod and retain the coupling-pin in an elevated position, as set forth.

3. In a car-coupling, the combination, with a coupling-pin and a guide-rod connected thereto, provided with a longitudinal slot near its lower extremity, and a toe upon said lower extremity, of a bifurcated sliding grip provided with a transverse tongue between the approaching face of the grip-arms, and a weighted lever pivoted at the rear of said grip and having a constant bearing thereon, substantially as and for the purpose herein set forth.

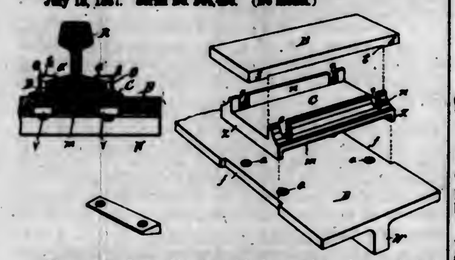
382,391. PIPE-WRENCH. GEORGE G. SMITH, St. Albans, Vt. Filed Aug. 29, 1887. Serial No. 248,110. (No model.)

Claim.—The combination, in a pipe-wrench, of a handle bar or lever, a bent grip-bar coupled thereto at one end to be free to move longitudinally thereon without separating therefrom, and an adjustable transverse link pivoted to each bar about midway the length of the grip-bar, all substantially in the manner and for the purpose herein set forth.

382,392. CHECKREIN-HOLDER. FREDERICK SNYDER, Lancaster, Pa. Filed Feb. 25, 1888. Serial No. 265,234. (No model.)

Claim.—1. In a checkrein-holder, the forward post, A, provided with a base, a vertical column for a roller, and a tip, *a*, curved downward behind said column, substantially as set forth.

382,392.

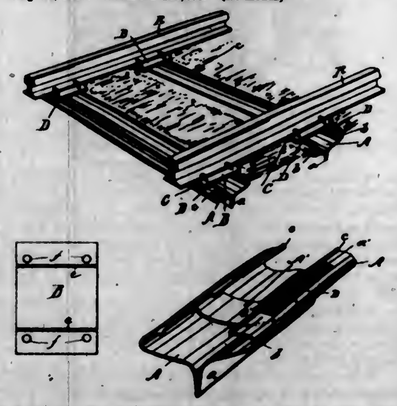


2. In a checkrein-holder, a rear post, C, having a recess, *c*, in combination with a tongue, D, pivotally suspended in said recess, and a spring, D', within said recess, which forces out said tongue, substantially as set forth.

3. A tongue, D, having a spring, D', integral therewith, in combination with a rear post, C, having a recess, *c*, in which said tongue is pivoted, substantially as set forth.

4. A rear post, C, having a recess, *c*, and a rear wall, C', therefor, in combination with a front post, a tongue, D, pivoted in said recess, and a spring, D', extending down behind said tongue, bearing against said rear wall, and operating substantially as set forth.

5. In a checkrein-holder, the combination of the rear post, C, and the tongue D, with the spring D', the post A, having the downwardly-curved tip *a*, the column A', and the roller B, substantially as set forth.

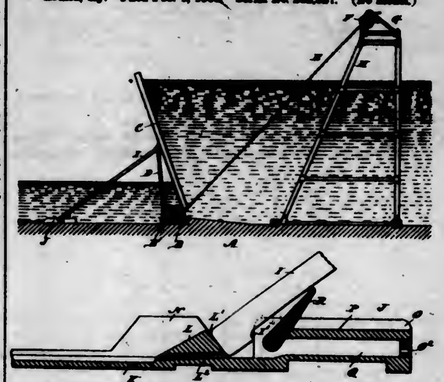


382,393. RAILWAY. JOHN B. SUTHERLAND, Detroit, Mich. Filed July 15, 1887. Serial No. 244,494. (No model.)

Claim.—1. In combination with the metal tie, the metal chair having depending flanges Z and upright flanges *n*, the bolt-holes in said chair registering with the holes of the tie, the rail, and the flexible agent located between said rail and the chair, as and for the purposes specified.

2. In combination with the metal tie having the recesses *f* and holes *a*, the metal chair having the flanges Z at the ends, the side flanges, *n*, the holes *e* registering with the holes of the tie, the rail, the flexible strip B, and bolts binding said parts together, as and for the purposes set forth.

382,394. RAILWAY. JOHN B. SUTHERLAND, Detroit, Mich. Filed Aug. 20, 1887. Serial No. 247,698. (No model.)

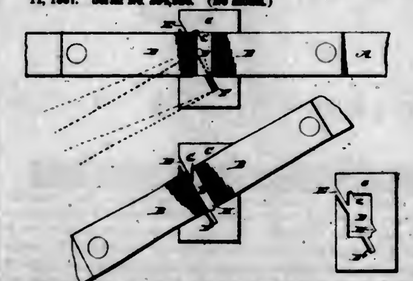


Claim.—1. In combination with a metallic tie having a rigid web and lateral flexible wings provided with strengthening-flanges on their edges, a metallic chair having flanges *d d*, grooves *e b*, and holes *f f*, the rail R, the cushion C, the bolts *g g*, and nuts A A, substantially as and for the purposes set forth.

2. In combination with a metallic tie having a rigid web and lateral flexible wings, the chair B, having flanges *d*, grooves *e e*, and holes *f f*, the rail R, cushion C, and flexible strip D, suitably perforated, the bolts *g g*, and nuts A A, substantially as specified.

3. A metallic railway-tie formed out of one single piece and having a central rigid anchoring web and lateral concave-convex supporting-wings, and provided on its inner face at the supporting-points with a spring re-enforce, substantially as set forth.

382,395. WICKET-DAM. REES F. THOMAS and JOHN C. THOMAS, Louisa, Ky. Filed Feb. 1, 1888. Serial No. 262,627. (No model.)



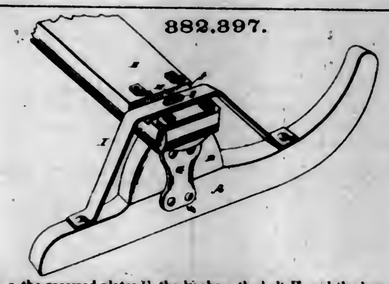
Claim.—1. In a wicket-dam, the combination, with a dam and hinged posts pivotally connected with the said dam, of props pivotally connected with the said dam, a hearter in which the lower end of each prop abuts, and a trigger for carrying the lower end of the prop over its abutment, substantially as shown and described.

2. In a wicket-dam, the combination, with a hearter provided with a cross-piece, of a prop resting against the said cross-piece, and a trigger for carrying the lower end of the said prop over the said cross-piece, substantially as shown and described.

3. In a hearter, the combination, with a base-plate and sides, of a triangular cross-piece held between the said sides and provided with longitudinal apertures for the passage of the water and impurities, substantially as shown and described.

4. A hearter comprising a base-plate, a cross-piece held on the said base-plate, and a trigger for carrying the lower end of the prop over the said cross-piece, substantially as shown and described.

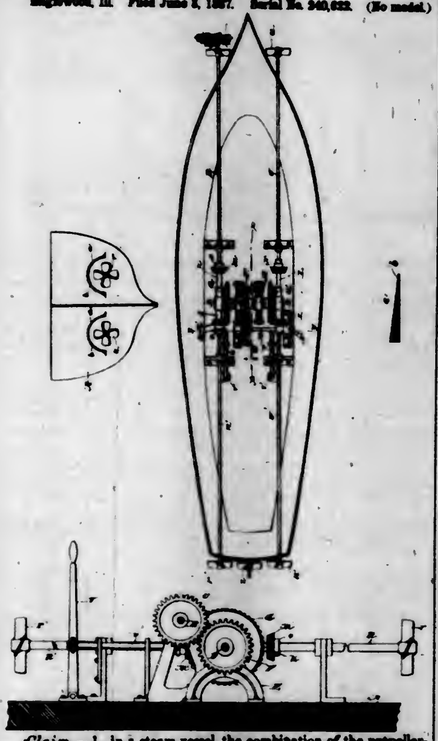
382,396. BALE-TIE. THOMAS T. WELLS, Union, Miss. Filed Nov. 11, 1887. Serial No. 254,980. (No model.)



Claim.—A buckle for bale-ties having a longitudinal slot, D, an oblique passage, E, extending from one side of said slot to the edge of the buckle, a notch, F, extending obliquely from the end of the slot in line with the passage E, and V-shaped notches G H at the opposite end and side, respectively, of said slot D, substantially as specified.

382,397. SLEIGH-KNEE. HERMAN WEBLE and HENRY WEBLE, Medford, Wis. Filed Nov. 25, 1887. Serial No. 256,118. (No model.)

Claim.—1. As an improved article of manufacture, an attachment for sleigh-knees, formed of the convex plate D, having recesses *b* and a central aperture, *a*, the recessed plates G, fitted to the convex surface of the plate D, and the hooks *c*, received in the recesses, substantially as specified.

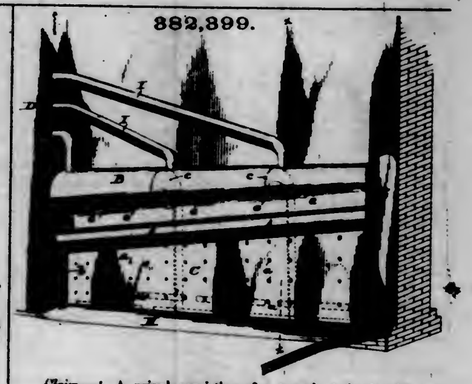


2. In a sleigh-knee, the combination of the runner A, the standard B, the convex plate D, provided with the recesses *b* and central

382,397.

slot, *a*, the recessed plates U, the hooks *e*, the bolt H, and the brace I, substantially as specified.

382,398. SCREW-PROPELLER FOR VESSELS. FRANK G. WHITE, Englewood, Ill. Filed June 8, 1887. Serial No. 240,622. (No model.)

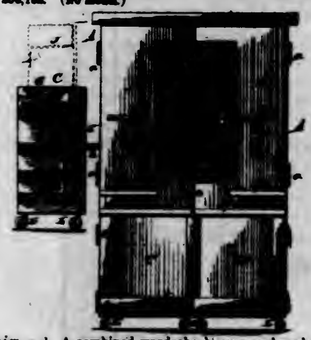


Claim.—1. In a steam-vessel, the combination of the propeller-shafts arranged in line with each other and extending beyond the bow and stern of the vessel, the right and left hand propeller-screws on both ends of the said shafts adapted to rotate simultaneously in opposite directions, the endwise-moving shaft connecting the opposing ends of the propeller-shafts and having the pinions at opposite ends, and the gear-wheel adapted to engage either of the said pinions when the said shaft is moved endwise, substantially as described.

2. The combination of the propeller-shafts on opposite sides of the vessel arranged in line with each other and provided with right and left hand propelling-screws, the endwise-moving shafts connecting the inner opposing ends of the propeller-shafts and having the beveled pinions at their opposite extremities, the rotating shafts D, the beveled gear-wheels G and G', attached to the said shafts and adapted to engage either of the pinions, and the endwise-moving shafts and the levers connected to the said endwise-moving shafts to shift the same longitudinally, for the purpose set forth, substantially as described.

382,399. URINAL. JAMES A. WELLS, Philadelphia, Pa. Filed Sept. 14, 1887. Serial No. 249,671. (No model.)

382,399.



Claim.—1. A urinal consisting of a trough, A, having its rear upper wall perforated, in combination with an air-chamber over the same, and one or more vent-pipes, I, connecting said air-chamber with a draft-flue, D, said parts being constructed and arranged to operate substantially as shown and described.

2. In combination with a trough or urinal, the perforated partition below the same, with one or more vent-pipes arranged to draw the air and odors from underneath the urinal into the air-space in rear of said partition, and from thence into a draft-flue, *D*, substantially as described.

3. The combination, in a urinal, of a trough, A, having its rear upwardly-extending wall perforated, an air-chamber arranged to receive the air and odors down through said perforations, and one or more pipes connecting said air-chamber to a draft-flue, the area or capacity of said pipe or pipes being equal to or greater than the combined area of said perforations for the purpose of securing a uniform current of air to intercept and convey away the odors through the entire extent of said trough.

382,400. COMBINED WARDROBE, BUREAU, AND WASH-STAND. HENRY F. WILEY, San Antonio, Tex., assignor of one-half to Max B. Mayer and Abraham Cohen, same place. Filed Dec. 17, 1887. Serial No. 258,182. (No model.)

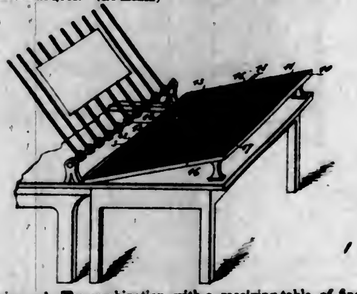
Claim.—1. A combined wardrobe, bureau, and wash-stand constructed with a main wardrobe-section, A, provided with hinged upper doors, A' A^3, having lower ledges or shelves, a' a^3, respectively, and bureau and wash-stand structures B C, hinged at opposite sides of the wardrobe below its doors A' A^3, and adapted when closed to close the lower front part of the wardrobe, and said door-ledges a' a^3 forming top covers to the wash-stand and bureau, substantially as herein set forth.

2. The combination, with the wardrobe having two doors hinged at the sides and closing toward the center, of the mirror A^5, fastened to one of the wardrobe-doors and overlapping the other door, substantially as described.

3. In a combined wardrobe, bureau, and wash-stand, comprising hinged sections A B C, the doors of section A having ledges a' a^3, covering the tops of sections B C when all are closed, and provided at or near said ledges with toilet-boxes E E, substantially as shown and described.

4. In a combined wardrobe, bureau, and wash-stand, comprising hinged sections A B C, the doors A' A^3, hinged at the sides of the section A and closing toward the center, said doors having ledges a' a^3, covering the tops of sections B C when all are closed, and provided at said ledges with toilet-boxes E, a mirror, A^5, secured to the door A^3, and overlapping the other door, substantially as and for the purposes described.

382,401. BED-BOTTOM. WILLIAM C. BAILEY, Chicago, Ill. Filed July 13, 1887. Serial No. 244,176. (No model.)



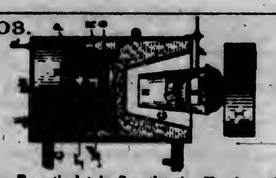
Claim.—1. A bed-bottom having the intermediate springs provided with vertical shanks fixed in supporting-strips, and twin end springs having shanks inserted diagonally in said strips, in combination with a single continuous lacing wire or cord connected to alternate springs of two adjoining series, substantially as described.

2. In a bed-bottom, the combination of the horizontal strips, the end spring having the inclined shanks inserted diagonally in the strips, intermediate springs arranged in continuous series with the end springs, and a lacing-wire connecting all the end and intermediate springs of two adjoining series, and having its ends connected together and unattached to the bedstead or the horizontal strips, as and for the purpose described.

3. In a bed-bottom of the class described, an adjustable head-section, B, adapted to assume a horizontal position and rest upon the notched rails of the bedstead, in combination with the bracket-castings B', affixed to said head-section and having the slots *b'*, which open through one edge thereof, pivots *b*, affixed in the bedstead at suitable points to suspend the inner end of the head-section out of contact with the notched rails of the bedstead when fitted in the slots of the bracket-castings, and means, substantially as described, for maintaining the free end of the head-section in its adjusted position, as and for the purpose set forth.

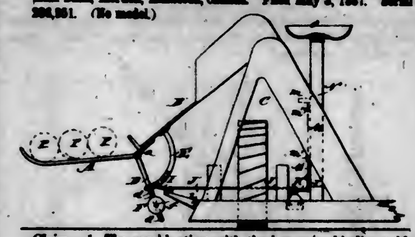
382,402. RECEIVING-TABLE FOR CYLINDER PRINTING-PRESSES. FRANK W. BALCH, Portland, Oreg. Filed Nov. 12, 1887. Serial No. 254,905. (No model.)

Claim.—1. The combination, with a receiving-table, of finger-guides 16, adjustably secured to said table and provided with laterally-projecting arms 18, substantially as described, whereby the fingers are made to serve a twofold purpose—viz., guides to the sheet and stops for the fly—as set forth.



2. The combination, with a longitudinally and transversely slotted receiving-table, of curved fingers 18, secured in the transverse slots of the table, the fingers 16, provided with the laterally-projecting arms 18, and the crank-ed fingers 17, the said fingers 16 and 17 being secured in the longitudinal slots of the table, substantially as described.

3. A receiving table or frame having strips 11, between which there are slots or openings 2, and strips 12, between which there are slots or openings 3, in combination with backwardly-curved fingers 13, the shanks of which pass through the slots 3, fingers 16, the shanks of which pass through slots 2, said fingers being formed with outwardly-extending arms and crank-shaped fingers 17, the shanks of which also pass through the slots 2, the shanks of all of the fingers being engaged by nuts, substantially as described.



382,403. HEAT-REGULATOR FOR INCUBATORS. CHARLES R. BEAN, Westport, assignor of one-half to Mathew C. Yarwood, Fall River, Mass. Filed May 14, 1888. Serial No. 273,210. (No model.)

Claim.—The combination, with the heater D, of the air-chamber O, annular chamber R, provided with mercury, M^2, the air-valve N P, valve-chamber T, vertical tube S, outlet-pipe U, valve-rod M, lever K, rod J, lever F, and wick-tube sleeve E, as set forth.

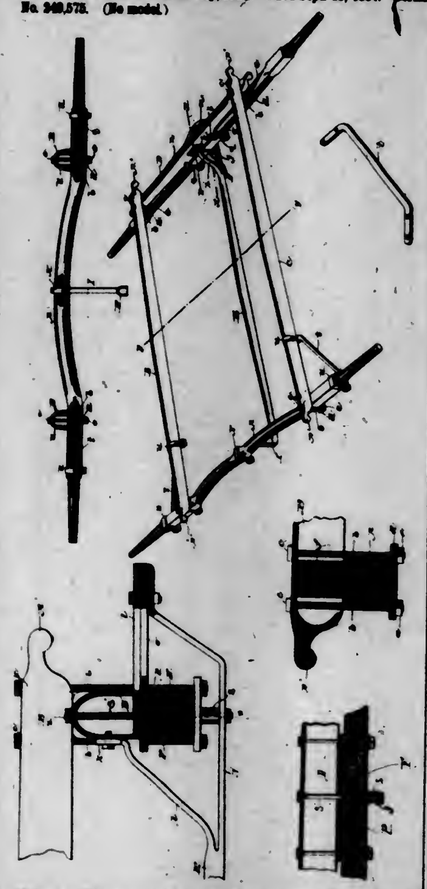
382,403.

382,404. SHEAF-CARRIER FOR GRAIN-HARVESTERS. WILLIAM BELL, Morden, Manitoba, Canada. Filed May 3, 1887. Serial No. 236,951. (No model.)

Claim.—1. The combination, with the harvester binding-table, of the hinged sheaf carrier or tray having a pendent counterbalanced or weighted arm, a guide-bar fixed to the binding-table and through which plays the said arm, and the spring-latch applied to the guide-bar and adapted to hold the arm in such position as to retain the sheaf-carrier with its load in a horizontal position, substantially as set forth.

2. The combination of a sheaf carrier or tray, A, hinged to the binding-table B, a weighted arm, D, fixed to the sheaf carrier or tray, a guide-bar, E, fixed to the binding-table through which the arm plays, a latch, G *g*, mounted on and extending into said guide-bar and in the path of the movement of the said arm, a rod, H, connected to the latch, elbow-levers I K, fulcrumed on the harvester-frame, connections J L to the elbow-levers, and a treadle-bar, M, fitted to the harvester-frame and to which the cord or rod L is attached, substantially as described, for the purposes set forth.

382,405. STOCK-CAR. WILLIAM A. BERNARD and BENJAMIN W. RIDDICK, Danville, Va. Filed Sept. 1, 1887. Serial No. 248,503. (No model.)



Claim.—1. The combination, with a stock-car having a trough, J, and plugs Q at the ends of said car, of the pipe L, secured to the central portion of the bottom of the car, having cross feed-pipes L', with branch pipes L^2, extending upward and having bends *l*, project-

ing over the trough, and the coupling P, with hose attachment P' connected to pipe L, and said coupling P adapted to be connected to plugs Q, as shown and described.

2. A stock-car having each of its sides consisting of the beams E E', grooved pillars D, the bars F, seated in said grooved pillars and connected to the beams E E', the braces G, secured to beams E' and pillars D, the transverse bars H' H², and the doors C, as shown and described.

3. In a stock-car, the combination, with the beams E E', the grooved pillars D, the bars F, seated in said grooves of the pillars and connected to the beams E E', the braces G, secured to beams E' and pillars D, and the bars H' H², of the trough J, formed in one piece and connected to bars H' H², and the flanged shields K, secured to the trough and to the pillars, as shown and described.

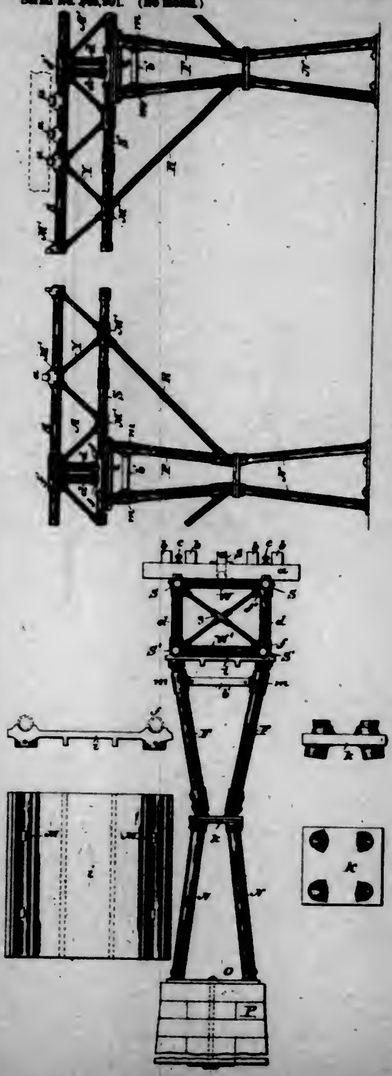
382,406. RUNNING-GEAR FOR VEHICLES. NICHLAS H. BLOCH and JOSEPH H. BLOCH, Charles City, Iowa. Filed Sept. 13, 1887. Serial No. 249,573. (No model.)

Claim.—1. The combination, with the rear axle and front bar, of the recessed side bars connected at their ends to said rear axle and front bar, and yielding cushions located in said recessed side bars at the points of connection to the rear axle and front bar, substantially as described.

2. The combination of the rear axle and front bar, the side bars, the bolts passing through the side bars to secure them to the rear axle and front bar, and the rubber cushions *f* between the said bolts, substantially as specified.

3. The improved reach herein described, consisting of a metal section of inverted-U shape and having integral vertical arms at its ends, substantially as described.

4. The combination, with the rear and front axles and front and side bars, of the hollow reach connected to the rear axle and having arms *i j* at its front end connected to the front bar and axle, substantially as described.



5. The combination, with the rear and front axles and side and front bars, of the fifth-wheel consisting of the upper and lower segmental plates, the latter having plate P bolted to the front axle, and a clip secured to said front axle and having bolts *s s*, forming the king-bolt, substantially as described.

6. The combination, with the rear axle, of the side bars bolted to the top side thereof, and yielding cushions between the axle and side bars at the point of intersection, as set forth.

7. In a running-gear, a hollow reach having its front end extended past the front axle and upward in front thereof to form a support for the fifth-wheel, as set forth.

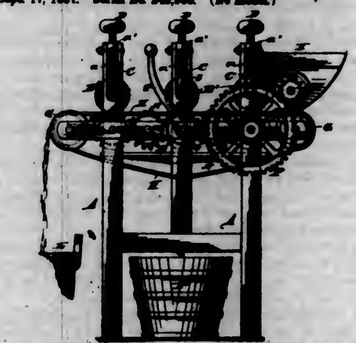
8. In a running-gear, a reach provided at its front end with integral diverging arms, one of said arms forming a support for the fifth-wheel and the other being adapted to be secured to the front bar of the gear, as set forth.

382,407. ELEVATED CABLE-MOTOR OR OTHER RAILWAY STRUCTURE. EUGENE P. BOYER, Philadelphia, Pa. Filed Aug. 12, 1887. Serial No. 246,901. (No model.)

Claim.—1. A supporting-column for an elevated structure, made in sections, each section consisting of two or more struts and rigid connections for the ends thereof of unequal length, giving to said section the form of a truncated triangle, substantially as set forth and described.

2. A supporting-column for an elevated structure, made in sections, each section consisting of two or more struts united near their ends by unequal rigid connections, said sections being connected to each other by their narrower ends, their wider ends forming the ends of the compound column, substantially as shown and described.

3. A support for an elevated structure, made in sections, each section consisting of four struts united to each other near their ends by unequal rigid connections, giving to said section the form of a truncated pyramid, said sections being superposed one upon another, with their smaller ends in juxtaposition, their larger ends forming the ends of the compound column, substantially as shown and described.



4. An elevated-railroad structure comprising the following mechanism: a track supporting tubular spans braced laterally, vertically, and diagonally, tubular supporting-columns having interposed plates between the lower ends of the upper columns and the upper ends of the lower columns, said plates being provided with means of securing the ends of said columns, all substantially as described.

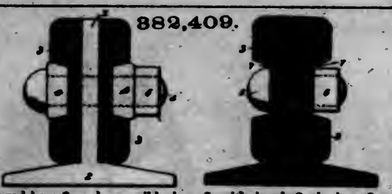
5. An elevated-railroad structure having tracks, tubular spans braced by tubular braces and sleeves, interposed plates between said spans and the upper ends of the columns, said plates having seats for the lower chords, and means of connecting them with the upper ends of said columns, substantially as set forth and described.

6. In an elevated-railway structure, the combination of a track and tubular spans, of supporting-columns made up in sections, the members of the upper section converging to an intermediate plate, the members of the lower section diverging to a base-plate, substantially as set forth and described.

7. In an elevated-railway structure of the character described, the combination of the chords thereof, and a sleeve provided with seats for cross-ties, and also means for securing braces thereto, substantially as set forth and described.

382,408. CIDER-MILL. CHARLES W. BOYLE, Bradley, Mich. Filed Sept. 17, 1887. Serial No. 249,998. (No model.)

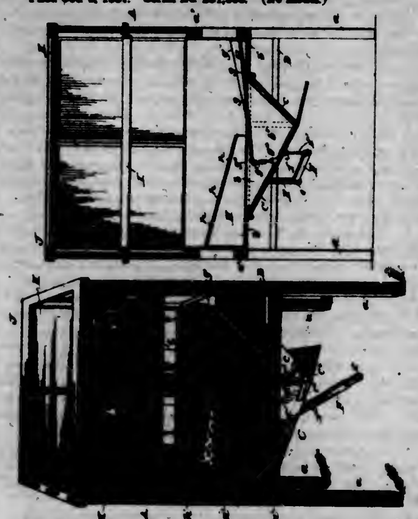
Claim.—1. The combination, in a cider-mill, of a frame, pairs of pressing-rollers journaled thereon, and an endless belt passed between the rollers, and the bed-rollers inclined toward one end to incline the belt to facilitate discharge of the juice, substantially as herein set forth.



2. The combination, in a cider-mill, of a frame, A, pairs of rollers B B', journaled thereon, and provided with gear-wheels O, shafts M, journaled on the frame, gear-wheels N on said shafts and meshing with the wheels O, springs arranged above the yielding bearings of the upper rollers, B', an apron, R, below the rollers, an endless belt, H, passed over guides and between the pressing-rollers, a hopper, I, opening to the belt, a cutter-head, J K, in the hopper, a gear-wheel, P, on the shaft of one of the rollers B, and a gear-wheel, R, on the cutter-head shaft, all arranged for operation, substantially as described, for the purposes set forth.

382,409. COMPOUND RAIL. EDWARD G. CHAMBERLAIN, San José, Costa Rica, Central America. Filed Nov. 26, 1887. Serial No. 256,193. (No model.)

Claim.—1. A compound railway-rail consisting of a central bar having a flanged base and side reversible bars bolted thereto, and having their lower edges resting entirely on top of the flanges of the central bar, the central and side bars having their upper edges worn to form the tread of the compound rail, substantially as shown and described.

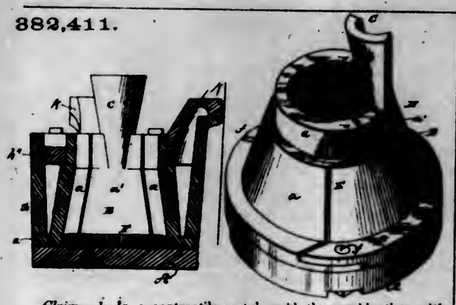


2. A compound railway-rail, consisting of central bar, 1, with

382,409.

flanged base 2, and reversible bars 3, with heads 3, the bars 3 and 1 forming a tread for the rail and bolted together, substantially as described.

382,410. SHELL-FISH REFRIGERATOR. HENRY C. CORNFORTH, Brooklyn, N. Y., assignor to himself and HENRY J. BECKMAN, same place. Filed Oct. 6, 1887. Serial No. 251,602. (No model.)



Claim.—1. A refrigerating-receptacle for shell-fish, consisting of a frame provided with a transparent top and inclosed by transparent doors, an ice-rack supported therein, a case beneath said rack having a central opening from which depend triangular side pieces, inclined platforms, one stationary and the other vertically movable in said case and projecting one over the other above said opening, an apron hinged to the movable platform, a triangular box in two parts hinged beneath said opening, one of said parts hinged to said apron and projecting beyond the other, and means for opening and closing said box, substantially as shown and described.

2. In a refrigerating-receptacle, the combination, with a frame having a transparent cover and inclosed by transparent doors, supporting within it an ice-rack, and a case having end ledges and a central bottom opening from which depend triangular side pieces, and a stationary and a movable inclined platform, projecting the one above the other over said opening, of a triangular box in two parts, having a pin-and-slot connection at their ends and hinged at their upper side edges beneath said opening, one of said parts projecting beyond the other, and means, substantially as shown and described, for opening and closing said box, for the purposes herein set forth.

3. In a refrigerating-receptacle, the combination, with a frame having a transparent cover and inclosed by transparent doors, supporting within it an ice-rack, and a case having end ledges and a central bottom opening from which depend triangular side pieces, a stationary and a movable platform, projecting the one above the other over said opening, and an apron hinged to the movable platform, of a triangular box in two parts having a pin-and-slot connection at their ends and hinged at their upper side edges beneath said opening, one of said parts being hinged to the lower edge of said apron and projecting beyond the other part, and means, substantially as shown and described, for opening and closing said box, for the purposes herein set forth.

382,411. METALLIC MOLD. PHILIP F. DILLON, Savannah, Ga. Filed Dec. 9, 1887. Serial No. 257,493. (Model.)

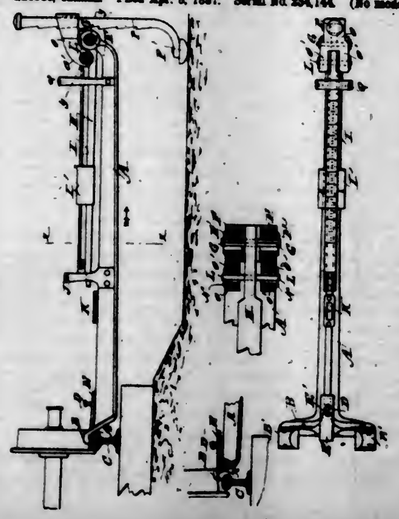
382,411.

Claim.—1. In a contractile metal mold, the combination, with the cheek of the contractile core and a contractile cope, substantially as described.

2. In a contractile metal mold, the combination of a core formed of segments *a a a'*, pivotally connected with the base, and the cope D, formed of segments *h h' h²* and connecting-pieces *i*, substantially as described.

3. The combination, with the contractile core B and contractile cope D, of the halves *b b'* of the gate, substantially as described.

4. In a metallic mold, the combination, with the cheek and cope, of the contractile core formed of segments *a a a'*, pivotally connected with the base, said segments formed with a rabbet, *c*, adapted for receiving the cope, substantially as shown.



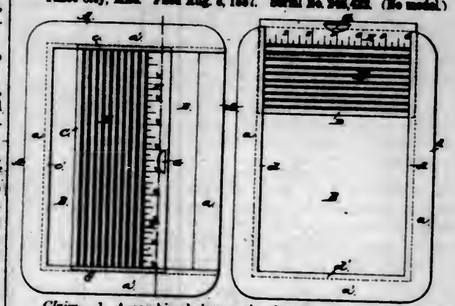
5. In a metallic mold, the combination, with the cheek and cope, of the contractile core formed of the segments *a a a'*, one end, E, of each segment extended so as to overlap the beveled free end of the adjoining segment, the extended end E, provided with an aperture to receive a pivot-bolt, *f*, the end of the adjoining segment provided with an elongated slot, and the bolt *f*, passing through said slot, whereby said segments are permitted to swing upon the bolts *f* when contracted, substantially as shown and described.

6. In a metallic mold, the contractile core composed of the sections *a a a'*, each section formed with a rabbet, *c*, and having one end, E, extended and provided with a bolt-hole and the other end extended and provided with an elongated bolt-opening, whereby the same may be adapted to swing upon the bolts *f*, as shown and described.

7. The combination, with the contractile core B, formed of segments *a a a'*, and a spring, F, arranged to press the segments of core outward, of the contractile cope D, substantially as shown and described.

8. In a contractile metal mold, the combination, with the cheek, of the contractile core provided with the gate portion *b'* of the gate C and a contractile cope provided with the portion *b* of the gate C, all arranged substantially as shown and described.

382,412. WEIGHING-SCALE FOR RAILWAY-CARS. ELOUILD DUPLESSIS, Lake Weedon, assignor to himself and John Roche, Quebec, Quebec, Canada. Filed Apr. 8, 1887. Serial No. 234,144. (No model.)

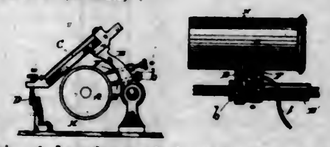


Claim.—1. In a weighing-scale, the combination of a lever provided with a cross-head at its inner end, a weighing-beam pivoted to the outer end of the said lever, a swinging block pivoted to said weighing-beam, and a support carried by said swinging block, substantially as described.

2. In a weighing-scale, the combination of a lever provided at its inner end with a cross-head having forwardly-extending projections, a weighing-beam pivoted to the outer end of the lever, an apertured swinging block pivoted to the weighing-beam a short distance from the pivoted end of said beam, and a ratcheted support working in the aperture of the said block, substantially as described.

3. In a weighing-scale, the combination of the lever A, provided with a cross-head, B, having the projections B' at its inner end and with the forked outer end, the beam H, pivoted between the forks of the said lever A, the graduated beam secured to the beam I, the equipoise I', sliding on the beam H, the apertured block O, pivoted to the beam H, and the ratcheted support P, provided with the foot P' and working in the aperture of the said block, substantially as herein shown and described.

382,413. COMBINED SLATE AND RULER. LOUIE M. DYER, Yazoo City, Miss. Filed Aug. 6, 1887. Serial No. 246,422. (No model.)



Claim.—1. A combined slate and ruler comprising a slate fitted in a frame which is provided with longitudinally and transversely ranging grooves next opposite faces, respectively, of the slate, and a ruler fitted in said grooves at each side of the slate, one ruler being arranged with a series of pencil-guiding slots ranging lengthwise of the slate and the other ruler provided with a series of pencil-guiding slots ranging crosswise of the slate, substantially as herein set forth.

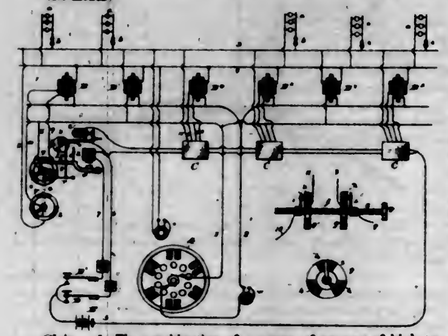
2. A combined slate and ruler comprising a frame, A, provided with a slate B, and having grooves *c c d d* at opposite bars and next opposite sides of the slate, and rulers C D, provided with pencil-guide slots E, and fitted in the grooves *c d*, respectively, substantially as described, for the purposes set forth.

3. A combined slate and ruler comprising a frame, A, provided with a slate, B, and having grooves *c c c'* and *d d d'* next opposite faces of the slate, and rulers C D, provided with pencil-guide slots E, and adapted to said grooves, substantially as herein set forth.

4. A slate provided with a frame having grooves formed in it at opposite faces of the slate proper, and said grooves opening at the side of the frame at one side of the slate and at the end of the frame at the other side of the slate, substantially as described, for the purpose set forth.

382,414. BURNISHING ATTACHMENT FOR PHONOGRAPHS. THOMAS A. EDISON, Llewellyn Park, N. J. Filed Nov. 26, 1887. Serial No. 256,190. (No model.)

Claim.—1. In a phonograph, the combination, with the phonogram-blank carrier adapted to carry a wax-surfaced blank, of a burnishing-tool mounted upon the machine in position to act on the wax surface of the blank, substantially as set forth.



2. In a phonograph, the combination, with the phonogram-blank carrier adapted to carry a wax-surfaced blank, of a heated burnishing-tool mounted upon the machine in position to act on the wax surface of the blank, substantially as set forth.

3. In a phonograph, the combination, with the phonogram-blank carrier adapted to carry a wax-surfaced blank, of a cutting-tool and a burnishing-tool mounted upon the machine in position to act in succession on the wax surface of the blank, substantially as set forth.

4. In a phonograph, the combination, with the revolving phonogram-cylinder and the traveling holding-arm, of the cutting-tool and the heated burnishing-tool moving with such traveling holding-arm, substantially as set forth.

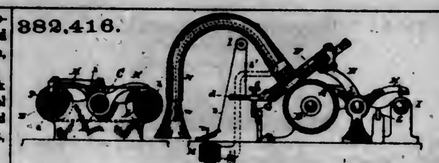
5. In a phonograph, the combination, with the phonogram-blank carrier adapted to carry a wax-surfaced blank, of a burnishing-tool mounted upon the machine in position to act on the wax surface, and electric-circuit connections for heating the tool by an electric current, substantially as set forth.

382,415. SYSTEM OF ELECTRICAL DISTRIBUTION. THOMAS A. EDISON, Llewellyn Park, N. J. Filed Dec. 27, 1887. Serial No. 258,141. (No model.)

Claim.—1. The combination of a source of current of high tension, a circuit extending therefrom, two or more tension-reducing converters having their primary circuits connected with said high-tension circuit, a translation-circuit supplying a variable number of translating devices, to which the secondary circuits of all said converters are connected, and switches for making and breaking the primary and secondary connections of individual converters, substantially as set forth.

2. The combination of a source of current of high tension, a circuit extending therefrom, two or more tension-reducing converters having their primary circuits connected in multiple arc with said high-tension circuit, a translation-circuit supplying a variable number of translating devices, with which the secondary circuits of all said converters are connected in multiple arc, and switches for making and breaking the primary and secondary circuits of individual converters, substantially as set forth.

3. The combination of a source of current of high tension, a circuit extending therefrom, two or more tension-reducing converters having their primary circuits connected with said high-tension circuit, a translation-circuit supplying a variable number of translating devices, to which the secondary circuits of all said converters are connected, and switches controlled from the central station or source of supply for making and breaking the primary and secondary connections of individual converters, substantially as set forth.



4. The combination of a source of current of high tension, a circuit extending therefrom, two or more tension-reducing converters having their primary circuits connected with said high-tension circuit, a translation-circuit supplying a variable number of translating devices, to which the secondary circuits of all said converters are connected, one or more separate circuits extending from the central station, electro-magnets energized thereby, and switches controlled by said electro-magnets for making and breaking the primary and secondary circuits of individual converters, substantially as set forth.

382,416. FEED AND RETURN MECHANISM FOR PHONOGRAPHS. THOMAS A. EDISON, Llewellyn Park, N. J. Filed Jan. 5, 1888. Serial No. 259,897. (No model.)

Claim.—1. In a phonograph, the combination, with the rocking holding-arm carrying the reproducer, of a revolving screw-shaft and

382,416.

an arm connected with the rocking holding-arm and engaging this screw-shaft when the rocking holding-arm is rocked to lift the reproducer from the phonogram, whereby the reproducer is retracted or set back, substantially as set forth.

2. In a phonograph, the combination, with the phonogram-cylinder, the lead-screw, and holding and guide arms, of a revolving screw-shaft having a screw of greater pitch than the lead-screw, and an arm engaging this screw-shaft when the guide-arm is raised from the lead-screw, substantially as set forth.

3. In a phonograph, the combination, with the phonogram-cylinder, the lead-screw, and holding and guide arms, of a revolving screw-shaft having a screw composed of a number of threads of greater pitch than the lead-screw, and an arm engaging this screw-shaft when the guide-arm is raised from the lead-screw, substantially as set forth.

4. In a phonograph, the combination, with the phonogram-cylinder, the lead-screw, the guide-sleeve, and the holding and guide arms, of the retracting-screw shaft and the arm engaging therewith fixed adjustably upon the guide-sleeve, substantially as set forth.

5. In a phonograph, the combination, with the phonogram-cylinder, the lead-screw, the guide-sleeve, and the holding and guide arms, of the retracting screw-shaft driven by a belt from the cylinder-shaft, and the arm engaging therewith fixed adjustably upon the guide-sleeve, substantially as set forth.

6. In a phonograph, the combination, with the rocking holding-arm, the lead and retracting screws, and the arms engaging such screws alternately, of a lever connected by an elastic lifting-cord with such rocking holding-arm to rock and set back the holding-arm, substantially as set forth.

7. In a phonograph, the combination with the rocking holding-arm carrying the reproducer or recorder, of an electro-magnet and armature acting to lift such arm and disengage the reproducer or recorder from the phonogram-surface, substantially as set forth.

8. In a phonograph, the combination, with the rocking holding-arm carrying the reproducer or recorder and the lead-screw, of an electro-magnet and armature acting to lift such arm, disengaging it from the phonogram and from the lead-screw, substantially as set forth.

9. In a phonograph, the combination, with the rocking holding-arm carrying the reproducer or recorder and the lead and retracting screws, of an electro-magnet and armature acting to lift such arm, disengaging it from the lead-screw and connecting it with the retracting-screw, substantially as set forth.

382,417. PROCESS OF MAKING PHONOGRAM-BLANKS. THOS. A. EDISON, Llewellyn Park, N. J. Filed Feb. 4, 1888. Serial No. 263,047. (No specimens.)

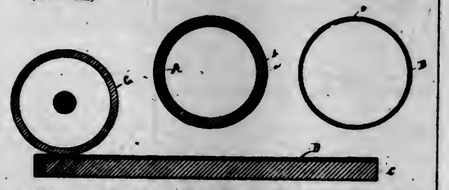
Claim.—1. The process of making wax phonogram-blanks, consisting in first molding the blank from melted wax and then pressing the blank in a polished die, substantially as set forth.

2. The process of making cylindrical wax phonogram-blanks, consisting in first molding the cylindrical blank from melted wax and then pressing the blank both externally and internally in a polished die, substantially as set forth.

382,418. PHONOGRAM-BLANK. THOMAS A. EDISON, Llewellyn Park, N. J. Original application filed Nov. 26, 1887, Serial No. 256,192. Divided and this application filed Mar. 2, 1888. Serial No. 265,999. (No model.)

Claim.—1. A phonogram-blank or phonogram having a bore tapered throughout its length, substantially as set forth.

2. A phonogram-blank or phonogram having a cylindrical recording-surface and a tapering bore, substantially as set forth.



3. A phonogram-blank or phonogram having a cylindrical record-

882,418.

ing-surface of wax or wax-like material and provided with a tapering bore, substantially as set forth.

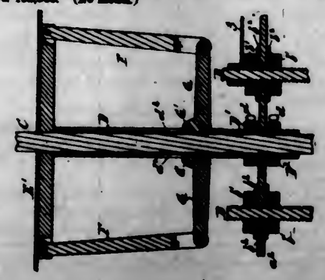
882,419. PROCESS OF DUPLICATING PHONOGRAMS. THOMAS A. EDISON, Llewellyn Park, N. J. Filed Mar. 8, 1888. Serial No. 266,594. (No model.)

Claim.—1. The process of duplicating phonograms, consisting in forming a kaurl having the original record in relief by depositing metal upon the original record, removing the original phonogram and opening the metallic coating, and then impressing duplicate phonogram-blanks with the original record by means of such kaurl, substantially as set forth.

2. The process of duplicating phonograms, consisting in depositing a flexible metallic coating upon an original cylindrical phonogram, removing the original phonogram from the inclosing-coating, splitting the inclosing-coating longitudinally, bending the same to form a kaurl, and then impressing the duplicate phonogram-blanks with the original record by means of this kaurl, substantially as set forth.

882,420. SECONDARY BATTERY. LUDWIG EPSTEIN, Marthafenfelde, near Berlin, Germany. Filed Feb. 18, 1887. Serial No. 228,092. (No model.) Patented in Germany Aug. 17, 1883, No. 27,675, and May 1, 1884, No. 30,264; in France June 13, 1884, No. 163,730; in Belgium June 13, 1884, No. 65,664; in England June 19, 1884, No. 8,195; in Italy June 30, 1884, XXXIV, 77, and in Austria-Hungary Nov. 11, 1884, XXXIV, 2,236, and XVIII, 2,194.

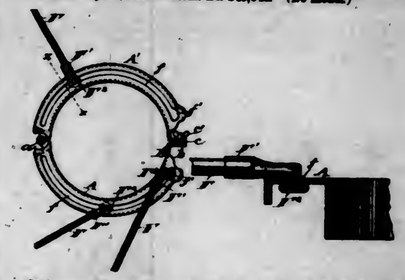
Claim.—1. The method herein described of preparing powdered lead for electrodes, consisting in adding sulphate of lead to molten metallic lead and stirring the liquid mass until it has been transformed into a finely-divided powder, as set forth.



2. The method herein described of making electrodes, consisting in reducing a powder of metallic lead and salt of lead to a paste and then compressing the mass and forming it into the desired shape.

3. The herein-described method of forming electrodes, consisting in reducing a finely-divided lead-powder into a paste, forming the mass into slabs, and finally uniting the slabs together by means of molten metal, as set forth.

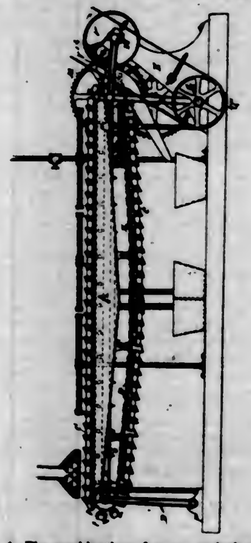
4. The method herein described of forming electrodes, consisting in reducing a finely-divided lead-powder into a paste, compressing the mass in a cake, cutting the cakes into notched or grooved slabs, and uniting the slabs together by means of molten metal, as set forth.



5. An electrode consisting of a series of bodies of metallic lead and sulphate of lead and a metallic uniting medium between the said bodies, substantially as described.

882,421. ELECTRIC-ARC LAMP. EDWARD H. FRENCH, Chicago, Ill., assignor to Charles K. Giles, same place. Filed Feb. 17, 1886. Serial No. 192,208. (No model.)

Claim.—The combination, with the carbon-supporting rod C, of the sleeve D, provided with adjustable stops or collars D' D², the gripping-levers G, pivoted to the said sleeve, the links F, pivoted to the gripping-lever, the armature, and the electro-magnet E, substantially as and for the purposes specified.



882,422. CLOTHES-DRIER. HERMAN RENTZ, Milwaukee, Wis., assignor to Harold G. Underwood, same place. Filed Mar. 17, 1885. Renewed Sept. 7, 1887. Serial No. 249,049. (No model.)

Claim.—1. In a clothes-rack, the circumferentially-slotted hinged sections in combination with arms having bent and headed ferrules, as set forth.

2. In a clothes-drier, the combination of the hinged sections, each section having a horizontal and a vertical flange, the latter to embrace the support of the drier, and the former provided with a circumferential slot extending continuously from end to end, with removable arms having ferrules bent at about a right angle, and provided with headed ends for engagement with the described slots, substantially as set forth.

882,423. ORE-WASHER. ARTHUR HENDEY, Denver, Colo., assignor to Christian Wahl, Milwaukee, Wis., and Louis Wahl, Chicago, Ill. Filed Mar. 16, 1887. Serial No. 231,133. (No model.)

Claim.—1. The combination of a progressively-moving endless series or apron of sluices, a reciprocating frame carrying said apron, pivoted links or frames supporting said sluice-frame from fixed points below, a shaft mounted in the frame-work concentric with the pivots of one pair of the links, a slow-down gear-connection between said shaft and a shaft of the endless apron for imparting the progressive movement to said apron, substantially as described.

2. The combination of an endless chain of sluices, a reciprocating frame for supporting said sluices, the rigid frames H H, adjacent to the reciprocating frame, distributing-gearing carried by frames H H, (consisting of main driving-shaft G, carrying pulleys H and R, the crank-shaft Q, carrying cranks V V, fast pulley P and loose pulley T, the shaft K, carrying pulley and pinion,) pitman W, for reciprocating the frame, and the train M, for moving the chain of sluices, substantially as described.

3. The combination of a progressively-moving endless series or apron of sluices, a reciprocating frame carrying said apron, pivoted links supporting said frame from fixed points below, a solid frame-work, H H, at one end thereof, devices, substantially as described, mounted in frame H H for reciprocating the sluice-frame, a shaft mounted in the frame-work concentric with the pivots of the links at that end, a slow-down gear-connection between said shaft and the shaft for imparting the progressive movement to the apron, substantially as described.

4. In a machine for washing ores, the combination of a reciprocating frame, the vertically-adjustable pendent bars or ways X X, supported by the frame, a series of sluices arranged transversely of said frame, endless chains and ways Y Y, fastened to said chains for connecting and carrying the series of sluices, as and for the purpose specified.

5. In a machine for washing ores, the combination of a reciprocating frame, the vertically-adjustable rods a a, mounted on said frame, and the flat bars or ways Z Z, mounted on said rods, as and for the purpose set forth.

6. In a machine for washing ores, the combination of a reciprocating frame having two diagonally-opposite corners higher than the other two, making a wind or twist in the frame, and an endless series of sluices mounted thereon, with the straight and offset castings c and d, connected with the alternate corners of the frame, substantially as described.

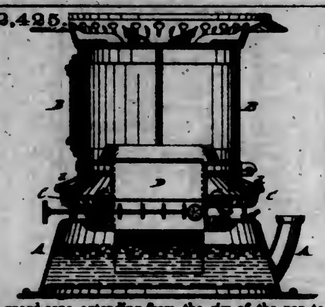
882,424. ROTARY VAPOR-ENGINE. ROBERT HAVEMS, San Francisco, Cal. Filed Nov. 19, 1887. Serial No. 255,669. (No model.)

Claim.—1. The generator having the annular chambers M M' and perforated diaphragm upon one side, valves by which vapor or gas under pressure may be admitted into the chambers from the generator, and a reactionary wheel journaled so as to rotate in close proximity with the perforated diaphragm, substantially as herein described.

2. The generator or boiler having the wheel-casing and perforated diaphragm upon one side, a wheel having concentric sets of buckets standing in opposition to each other, and corresponding annular chambers formed upon the back of the perforated diaphragm and communicating with the openings therein, in combination with the valves whereby the gas may be admitted into these annular chambers from the generator and thence delivered to either set of wheel-buckets, so as to drive the wheel in either direction, substantially as herein described.

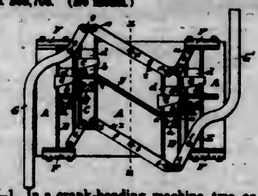
3. The reversible reactionary wheel consisting of the two sets of buckets set reversely to each other and concentrically, one set within the other, substantially as and for the purpose herein described.

4. The generator, wheel-case, perforated diaphragm, annular chambers, and double reactionary wheel, in combination with the discharge-pipe connecting with the wheel-case, and pipes leading therefrom to the generator furnace or furnaces and having controlling-valves, substantially as herein described.



5. The generator having the double reactionary wheel journaled within the wheel-case at one side, the annular chambers, and intermediate perforated diaphragm through which vapor under pressure may be discharged from the generator upon the wheel, in combination with the valves, valve-stems, and controlling hand-levers, substantially as herein described.

6. The generator having the furnaces and return-flues extending through it from one end to the other, having a double reactionary wheel contained within a wheel-case upon one of the sides, a double perforated diaphragm with annular connecting-chambers and controlling-valves, and a discharge-pipe connecting with the wheel-case and having pipes leading therefrom into the furnaces, substantially as herein described.



882,425. PETROLEUM COOKING-STOVE. FREDERIC HILDEBRANDT, New York, N. Y. Filed Feb. 21, 1887. Serial No. 228,260. (No model.)

Claim.—In a petroleum cooking-stove, the combination, with an oil-fount, of a pan supported on said fount and provided with side and bottom apertures, a detachable top part supported on said pan, and a closed guard-cone extending from the rim of the pan to the lower edge of the top part, substantially as set forth.

882,425.

882,426. CRANK-BENDING MACHINE. GEORGE H. HOWE, Hoosick Falls, assignor to James A. Bixby, Troy, N. Y. Filed Feb. 20, 1888. Serial No. 265,702. (No model.)

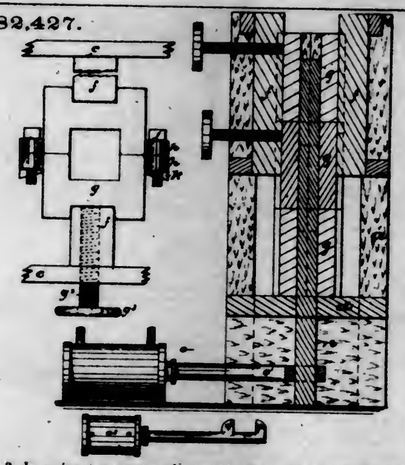
Claim.—1. In a crank-bending machine, two or more bars provided with clamping devices to hold transverse to the lengths of the bars the metal to be bent and linked together at their opposite ends, substantially as and for the purpose specified.

2. In a machine for bending cranks in bars, the combination of a fixed bar and a movable bar linked at or near both ends thereto, both bars provided with clamping devices to hold the bar to be bent transversely to the length of the clamping-bars, and means to swing the linked bar diagonally toward the fixed bar to form the crank, substantially as and for the purpose described.

3. In a crank-bending machine, the combination of a series of bars, each provided with a clamping device to hold the bar to be bent transverse to its length, said bars being linked together at their opposite ends and pivoted by links to the bed-plate of the machine, and means, substantially as described, for moving the crank-forming clamping-bars diagonally toward the pivot-points and the axial clamping-bars directly thereto, as and for the purpose set forth.

4. In a crank-bending machine, the combination of a series of parallel bars linked together at or near their opposite ends and pivoted by links to the machine, and provided with transverse clamping devices to receive the bar to be bent, and means for moving the crank-forming bars diagonally toward the pivots on the machine and the axial bars directly thereto, as and for the purpose specified.

5. The combination, in a crank-bending machine, of a series of parallel bars formed or provided with clamping devices to hold the bar of metal to be bent transversely to their length, said bars being linked together at or near their opposite ends and pivoted by links to the bed-plate of the machine, and the guides for guiding the movement of the axial clamping-bars perpendicularly toward the pivot-points, substantially as and for the purpose specified.



6. The combination of the perpendicularly-moving bars B and C, and the diagonally-moving bars C and D pivoted thereto and to each other at or near their opposite ends, said bars being provided with clamping devices to hold the metal to be bent transverse to their length, and all being pivoted by links to the bed-plate of the machine, substantially as and for the purpose specified.

882,427. INGOT-FORMING APPARATUS. JOHN ELDEWORTH, Newark, N. J. Filed Jan. 4, 1888. Serial No. 259,774. (No model.)

Claim.—1. In an ingot apparatus, the combination, with a frame-work having stripping-spaces n' and a covering-chamber, of a series of mold-sections, and holders adapted to be withdrawn from said sections to allow said sections to gravitate, and means for covering the ingot, said parts being arranged and combined substantially as set forth.

2. The combination, with a series of ingot-mold sections arranged vertically in line and adapted to be stripped from the ingot, of a step, d', for limiting the downward movement of the mold without limiting the movement of the ingot, and means for covering the stripped ingot, substantially as set forth.

382,427.

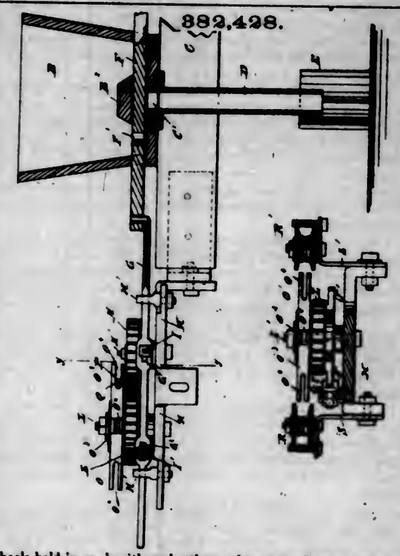
3. In an ingot apparatus, the combination, with a frame having suitable ways, *f*, and an apertured stop or flooring, *d*, of a series of molds and means for severing the ingot, substantially as and for the purposes set forth.

4. In an ingot apparatus, the combination, with a suitable frame having suitable ways, *f*, a fulcrum, and a mold-stop adapted to serve as a holder or bearing in severing the ingot and for limiting the downward progress of the mold, of said mold and means for severing the ingot, substantially as set forth.

5. In combination, in an ingot apparatus, a frame having holders for preventing downward movement, and a stripping-space, a stop, and means for severing said lower portion, substantially as set forth.

6. The combination, with a series of ingot-mold sections formed in part sections or halves, of a holder to retain certain upper sections of said series in an elevated position, while certain lower sections of said series are being stripped, and means for severing the bared portion of the ingot from the body portion, substantially as set forth.

7. In combination, a frame having a stripping-space and a severing-chamber below said stripping-space, suitable ways, *f*, for mold-sections, holders g^3, perforated flooring *d*, and severing means, substantially as set forth.



8. In combination, a frame, suitable ways, *f*, set-screws g^3, and a perforated flooring serving as a stop for limiting the gravitation of the mold-sections and as a passage for the ingot, and means for severing the ingot, substantially as and for the purposes set forth.

9. In an ingot-mold, the combination of a series of short mold-sections, a long mold-section, and a frame having a flooring adapted to allow the downward progress of the ingot but not the said mold-sections, substantially as set forth.

10. In an ingot apparatus, in combination, a frame having holders, a series of mold-sections adapted to be stripped from the casting and free to drop automatically into a stripping-space into engagement with a flooring or stop, and means for severing the stripped portion of the ingot, substantially as set forth.

382,428. CHECK-ROW ATTACHMENT FOR PLANTERS. ISAAC JACKSON, Kingman, Kans. Filed Feb. 20, 1883. Serial No. 265,702. (No model.)

382,428.

Claim.—1. In a check-row attachment for planters, the combination, with the seed-boxes and an apertured plate held to slide through the said seed-boxes, of a rod connected to the end of the said plate and provided with lugs, arms adapted to engage alternately the said lugs to impart a sidewise sliding movement to the said rod and plate, gear-wheels carrying the said arms and held in mesh with each other, and slotted arms secured to one of the said gear-wheels and adapted to be operated upon by the balls or knots of the check-row cord or wire, substantially as shown and described.

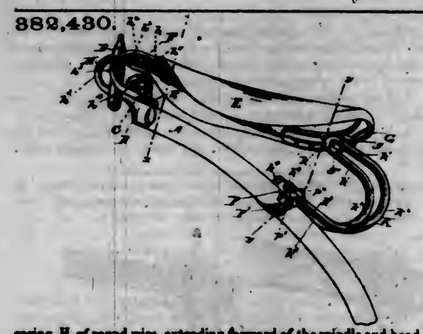
2. In a check-row attachment for planters, the combination, with the check-row rope or wire provided with balls or knots, of slotted arms adapted to be operated on by the said rope or wire, and two gear-wheels held in mesh with each other, one of the gear-wheels carrying the said slotted arms, one diametrical arm secured on each of the said gear-wheels and adapted to impart movement to the drop of the seed-boxes, substantially as shown and described.

3. In a check-row attachment for planters, the combination, with the check-row rope or wire provided with balls or knots, of slotted arms adapted to be operated on by the said rope or wire, two gear-wheels held in mesh with each other and one carrying the said slotted arms, one diametrical arm secured on each of the said gear-wheels, lugs operated on alternately by the said diametrical arms of the gear-wheels, a rod mounted to slide laterally and carrying the said lugs, and an apertured sliding bar connected with the said rod and operating transversely in the seed-boxes, substantially as shown and described.

4. In a check-row attachment for planters, the combination, with the check-row rope or wire provided with balls or knots, of slotted arms adapted to operate on the said rope or wire, two gear-wheels held in mesh with each other and one carrying the said slotted arms one diametrical arm secured on each of the said gear-wheels, lugs operated on alternately by the said diametrical arms of the gear-wheels, a rod mounted to slide laterally and carrying the said lugs, an apertured sliding bar connected with the said rod and operating transversely in the said box, and pulleys for guiding the said rope or wire to the said slotted arms, substantially as shown and described.

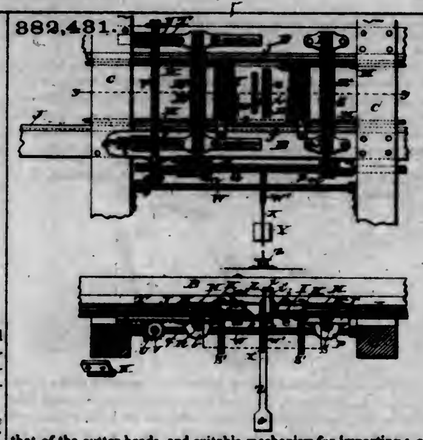
382,429. LASTING-TOOL. JOSEPH R. JACQUES, Hancock, Mich. Filed Feb. 14, 1888. Serial No. 263,904. (No model.)

Claim.—The herein-described lasting-tool, consisting of the handles A B, the downwardly-curved and corrugated jaws C D, the projection E on the jaw C, and the curved and corrugated lip H, pivoted between ears *b* on the jaw D, as specified.



382,480. VELOCIPEDE-SADDLE. JOHN KNOX, Hartford, Conn., assignor to the Pope Manufacturing Company, Portland, Me. Filed Nov. 25, 1887. Serial No. 256,020. (No model.)

Claim.—1. In a velocipede-saddle-supporting mechanism, an improved bifurcated vertical-action forward-extending front spring, H, of round steel rod or wire formed into a larger loop, A, for attachment to the flexible seat-piece, and a smaller loop, *k*, to fit upon and about the neck, and further constructed with two long arms, h^3, extending forward of the spindle and head, downward bends h^4, backward bends h^5, rests h^6, and short arms h^7, essentially as set forth.



2. In a velocipede-saddle-supporting mechanism, an improved independent bifurcated vertical-action backward-extending rear spring, K, of round steel rod or wire formed to a loop, *k*, for attachment to the saddle-piece, and further constructed with backward arms *k'*, downward bends k^3, forward arms k^4, and with the ends k^5, held in a movable clip-piece, as P, essentially as set forth.

3. An improved velocipede-saddle mechanism consisting in a flexible seat, E, loop F, a saddle-piece, G, a bifurcated vertical-action front spring, H, of round wire, extending forward of the spindle and head and supported by a pin, C, in the neck, and an independent bifurcated vertical-action rear spring, K, of round wire bent with nearly-parallel backward-extending arms held in a movable clip, as P P', on a perch, A, essentially as set forth.

382,430.

382,431.

382,431. MACHINE FOR MAKING EXCELSIOR. ADDISON M. LITTLE, Menasha, Wis. Filed May 28, 1887. Serial No. 239,680. (No model.)

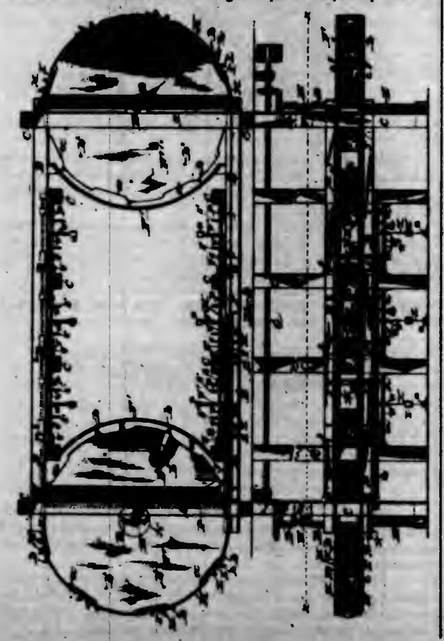
Claim.—1. In a machine for making excelsior, the combination of a series of feed-rollers arranged in pairs, the bearings for one roller in each pair being movable and those for the other stationary, a series of clamping-plates also arranged in pairs in front of the respective feed-rollers, and one plate in each pair having a movement that corresponds to that of said movable bearings, an endless carrier having a series of suitable cutter-heads mounted thereon, and suitable mechanism for actuating the carrier, substantially as set forth.

2. In a machine for making excelsior, the combination of a series of feed-rollers arranged in pairs, an endless carrier having a series of suitable cutter-heads mounted thereon, a flexible strip interposed between each two of the cutter-heads, and suitable mechanism for actuating the carrier, substantially as set forth.

3. In a machine for making excelsior, the combination of a suitable frame, revolvable drums mounted in the frame and having their peripheries provided with a series of depressions, an endless carrier arranged on the drums, a series of suitable cutter-heads mounted on the carrier and corresponding in contour with the depressions in said drums, a series of feed-rollers arranged in pairs in a plane parallel to that of the cutter-heads, and suitable mechanism for imparting a continuous motion to said carrier and an intermittent rotation to the rollers, substantially as set forth.

4. In a machine for making excelsior, the combination of a suitable frame, revolvable drums mounted in the frame and having their peripheries provided with a series of depressions, an endless carrier arranged on the drums, a series of suitable cutter-heads mounted on the carrier and corresponding in contour with the depressions in said drums, spurs projecting from the peripheries of the drums to come against the rear of the cutter-heads as the latter successively pass a given point, a series of feed-rollers arranged in pairs in a plane parallel to that of the cutter-heads, and a suitable mechanism for imparting a continuous motion to said carrier and an intermittent rotation to the rollers, substantially as set forth.

5. In a machine for making excelsior, the combination of a suitable frame, revolvable drums mounted in the frame, an endless carrier arranged on the drums and carrying a series of suitable cutter-heads, a driving-shaft geared to the drums, a disk fast on one of the drum-shafts and having a face thereof provided with a series of teeth arranged at an acute angle to its periphery, a transverse shaft carrying a pinion arranged to be actuated by said toothed disk, horizontal shafts geared to the transverse ones and provided with a series of worms, and feed-rollers having their bearings on the frame and provided with pinions that mesh with said worms, substantially as set forth.

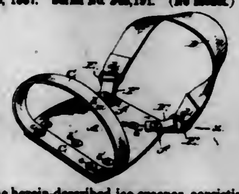


6. In a machine for making excelsior, the combination of a suitable frame, a series of feed-rollers having stationary bearings on the frame, rack-plates loosely arranged on said frame, another series of feed-rollers having their bearings on the rack-plates, vertical shafts carrying pinions arranged to mesh with said rack-plates, horizontal shafts geared to the vertical ones and severally provided with a disk, a weighted rope or chain arranged on each disk, a treadle connected to each rope or chain, an endless carrier having a series of suitable cutter-heads mounted thereon, and suitable mechanism for actuating the carrier, substantially as set forth.

7. In a machine for making excelsior, the combination of a suitable frame, a series of feed-rollers having stationary bearings on the frame, stationary clamping-plates arranged in front of said rollers, another series of feed-rollers and clamping-plates mounted on suitable carriages, suitable mechanism for automatically actuating the carriages in one direction and for imparting a reverse movement thereto at the will of the operator, an endless carrier having a series of suitable cutter-heads mounted thereon, and suitable mechanism for imparting a continuous movement to the carrier and an intermittent movement to the feed-rollers, substantially as set forth.

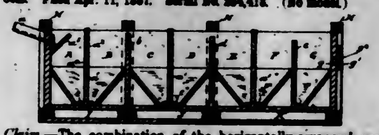
8. In a machine for making excelsior, the combination of a suitable frame, a series of feed-rollers arranged in pairs, inwardly-extended brackets secured to the frame between each pair of feed-rollers to support the blocks engaged by said rollers, an endless carrier having a series of suitable cutter-heads mounted thereon, and suitable mechanism for actuating said carrier and feed-rollers, substantially as set forth.

9. In a machine for making excelsior, the combination of a series of feed-rollers arranged in pairs, an endless carrier composed of two wire cables arranged on suitable drums, a series of heads having vertical slots and longitudinal grooves, clamping-plates having longitudinal grooves that unite with those in the heads to engage the chains or cables, a series of slitter-knives, and a single planer-knife secured to each head and extended through the slots therein, and suitable mech-



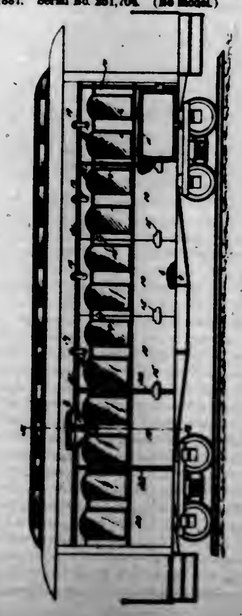
382,431.

anism for actuating said carrier and feed-rollers, substantially as set forth.



10. In a machine for making excelsior, the combination of a suitable frame having side timbers provided with grooved tracks, an endless carrier having a series of suitable cutter-heads mounted thereon, and each of said heads provided with flanges that engage said tracks, a series of feed-rollers arranged in pairs, and suitable mechanism for actuating said carrier and feed-rollers, substantially as set forth.

882,432. ICE-CREEPER. CHARLES J. LESS, Jamestown, N. Y. Filed Aug. 5, 1887. Serial No. 246,191. (No model.)



Claim.—The herein-described ice-creeper, consisting of the metallic plate A, provided with the spurs B, projecting from its under side, the toe-strap C, secured to the upper surface of the plate at the front edge thereof, the metal clips F, secured to the rear corners of the plate, and the elastic heel or back strap D, provided at its ends with the rings E, through which the clips pass and by means of which the band is secured to the plate, as specified.

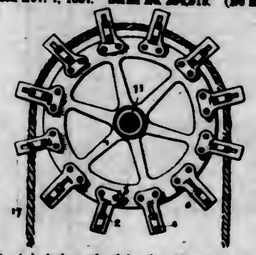
882,433. SLIMER AND SETTLER. THOMAS H. MINTER, Whitfield, Ohio. Filed Apr. 11, 1887. Serial No. 234,418. (No model.)

Claim.—The combination of the horizontally-arranged ore-settling chambers provided with exit-openings at the bottom, the horizontal frames H, supporting said chambers upon a common base, the receptacles formed in the said base below the chambers, the partitions *b d e*, diminishing in height from front to rear, the alternating partitions *a'*, and the adjustable partitions a^2, arranged over said partitions, so as to form adjustable openings a^4, substantially as and for the purpose set forth.

882,434. RAILWAY-CAR. HENRY HIRSCH, New York, N. Y. Filed Oct. 7, 1887. Serial No. 251,704. (No model.)

Claim.—1. The combination, with a railway-car frame, of side panels, means for connecting the adjacent edges of said panels, tongues arranged to enter recesses in the upper edges of the panels, and levers connected to the tongues, substantially as described.

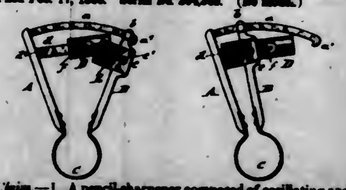
2. A detachable railway-car panel formed with a compartment in which a buoyant material is confined, substantially as described.



3. A detachable railway-car panel, in combination with an air-tight vessel or chamber fitted within said panel, substantially as described.

882,435. ATTACHING COULTERS. JOHN F. PARKER, Chicago, Ill., assignor to the David Bradley Manufacturing Company, same place. Filed Aug. 20, 1887. Serial No. 247,478. (No model.)

Claim.—The plate A, having on opposite sides a series of holes, *a*, in the arc of a circle, and provided with the hollow socket E, said socket having on its interior a groove, *b*, in combination with an eye-bolt, F, the body of which rests in said groove, and having a screw-threaded shank projecting through an opening in the socket and secured in place by a nut, and a standard, G, passing through the socket E and held therein by the eye-bolt F, the whole being secured to the plow-beam by bolts C D and plate B, substantially in the manner described, and for the purpose specified.



882,436. HOISTING-MACHINE. FREDERICK H. A. PETERS, Detroit, Mich. Filed Nov. 7, 1887. Serial No. 254,512. (No model.)

Claim.—1. A hoisting-wheel having its periphery provided with forked arms having longitudinal slots in the branches of the forks and containing slidable blocks or jaws mounted in the slots, substantially as shown and described.

2. A hoisting-wheel, 1, having the forked arms 2, with the slots 6 in the branches of the arms, and slidable blocks or jaws 4, with projection 5, mounted in the slots 6, and secured in place by plate 7 and screws 8, substantially as shown and described.

882,437. PENCIL-SHARPENER. PETER PETRY, Newark, N. J. Filed Feb. 17, 1888. Serial No. 264,368. (No model.)

Claim.—1. A pencil-sharpener composed of oscillating and spring-actuated handles, an inclined pencil-supporting tube attached to one handle, and an inclined cutting-knife attached to the other handle, substantially as set forth.

2. A pencil-sharpener composed of oscillating and spring-actuated handles, an inclined pencil-supporting tube attached to one handle and provided with an inclined side recess, and an inclined cutting-knife attached to the other handle, substantially as set forth.

3. The combination of two spring-actuated handles hinged at one end, a device for guiding said handles at the opposite end, a pencil-supporting tube attached to one handle, and an inclined knife attached to the other handle, substantially as set forth.

4. The combination of two handles connected by a hand-spring at one end, a guide and stop device at the other end of the handles, a pencil-supporting tube attached to one arm and provided with an inclined side recess, and an inclined cutting-knife attached to the other handle, substantially as set forth.

5. The combination of two oscillating and spring-actuated handles, a fixed guide-arm attached to one handle and provided with a stop at the outer end for the forked end of the other handle, a pencil-supporting tube attached by an arm to the first handle, and an inclined cutting-knife attached to the second handle, substantially as set forth.

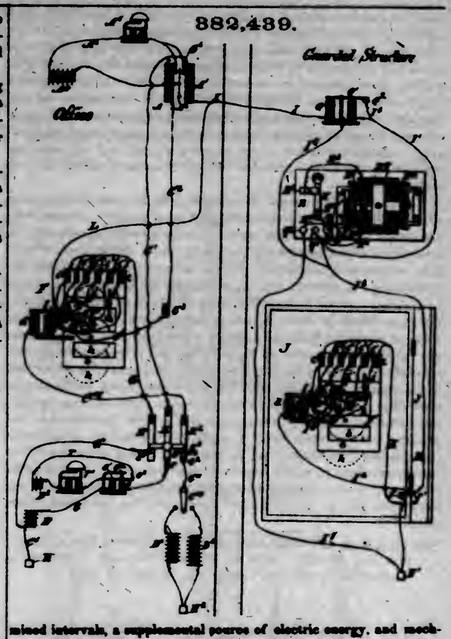
6. The combination of two oscillating handles, one of said handles being forked at the outer end, a hand-spring connecting the handles at one end, a fixed arc-shaped guide-arm attached to the opposite end of one handle, a stop at the outer end of said guide-arm, a pencil-supporting tube attached to one handle, and an inclined cutting-knife attached to the other handle, substantially as set forth.

882,438. LAND-MEASURING MACHINE. EDWARD ROBARDS, Stilesville, Ind. Filed Jan. 5, 1888. Serial No. 259,593. (No model.)

Claim.—1. The combination, in a land-measuring device, with the frame having a carrying-wheel secured at its front end, of a tripod mounted in rear of said wheel, having a rearwardly-inclined top for the reception of a compass or other instrument and the retention of said instrument in horizontal position when the machine is inclined or operated, substantially as set forth.

2. The combination, in a measuring device, with the frame, of an indicator provided at one side thereof, comprising a gear, a worm-shaft meshing therewith, and having an angular or pyramidal shaped inner end, a carrying-wheel provided with a scale at its outer edge, and mounted upon an axle having a recessed end corresponding to and adapted to engage the pyramidal end of the worm-shaft, substantially as set forth.

3. The combination, in a measuring device, with the frame, of a carrying-wheel mounted at the forward end thereof, and an indicator connected with said wheel and comprising a casing provided with a concentric scale, a gear seated therein, a worm-shaft mounted in said casing, and a pin engaging a circumferential groove in said shaft to prevent lateral displacement thereof, substantially as set forth.



4. The herein-described land-measuring device, comprising the frame, an indicator provided at one side thereof, and comprising a worm-shaft having a pyramidal-shaped end, a carrying-wheel having a circumferential scale, mounted at the forward end of the frame upon a shaft, said shaft having a recessed end corresponding to and engaging the pyramidal end of the worm-shaft, and a tripod having an inclined top mounted on the frame, said top being adapted to assume a horizontal position when the device is operated, substantially as set forth.

5. The herein-described land-measuring device, consisting of the frame, comprising two forwardly-convergent longitudinal beams, handles provided at the rear ends of the same, a rest, or support, near the rear ends of said beams, a tripod upon the beams, an operating-wheel having its axle removably secured in slots at the front end of the beams, the outer edge of said wheel being provided with a scale, a recess in the end of the axle, and an indicator comprising a worm pin or shaft, having a pyramidal or angular end engaging said corresponding recess, substantially as and for the purpose set forth.

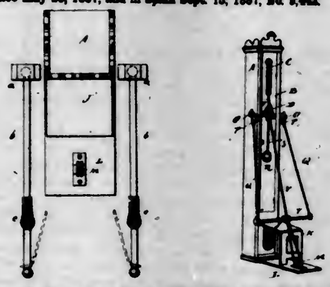
882,439. ELECTRIC BURGLAR-ALARM. HENRY G. ROSSE, Jersey City, N. J. Filed Sept. 16, 1886. Serial No. 243,603. (No model.)

Claim.—1. In an electric burglar-alarm comprising an internal circuit and an external circuit, the combination of a set of variable resistances in connection with the internal circuit, a set of variable resistances in connection with the external circuit, mechanism for varying the resistances in the internal and external circuits at predetermined intervals, a supplemental source of electric energy, and mechanism for throwing the supplemental energy into connection with the variable resistances at pleasure, substantially as set forth.

882,439.

2. In an electric burglar-alarm comprising an internal circuit and an external circuit, the combination of a set of variable resistances in connection with the internal circuit, a set of variable resistances in connection with the external circuit, mechanism for varying the resistances at predetermined intervals, a supplemental battery, a switch for throwing the supplemental battery into and out of connection with the variable resistances, and an alarm under the influence of the internal and external circuits, whereby attention is called to any disturbance in the resistances in the external circuits, substantially as set forth.

3. In an electric burglar-alarm comprising an internal circuit and an external circuit, the combination of a set of variable resistances in connection with the external circuit, and a set of corresponding variable resistances in connection with the internal circuit, mechanism for changing the resistances at predetermined intervals, a supplemental source of electric energy, means for throwing said supplemental energy into connection with the said variable resistances, a galvanometer or analogous device located under the influence of both the internal and external circuits and held normally in equilibrium thereby, and a compound key in connection with the internal and the external circuits, whereby the internal circuit may be broken when the supplemental electric energy is thrown into connection with the variable resistances, substantially as set forth.



4. In an electric burglar-alarm comprising internal circuits at the office and external circuits extending to and through guarded structures, the combination of a galvanometer or analogous device located at the office and connected with the external circuits for the purpose of giving alarm, a set of variable resistances in connection with one of the internal circuits, mechanism in connection with the set of variable resistances for successively introducing different resistances into one of the internal circuits, a corresponding set of variable resistances in each of the external circuits, mechanism for successively introducing different resistances into the said circuits, a supplemental battery, a switch to throw the supplemental battery into and out of connection with the set of variable resistances, switches for throwing any one of the galvanometers or analogous devices at the office out of its normal circuit and into the circuit comprising the supplemental battery, and a compound key for manipulating the several circuits, substantially as set forth.

5. In an electric burglar-alarm comprising internal circuits at the office and external circuits extending to and through guarded structures, the combination of a galvanometer or analogous device located at the office and connected with the external circuits for the purpose of giving alarm, a set of variable resistances in connection with one of the internal circuits, a train of wheels including a switch-wheel, and

controlling electro-magnet for throwing the variable resistances into and out of circuit, adjustable rheostats arranged in other internal circuits, a set of variable resistances in connection with each of the external circuits, a train of wheels including a switch-wheel, and a controlling electro-magnet, in connection with each of the external sets of variable resistances for throwing the different resistances into and out of circuit, and a system of switches and connections at the office, whereby the set of variable resistances at the office may be temporarily connected with any of the external circuits and subsequently replaced by the circuit provided with the rheostats, substantially as set forth.

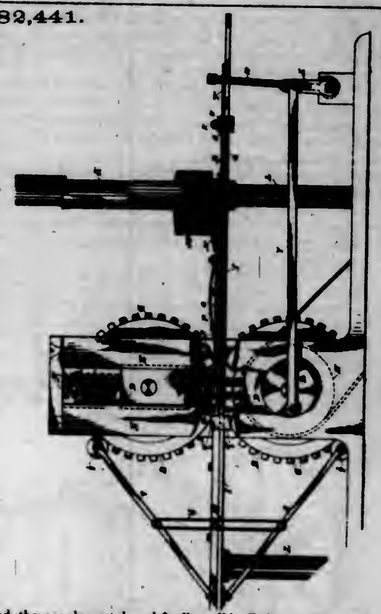
6. In an electric burglar-alarm comprising an internal circuit and an external circuit, the combination of a set of variable resistances in connection with the external circuit, mechanism for introducing the several resistances successively into the external circuit, a set of variable resistances in connection with the internal circuit, mechanism for introducing the different resistances successively into the internal circuit, a supplemental battery for setting in motion the aforesaid mechanisms, a switch for throwing said battery into and out of connection with the sets of variable resistances, a galvanometer or analogous device under the influence of the internal and external circuits, and adapted to give an alarm in the event of a change in the resistances of the internal and external circuits, a short-circuiting mechanism in connection with the external circuit, an electro-magnet having a polarized armature, a battery arranged to send an electric current in the opposite direction from the said supplementary battery, and connections leading from the magnet, having the polarized armature to the battery arranged to send a reverse current and to the set of variable resistances in the external circuit, whereby the said short-circuiting mechanism may be shunted out of its circuit by the watchman at the office.

382,440. EXERCISING-MACHINE. José Sanchis, Mexico, Mexico. Filed Dec. 26, 1887. Serial No. 259,280. (No model.) Patented in Mexico May 20, 1887, and in Spain Sept. 13, 1887, No. 9,462.

Claim.—1. In an exercising-machine, the combination, with an upright box having a hinged door on its front, said door being provided with two upright slots one above the other, of a weight guided in said box, a pulley in the top of the box, and a rope passed over said pulley and connected with the weight, substantially as herein shown and described.

2. In an exercising-machine, the combination, with an upright box, of a weight guided in the same, a pulley in the top of the box, a rope passed over said pulley, and a folding seat hinged to the front of the box at the bottom, substantially as herein shown and described.

3. In an exercising-machine, the combination, with an upright box, of a weight guided in the same, a pulley in the top of the box, a rope passed over said pulley and connected with the weight, levers pivoted on the floor at the sides of the base of the block, and ropes connecting said levers with the rope passed over the pulley in the box, substantially as herein shown and described.



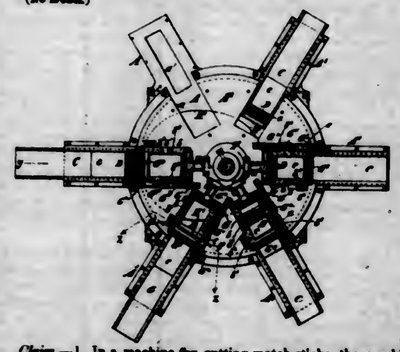
4. In an exercising-machine, the combination, with an upright box, of a weight guided in the same, a pulley in the top of the box, a rope passed over said pulley and connected with the weight, foot-levers pivoted on the floor at the sides of the base of the box, ropes connecting said foot-levers with the rope passed over the pulley in the box, and adjustable foot-rests on said foot-levers, substantially as herein shown and described.

382,441. WAD-PRINTING MACHINE. Phineas Smlly, Oakland, Cal. Filed Aug. 31, 1887. Serial No. 248,413. (No model.)

Claim.—1. The rotating rollers carrying the printing-dies and journaled one above the other, so that the dies shall print simultaneously upon both sides of the wad which passes between them, the wad reservoir or cylinder having a surrounding weighted shoe, N, the sliding table Q, and the supplemental wad-feeding slide R, substantially as herein described.

2. The wad-reservoir with its surrounding weighted shoe, the slide

382,441.



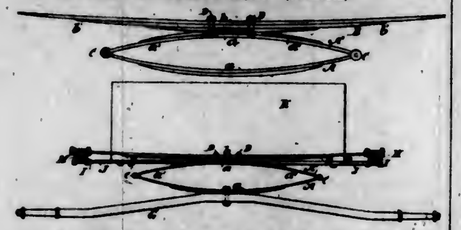
Q, and the supplemental wad-feeding slide R, having the slot S, and the bolt or pin V, whereby the slides may be adjusted with relation to each other, substantially as herein described.

3. The simultaneously-rotating printing-rollers journaled one above the other, the table extending between the two and having the movable slides Q and R, and the operating-levers, in combination with the wad-reservoir, the surrounding segmental shoe, the guides O, and the spring P, substantially as herein described.

4. The rotating printing-rollers, in combination with the inking-rollers adjustably supported, so as to press upon the printing-dies, and connected together by an elastic cord or band, substantially as herein described.

382,442. MACHINE FOR CUTTING MATCH-STICKS. William H. H. Smoe, Brooklyn, N. Y. Filed June 18, 1886. Serial No. 205,561. (No model.)

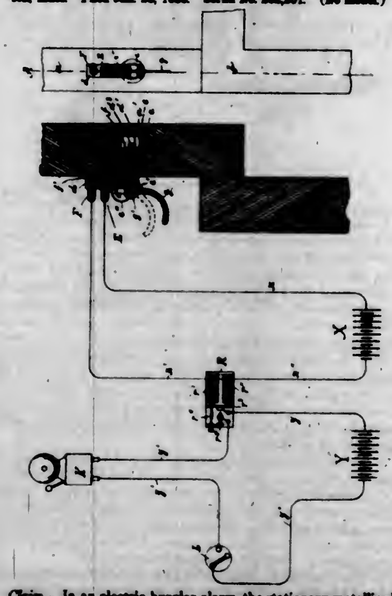
Claim.—1. In a machine for cutting match-sticks, the combination of a number of radially-reciprocating cutters operating to make cuts in one direction, mechanism, substantially such as described, for reciprocating the cutters successively beneath pieces of wood, and a revolving knife operating to make cuts in the pieces of wood at right angles to the other cuts, substantially as specified.



2. In a machine for cutting match-sticks, the combination of a platform, a number of radially-arranged slideways, slides carrying cutters arranged in said slideways and operating successively to make cuts in pieces of wood in one direction, and a revolving cutter operating to make cuts in the pieces of wood at right angles to the other cuts, substantially as specified.

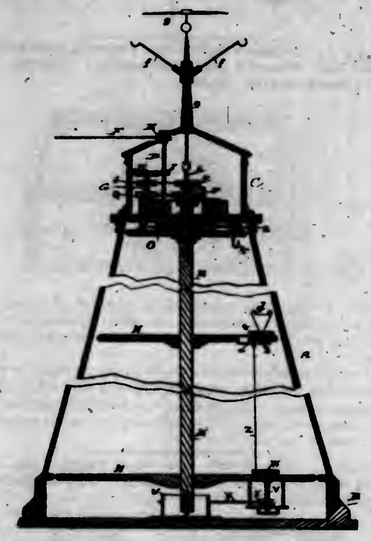
3. In a machine for cutting match-sticks, the combination, with a platform, of a number of radially-arranged slideways, open-bottom holders for blocks of wood, mounted on the platform above the slideways, mechanism for periodically feeding down the blocks of wood, slides sliding in said slideways, provided with rests onto which said blocks of wood are fed, and with cutters, said cutters operating successively to make cuts in the blocks of wood in one direction, and a revolving cutter operating to make cuts in the pieces of wood in a direction at right angles to the other cuts, substantially as specified.

4. In a machine for cutting match-sticks, the combination of a platform, open-bottom holders for blocks of wood, rollers arranged upon the holders for feeding the blocks of wood, mechanism comprising levers for operating the rollers, a cam for actuating the said levers, slides carrying cutters, an eccentric for actuating the slides, and a revolving knife, substantially as specified.



5. The holder B, comprising the sections *b b'* and the adjustable section *b²*, combined for use substantially as specified.

382,443. SPRING-VEHICLE. Edward Storm, Poughkeepsie, N. Y., assignor to the Edward Storm Spring Company, (Limited,) same place. Filed Oct. 31, 1887. Serial No. 253,353. (No model.)



Claim.—The combination, with the axle of a wagon or other vehicle and a body or side bars supporting a body, of an elliptic spring supported by the axle, and a semi-elliptic spring, one of said springs having a concave seat at the central portion conforming to the adjacent convex portion of the other spring, said springs extending transversely to the length of the body of the wagon or other vehicle, substantially as specified.

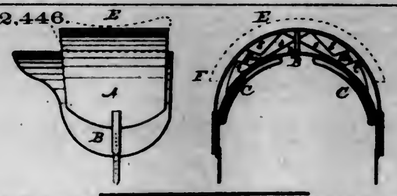
382,444. ELECTRIC BURGLAR-ALARM. George F. Tafe, Boston, Mass. Filed Jan. 23, 1886. Serial No. 209,201. (No model.)

Claim.—In an electric burglar-alarm, the stationary metallic ring or ferrule *c*, in combination with the detachable circuit-breaker, consisting of the non-conducting part *d d'*, the lever *g*, pivoted to it and normally held in metallic connection with the insulated binder-screw E and ferrule *c* by means of the spring *d'* and metal plate *e d'*, respectively, and the binder-screw F, metallically connected to said ferrule by means of the metal plate *f f'*, and wires leading from said binder-screws E F to a battery and electric alarm arranged in the circuit, as and for the purpose set forth.

382,445. REVOLVING SHOW-CASE. Charles H. Tully, Middletown, Ohio. Filed Aug. 26, 1887. Serial No. 247,883. (No model.)

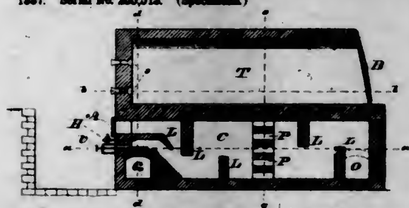
Claim.—1. The vertical central shaft and tables within the stationary outer case, the counter-shaft in the upper part of the structure and to one side of the central shaft, gears and pulleys carried by said shafts, whereby said central shaft is caused to rotate, an underlying disk supported and loosely journaled about the central axis, and pulleys by which it may be rotated in the opposite direction from this axis, in combination with a stationary pulley, R, in the upper part of the case and a belt extending from said pulley to a pulley, S, upon the shank of the hook T, whereby the latter will be rotated, substantially as herein described.

2. The stationary case, with the vertical central shaft and tables, mechanism whereby they are rotated, in combination with supplemental tables W and shafts V in the base of the case journaled around the periphery of the main tables and having pulleys upon the shafts, a stationary central drum, U, at the base of the central shaft, around which belts pass to the pulleys X, so that the latter and the tables W are caused to rotate, substantially as herein described.



3. The exterior case, with the vertical central rotating shaft and tables and gearing whereby it is driven, the supplemental tables upon the lower of the main tables, with their shafts, pulleys, and belts, whereby they are rotated, in combination with the shaft extending from the lower tables, W, through the upper tables, N, having gears *a* upon their upper end which engage with corresponding gears in the supplemental upper tables, *c*, whereby they are caused to rotate in opposite directions while being carried around by the main tables N, substantially as herein described.

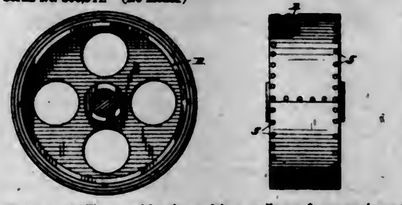
4. In combination with the stationary outer case, the interior revolving shafts and tables, and the pulleys, shafts, and gears by which they are driven, the vertical shaft extending upwardly from the roof of the structure, having the projecting arms *f*, with suspending hooks, and magnetic needle upon the vertex of the shaft *e*, said shaft being rotated in conjunction with the interior tables and mechanism, substantially as herein described.



382,446. SADDLE. David Univershee, Dayton, Ohio. Filed Jan. 28, 1886. Serial No. 261,293. (No model.)

Claim.—The elastic horse-saddle comprising the parts A and B, the longitudinal blocks *s s*, attached to the former, and the blocks *t t*, attached to the latter, with a series of intervening spiral springs, *v*, and means to retain these parts in a proper relation, substantially as set forth.

382,446.



382,447. PROCESS OF COATING IRON AND STEEL WITH RUST-LESS OXIDE. WILLIAM T. WELLS, Harlemmeck, N. J. Filed Nov. 14, 1887. Serial No. 255,513. (Specimens.)

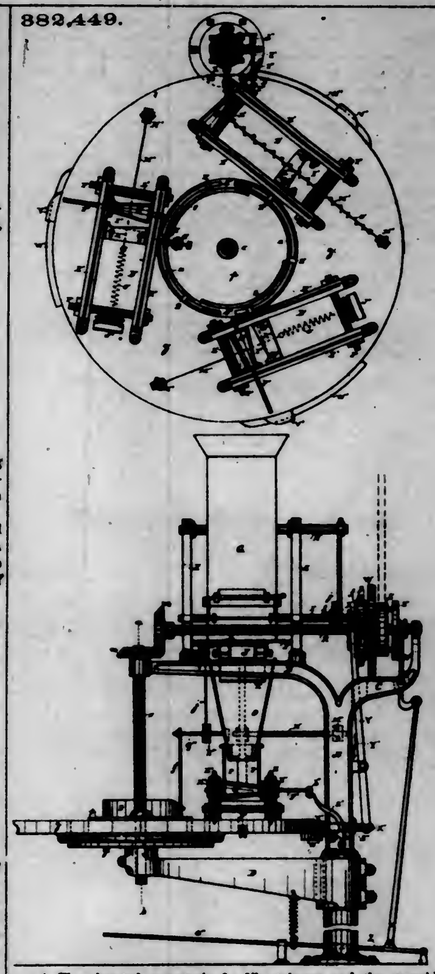
Claim.—1. The process, substantially as described, of protecting iron and steel articles from rust, which consists in subjecting such articles at a high temperature to the action of mingled steam and carbon monoxide.

2. The process, substantially as described, of protecting iron and steel articles from rust, which consists in subjecting such articles at a high temperature to the action of steam, then subjecting them to the action of carbon monoxide, and then subjecting them to the action of mingled steam and carbon monoxide.

382,448. BAND-PULLEY. JOHN WILEY, Fitchburg, Mass., assignor of one-half to Harold B. Eaton, same place. Filed Jan. 12, 1888. Serial No. 260,511. (No model.)

Claim.—1. The combination, with a pulley, of a covering of canvas and cement secured thereto, each layer of the covering being composed of a series of strips the adjoining ends of which overlap each other transversely to the face of the pulley.

2. The combination, with a pulley the rim of which is provided with a transverse row of holes, and also a row of holes along each of its edges, of a covering of canvas and cement secured to the face of the pulley, and rivets through said holes and covering.



382,449. CIGAR-BUNCHING MACHINE. JOHN R. WILLIAMS, Newark, N. J., assignor to the John R. Williams Company, New York, N. Y. Filed Dec. 28, 1887. Serial No. 259,199. (No model.)

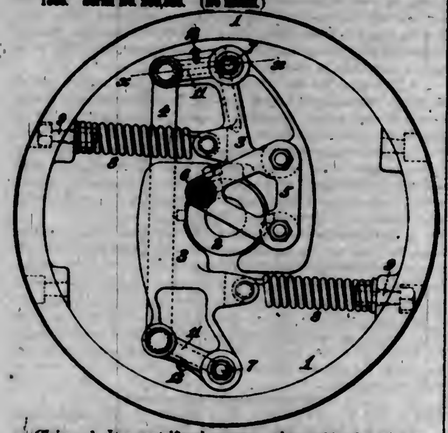
Claim.—1. The elevated receptacle for filler-tobacco, containing feed mechanism and the chute for conveying the charges of tobacco therefrom, combined with the rotating dial having an intermittent motion and carrying a series of rolling-tables, the reciprocating rollers for said tables, the rotary disk within said dial, connections between said disk and dial, whereby motion may be communicated from one to the other, and mechanism, substantially as described, for applying power, substantially as set forth.

2. The elevated receptacle for filler-tobacco and the movable chute for conveying the charges of tobacco therefrom, in combination with the rotary dial carrying the series of rolling-tables and rollers, the disk within the said dial, the series of projections K', connected with said dial, the arm Z', connected with said disk, and the arm adapted to engage the shafts of said rollers during the revolution of the dial, substantially as set forth.

3. The elevated receptacle for filler-tobacco and the movable chute for conveying the charges of tobacco therefrom, in combination with the rotary dial carrying the series of rolling-tables and rollers, the disk within said dial carrying the flanges f, and the arms f' and f'', for turning said chute upward at intervals, substantially as set forth.

382,449.

4. The elevated receptacle for filler-tobacco and the movable chute for conveying the charges of tobacco therefrom, in combination with the revolving dial having an intermittent movement and carrying the series of rolling-tables, the reciprocating rollers for each of said tables, and mechanism, substantially as described, for retaining the said rollers while the table is in motion, substantially as described.



5. The elevated receptacle for filler-tobacco and the movable chute for conveying the charges of tobacco therefrom, in combination with the revolving dial having an intermittent movement and carrying the series of rolling-tables, the reciprocating roller for said tables, an arm for retaining the said roller while the table is in motion, and mechanism, substantially as described, for retracting the said roller to the front end of the table after the bunch has been rolled, substantially as set forth.

6. The elevated receptacle having an intermittent feed and the movable chute for conveying the charges of the filler-tobacco therefrom, in combination with the revolving dial having an intermittent motion and carrying the rolling-tables, the inverted toothed guides on opposite sides of said tables, the reciprocating roller with its shaft and pinions for each of said tables, and an arm for retaining the said roller while the table is in motion, substantially as set forth.

7. The elevated receptacle having an intermittent feed and the movable chute for conveying the charges of tobacco therefrom, in combination with the revolving dial carrying the rolling-tables and reciprocating rollers, the arm for retaining said rollers in succession while the table is in motion, a cam for actuating said rod, an additional

cam on the dial, and intermediate mechanism, as described, for controlling the feed, substantially as set forth.

382,450. GOVERNOR. WILLIAM A. BELL, Pittsburg, Pa., assignor to the Westinghouse Machine Company, same place. Filed Jan. 16, 1888. Serial No. 260,933. (No model.)

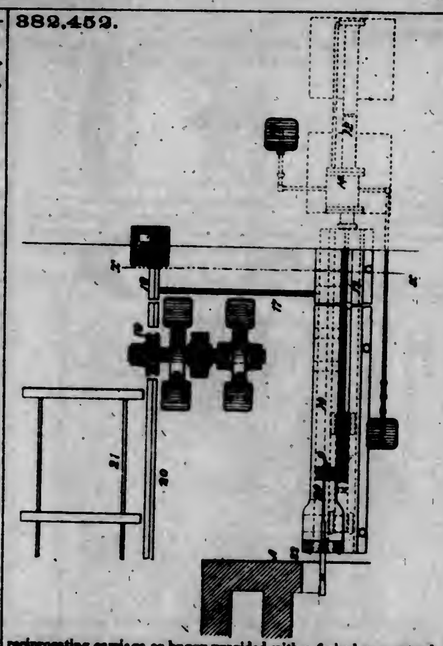
Claim.—1. In a centrifugal governor, the combination of a supporting-case, a weight or weighted arm pivoted thereto, and an oil-chamber fixed upon the weight and communicating with the bearing-surface of its pivot, substantially as set forth.

2. In a centrifugal governor, the combination of a supporting-case, a weight or weighted arm pivoted thereto, an oil-chamber fixed upon the weight and communicating with the bearing-surface of its pivot, and washers or packings fitting around said pivot at the ends of its bearing-surface, substantially as set forth.

3. In a centrifugal governor, the combination of a supporting-case, a pair of weights or weighted arms pivoted thereto, a link having end pivots fitting sockets in the weights, and oil-chambers fixed upon the weights and communicating with the bearing-surfaces of their pivots and of the pivots of the link, substantially as set forth.

382,451. CHAIN-COUPLING FOR STUMP-EXTRACTORS. WILBUR H. BARNES, Sheridan, Mich. Filed Dec. 15, 1887. Serial No. 257,926. (No model.)

Claim.—1. The combination, with the lifting-screw A, of the chain B and hook-link C, each secured to the end thereof, the hook D, having finger d', and a gravity catch-link, E, encircling said hook-link C and sliding longitudinally thereon and engaging with the finger of the hook D, substantially as described.



2. The combination, with the chain B, of the hook-link C, the hook D, and the catch-link E, having an outwardly-projecting lug, c, and fitted to slide upon said hook-link, substantially as described.

3. The combination, with the chain B, of the hook-link C, having outwardly-projecting shoulders c', the hook D, hinged to the end of said link, and the catch-link encircling said hook-link and adapted to move freely longitudinally and be held thereon by said shoulders, substantially as described.

382,452. PIPE-WELDING APPARATUS. THOMAS J. BRAY, Whitehall, W. Va., assignor of one-half to the Riverside Iron Works, same place. Filed Feb. 8, 1888. Serial No. 263,301. (No model.)

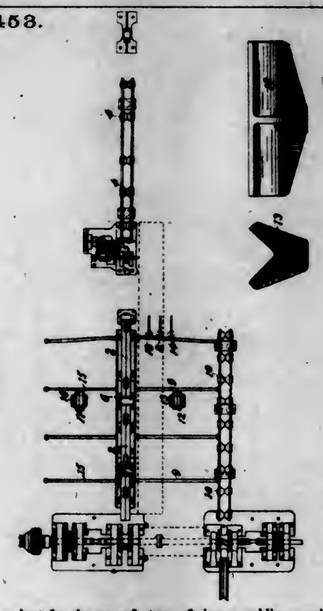
Claim.—1. In a pipe-welding apparatus, the combination of an inclined table, a welding-die located at the front end of said table, a

382,452.

reciprocating carriage or buggy provided with a forked arm extending over the table, and sizing-rolls for finishing and inclined bars for transferring the welded pipe from the table to a point in front of the sizing-rolls, substantially as set forth.

2. In a pipe-welding apparatus, the combination of a welding-die, a carriage or buggy provided with means for engaging the strip, a fluid-pressure cylinder and piston for operating the carriage or buggy, a valve mechanism controlling the admission and escape of fluid-pressure to and from the ends of the cylinder, and treadles located at or near the front and rear limits of the movement of the carriage or buggy for operating the valve mechanism, substantially as set forth.

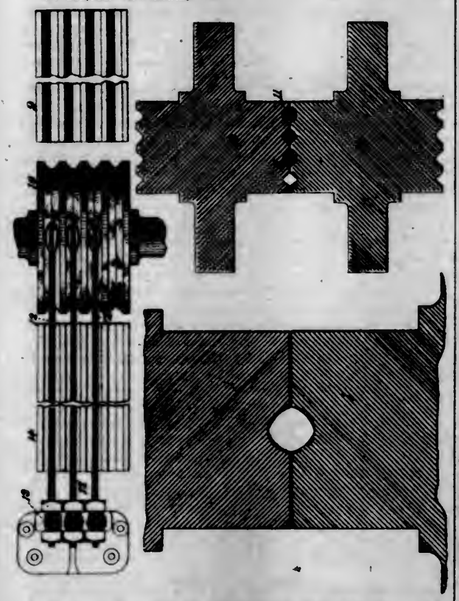
382,453. MECHANISM FOR THE MANUFACTURE OF PIPE. THOMAS J. BRAY, Wheeling, W. Va., assignor of one-half to the Riverside Iron Works, same place. Filed Feb. 3, 1888. Serial No. 263,007. (No model.)



Claim.—1. In a plant for the manufacture of pipe, a welding mechanism, in combination with a receiving-trough and a vertically-movable head for raising and discharging the pipe from the trough, substantially as set forth.

2. In a plant for the manufacture of pipe, a welding mechanism, in combination with a receiving-trough, skids located at one side of said trough, and a vertically-movable head for raising the pipe from the skids and reversing its position, substantially as set forth.

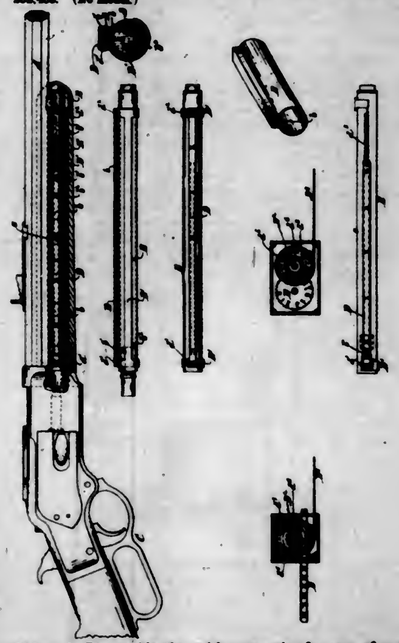
3. In a plant for the manufacture of pipe, a welding mechanism, in combination with a receiving-trough, skids located at one side of said trough, a vertically-movable head for raising the pipe from the trough and discharging it upon the skids, and a vertically and horizontally movable head for reversing the position of the pipe, substantially as set forth.



882,453.

4. In a plant for the manufacture of pipe, a welding mechanism, a sectional receiving-trough, and fluid-pressure mechanisms located between the sections of the trough and provided with heads having their upper faces inclined, substantially as set forth.

882,454. MECHANISM FOR THE MANUFACTURE OF ANGULAR TUBES. THOMAS J. BRAY, Wheeling, W. Va., assignor of one-half to the Riverside Iron Works, same place. Filed Feb. 3, 1886. Serial No. 262,906. (No model.)



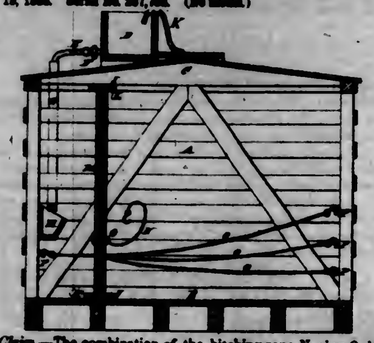
Claim.—1. In a plant for manufacturing polygonal tubes, a pair of welding-rolls having grooves formed therein, said grooves having their walls formed on arcs of circles of greater radii than the radius of the circumscribed circle, in combination with a welding-ball having a cross-sectional shape corresponding to the opening formed by the grooves of the welding-rolls, substantially as set forth.

2. In a plant for the manufacture of polygonal tubes, a pair of reversible reducing-rolls having a groove formed therein, said groove having its walls formed on arcs of circles of greater radii than the radius of the circumscribed circle, in combination with a ball or mandrel having a cross-sectional shape corresponding to the opening formed by the grooves in the rolls and tapering from the middle to its ends, substantially as set forth.

3. In a plant for the manufacture of polygonal tubes, a pair of reversible reducing-rolls having a groove formed therein, said groove having its walls formed on arcs of circles of greater radii than the radius of the circumscribed circle, in combination with a ball or mandrel having a cross-sectional shape corresponding to the opening formed by the grooves in the rolls and tapering from the middle to its ends, and one or more pairs of straightening-rolls grooved to correspond with the reducing-rolls and arranged on each side of the reducing-rolls, substantially as set forth.

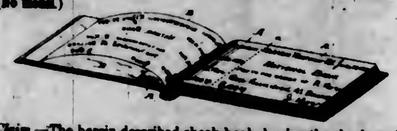
4. In a plant for the manufacture of polygonal tubes, a pair of reversible reducing-rolls having a series of grooves formed therein, the first of said series having its walls formed on arcs of circles of greater radii than the radius of the circumscribed circle, and the walls of each succeeding groove approximating more and more closely to plane surfaces so arranged as to form an opening or pass corresponding to the shape desired, in combination with a series of balls or mandrels tapering from their centers to their ends and shaped in cross-section to correspond to the openings formed by the grooves in the rolls, substantially as set forth.

882,455. CARTRIDGE FEED-INDICATOR FOR FIRE-ARMS. EDWARD S. BUTLER, New York, N. Y. Filed Mar. 26, 1887. Serial No. 232,483. (No model.)



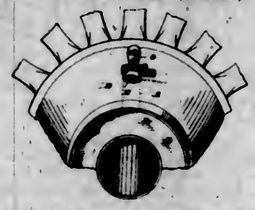
Claim.—1. The combination, with a magazine fire-arm, of an indicator bearing figures arranged upon one side of the magazine, a movable follower or pusher, and a tape or ribbon connected with the follower or pusher and serving to cause the display of the figures on the indicator successively, substantially as specified.

2. The combination, with a magazine fire-arm having its magazine provided with a longitudinal slot, of a strip bearing figures and connected through said slot to the follower or pusher of the magazine, substantially as specified.



3. The combination, with a magazine fire-arm having its magazine provided with a longitudinal slot, of a tape or ribbon bearing figures passing around guides and having its ends connected through the slot of the magazine to the follower or pusher of the magazine, substantially as specified.

882,456. STOCK-CAR. JAMES B. GALLION, Pontiac, Mo. Filed Mar. 19, 1888. Serial No. 267,762. (No model.)



Claim.—The combination of the hitching-rope N, ring O, hitching-post M, plank J, pipe E, stop-cock F, tarred-rope partitions Q Q Q, loading-gate R, with hinged section S, and loops T, all substantially as set forth.

882,457. CHECK-BOOK. ALEXANDER CARMICHAEL and SAMUEL D. TOURTELLOTTE, Westerly, R. I. Filed June 22, 1887. Serial No. 242,111. (No model.)

Claim.—The herein-described check-book, having the checks and stubs printed in copying-ink and comprising a number of leaves weakened at *a* and forming stubs A and checks A', and a number of sheets of prem-copying paper, B, alternated between said leaves and of equal size therewith, as and for the purpose specified.

882,458. AXLE-LUBRICATOR. WARREN COLE, Jr., Keokuk, Iowa. Filed Nov. 17, 1886. Serial No. 219,126. (No model.)

Claim.—1. In a lubricator, a forcing-plunger provided with a laterally-extending locking-handle secured to its head, substantially as set forth.

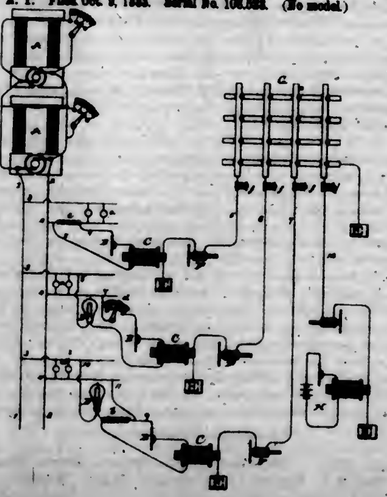
2. In a lubricator, the combination, with a lubricant-tube adapted to be inserted in a hub, of a plunger having a laterally-extending handle secured to its head and a spring-catch adapted to hook the plunger in the tube, substantially as set forth.

3. In a lubricator, the combination of an externally-threaded tube adapted to be screwed into a hub, a forcing-plunger to be inserted and locked in said tube, a flange on the upper end of said plunger, a laterally-extending locking-handle secured to said flange, and a hook-shaped catch located on the hub, so that the locking-handle can be swung into the hook portion of the same, substantially as described.

4. In a lubricator, a lubricant-tube having the same external diameter and a continuous thread from end to end and located in a hub, so that its inner end will be flush with the interior surface of the box and its outer end flush with the exterior surface of the hub, the upper end of the interior of said tube being rabbeted out, the interior surface of said rabbeted portion and tube being smooth and free from projections, a solid plunger provided with an enlargement at its upper extremity, the exterior surface of said plunger and enlargement being smooth and the diameters of the same being such that they will fill and be able to freely slide within said tube and rabbeted portion, a flat flange upon the upper end of the plunger to fit over the upper end of said tube, and a spring-actuated locking device, whereby when the plunger is forced home it can be locked in position by a slight lateral turn of the same, substantially as described.

882,459. BOTTLE-STOPPER. JOSEPH OSBORN, New York, N. Y. Filed Feb. 20, 1888. Serial No. 264,680. (No model.)

Claim.—The combination of rigid stem *a*, carrying conical valves *a'*, with perforated flexible packing *b*, having rounded surfaces, and with the flexible tubular projections *b'*, extending from opposite sides of packing *b*, and made in one piece therewith, the tubular projections *b'* having conical valve-seats, substantially as specified.



882,460. FOLDING BED. GEORGE W. OSER, Chicago, Ill., assignor to Myra J. Hoover, same place. Filed Jan. 24, 1887. Serial No. 225,204. (No model.)

Claim.—1. The combination, in folding beds of the class herein shown, having the sliding back or head-board Q, of the chain or cable E, one end of which is permanently attached at the bottom of the frame K, the other end attached to the top of said head-board, the lever B, pivoted to the support H and provided with the pan A for holding weights *a'*, and the purchase-bearing sheaves C C, pivoted to said lever and arranged to revolve against said cable, all substantially as set forth.

2. In a folding bed, the combination of the stationary section provided with the support-piece H, the weighted lever B, pivoted to said support and provided with the sheaves C C on the short arm thereof, the folding section of the bed pivotally attached to the stationary section having the sliding head-board, and the cable E, running between the sheaves C C and having one end attached to the bottom of the stationary case and the other end to the sliding head-board, substantially as described.

882,461. TELEPHONE SYSTEM. RICHARD H. DYER, New York, N. Y. Filed Oct. 9, 1883. Serial No. 108,263. (No model.)

Claim.—1. The combination, with two or more telephone-transmitters and induction-coils through which the transmitters are connected with the telephone-line, of a current-supplying circuit extending to said two or more telephone-transmitters and independent multiple-arc connections between each transmitters and said current-supplying circuit, substantially as set forth.

2. The combination, with two or more telephone-transmitters and induction-coils through which the transmitters are connected with the telephone-line, of a current-supplying circuit extending to said two or more telephone-transmitters, one or more dynamo-electric machines generating current in said supply-circuit, and independent multiple-arc connections between each transmitters and said current-supplying circuit, substantially as set forth.

3. The combination, with two or more telephone-transmitters and induction-coils through which the transmitters are connected with the telephone-line, of a current-supplying circuit extending to said two or more telephone-transmitters, two or more dynamo-electric machines generating current in said supply-circuit and acting to neutralize their individual vibrations, and independent multiple-arc connections between each transmitters and said current-supplying circuit, substantially as set forth.

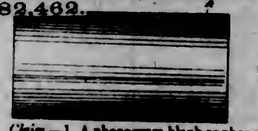
4. The combination, with two or more telephone-transmitters and induction-coils through which the transmitters are connected with the telephone-line, of a current-supplying circuit extending to said two or more telephone-transmitters and formed by the conductors of a multiple-arc system of electrical distribution, and independent multiple-arc connections between each transmitters and said current-supplying circuit, substantially as set forth.

5. The combination, with a supply-circuit—such as an electrical-distribution system common to a number of telephone-transmitters and having a higher electro-motive force than is required for operating the telephones—of two or more telephone-transmitters, independent multiple-arc connections from such supply-circuit to said transmitters, and resistances or other current-reducing devices located in or forming part of such connections and acting to reduce the current passing through the transmitters, substantially as set forth.

6. The combination, with a dynamo-current supplying-circuit common to a number of telephones, of two or more telephone-transmitters connected in multiple arc with said supply-circuit, and an electrical accumulator for each transmitter located between the supply-circuit and the transmitter, said accumulator being charged from the supply-circuit and discharging in the transmitter-circuit to maintain the current uniform in the latter, substantially as set forth.

7. The combination, with a dynamo-circuit, of telephones connected therewith and signaling devices also connected with said dynamo-circuit, substantially as set forth.

8. The combination, with a dynamo-circuit, of telephones connected therewith, signaling devices also connected with said dynamo-circuit, and resistances whereby greater energy is diverted from said dynamo-circuit for signaling than for the transmission of articulate speech, substantially as set forth.



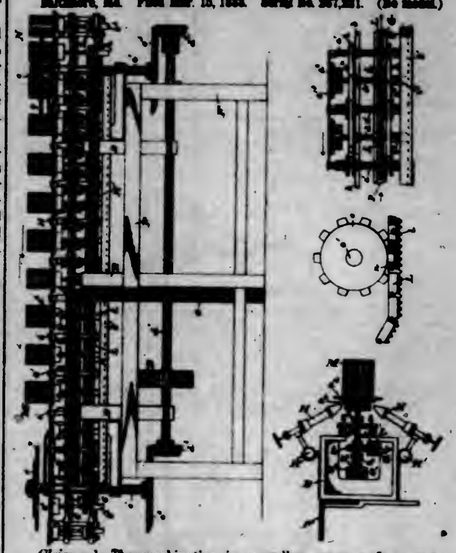
9. In a telephone system, the combination, with a current-supplying circuit, of a telephone-transmitter and induction-coil connected with said circuit, and a connection from such supply-circuit to the telephone-line through a circuit-controller for producing signals, whereby the telephone and signal devices are both operated from the same source of electrical energy, substantially as set forth.

10. In a telephone system, the combination, with a current-supplying circuit, of a telephone-transmitter and induction-coil connected with said circuit, and a connection from such supply-circuit to the telephone-line through a circuit-controller for producing signals, such connections with the supply-circuit having a multiple-arc relation, substantially as set forth.

11. In a telephone system, the combination, with a telephone-line, a telephone-transmitter, a telephone-receiver, an induction-coil, and a signaling-bell, of a current-supplying circuit, a connection from such supply-circuit to the telephone-transmitter and induction primary, another connection from the supply-circuit through the bell, a circuit-controller in the latter connection for producing signal impulses, and a switch alternately shifting the line-connection from the telephone-receiver to the bell, substantially as set forth.

12. In a telephone system, the combination, with a telephone-line, a telephone-transmitter, a telephone-receiver, an induction-coil, and a signaling-bell, of a current-supplying circuit, a connection from such supply-circuit to the telephone-transmitter and induction primary, another connection from the supply-circuit through the bell, a circuit-controller in the latter connection for producing signal impulses, and a switch alternately shifting the line-connection from the telephone-receiver to the bell and opening and closing the connection from the supply-circuit to the telephone-transmitter, substantially as set forth.

382,462. PHONOGRAM-BLANK. THOMAS A. EDISON, Llewellyn Park, N. J. Filed Jan. 6, 1888. Serial No. 259,866. (No model.)



Claim.—1. A phonogram-blank or phonogram constructed wholly of wax or wax-like materials and having the same coefficient of expansion throughout its mass, substantially as set forth.

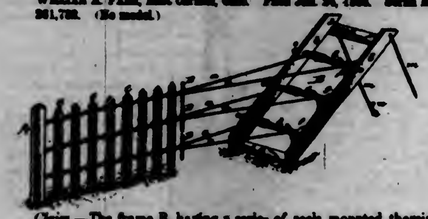
2. A phonogram-blank or phonogram constructed as a hollow cylinder wholly of wax or wax-like material and having the same coefficient of expansion throughout its mass, substantially as set forth.

3. A phonogram-blank or phonogram constructed as a hollow cylinder, with a tapering bore wholly of wax or wax-like materials, and having the same coefficient of expansion throughout its mass, substantially as set forth.

382,468. CAN-SOLDERING MACHINE. WILLIAM M. REHARE, Baltimore, Md. Filed Mar. 15, 1888. Serial No. 267,321. (No model.)

Claim.—1. The combination, in an endless conveyer for a can-soldering machine, of the jointed sections having top and bottom links, a revoluble spindle, *d*, which has bearing in both the top and bottom links, and a can-seat, a^6, on the upper end of the spindle and above the said top link.

2. The combination, in an endless conveyer for a can-soldering machine, of the jointed sections having top and bottom links, the said bottom links having on their lower sides a central boss, b^3, a revoluble spindle, *d*, which has its lower end stepped in said boss, a can-seat on the upper end of the spindle, two upper guide-bars, *b*, and a lower guide-bar having a groove in its top to receive the said bosses.



3. The combination, in a can-soldering machine, of the endless conveyer composed of jointed sections, each having a top and bottom link, a revoluble can-seat spindle which has bearing in both the said top and bottom links and is provided intermediate of its said bearings with a pinion, *k*, and an endless chain engaged with the said pinion, as shown and described.

4. The combination, in a can-soldering machine, of the endless conveyer composed of jointed sections, each having a top and bottom link, a revoluble can-seat spindle which has bearing in both the said top and bottom links and is provided intermediate of its said bearings with a pinion, *k*, an endless chain, each link of which has on one side cog-teeth *l* and on the opposite side a socket, *n*, and a sprocket-wheel, *o*, as shown and described.

5. The combination, in a can-soldering machine, of the endless conveyer composed of jointed sections, each having a top and bottom link, a revoluble can-seat spindle which has bearing in both the said top and bottom links and is provided intermediate of its said bearings with a pinion, *k*, upper guide-bars, *b*, a lower guide-bar, *b'*, a chain-guide located between the said upper and lower guide-bars, and an endless chain movable along said chain-guide and engaged with the pinions, as shown and described.

6. The combination, in a can-soldering machine, of a conveyer having revoluble spindles *d*, and a can-seat having two crossed bars, a^5, radiating from a hub which is attached to the said spindle, and an open cylindric shield, a^4, attached to said crossed bars and depending from them and surrounding the upper end of the spindle, which latter is thereby protected from the flame, as shown and described.

382,464. TENSION DEVICE FOR USE IN MAKING FENCES. WILLIAM A. FARR, East Cornwall, Ohio. Filed Jan. 24, 1888. Serial No. 261,722. (No model.)

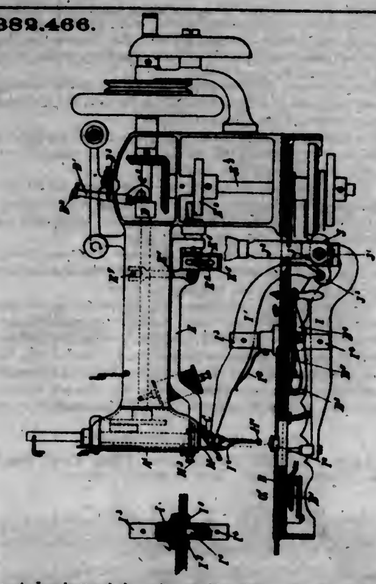
Claim.—The frame B, having a series of reels mounted therein, provided with hubs adjacent to one side of the frame, in combination with levers attached to the frame and one end thereof bearing upon the hubs, and links for securing the levers, substantially as described.

382,465. TUNING-PIN FOR STRINGED INSTRUMENTS. LARS LARSEN PETERSEN, Ravenswood, and GERRIT VAN LAMPE, Chicago, Ill. Filed Jan. 31, 1888. Serial No. 262,924. (No model.)

Claim.—1. In a key for the purpose set forth, the combination of the loose flange or collar having an angular opening with the spindle having an angular portion passing through said flange or collar and provided with a spool beyond the same, substantially as described.

2. A key for the purpose set forth, provided with two independent and oppositely-arranged cylindric bearing portions, each having an annular flange or shoulder and both forming conjointly that portion of the key that enters and turns within a hole through one of the sides of the instrument-seek, combined with the spindle passing through one cylindric bearing portion and fitted in a bore of the opposite cylindric bearing portion, and the adjusting-screw engaging in a threaded socket in the spindle, said two cylindric bearing portions being keyed upon the spindle, whereby a rotation of the spindle shall turn both cylindric bearing portions, said spindle, which is prevented from rotation independently of the bearing in which it enters, being adjustable endwise therein, whereby the screw can be turned to draw the two shoulders or flanges against the opposite faces of one of the side walls of the instrument-seek, substantially as described.

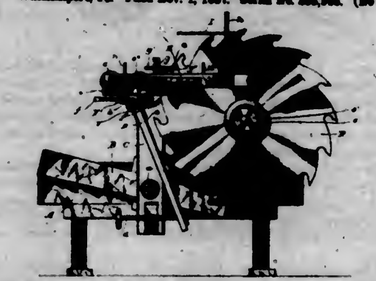
3. The combination, with the spindle B, of the flanged collar E, loosely fitted upon a squared portion of the spindle, the bearing-piece C, provided with a flanged cylindric bearing portion, and having a socket in which a portion of the thumb-piece is fitted, and the adjusting-screw F, engaging the spindle, substantially as described.



382,466. BUTTON-HOLE SEWING-MACHINE. JOHN S. PRESSE, Brooklyn, N. Y. Filed Oct. 28, 1886. Serial No. 217,574. (No model.)

Claim.—1. In a button-hole sewing-machine, a bed-plate having the slot G^2 partly straight and partly curved, as shown, a feed-wheel having the cam-groove G' and peripheral ratchet-teeth, a cloth-plate having a stud fitted in said slot of feed-plate to engage said groove of the feed-wheel, a spring-pawl engaging said teeth of the feed-wheel, a lever carrying said pawl, and a stop-lever adapted to engage with the feed-wheel, substantially as and for the purpose described.

2. In a button-hole sewing-machine, a cutting attachment composed of the levers I I', having return-springs and forming a cutting device, an operating-cam, J, constructed to engage both of said levers simultaneously by bearing against the tail end of the lower lever with its face and pulling the tail end of the upper lever by means of the hook J^3, and a handle, J^4, mounted on the cam-shaft, substantially as and for the purpose described.



3. In a button-hole sewing-machine, a cutting attachment composed of levers I I', one carrying a cutter and the other a block and meeting from opposite sides, an operating-cam, J, constructed to engage both of said levers simultaneously by bearing against the tail end of the lower lever with its face and pulling the tail end of the upper lever by means of the hook J^3, and a handle, J^4, mounted on the cam-shaft, in combination with a feed-wheel having an opening for the passage of said cutters, substantially as herein described.

382,466.

4. In a button-hole sewing-machine, the combination, with cutter-levers and means for operating the same, of posts I^5 I^6, forming the fulcra for said levers, one secured to the bed-plate and provided with a screw-threaded socket and the other having a screw-threaded shank fitted into said socket, substantially as and for the purpose described.

382,467. DEVICE FOR JOINTING, DRESSING, AND SHARPENING SAWS. HARRISON W. GRIMES, Shoemakersville, and EDWARD ARBOGAST, Williamsport, Pa. Filed Nov. 1, 1887. Serial No. 253,903. (No model.)

Claim.—1. The combination, in a machine for jointing saws, of the fixed saw-arbor, the standard, the incline B, whereby the standard may be vertically and horizontally adjusted with reference to the fixed saw-arbor, and the adjustable jointer pivoted to said standard, substantially as described.

2. In a machine of the character described, the saw-tooth gage *g'*, removably secured to the swinging arm G and provided with a cut-away portion on its under side, whereby said gage may serve as a gage and stop for arresting both long and short teeth, substantially as set forth.

3. In a machine of the character described, the saw-tooth gage *g'*, removably secured to the swinging arm G and provided with a cut-away portion on its under side, whereby said gage may serve as a gage and stop for both long and short teeth, and a screw for retaining said gage in position on said swinging arm, substantially as set forth.

4. The combination, with the standard, of the clamping-jaws removably secured thereto, and the sharpening guide-frame, also removably secured to said standard, substantially as set forth.

5. In a machine of the character described, the combination of the standard, the clamping-jaws, the eyebolt *l*, and the saw-sharpening file, substantially as herein set forth.

6. In combination, the standard, the clamping-jaws, the saw-sharpening guide-frame made in sections pivoted together, the eyebolt *l*, and the saw-sharpening file, substantially as set forth.

7. In a machine of the character described, a saw-sharpening guide-frame consisting of the arm J, removably secured to the standard, the arm K, pivotally mounted on said arm J, and gage-arm L, pivoted to said arm K, substantially as set forth.

8. In a machine of the character described, the saw-sharpening guide-frame composed of sections pivoted together and also provided with locking-screws, for the purpose set forth.

9. In a machine of the character specified, a sharpening-file provided with the cylindrical end and with the rod-guide removably secured to said end, substantially as described.

10. The described saw-sharpening file, consisting of the file portion S, the removable cylindrical portion T, provided with clamping-jaws, the guide-rod U, having enlarged head V, and set-screw *v*, for fastening said rod in position, substantially as set forth.

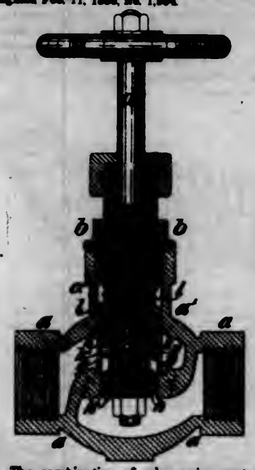
11. In a machine of the character described, a saw-sharpening-file guide-frame made substantially as set forth, with the guide proper composed of a flat arch or leaf, as herein specified.

12. A combined jointer, side-dresser, and saw-sharpening machine composed of a base, a fixed arbor upon the base to support the saw, an incline upon the base for a sliding standard, a sliding standard carrying clamping-jaws to hold the saw in position, a jointer to joint the teeth of the saw, guides for side-dressing, and an attached adjustable file-frame to guide the sharpening-file, so as to file uniformly the face and back of each tooth without removing the file, substantially as set forth.

382,468. HOSE OR PIPE COUPLING. THOMAS HALEY, Boston, Mass. Filed Sept. 21, 1887. Serial No. 250,281. (Model.)

Claim.—1. In a hose-coupling, the combination, with a tail-piece, of a binder consisting of the end portions, and the slotted intermediate portion secured at one end to the tail-piece and projecting over the latter, and a clamping-ring adapted to encircle and compress the binder at the slotted portion, clamping the hose between the binder and tail-piece, substantially as described.

2. The improved coupling composed of the tail-pieces connected as described, the binders having the slots closed at both ends, and the internally-threaded heads screwed upon and inclosing said tail-pieces, and the clamping-rings supported upon the binder, adapted to compress the slotted portion thereof and clamp the hose between it and the binder.

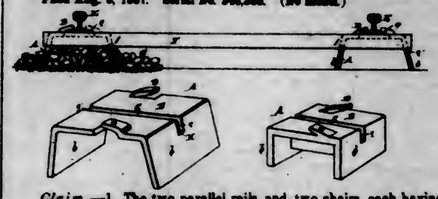


3. The combination, with a tail-piece adapted to be inserted in a hose or pipe and enlarged at its outer end, of a slotted compressible binder having an internally-threaded head screwed upon said tail-piece and adapted to receive the end of the hose in which the tail-piece is inserted, and a clamping-ring unconnected with the tail-piece, but supported entirely upon the binder-back of its point of connection with the tail-piece, arranged to compress it and clamp the hose between said binder and tail-piece, substantially as described.

4. The combination of the tail-piece *a*, having the flange *u*, and screw-threaded at both sides of said flange, the slotted binder and flanged nut *b*, adapted to be screwed upon the tail-piece and to bear the one against one side and the other against the opposite side of the flange *u*, the flanged tail-piece *a'*, engaged with said nut and threaded at *f'*, and the slotted binder *c'*, screwed upon the tail-piece *a'*, all arranged and operating substantially as described.

5. The combination, with an internal support for the hose, of a metallic binder composed of a cylinder having spirally-arranged slots in its body closed at the ends, and an independent clamping-ring adapted to be applied to the slotted portion of the binder and clamping the hose between the binder and internal support, substantially as described.

6. The combination, with the tail-piece, of the outer slotted sleeve or binder secured thereto, and a clamping-ring unconnected with the tail-piece applied to the slotted portion of the binder back of its connection with the tail-piece for clamping it to the hose and being itself held in place entirely upon said binder, substantially as described.



382,469. STOP-VALVE. JOHN HAWTHORN, New Hills, County of Chester, and SIDNEY MORGANSON, Stalybridge, County of Lancaster, England. Filed Feb. 7, 1888. Serial No. 263,220. (No model.) Patented in England Feb. 11, 1888, No. 1,994.

Claim.—1. The combination of valve-casing, seat, screw-spindle, and packed pistons operated by the spindle, with a shield for the pistons, and a spring acting on the shield to tend to press it onto the seat, substantially as described.

2. The combination of a valve-casing, seat, spindle, and piston, with a shield normally on the seat about the piston and bored to receive the piston as the latter is raised, and elevates the shield also to open the passage, as and for the purpose set forth.

382,470. RAILWAY. RUDOLPH M. HUNTER, Philadelphia, Pa., assignor to the Taylor Metallic Railway Tie Company, of New Jersey. Filed Aug. 8, 1887. Serial No. 246,326. (No model.)

Claim.—1. The two parallel rails and two chairs, each having clamping-lugs to grip the flanges of the rail upon being turned, and a transverse slot, in combination with a cross-tie made of a flat bar turned on edge, connecting said chairs, and extending through the slots therein to prevent them from turning.

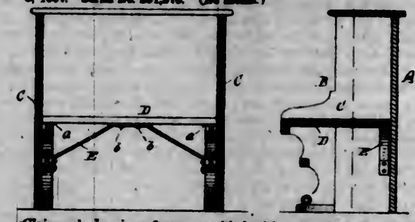
2. The two parallel rails and two chairs, each having clamping-lugs to grip the flanges of the rail upon being turned, and a transverse slot, in combination with a cross-tie connecting said chairs, having notched ends to lock it to the chairs, and extending through the slots therein to prevent them from turning.

3. The two parallel rails and two chairs, each having clamping-lugs to grip the flanges of the rail upon being turned, and a transverse slot, in combination with a cross-tie connecting said chairs, having notched ends to receive the flange of the rail, and extending through the slots therein to prevent them from turning.

4. The two parallel rails and two chairs, each having clamping-lugs to grip the flanges of the rail upon being turned, and a transverse slot, in combination with a cross-tie connecting said chairs, having notched ends to receive the flange of the rail and also the edge of the slot of the chair to lock it to said rail and chair, and extending through the slots therein to prevent them from turning.

5. A railway-chair having two lugs, D D, pointing in opposite directions and separated a distance at least equal to the width of the rail-flanges, and a transverse slot, C, across the chair between the lugs and opening through the top of the chair.

6. A railway-chair having two lugs, D D, pointing in opposite directions and separated a distance at least equal to the width of the rail-flanges, and a transverse slot, C, across the chair between the lugs, in combination with the rail and cross-tie F, having notches *f* to lock the said tie to the chair.



7. A railway-chair having two lugs, D D, pointing in opposite directions and separated a distance at least equal to the width of the rail-flanges, and a transverse slot, C, across the chair between the lugs, in combination with the rail and cross-tie F, having notch *f* to lock said tie to the rail and chair.

8. A railway-chair formed of sheet metal and having the upper face and lateral lugs, and provided with holding-lugs for the rail, pointing in opposite directions and stamped from the same piece of sheet metal, and also provided with a slot at right angles to the direction of the rail when laid upon the chair.

9. The railway-chair consisting of the top part, B, having lugs D D, pointing in opposite directions and of less, so as to fit over the rail-flange, the side lugs, *b b*, and the slots C *c c'*, in which the slot part *c* is deeper than part *c*.

10. The combination of two parallel rails with two chairs, each having two lugs for fitting over the rail-flange when the chair is turned, and two lugs, one on each side of the rail, said chair being slotted in its top and down into the lugs to form two widely-separated bearings in each chair, and a cross-tie formed of metal and adapted to fit down into the slots to prevent the chairs from turning and suite two chairs of which one is under each rail.

382,471. PIANO KEY-BOTTOM. WILLIAM H. IVERS, Dedham, assignor to the Ivers & Pond Piano Company, Boston, Mass. Filed Oct. 3, 1887. Serial No. 251,573. (No model.)

Claim.—1. In piano-fortes provided with a key-bottom and the end pieces to which said key-bottom is secured, a metallic brace, substantially as described, affixed to said end pieces and contiguous to the key bottom centrally, whereby the latter is supported and adjusted, as and for the purposes specified.

2. In musical instruments of the class herein specified, a horizontal key-bottom, D, having its ends permanently fixed, in combination with a brace, E, with its ends likewise fixed, and the interconnecting adjusting-nut *c* and bolt *c*, which unite the two, substantially as stated.

382,472. PORTABLE DRILL. WILLIAM C. JENNINGS, Camden, N. J. Filed Feb. 27, 1888. Serial No. 265,264. (No model.)

Claim.—1. A drill having the tool-carrier vertically adjustable by means of a worm, a worm-wheel, a rack, and a pinion, said worm, worm-wheel, and pinion being mounted on the bearing of the carrier and said rack being secured to the carrier, the latter having a gear-wheel which is connected with the same by a feather, substantially as described.

2. A drill having the bearing of the tool-carrier connected with a sleeve which is rotatably mounted in a bearing, whereby said carrier may be placed in vertical, horizontal, and oblique positions, as stated.

3. In a drill, the rotatable sleeve 29, connected with the bearings of the tool-carrier and mounted in a sectional bearing which may be clamped on said sleeve, substantially as described.

4. In a drill, a tool-carrier, in combination with gearing 32, 31 sleeve 29, clamping-bearings 30, shaft 27, gearing 25 26, and shaft 9 substantially as described.

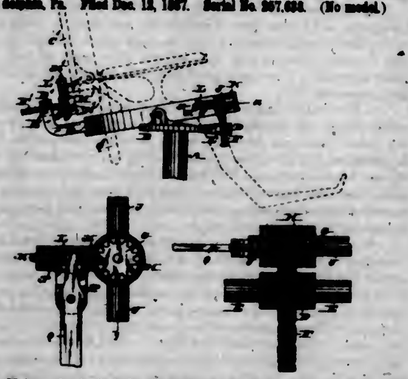
5. In a drill, a tool-carrier adjustably mounted in its bearings, in combination with an operating-shaft and intermediate gearing, a slide carrying the bearing of said shaft, a crane supporting said slide, and an operating-screw connected with the crane and fitted to said slide, substantially as described.

6. In a drill, a tool-carrier, in combination with the driving-shaft and intermediate gearing, said shaft being mounted on an arm which is rotatable on one of the shafts of said gearing, substantially as described.

7. In a drill, a tool-carrier, in combination with the shaft 9, the bearing 8 for said shaft, the driving-shaft 12, gearing 11 10 of said shaft, and an arm, 13, the latter supporting the shaft 12 and having a clamping sleeve or boss which is rotatably fitted on said bearing 8, substantially as described.

8. In a drill, a tool-carrying crane such as C, vertically adjustable on a rod, in combination with a chain and counterpoise and an arm secured to said rod, said chain passing around pulleys on said arm and crane, the pulley on the crane carrying a ratchet which is engaged by a pawl on said crane, substantially as described.

9. In a drill, a tool-carrier and an operating-shaft and support therefor, in combination with a traveler or movable hanger, a track, and a bolt for clamping said hanger to said track, substantially as described.



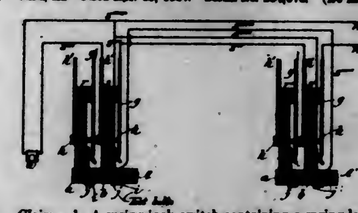
10. In a drill, a tool-carrying crane having a split boss for securing the same in vertically-adjusted position, in combination with a chain and counter-balance, substantially as described.

11. In a drill, a tool-carrying crane connected with a supporting-rod, in combination with a stand having bowls for sustaining said rod, substantially as described.

12. In a drill, a tool-carrying crane and a rod supporting the same, in combination with a traveler or hanger and a movable stand adjustably sustaining opposite ends of said rod, substantially as described.

13. A tool-carrier and an operation rack and pinion, in combination with shaft 36, clutch 46, worm-wheel 38, worm 39, and shaft 40, as stated.

382,473. DENTAL OR OTHER CHAIR. HENRY D. JUDY, Philadelphia, Pa. Filed Dec. 12, 1887. Serial No. 257,633. (No model.)



Claim.—1. A chair having a frame pivoted to a support, a nut having journal-bearings in said support, ears secured to the frame, a box having journal-bearings in said ears, a screw-shaft working in said nut, a spur or toothed wheel secured on said shaft so as to rotate therewith and in said box, a tubular guide leading into said box, a dog

in said guide, and a pivoted lever engaging said dog, said parts being combined substantially as and for the purpose set forth.

2. A chair having a standard with shelf thereon, a frame pivoted to said standard, the nut D, having journals E, with bearings in said shelf, the ears K, secured to the inner face of the said frame, the box H, having journals J, with bearings in said ears, the screw-shaft F, with spur-wheel G in said box, the tube L, the dog M, with spring N working in said tube L, and the lever Q, pivoted to the ear P of said tube L, said parts being combined substantially as described.

382,474. MULTIPLE SWITCH-BOARD. MILO G. KELLOGG, Hyde Park, Ill. Filed Apr. 13, 1887. Serial No. 234,670. (No model.)

Claim.—1. A spring-jack switch containing a spring-lever, a contact-point, and a contact-piece mounted on an insulating-strip, said lever being transverse to the front of said strip and said contact-point being so placed that said lever normally bears on it, said strip having through its front a transverse rectilinear hole in front of said lever and said contact-piece being mounted on one of the sides of said hole, in combination with a double or loop plug adapted, when inserted into said hole, to separate the spring-lever from the contact-point and form connection between its two contact-pieces and the lever and contact-piece of said switch, substantially as and for the purpose set forth.

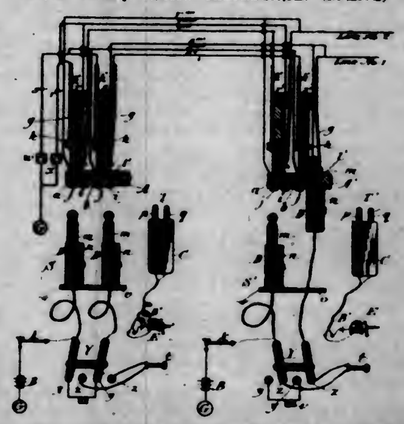
2. The combination, with a strip of insulating material having transverse rectilinear plug-holes through its front, of the metal parts of several spring-jack switches mounted thereon, each metal part consisting of a spring-lever placed transverse to the front of said strip and in the rear of a plug-hole, a contact-point so placed that the lever normally bears on it, and a contact-piece mounted on one of the sides of said hole, all substantially as and for the purpose set forth.

3. In a spring-jack switch, the movable contact-piece and another contact-piece, both suitably mounted and insulated, said movable contact-piece being mounted and located back of the face of the switch, said face having a transverse rectilinear hole in front of said movable contact-piece, said hole being adapted to receive a rectilinear switch-plug and to guide it in its horizontal and lateral directions until it moves said movable contact-piece, and said other contact-piece being mounted on one of the faces of said switch-hole, in combination with a rectilinear loop switch-plug adapted to fit said hole and be guided by it in its horizontal and lateral directions, said plug having two contact-pieces, each a plane and on a face of said plug, said plug being adapted after being inserted into said hole to move said movable contact-piece and to have one of its contact-pieces form connection therewith and its other contact-piece form connection with said other contact-piece of the switch, substantially as set forth.

4. The combination of spring-jack switches mounted on an insulating-strip and having their plug-holes through the front of said strip, with pairs of contact-pieces, one pair for each switch-hole, one of each pair forming a face of said hole, and the other piece of each pair being adjacent to it on the front of said strip, substantially as and for the purpose set forth.

5. The combination of pairs of contact-pieces placed at a multiple switch-board, one pair for each line which is connected to the board, one piece of each pair forming a face of its switch-hole and the other being adjacent to it, with a double test plug or device attached to a double flexible cord, said test plug or device having two insulated metal pieces so made, placed, and adjusted that the operator can readily connect them to any pair of said contact-pieces, substantially as and for the purpose set forth.

6. In a telephone system, a metallic-circuit telephone-line, a loop-switching device in the circuit of said line adapted to loop another circuit into the circuit of said line, and a pair of test-bolts, one of the bolts being connected to the line on one side of the switching device and the other bolt being connected to the line on the other side of the switching device, in combination with a testing plug or device having two contact-points connected by a loop in which is a battery and a test-receiving instrument, and said contact-points being adapted to be brought into contact with said test-bolts, whereby the operator may by testing determine whether another line has been looped into the circuit of said line.



7. In a telephone system, a metallic-circuit telephone-line, two or more loop-switching devices in the circuit of said line, each adapted to loop another line into the circuit of said line, and a pair of test-bolts, one of the bolts being connected to the line on one side of the switching devices, and the other bolt being connected to the line on the other side of the switching devices, in combination with a testing plug or device having two contact-points connected by a loop in which is a battery and a test-receiving instrument, and said contact-points being adapted to be brought into contact with said test-bolts, whereby the operator may by testing determine whether or not some other line is looped into the circuit of said line at some one of the switching devices.

8. In a telephone system, two or more metallic-circuit telephone-lines, each having two or more loop-switching devices in its circuit, each switching device being adapted to loop another line into the circuit of its line, and pairs of test-bolts, one pair for each line, and one bolt of each pair being connected to its line on one side of its switching devices, and the other bolt of the pair being connected to its line on the other side of its switching devices, in combination with a testing plug or device having two contact-points connected by a loop in which is a battery and a test-receiving instrument, said contact-points being adapted to be brought into contact with any pair of said test-bolts, whereby the operator may by testing determine whether or not either of said lines is in use.

9. In a telephone-exchange system, two or more multiple switch-boards for the lines provided with series of switches, one series for each line, and one switch of each series arranged on each board, and each line passing through its series, switch-plugs adapted to be inserted into any of said switches, and when inserted to open the line at the contact-points of said switch, and series of pairs of test-bolts, one series for each line, and one pair of each series on each board, one bolt of each pair being connected to its line before the line passes to its switches, and the other bolt of the pair being connected to the line after it has passed through its switches, in combination with testing plugs or devices, one at each board, and each having two contact-points connected by a loop in which is a battery and a test-receiving instrument, the two contact-points of the testing device being adapted to be brought into contact with any pair of test-bolts at its board whereby the operator at any board may by testing determine whether or not either of said lines is in use.

10. In a telephone system, a metallic-circuit telephone-line, a loop-switching device in the circuit of said line adapted to loop another line into the circuit of said line, and a pair of test-bolts, one of the bolts being connected to the line on one side of the switching device, and the other bolt being connected to the line on the other side of the switching device, in combination with an operator's testing system consisting of a testing plug or device with two contact-pieces and a battery, a test-receiving instrument, and a loop, said contact-pieces being connected by the loop and being adapted to be brought into contact with said test-bolts, said loop containing said battery and test-receiving instrument, and said battery and test-receiving instrument being so adjusted to each other that the instrument will respond when the testing device is applied to the test-bolts and no other line is looped into the circuit of said line, but will not respond when another line is looped into the circuit, substantially as and for the purpose set forth.

382,475. MULTIPLE SWITCH-BOARD. MILO G. KELLOGG, Hyde Park, Ill. Filed Apr. 13, 1887. Serial No. 234,143. (No model.)

Claim.—1. The combination of two or more strips of insulating material placed one above the other, each having several spring-jack parts mounted thereon, each part containing a spring-lever placed

transverse to the front of the strip, and a contact-point normally in contact with the spring-lever, with transverse rectilinear holes along one of the edges of each of said strips, one hole in front of each of said levers, whereby the edge of one strip provides one of the sides of the holes of another strip, substantially as and for the purpose set forth.

2. The combination of spring-jack switches mounted on an insulating-strip, and having their plug-holes through the front of said strip, with pairs of test-bolts or pieces, one pair for each switch, and each pair being mounted on the front of the said strip adjacent to its switch, whereby the operator may know to what switch each pair of test-bolts corresponds, substantially as and for the purpose set forth.

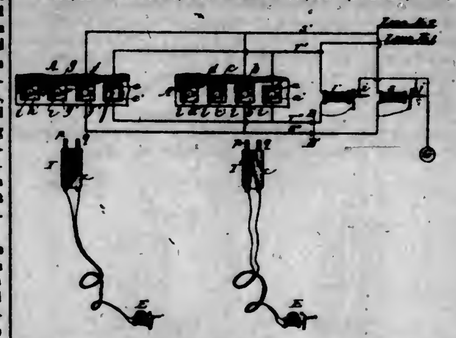
3. In a telephone system, a telephone-line, a switching device in the circuit of said line, adapted to open and close said line at its contact-points, and a pair of test-bolts, one of the bolts being connected to the line on one side of the switching device and the other bolt being connected to the line on the other side, in combination with a testing plug or device having two contact-points connected by a loop in which is a battery and a test-receiving instrument, said contact-points being adapted to be brought into contact with said test-bolts, substantially as and for the purpose set forth.

4. In a telephone system, a telephone-line, two or more switching devices in the circuit of said line, each adapted to open and close said line at its contact-points, and a pair of test-bolts, one of the bolts being connected to the line on one side of the switching devices and the other bolt being connected to the line on the other side of the switching devices, in combination with a test plug or device having two contact-points connected by a loop in which is a battery and a test-receiving instrument, said plug contact-points being adapted to be brought into contact with said test-bolts, whereby the operator may determine whether or not the circuit from one test-bolt to the other is opened at some one of the switching devices.

5. In a telephone system, two or more telephone-lines, each having two or more switching devices in its circuit, each switching device being adapted in the operation of the system to open and close its line at its contact-points, and pairs of test-bolts, one pair for each line, one bolt of each pair being connected to its line on one side of its switching devices and the other bolt being connected to its line on the other side of its switching devices, in combination with a testing plug or device having two insulated contact-points connected by a loop in which is a battery and a test-receiving instrument, said plug contact-points being adapted to be brought into contact with any pair of said test-bolts, whereby the operator may determine whether or not either of said lines is in use.

6. In a telephone system, a telephone-line grounded at its two ends, a switching device in the circuit of said line, adapted to open and close said line in the operation of the system at the contact-points, and a pair of test-bolts, one of the bolts being connected to the line on one side of the switching device and the other bolt being connected to the line on the other side of the switching device, in combination with an operator's testing system, consisting of a testing plug or device, with two contact-pieces, a battery, a test-receiving instrument, and a loop, said contact-pieces being connected by the loop and adapted to be brought into contact with said test-bolts, said loop containing said battery and test-receiving instrument being so adjusted to each other that the instrument will respond when the testing device is applied to the test-bolts and the circuit between the bolts is closed at the switching device, but will not respond when the circuit is open at the switching device, substantially as and for the purpose set forth.

7. In a telephone-exchange system, two or more switch-boards provided with series of switches, one series for each line and one switch of each series arranged on each board, each line passing through each switch of its series and to ground, switch-plugs adapted to be inserted into any of said switches, and when inserted to open the line at the contact-points of the switch and disconnect it from the ground, and series of pairs of test-bolts, one series for each line and one pair of each series on each board, one bolt of each pair being connected to its line before it is connected to any of its switches, and the other bolt being connected to its line after it has passed through its switches and before it is connected to the ground, in combination with operators' testing systems, one system at each board, and each consisting of a testing plug or device, with two contact-points, a battery, a test-receiving instrument, and a loop, said contact-points being connected to the loop and being adapted to be brought into contact with any pair of the test-bolts at the board, and said loop containing the battery and test-receiving instrument, whereby the operator at any board may by a preliminary test determine whether any line is in use.



8. The combination of two or more strips of insulating material placed one above the other and each having the metal parts of spring-jack switches mounted thereon, with rectilinear plug-holes, one for each of said switches and transverse to the front and along one of the edges of its strip, whereby the edge of one strip provides one of the sides of the holes of another strip, substantially as and for the purpose set forth.

9. In a telephone-exchange system, two subscribers' lines temporarily connected together for conversation, in combination with a calling generator or battery, a clearing-out annunciator, an operator's telephone, a calling-key, and a switching device, said key and said generator being in a wire or circuit grounded on one side and connected to the circuit of said lines on the other side, said operator's telephone and said clearing-out annunciator being each in a loop, the two ends of which are connected to the two contact-bolts of a pair of contact-bolts of said switching device, (there being one pair of contact-bolts for each loop,) said switching device having two contact-pieces, each connected to its side of the circuit of said lines, and the two contact-pieces being adapted to be brought into connection with either pair of said bolts, whereby at the will of the operator he may loop either the operator's telephone or the clearing-out annunciator into the circuit of the lines so connected together, and may ground said circuit through the calling-generator, substantially as set forth.

10. In a telephone-exchange system, two subscribers' lines temporarily connected together for conversation, in combination with a calling generator or battery, a clearing-out annunciator, a calling-key, and a switching device, said key and said generator being in a wire or circuit grounded on one side and connected to the circuit of said lines on the other side, said clearing-out annunciator being in a loop, the two ends of which are connected to two contact-bolts of said switching device, said switching device having two contact-pieces, each connected to its side of the circuit of said lines, and said contact-pieces being adapted to be brought into connection with said bolts, whereby at the will of the operator he may loop the clearing-out annunciator in and out of the circuit of the lines so connected together, and may ground said circuit through the calling-generator, substantially as set forth.

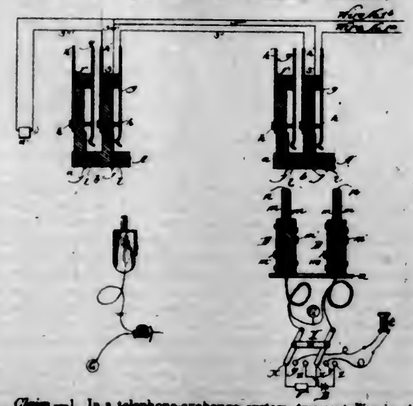
11. In an operator's cord system, two cords normally (or when their plugs are not in line-switches) grounded, in combination with an operator's telephone, a calling-generator, a calling-key, and a switching device, said key and said generator being in a wire or circuit grounded on one side and connected to the circuit of said lines on the other side, said telephone being in a loop, the two ends of which are connected to two contact-bolts of said switching device, said switching device having two contact-pieces, either connected to its one of said cords, and said contact-pieces being adapted to be brought into connection with said bolts, whereby at the will of the operator he may loop said telephone into and out of the circuit of the cords, and may ground said circuit through the calling-generator, substantially as set forth.

382,476. MULTIPLE SWITCH-BOARD. MILO G. KELLOGG, Hyde Park, Ill. Filed June 3, 1887. Serial No. 240,114. (No model.)

Claim.—1. In a telephone-exchange system, the combination of a telephone-line entering the central office and separated into two branches, with a line-switch containing two normally-insulated metal parts, said parts being adapted to be brought temporarily into contact when said line is switched for conversation, and one of said parts being connected to one of said branches and the other of said parts being connected to the other of said branches, a back-contact relay and a battery, both in the circuit of said branches, as described, and a ground-wire, said line being connected to one of the contact-points of said relay, and said ground-wire being connected to the other contact-point of said relay, substantially as and for the purpose set forth.

2. In a telephone-exchange system, two or more switch-boards at the central office, in combination with a telephone-line, line-switches, one switch on each of said boards for said line, each switch being adapted to receive a switch-plug and having two normally-insulated metal parts, said parts of each switch being adapted to be temporarily brought into connection when a plug is inserted into the switch, said line being separated into two branches, one of said branches being connected to one of said metal parts of each of said switches, and the

other of said branches being connected to the other of said metal parts of each of said switches, a ground wire or connection, a back-contact relay in the circuit of one of said branches before the branch is connected to any of said switch parts, one of the contact-points of said relay being connected to the line and the other contact-point being connected to the ground wire or connection, and an electric battery in the circuit of one of said branches before the branch is connected to any of said switch parts, whereby when the switch-plug is placed in the switch of the line at either board the line is temporarily disconnected from the ground.



3. In a telephone-exchange system, the combination of two or more switch-boards at the central office, a telephone-line, the two branches of said line, the two-part switches of the line, one switch on each board, the switch-plugs, the back-contact relay, the battery, and the ground wire or connection, all connected and operating substantially as and for the purpose set forth.

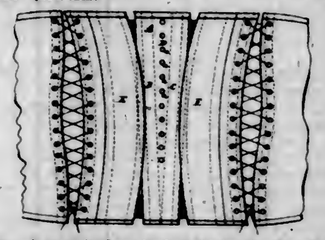
4. In a telephone-exchange system, the combination of two or more switch-boards at the central office, a telephone-line, the two branches of said line, the two-part switches of the line, one switch on each board, the switch-plugs, the battery, the relay, and the operators' test systems, one system at each board, each containing a double test-plug, a test-receiving instrument, and a loop, all connected and operating substantially as set forth, whereby when a switch-plug is inserted into either switch the battery is closed to the relay and is short-circuited to the test-receiving instrument if the test is applied at either board.

5. In a telephone-exchange system, two or more switch-boards, a telephone-line adapted to be switched at either board, a test-circuit for the line, said test-circuit being a loop in which is a battery, two or more pairs of contact-points, one pair at each board, each pair being normally open and adapted to be closed or connected at a board when the line is switched for conversation at the board, one point of each of said pairs of contact-points being connected to said test-circuit on one side of said battery, and the other point of each of said pairs being connected to the test-circuit on the other side of the battery, in combination with operators' test-receiving instruments, one at each board, and switching devices or means whereby the operator at either board may at will connect the two sides of her test-receiving instrument to said loop or test-circuit on the two sides of the battery and determine whether or not said line is switched for use.

6. In a telephone-exchange system, a line-switch adapted to receive a switch-plug and containing two contact-points, said points being normally open at the switch and connected by a loop in which is a battery and a back-contact relay, one point of said back-contact relay being connected with the ground and the other point being connected with the loop, in combination with a telephone-line also connected with the loop, and a switch-plug with a flexible conducting-cord attached to its metal part, said plug being adapted to be inserted into the switch, and when connected to connect or cross the two contact-points of the switch, whereby when the plug is inserted the line is disconnected from the ground and is connected with the flexible conducting-cord.

382,477. MULTIPLE SWITCH-BOARD. MILO G. KELLOGG, Hyde Park, Ill. Filed Aug. 29, 1887. Serial No. 248,162. (No model.)

Claim.—1. In a telephone-exchange system, two metallic-circuit telephone-lines normally disconnected from the ground and temporarily connected together for conversation, with their circuit grounded, in combination with a test-bell grounded on one side and connected on its other side to a switch-testing device, adapted to be brought into connection with either line for testing, and a battery in the test-circuit between the ground-connection on one side of the bell and the temporary ground-connection of the two lines, substantially as and for the purpose set forth.



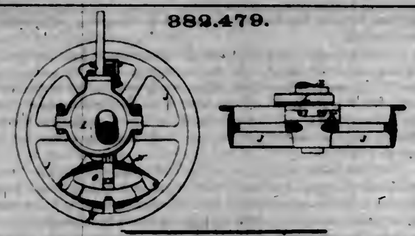
2. In a telephone-exchange system, two metallic-circuit telephone-lines normally disconnected from the ground and temporarily connected together for conversation, with their circuit grounded, in combination with a test-wire grounded on one side and connected on its other side to a switch-testing device, adapted to be brought into connection with either line for testing, and a battery and test-bell in the circuit of said test-wire, substantially as and for the purpose set forth.

3. In a telephone-exchange system, the combination of two metallic-circuit lines temporarily connected together for conversation, a test-circuit containing a test-receiving instrument and a test-battery, said test-circuit being electrically connected on one side of said instrument and battery with said lines when they are thus connected for conversation, and then only, a test-bolt connected to said metallic circuit, and a switching device connected to said test-circuit on the other side of said instrument and battery, adapted at the will of the operator to be brought into electrical connection with said test-bolt, substantially as and for the purpose set forth.

4. In a telephone-exchange system, metallic-circuit lines normally disconnected from the ground, two or more switch-boards, to each of which the lines are connected, and switching devices at each board adapted to temporarily connect any two of the lines together for conversation, and when they are thus connected to ground their circuit, in combination with test-receiving instruments, one at each board, grounded on one side, switch-testing devices at each board adapted at the will of the operator to connect its test-receiving instrument on the other side to the circuit of any line for testing, and a battery in the test-circuit thus established, substantially as and for the purpose set forth.

5. In a telephone-exchange system, the combination of metallic-circuit lines, two or more switch-boards for said lines, test-circuits, one at each board, each test-circuit containing a test-receiving instrument and a test-battery, said test-circuits being electrically connected on one side to their test-receiving instruments and test-batteries, and normally disconnected from said lines, switching devices at each board adapted to connect any two of said lines together for conversation and to connect them temporarily or when thus connected electrically with said test-circuits on said side of their test-receiving instruments and batteries, test-bolts, one for each line on each board, each test-bolt being connected to its line when it is switched for conversation, and switch-testing devices at each board, each connected to the test-circuit at its board on the other side of the test-receiving instrument and battery, and adapted at the will of the operator to be brought into electrical connection with any of the test-bolts at her board, substantially as and for the purpose set forth.

382,478. CORSET. JOSEPH KOCH, New Haven, Conn., assignor to Lewis Schiele & Co., New York, N. Y. Filed Feb. 27, 1888. Serial No. 265,452. (No model.)

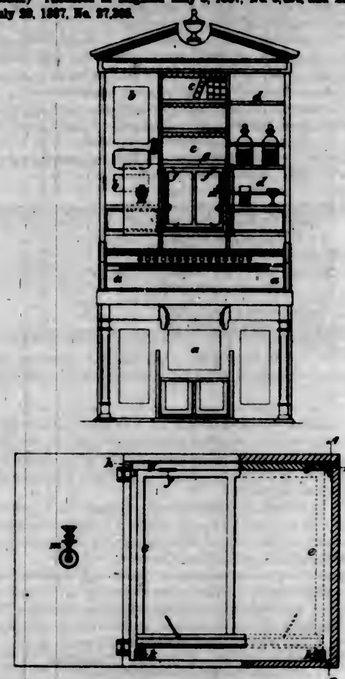


Claim.—A corset having a back section laced to the adjacent sections, the said back section provided with two stays at the center extending from top to bottom and gradually diverging from the bottom to the top, the space between the said two stays perforated, combined with the two stays E E, arranged, respectively, to the back at the right and left of the central or back stays, the said stays E E curved from the waist-line upward and forward and downward and forward, substantially as described.

382,479. STEAM-ENGINE. HIPPOLYTE LEBOUTHEUX and EMILE GARNIER, Paris, France. Filed July 31, 1884. Serial No. 139,333. (No model.) Patented in France Jan. 10, 1884, No. 160,669; in Belgium Nov. 13, 1884, No. 66,872; in England Nov. 15, 1884, No. 15,079, and in Germany Nov. 20, 1884, No. 30,202.

Claim.—The combination of the crank-shaft, fly-wheel, and eccentric free to move transversely across the fly-wheel, with a spring, N, secured at one end directly to the wheel and at the other to the eccentric, and a weight also secured to the eccentric, substantially as set forth.

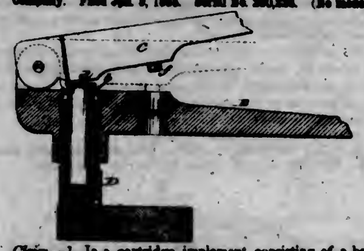
382,479.



382,480. CLASP. SAMUEL M. LOEB, Indianapolis, Ind. Filed Feb. 27, 1888. Serial No. 265,602. (No model.)

Claim.—In a clasp, the combination, with the gripping-jaws, the pivot, and the coiled spring mounted on the pivot, of the hook formed integral with the spring and secured to the jaws, substantially as and for the purpose specified.

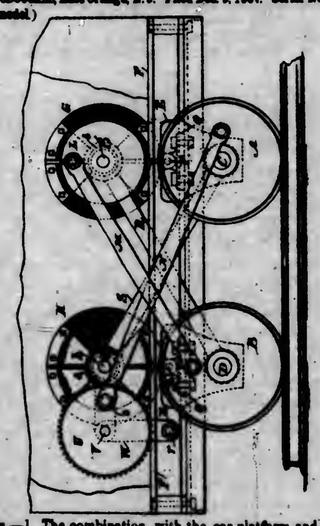
382,481. PIANO-FORTE, ORGAN, HARMONIUM, OR OTHER MUSICAL INSTRUMENT. EDWARD A. LOEB, Manchester, County of Lancaster, England. Filed July 12, 1887. Serial No. 244,179. (No model.) Patented in England May 3, 1887, No. 6,494, and in Canada July 29, 1887, No. 27,368.



Claim.—1. The combination, with the top of a piano-forte, harmonium, or other musical instrument, of a horizontally-sliding bar, a music-desk hinged to the bar, and supports below for the desk, substantially as described.

2. The combination of the top of a piano-forte or other musical instrument with a horizontally-sliding bar, a music-desk hinged to the bar, and supports below for the desk, and doors to conceal the desk when closed, substantially as set forth.

3. The combination, with the top of a piano-forte or other musical instrument, of a cabinet having a compartment fitted with an adjustable hinged and sliding music-desk, and having doors provided with candle-brackets on the inside, substantially as described.

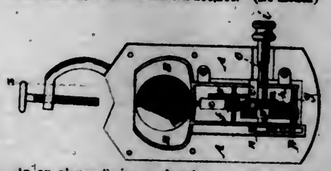


382,482. CARTRIDGE-RELOADING IMPLEMENT. WILLIAM MASON, New Haven, Conn., assignor to the Winchester Repeating Arms Company. Filed Jan. 9, 1888. Serial No. 260,236. (No model.)

Claim.—1. In a cartridge implement consisting of a base constructed with an opening adapted to receive the cartridge, but of smaller diameter than the head of the cartridge, the said opening enlarged below, the enlarged portion internally screw-threaded, combined with a follower screw-threaded upon its outer surface corresponding to the screw-thread of the said opening, and so as to be adjustable therein, the said follower constructed with a chamber in line with the said opening in the base and corresponding in shape to the exterior of the cartridge-shell, and the bottom of the chamber corresponding to the shape of the ball, the follower provided with a handle by which it may be rotated, and a forcing device, substantially such as described, adapted to operate in line with the said follower, substantially as specified, whereby said follower serves the double purpose as a support for the cartridge and as an extractor for the cartridge.

2. The combination of the two levers A C, the said lever A forming a base constructed with an opening, *b*, therein in diameter less than the diameter of the head of the cartridge, the other lever constructed with a working-face, *d*, corresponding to said opening, the said opening in the base below the face enlarged and internally screw-threaded, and the follower D screw-threaded corresponding to the screw-thread in said opening, the follower constructed with a chamber in line with said opening and corresponding to the outer surface of the shell, the bottom of the recess corresponding to the shape of the bullet, the said follower provided with a handle, substantially as described, whereby said follower serves the double purpose as a support for the cartridge and as an extractor for the cartridge.

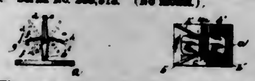
382,483. ELECTRIC MOTOR FOR RAILWAY-CARS. WILLIAM H. MCDONALD, East Orange, N. J. Filed Dec. 9, 1887. Serial No. 257,631. (No model.)



Claim.—1. The combination, with the car-platform and driving-wheels and axle, of an electric motor, hinges by which the frame of the motor is connected to the car-platform, connecting-rods between the shaft of the motor and the axle, and crank-pins and connecting-rods for rotating the drivers by the motor, substantially as set forth.

2. The combination, with the car-platform and the two pairs of driving-wheels and their respective axles, of two electric motors over

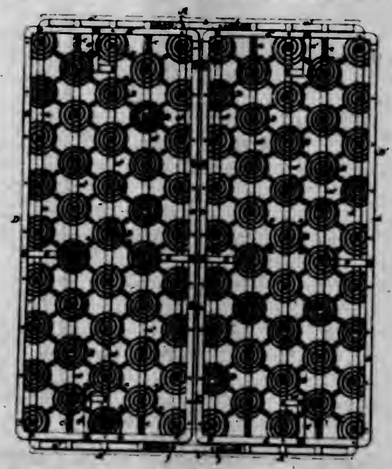
the respective axles, hinges for connecting the motors to the car-platform, links extending diagonally from the motor over one axle to the axle under the other motor, and cranks and connecting-rods that cross each other and extend diagonally to connect the respective crank-pins, substantially as set forth.



3. The combination, with the car-platform and driving-wheels and axle, of an electric motor, gearing, cranks, and connecting-rods for rotating the driving-wheels, and hinges to allow the parts to rock, and links to maintain the proper distance between the driving-shaft and axle, substantially as set forth.

382,484. BURGLAR-ALARM. WILLIAM R. MCINTOSH, Keene, N. H. Filed Mar. 23, 1888. Serial No. 268,310. (No model.)

Claim.—In an alarm device, a chamber provided with a curved floor which is slotted at the center, and a loose roller in said chamber, in combination with an alarm mechanism having a bell and provided with a striking-hammer, which is provided with an arm or projection in position to enter the slot in the floor when the hammer makes its upward movement, substantially as and for the purposes described.



382,485. SLEEVE-BUTTON. OTTO T. MOOCK and WILLARD L. HEALEY, Philadelphia, Pa.; said Moock assignor to said Healey. Filed Feb. 13, 1888. Serial No. 263,812. (No model.)

Claim.—1. The combination, with the face and posts of a sleeve-button, of a pair of wings furnished with levers having upon their ends catches adapted to lock one into the other, said wings and levers being secured to said posts and face by a pivot, the whole arranged and operating substantially as and for the purposes set forth.

2. The combination, with the face, posts, wings, and locking-levers having upon their ends catches adapted to lock one into the other, of a cap adapted to cover the hinges and act as a stop to prevent the wings from passing the centers, substantially as set forth.

382,486. SPRING BED-BOTTOM. WILLIAM A. MOONEY, Philadelphia, Pa. Filed June 15, 1887. Serial No. 241,397. (No model.)

Claim.—1. The combination of the quadrangular base-frame made in two sections, springs supported thereby, and two top frames carried by said springs, each top frame and its springs being entirely independent of the other, a pivot-section free from springs connecting the two spring-sections together, whereby the whole structure can be folded with the top frames face to face without distorting any of the springs, the base-frame acting as a guard for the springs, substantially as specified.

2. The combination of the quadrangular base-frame, two sets of springs supported thereby, and two top frames carried by said springs, each top frame and its springs being entirely independent of the other, and each top frame detachably secured to the outside rows of the springs supporting said frames, whereby either one or both of the top frames are removable from the bed, all substantially as and for the purpose described.

3. The combination, in a spring bed-bottom, of the base-frame with supporting-springs connected thereto, each end bar of the frame having a flexible connecting-section free from springs, and extending to or nearly to the top of the springs, substantially as described.

4. The combination of the base-frame A, made in two sections, *a a'*, carrying suitable springs, and independent top frames for each section, a flexible section free from springs connecting the two spring-sections together, and extending to or nearly to the top frame, so that when the bed is folded the springs will not be crushed, substantially as specified.

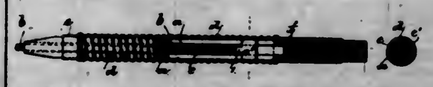
5. The combination of the base-frame A, made in two sections, *a a'*, each having an upright extension, *i i*, with a flexible strip, *b*, connecting the extensions *i* of the sections together, all substantially as specified.

6. The combination of the base-frame A, made in two sections, *a a'*, each having upright extensions *i i*, with a connecting flexible strip, *b*, adjustably attached to one or both of the extensions *i* of the sections, substantially as specified.

7. The combination of the bottom frame, the end strips, *a*, and spring-bearing strips *a'*, with a cross-piece, *c'*, extending from one bearing-strip to another, and a brace extending from the cross-strip *c* to the top frame, substantially as described.

8. The combination of the base-frame A, made in two sections, with connecting-strips adjustably attached to one or both of said sections, springs carried by each section of the base-frame, and quadrangular top frames carried by said springs, one or both of said top frames being adjustable as to width, and each top frame and its springs being entirely independent of the other, all substantially as specified.

382,487. ELEVATOR. GEORGE A. MOSES, Cambridge, Mass. Filed Jan. 27, 1888. Serial No. 262,194. (No model.)



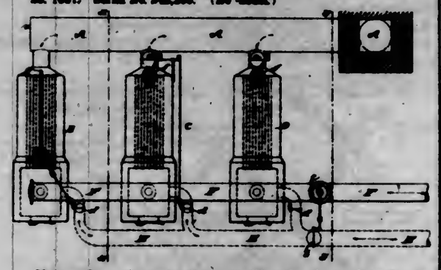
Claim.—1. In an elevator, a passenger-car combined with an auxiliary car or platform extensibly connected thereto, substantially as described.

2. In an elevator, a passenger-car, tubes or pipes, as a^3, secured thereto, combined with an auxiliary car or platform located below the said passenger-car and provided with rods to enter the said tubes or pipes, and with a clamping device to secure the said rods and lock the auxiliary car in its elevated position in proximity to the passenger-car, substantially as described.

3. In an elevator, a passenger-car provided with a panel, as a^4, combined with an auxiliary car or platform extensibly connected to the passenger-car and adapted to be concealed in its elevated position by the said panel, substantially as described.

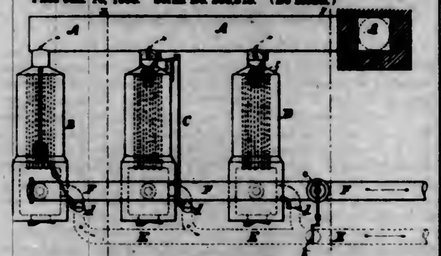
4. In an elevator, a passenger-car, tubes or pipes secured thereto, and an auxiliary car or platform located below the said passenger-car and provided with rods a^5 to enter the said tubes or pipes, combined with a clamping device at or near the top of the said tubes to secure the said rods, and with a second or auxiliary clamping device located below the passenger-car floor, substantially as described.

382,488. PENCIL. OMAR MEREHAM, Jr., New York, N. Y., assignor to Eberhard Faber, same place. Filed Feb. 3, 1888. Serial No. 262,801. (No model.)



Claim.—1. In a pencil, the combination of a tubular slotted body, a slotted tubular holder for one end of the lead, a toothed plate projecting from said holder, a sheet-metal cylindrical screw around the tubular body, and into which the teeth of the plate mesh, and collars or rings around the body at the ends of the cylindrical sheet-metal screw, said screw becoming the motor in a propel and repel pencil, substantially as specified.

2. In a pencil, the combination of a tubular body or sheath, *a*, slotted centrally for part of its length, the slotted tubular holder *c* for one end of the lead, the toothed plate *d*, projecting from said holder, the sheet-metal cylindrical screw *d*, the metal ring or collar *e* at one end of said screw *d*, and the metal ring or collar *f* at the other end of the same, said collar *f* being extended as a sleeve and adapted to hold an erasing-rubber, substantially as specified.



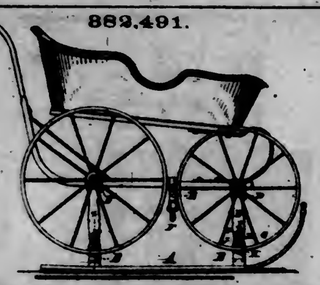
3. In a pencil, the combination of a tubular body or sheath, *a*, slotted centrally for part of its length, the slotted tubular holder *c* for one end of the lead, the toothed plate *d*, formed with said holder, the slotted metal tube A, surrounding the tubular slotted body *a*, the sheet-metal cylindrical screw *d*, and the metal rings or collars *e f* around the body at the ends of the cylindrical screw, substantially as and for the purposes set forth.

382,489. APPORTIONING FURNACE-DRAFT FOR BATTERIES OF STEAM-BOILERS. MAT. W. PRATT, Brooklyn, N. Y. Filed June 28, 1887. Serial No. 242,209. (No model.)

Claim.—In an apparatus for controlling the air-supply to the furnaces of a battery of steam-boilers, the combination of a main draft-regulator, automatically governed by the fluctuation of steam-pressure within said boilers and arranged to control the total air-supply with auxiliary regulating-dampers operated by the variations of temperature of the escaping gases from the several furnaces, and arranged to intercept the passage of the air-supply apportioned by said auxiliary dampers to each furnace, respectively.

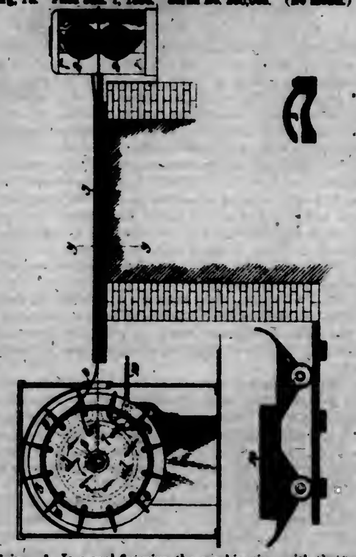
382,490. METHOD OF APPORTIONING FURNACE-DRAFT FOR BATTERIES OF STEAM-BOILERS. MAT. W. PRATT, Brooklyn, N. Y. Filed Jan. 16, 1888. Serial No. 260,515. (No model.)

Claim.—The method described of first controlling the total air-supply to the furnaces of a battery of steam-boilers by a regulator operated by the varying steam-pressure within said boilers, and, second, apportioning said air-supply to the several furnaces by regulators operated by the respective varying temperatures of said furnaces.



382,491. CHILD'S CARRIAGE. GEORGE RATHBUN, Buffalo, N. Y. Filed Mar. 5, 1888. Serial No. 266,142. (No model.)

Claim.—1. In combination with the wheels and running-gear of a child's carriage, the uprights hinged to said gear, a pair of runners attached to said uprights and folding therewith, and fastening devices detachably connecting the runners to the wheels, substantially as set forth.



2. In combination with the wheels and running-gear of a child's carriage, two pairs of uprights hinged to said gear, and runners attached to the lower ends of said uprights, the forward pair, B', of the latter having bends formed in them to avoid the forward wheels, which are closer together than the rear wheels, substantially as set forth.

3. The combination, with the carriage-gear, of the two runners A A', having the uprights B B', hinged to said gear, the wheels having plates, and the bolts with the guides and springs, all being constructed and combined in the manner as and for the object set forth.

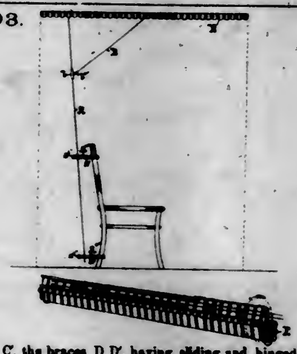
382,491.

382,492. REEL FOR WIRE-ROD MILLS. HENRY RAHMING, Pittsburg, Pa. Filed Jan. 7, 1888. Serial No. 260,082. (No model.)

Claim.—1. In a reel for wire, the combination, with the frame of the reel, of arms pivoted to the frame and rotary on axes longitudinal with the arms, the said arms projecting from the frame in a direction out of line with their axes, substantially as and for the purposes described.

2. In a reel for wire, the combination, with the frame of the reel, of arms pivoted to the frame and rotary on axes longitudinal with the arms, the said arms projecting from the frame in a direction out of line with their axes, and gearing connecting the said arms whereby they may be rotated simultaneously, substantially as and for the purposes described.

3. In a wire-rod mill, the combination, with the rolls, of a reel situate opposite to the delivery end thereof, having a boss projecting from the frame thereof, and arms projecting from the reel-frame around the boss, substantially as and for the purposes described.



4. In a wire-rod mill, the combination, with the rolls, of a reel situate opposite thereto, having a central boss projecting from the frame thereof and having two series of arms projecting from the frame around the said boss—namely, an outer series of arms around which the rod is wound, and an inner series of arms whereby the end of the wire rod, when fed to the reel, is locked—substantially as and for the purposes described.

5. The combination, with the rolls of a wire-rod mill, of a reel situate opposite to the delivery side of the rolls and a guide extending thence from the rolls to the reel, said guide being open to permit free lateral escape of the wire, substantially as and for the purposes described.

382,493. CANOPY ATTACHMENT FOR CHAIRS, &c. ALMIRA A. SMITH, Hadley, Mass. Filed Dec. 12, 1887. Serial No. 257,720. (No model.)

Claim.—1. The herein-described canopy attachment, consisting of the combination of the standards A A', the side pieces, B B', the

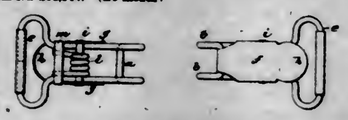
382,493.

end pieces, C C', the braces D D', having sliding and hinged connections with the said standards, and side pieces and clamps for securing said standards to a chair or settee, each of said end pieces having a hinged connection with one of said side pieces and a detachable connection with the other thereof, whereby the said end and side pieces and standards are all adapted to be folded to positions parallel with and adjacent to each other, substantially as set forth.

2. The combination, with the standards A A', supporting the awning-frame, of the clamps A^2, adjustably secured to the said standards, each of said clamps having a hole and set-screw for attachment to its standard, and consisting of two curved grasping-jaws having shanks which are pivotally connected at their rear ends, a threaded bolt projecting from the shank of one of said jaws through a slot in the shank of the other jaw, a nut on said bolt, and a spring for separating said jaws, substantially as set forth.

3. The combination, with the standards A A' and the side pieces, B B', of the sleeves b, fitted to slide on said standards and side pieces, set-screws b' for securing said sleeves in place, and the braces D D', provided with the caps b^2, hinged to the said sleeves, substantially as set forth.

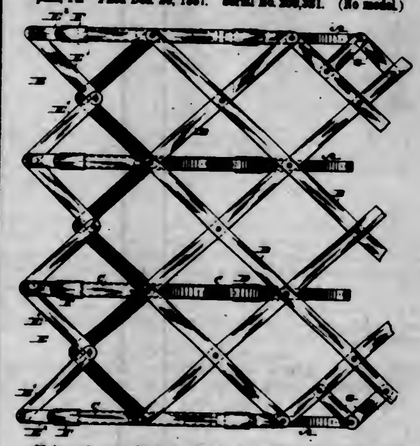
4. The combination, with standards A A' and side pieces, B B', each of said side pieces being provided at one end with a cap, c^2, having depression c^3 and orifice c^4, of end pieces, C C', connected by a hinge to said side pieces at the end opposite to said caps c^2, each of said end pieces being provided at its free end with a cap, c^2, having the projection c^3, and lug or pin c^4, arranged and operating substantially as and for the purpose set forth.



5. As an article of manufacture, the canopy attachment for chairs herein described, consisting of the side pieces, B B', having an awning cloth and a mosquito-guard attached thereto, substantially in the manner described, end pieces, C C', standards A A', suitable braces having hinged and sliding connections with said standards and side pieces, and clamps A^2, adjustably secured to said standards, arranged and operating substantially as set forth.

382,494. LOOP FOR SUSPENDER-BUCKLES. DWIGHT L. SMITH, Waterbury, Conn., assignor of one-half to Earl A. Smith, same place. Filed Mar. 26, 1888. Serial No. 268,506. (No model.)

Claim.—The herein-described loop for suspender-braces, consisting of the curved tubular slide, the ends of which are doubled upon themselves, forming smooth rounded ends, combined with a loop attached to said slide, substantially as and for the purpose described.

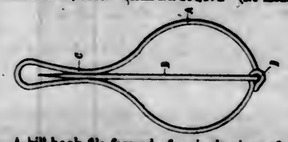


382,495. SNAP-HOOK. DWIGHT L. SMITH, Waterbury, Conn., assignor of one-half to Earl A. Smith, same place. Filed Mar. 26, 1888. Serial No. 268,507. (No model.)

Claim.—1. The herein-described snap-hook, consisting of a body made from wire doubled to form the tip a of the hook, the two branches then bent to form the hook b b, the two branches extending substantially parallel to the opposite end, where the branches are bent to form the loop c, and the two sides bent at a point between the loop and hook at right angles to the plane of the two sides to form the pivot-bearings d d, combined with the tongue f, constructed with ears g g, the pintle i through said ears and resting in the said bearings d d, and a torsion-spring, l, between said body and tongue adapted to take a bearing between the body and the tongue in rear of the pivots, substantially as described.

2. The herein-described snap-hook, consisting of a body made from wire doubled to form the tip a of the hook, the two branches then bent to form the hook b b, the two branches extending substantially parallel to the opposite end, where the branches are bent to form the loop c, and the two sides bent at a point between the loop and hook at right angles to the plane of the two sides to form the pivot-bearings d d, the two sides of the body connected by a bar, m, combined with a sheet-metal tongue, f, constructed with ears g g, pierced corresponding to the bends d d of the body, a pintle, i, through said ears and within said bearings d d, and a torsion-spring, l, around said pintle, one arm of the spring resting upon said bar m and the other resting at a corresponding point on the tongue, the tendency of said spring being to yieldingly hold the tongue in the closed position, substantially as described.

382,496. SPRING BED-BOTTOM. FREDERICK STORER, Philadelphia, Pa. Filed Dec. 20, 1887. Serial No. 259,261. (No model.)

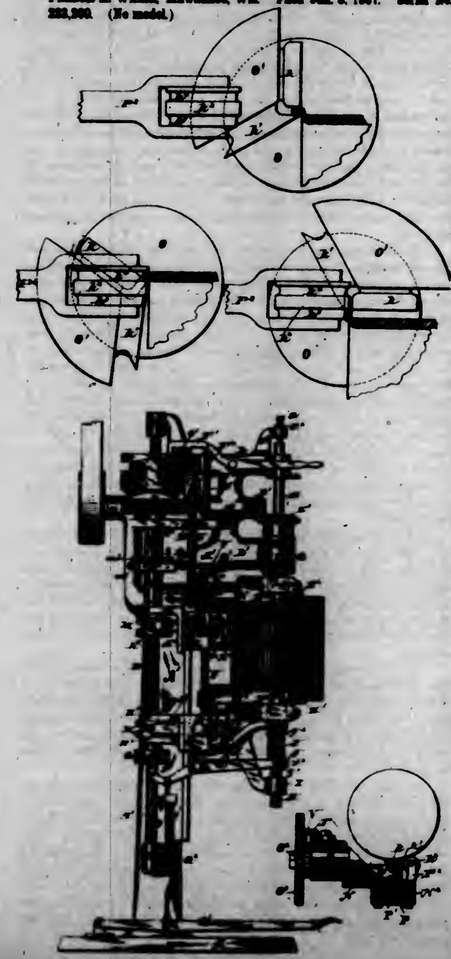


Claim.—1. An adjustable bed-bottom, consisting of cross and longitudinal slats pivoted, as described, and provided with an end section consisting of the slats E' and E^2, pivoted at one end, as described, each of the slats E^2 having a keeper, F, in which a longitudinal slat of the bottom rests, the slats E' being also pivotally connected at their inner ends, said parts being combined substantially as described.

2. An adjustable end section, consisting of the slats E', pivotally connected at their ends, the slats E^2, pivoted at each alternate pivotal connection of the slats E' and having keepers F, the said slats E^2 being so connected to the slats C by the said keepers F of the bed-bottom as to slide thereon, substantially as and for the purpose set forth.

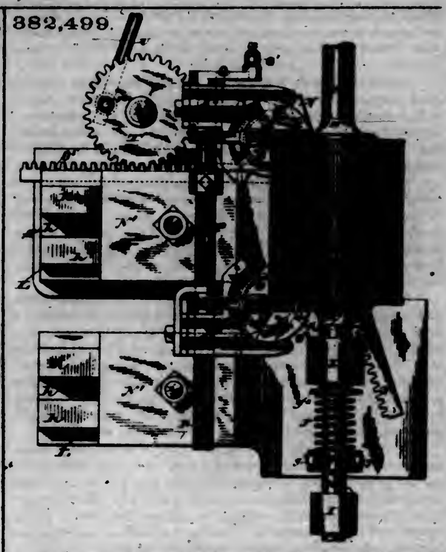
3. A bed-bottom formed of top and lower cross and sectional longitudinal slats pivotally connected, as described, springs, each of which is formed of two leaves connected together and to the top and lower slats, and an adjustable end piece of pivoted slats connected to said top longitudinal slats by slats E^2 and keepers F, said parts being combined substantially as and for the purpose set forth.

382,497. BILL-HOOK FILE. FREDERIC M. STORY, Union Hill, N. J. Filed Feb. 16, 1888. Serial No. 264,174. (No model.)



Claim.—A bill-hook file formed of a single piece of spring-wire, with a back, A, of approximately pear shape, adapted to be suspended by its upper or smaller end, and a hook, B, projecting outward from the base of said back and thence upward in the line of the center thereof, the back being contracted at a point opposite to the end of the hook to receive said end, and thereby retain the hook at a closed position, as shown and described.

382,498. RUBBER BOOT. JOSEPH B. THOMAS, South Framingham, Mass. Filed Dec. 1, 1887. Serial No. 256,494. (No model.)



Claim.—As an improved article of manufacture, a rubber boot having a rubber foot part, a leg formed of the inner and outer cloth layers, c d, and intervening rubber layer, f, and a fur guard, k, secured to the cloth layers at the top edge of the boot and overlapping said edge and extending upon both the inside and outside thereof, substantially as described.

382,499. BRAKING-MACHINE FOR SHEET-METAL VESSELS. FRANCIS A. WALSH, Milwaukee, Wis. Filed Jan. 3, 1887. Serial No. 223,260. (No model.)

382,499.

Claim.—1. In a machine for working the seams of sheet-metal vessels, the combination of a non-reciprocating revolving chuck, a movable chuck opposing the one first named, a fulcrumed bearing, a shaft arranged in the bearing, rolls or formers carried on the shaft, and suitable mechanism for actuating the movable chuck, tilting the bearing, and rocking said shaft at predetermined intervals, substantially as set forth.

2. In a machine for working the seams of sheet-metal vessels, two fulcrumed bearings, a shaft arranged in each bearing, rolls or formers carried on each shaft, and suitable mechanism for simultaneously tilting the bearings and rocking the shafts at predetermined intervals, substantially as set forth.

3. In a machine for working the seams of sheet-metal vessels, the combination of a continuously-revolving chuck, a normally-stationary chuck arranged in opposition to the one first named and provided with a loosely-journaled spindle, a lever pivoted to the frame of the machine and connected at one end to the spindle, a shaft geared to a driving mechanism, and a cam carried by the shaft and so positioned as to impinge against the end of said lever opposite that connected with said spindle, whereby the spindle and its chuck are raised and lowered at predetermined intervals, substantially as set forth.

4. In a machine for working the seams of sheet-metal vessels, the combination of a continuously-revolving chuck, a normally-stationary chuck in opposition to the one first named and provided with a loosely-journaled spindle, a lever pivoted to the frame of the machine and connected at one end to the spindle, a shaft geared to a driving mechanism, a cam carried by the shaft and so positioned as to impinge against the end of the lever opposite that connected with said spindle, and a treadle mechanism for actuating said lever independent of the cam, substantially as set forth.

5. In a machine for working the seams of sheet-metal vessels, the combination of a continuously-revolving chuck, a normally-stationary chuck in opposition to the one first named and provided with a loosely-journaled spindle, a spring arranged on the spindle, a lever pivoted to the frame of the machine and connected at one end to said spindle in opposition to the spring, a shaft geared to a driving mechanism, and a cam carried by the shaft and so positioned as to impinge against the end of the lever opposite that connected with said spindle, substantially as set forth.

6. In a machine for working the seams of sheet-metal vessels, the combination of a main standard, a bracket suitably connected to the standard, a chuck having its spindle loosely journaled in the bracket, a lever fulcrumed to the bracket and operatively united at one end to the chuck-spindle, a shaft having a loose gear-connection with a driving mechanism, a cam-flut on the shaft, a clutch mechanism for uniting the cam and gear, a notched wheel arranged on said shaft to impinge against the other end of the chuck-lever, and a chuck in opposition to the one first named, substantially as set forth.

7. In a machine for working the seams of sheet-metal vessels, a head comprising a suitable block, a bearing secured to the block, a shaft arranged in the bearing and provided with rolls or formers, a

suitably-arranged shaft carrying an arm provided with a roll or former, and suitable means for imparting a partial revolution to the last-named shaft at predetermined intervals, substantially as and for the purpose set forth.

8. In a machine for working the seams of sheet-metal vessels, a head comprising a fulcrumed block, a bearing secured to the block, a shaft arranged in the bearing and provided with rolls or formers, a suitably-arranged shaft carrying an arm provided with a roll or former, and suitable means for tilting the head and for actuating the shafts at predetermined intervals, substantially as and for the purpose set forth.

9. In a machine for working the seams of sheet-metal vessels, the combination of a main standard provided with a suitable box, a head comprising a block fulcrumed to the box, a bearing secured to the block, and a shaft arranged in the bearing and provided with rolls or formers, a rack operative in said box, a pinion on said shaft arranged to engage the rack, and means, substantially as described, for actuating said rack, as and for the purpose set forth.

10. In a machine for working the seams of sheet-metal vessels, the combination of a main standard provided with a suitable box, a head comprising a block fulcrumed to the box, a bearing secured to the block, and a shaft arranged in the bearing and provided with rolls or formers, a rack operative in said box, a pinion on said shaft arranged to engage the rack, a suitably-arranged shaft carrying an arm provided with a roll or former, and suitable means for tilting the head, operating the rack, and actuating the last-named shaft at predetermined intervals, substantially as and for the purpose set forth.

11. In a machine for working the seams of sheet-metal vessels, the combination of a main standard, a head comprising a block fulcrumed to the standard, a bearing adjustably united to the block, and a rock-shaft arranged in the bearing and provided with rolls or formers, a suitably-arranged shaft carrying an arm provided with a roll or former, and suitable means for actuating the shafts at predetermined intervals, substantially as and for the purpose set forth.

12. In a machine for working the seams of sheet-metal vessels, the combination of a main standard provided with a suitable box, a head comprising a block fulcrumed to the box, a bearing secured to the block, and a shaft arranged in the bearing and provided with rolls or formers, a rack operative in said box, a pinion on said shaft arranged to engage the rack, another pinion engaging said rack, a rod having its lower end wristed to the latter pinion, a lever-arm fulcrumed to said standard and united with the rod, a suitably-arranged shaft carrying an arm provided with a roll or former, and suitable means for tilting the head and actuating the lever-arm and last-named shaft, substantially as and for the purpose set forth.

13. In a machine for working the seams of sheet-metal vessels, the combination of a main standard, a head comprising a block suitably secured to the standard, a bearing united to the block, and a rock-shaft arranged in the bearing and provided with rolls or formers, a suitably-arranged shaft carrying an arm provided with a roll or former, a sliding plate operatively connected by a rod with the last-named shaft, and suitable means for actuating the rock-shaft and sliding plate at predetermined intervals, substantially as and for the purpose set forth.

14. In a machine for working the seams of sheet-metal vessels, the combination of a main standard, a head comprising a block suitably secured to the standard and provided with a ⊢- -shaped slot and shoulders, a bearing having a flange fitted to slide on said shoulders and secured to the block by a ⊢- -bolt, a rock-shaft arranged in the bearing and provided with rolls or formers, a suitably-arranged shaft carrying an arm provided with a roll or former, and suitable means for actuating the shafts at predetermined intervals, substantially as and for the purpose set forth.

15. In a machine for working the seams of sheet-metal vessels, the combination of a main standard, two heads, each comprising a block suitably secured to the standard, a bearing united to the block, a rock-shaft arranged in the bearing and provided with rolls or formers, a suitably-arranged shaft carrying arms provided with rolls or formers, and suitable means for simultaneously operating both rock-shafts and actuating the arm-shaft at predetermined intervals, substantially as and for the purpose set forth.

16. In a machine for working the seams of sheet-metal vessels, the combination of a main standard, two heads, each comprising a block suitably secured to the standard, a bearing united to the block and provided with a chamber, a rock-shaft arranged in the bearing and provided with rolls or formers, and a disk loosely arranged in the chamber, a shaft journaled in the disks and carrying arms provided with rolls or formers, and suitable means for simultaneously operating both rock-shafts and actuating the arm-shaft at predetermined intervals, substantially as and for the purpose set forth.

17. In a machine for working the seams of sheet-metal vessels, the combination of a main standard, two heads, each comprising a block suitably secured to the standard, a bearing united to the block, and a shaft arranged in the bearing and provided with rolls or formers, a pinion on each shaft, a horizontal rack arranged to engage the pinion of one shaft, a vertically-disposed rack, also arranged to engage this pinion, an intermediate pinion arranged to engage the latter rack and the pinion on the other shaft, a suitably-arranged shaft carrying arms provided with rolls or formers, and suitable means for actuating the horizontal rack and the last-named shaft at predetermined intervals, substantially as and for the purpose set forth.

18. In a machine for working the seams of sheet-metal vessels, the combination of a main standard, two heads suitably secured to the standard, to be laterally adjustable with relation thereto, and one of said heads vertically adjustable on said standard, each head having a shaft arranged in a bearing and provided with rolls or formers, a pinion on each shaft, a horizontal rack arranged to engage the pinion on one shaft, a vertically-disposed shaft arranged to engage this pinion, an intermediate pinion arranged to engage the latter rack and the pinion on the other shaft, a suitably-arranged shaft carrying arms provided with rolls or formers, and suitable means for actuating the horizontal rack and last-named shaft at predetermined intervals, substantially as and for the purpose set forth.

19. In a machine for working the seams of sheet-metal vessels, the combination of a main standard, a shaft having its bearings on the standard, a head fulcrumed to said standard and provided with an arm, a rock-shaft journaled in the head and provided with rolls or formers, a chucking mechanism, and cams arranged on said shaft to engage the arms on the head and actuate said chucking mechanism, substantially as set forth.

20. In a machine for working the seams of sheet-metal vessels, the combination of a main standard, a shaft having its bearings on the standard and provided with a series of cams, a chuck normally held in one position and continuously revolved, a sliding chuck in opposition to the one first named and normally non-revolvable, a lever mechanism arranged to actuate the latter chuck independent of the seaming mechanism, suitable heads fulcrumed to said standard and provided with arms to engage the cams on the shaft, and rock-shafts carrying rolls or formers, another shaft journaled to the heads and carrying arms provided with rolls or formers, a spring sliding plate operatively connected to the latter shaft, a cam on the former shaft arranged to actuate the sliding plate at predetermined intervals, and suitable means for starting and automatically stopping the revolution of said former-shaft, imparting a simultaneous movement to both rock-shafts and automatically unchucking the vessel, substantially as and for the purpose set forth.

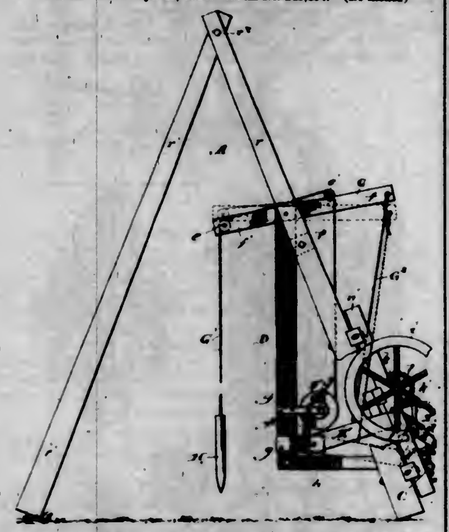
21. In a machine for working the seams of sheet-metal vessels, the combination of a main standard provided with a suitable box, a head comprising a block fulcrumed to the box, a bearing secured to the block, and a shaft arranged in the bearing and provided with rolls or formers, a rack operative in said box, a pinion on said shaft arranged to engage the rack, and suitable means for tilting the head and operating the rack, substantially as and for the purpose set forth.

22. In a machine for working the seams of sheet-metal vessels, the combination of a main standard provided with a suitable box, a head comprising a block fulcrumed to the box, a bearing secured to the block, and a shaft arranged in the bearing and provided with rolls or formers, a rack operative in said box, a pinion on said shaft arranged to engage the rack, another pinion engaging said rack, a rod having its lower end wristed to the latter pinion, a lever-arm fulcrumed to said standard and united to the rod, and suitable means for tilting the head and actuating the lever-arm, substantially as and for the purpose set forth.

23. In a machine for working the seams of sheet-metal vessels, the combination of a main standard, a head comprising a block suitably secured to the standard and provided with a ⊢- -shaped slot and shoulders, a bearing having a flange fitted to slide on said shoulders and secured by a ⊢- -bolt, a rock-shaft arranged in the bearing and provided with rolls or formers, and suitable means for actuating the shaft at predetermined intervals, substantially as and for the purpose set forth.

24. In a machine for working the seams of sheet-metal vessels, the combination of a main standard, two heads, each comprising a block suitably secured to the standard, a bearing united to the block, and a rock-shaft arranged in the bearing and provided with rolls or formers, and suitable means for simultaneously operating both rock-shafts at predetermined intervals, substantially as and for the purpose set forth.

25. In a machine for working the seams of sheet-metal vessels, the combination of a main standard, two heads, each comprising a block suitably secured to the standard, a bearing united to the block, and a shaft arranged in the bearing and provided with rolls or formers, a pinion on each shaft, a horizontal rack arranged to engage the pinion of one shaft, a vertically-disposed rack, also arranged to engage this pinion, an intermediate pinion arranged to engage the latter rack and a pinion on the other shaft, and suitable means for actuating the horizontal rack at predetermined intervals, substantially as and for the purpose set forth.



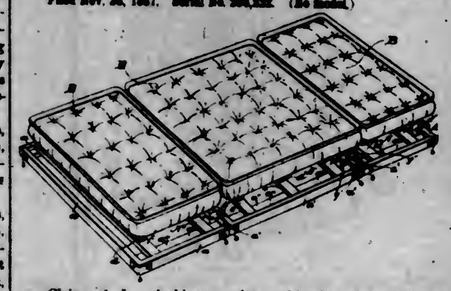
26. In a machine for working the seams of sheet-metal vessels, the combination of a main standard, two heads suitably secured to the standard, to be laterally adjustable with relation thereto, and one of said heads vertically adjustable on said standard, each head having a shaft arranged in a bearing and provided with rolls or formers, and a pinion on each shaft, a horizontal rack arranged to engage the pinion on one shaft, a vertically-disposed shaft arranged to engage this pinion, an intermediate pinion arranged to engage the latter rack and the pinion on the other shaft, and suitable means for actuating the horizontal rack, substantially as and for the purpose set forth.

27. In a machine for working the seams of sheet-metal vessels, the combination of a main standard, a shaft having its bearings on the standard and provided with a series of cams, a chuck normally held in one position and continuously revolved, a sliding chuck in opposition to the one first named and normally non-revolvable, a lever mechanism arranged to actuate the latter chuck independent of the seaming mechanism, suitable heads fulcrumed to said standard and provided with arms to engage cams on the shaft and rock-shafts carrying rolls or formers, and suitable means for starting and automatically stopping the revolution of the former-shaft, imparting a simultaneous movement to both rock-shafts and automatically unchucking the vessel, substantially as and for the purpose set forth.

28. In a machine for working the seams of sheet-metal vessels, the combination of a chucking mechanism, a seaming mechanism, and a revolvable shaft provided with a series of cams arranged at intervals thereon to directly actuate said mechanisms, substantially as set forth.

29. In a machine for working the seams of sheet-metal vessels, the combination of a chucking mechanism, a seaming mechanism, and a revolvable shaft provided with a series of cams arranged at intervals thereon to directly actuate said mechanisms, and so timed that a vessel is chucked, seamed, and released by one revolution of the shaft, substantially as set forth.

382,500. WELL-DRILLING MACHINE. CHRISTIAN WEBER, Oak Glen, Ill. Filed Sept. 14, 1887. Serial No. 249,887. (No model.)



Claim.—1. In a well-drilling machine, the combination of a frame, A, a lever, E, a walking-beam, G, a drill, H, connected through the walking-beam by a chain or cable with the lever, a frame, A', upon the frame A, a driving-shaft, C, and a shaft, I', on the frame A' and geared together, and a striker, I, on the shaft I' and operated thereby to engage with the lever to actuate the drill, substantially as described.

2. In a well-drilling machine, the combination of a frame, A, rotary shafts I' and C, supported on the frame and carrying intermeshing gear-wheels k' and k², a striker, I, on the shaft I', a lever, E, extending into the path of the striker, a walking-beam, G, and a drill, H, connected through the walking-beam with the lever, substantially as described.

3. In a well-drilling machine, the combination of a frame, A, rotary shafts I, I', and C, supported on the frame and carrying intermeshing gear-wheels k, k', and k², a fly-wheel, i, on the shaft I, a striker, I, on the shaft I', a lever, E, extending into the path of the striker, a walking-beam, G, and a drill, H, connected through the walking-beam with the lever, substantially as described.

4. A well-drilling machine comprising a frame, A, formed of converging uprights r and r', connected together, a frame, A', upon the frame A, an upright, D, carrying a walking-beam, G, a drum, F, a drill, H, connected with the drum through the medium of the walking-beam by a chain or cable, G', a lever, E, pivotally connected with the upright D, near one end, and near its opposite end with the walking-beam, rotary shafts I, I', and C, supported on the frame A' and carrying intermeshing gear-wheels k, k', and k², a fly-wheel, i, on the shaft I, and a striker, I, on the shaft C, in line with the lever E, the whole being constructed and arranged to operate substantially as described.

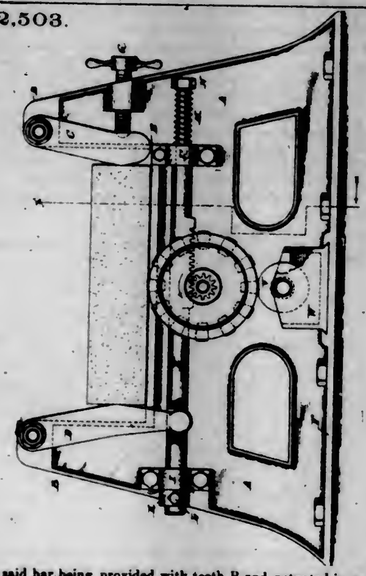
382,501. BED-BOTTOM. WILLIAM F. ADE, Jr., Williamsport, Pa. Filed Nov. 26, 1887. Serial No. 256,332. (No model.)

Claim.—1. In a bed-bottom, the combination of the following elements, viz: a frame-work made in sections, each provided with the locking-hook f, attached to the lower bar n' of each section or frame and adapted to engage the opposite bar of the adjacent section for removably fastening said sections together, for the purpose set forth, spiral springs d, and mattress B B B, also made in sections and attached to said springs, substantially as described.

2. In a bed-bottom, the combination of the following elements, viz: a frame-work made in sections, each provided with the locking-hook f, for the purpose set forth, spiral springs d, mattress B B B, also made in sections and attached to said springs, and elastic brace c inside of each section of the mattress, substantially as described.

382,502. SPRING FOR SCISSORS, &c. FRANK C. ALTHAM, New Haven, Conn. Filed July 5, 1887. Serial No. 243,261. (No model.)

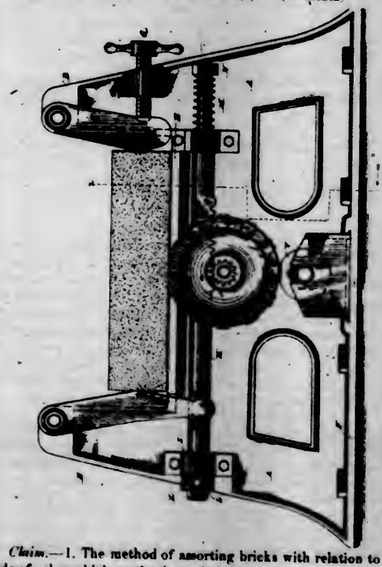
Claim.—In a pair of scissors or shears substantially such as described, the combination therewith of the spring H, arranged upon one blade between the head of the pivot and the blade, the said spring constructed with bearing-points b b, distant from each other forward of the pivot, the said bearing-points turned downward from the plane of the spring onto the blade, the body of the spring inclined downward and rearward beneath the head of the pivot, the head of the pivot taking its bearing upon the spring forward of the pivot, and the spring extending to the rear of the pivot and in slotted connection with the blade, substantially as described.



382,503. APPARATUS FOR GAGING BRICK AND MARKING THEREON THE GRADE OR COLOR THEREOF. JAMES C. ANDERSON, Highland Park, Ill. Filed Jan. 9, 1888. Serial No. 260,140. (No model.)

Claim.—1. In a machine for indicating the color or grade of bricks, a receptacle for the brick having a movable portion and a marking mechanism, substantially as described, operated by said movable portion, whereby the marking of the brick to correspond to its size and color is automatically and mechanically performed, as set forth.

2. A machine for indicating the color or grade of brick and marking the same, consisting of an open frame having a rigid and a movable jaw between which the brick is placed, a sliding bar to which the movable jaw is attached, and a numbering or printing wheel operated by the sliding bar to bring the proper number or character on the wheel into printing position, as set forth.

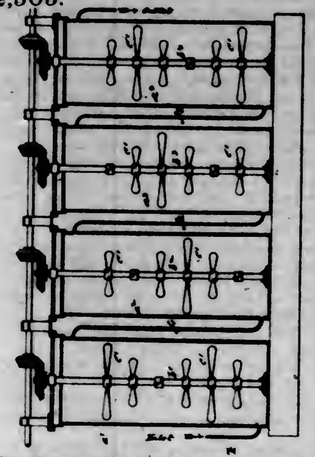


3. In a machine for indicating the color or grade of brick and marking the same, the frame A, having the projection B, to which the jaws C and D are pivoted, the jaw D being secured to the sliding

382,503.

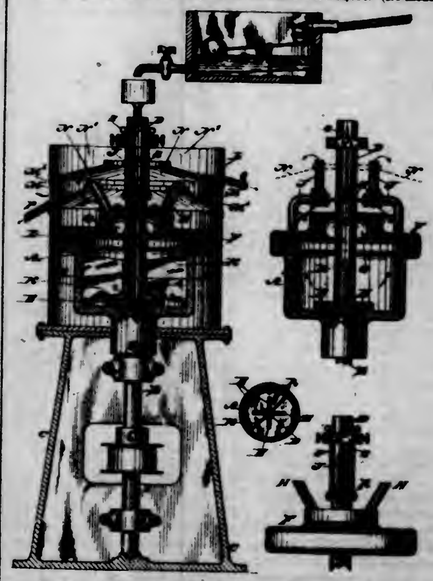
bar H, said bar being provided with teeth R and actuated in one direction by the spring M, in combination with the pinion-wheel P, type-wheel S, and inking-roll V, as set forth.

382,504. METHOD OF ASSORTING BRICKS WITH RELATION TO THEIR COLOR AND GRADE. JAMES C. ANDERSON, Highland Park, Ill. Filed Jan. 9, 1888. Serial No. 260,141. (No model.)



Claim.—1. The method of assorting bricks with relation to their grade of color, which consists in gaging the amount of shrinkage which each brick has sustained in drying and burning, as set forth.

2. The method of assorting brick with relation to their grade of color, which consists in determining by measurement the amount of shrinkage which each brick has sustained in drying and burning, and then marking the same with a symbol indicating the grade or shade of color to which it belongs, as set forth.

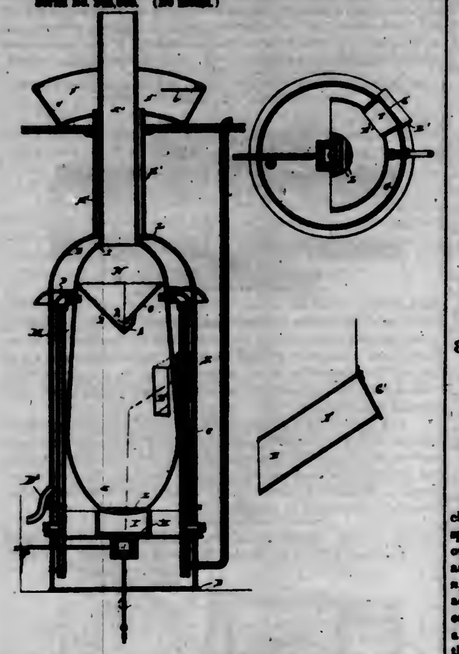


382,505. PROCESS OF OBTAINING ALUMINA. KARL J. BAYER, St. Petersburg, Russia. Filed Aug. 18, 1887. Serial No. 247,268. (No specimens.)

382,505.

Claim.—The process herein described of obtaining pure alumina compounds from bauxite and other materials containing alumina, which consists in subjecting an aluminate lye under constant stirring and at ordinary temperature to the action of hydrate of alumina, so as to decompose said solution and precipitate hydrate of alumina, concentrating the remaining mother liquor, mixing the resulting product with bauxite or other material containing alumina, and, lastly, calcining the mixture, substantially as set forth.

382,506. CENTRIFUGAL CREAMER. HENRY P. BEMBLING, Philadelphia, Pa., assignor to Charles H. Schwerdtfeger and Charles S. Weiderman, same place. Filed July 19, 1887. Serial No. 244,700. (No model.)



Claim.—1. In a centrifugal separator, the rotary vessel A, in combination with the supply-tube D, the cap F, having the chamber G thereto, communicating with said vessel A, the pipes H, inclining outward from said chamber G, the pipes J, leading from the periphery of said vessel A through said cap F, the jacket L, encircling said vessel A, the tables M and N, and the discharge-pipes P and Q, substantially as described.

2. In a centrifugal separator, the rotary vessel A, in combination with the stationary supply-tube D, the cap F, having the chamber G, the outward-inclined pipes H, the pipes J, the jacket L, and the flanged tables M and N, the said pipes H and J respectively extending above the flanged rim of said tables M and N, substantially as and for the purpose set forth.

3. In a centrifugal separator, the vessel A, with inlet-tube D, having distributing-pipes E, in combination with cap F, having chamber G, the pipes H and J, leading, respectively, from chamber G and vessel A, the cock R in said pipe J, and arms S, attached to said cock, substantially as and for the purpose set.

382,507. CAR-HEATER. WILLIAM P. BRENNEN, Columbus, Ohio, assignor of one-half to Wm. S. Bellmer, same place. Filed Sept. 2, 1887. Serial No. 248,695. (No model.)

Claim.—1. The combination of the outer shell, the hood at the upper end thereof, the plate D below said hood, the fire-pot within the outer shell, and the deflectors O P, arranged in the upper end of the fire-pot and in about the same horizontal plane as the plate B, substantially as set forth.

2. The combination of the outer shell, the fire-pot, and the deflectors O P, arranged in the upper end of the fire-pot, the lower edge of the deflector P being extended below the deflector O and having the upturned flange S, substantially as specified.

382,508. REMOVING IMPURITIES FROM STEAM-BOILERS. JOSEPH REESE, Chicago, Ill. Filed Nov. 19, 1887. Serial No. 255,671. (No model.)

Claim.—1. In a steam-boiler, the combination, with a perforated sediment-collecting tube located within and longitudinally of the boiler at the water-line, a deposit-chamber exterior to the boiler, a pipe communicating with the sediment-collecting pipe in the boiler and with the upper end of the sediment-chamber, a return-pipe leading from the upper end of the deposit-chamber and with the interior of the boiler below the water-line, a blow-off pipe extending longitudinally of the deposit-chamber and perforated therein and opening outside thereof, each of said pipes being provided with suitable cocks, substantially as and for the purpose set forth.

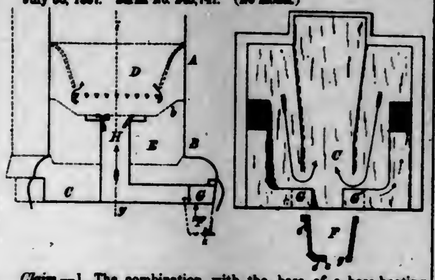
2. In a steam-boiler, the combination, with a perforated tube or tubes, *c*, and pipes *d* and *e*, the latter provided with a cock, *f*, of a deposit-chamber, B, exterior to the boiler, having therein a perforated tube, *j*, with which latter is connected a pipe, *i*, provided with a cock, *n*, substantially as and for the purpose set forth.

3. In a steam-boiler, the combination of a perforated tube or tubes, *c*, pipe *d*, leading therefrom, chamber B exterior to the boiler, provided with curved branches D and D', perforated tube *j*, pipe *i*, and hand-hole E, and a pipe, *e*, leading from the chamber to the interior of the boiler, substantially as specified.

382,508.

382,509. CURTAIN-FIXTURE. CHARNEY BUCKLEY, Meriden, Conn. Filed Feb. 14, 1887. Serial No. 227,519. (No model.)

Claim.—The combination of the roller A, having a concentric chamber extending from one end of the roller inward, a concentric spindle in the said chamber extending through a bearing at the end of the roller, a spring in said chamber, one end fixed to said spindle and the other to the roller, the spindle constructed with a shoulder, *a*, on one side, and the roller provided with a corresponding stop adapted to engage or pass said shoulder, as the case may be, the outer end of said spindle constructed with a notch, *d*, upon one side, and with a recess, *e*, in the opposite side longer than the width of the notch on the other side, with a bracket adapted for attachment to the window-jamb, and constructed with a horizontal recess, *f*, and with a vertical recess opening from said horizontal recess and forming the seat *l*, the thickness of the bracket on one side of said horizontal and vertical recesses corresponding to the width of the notch in the spindle, and the other side of said horizontal and vertical recesses broader than said notch, all substantially as and for the purpose described.



382,510. BARREL FOR OUTHOUSES. THOMAS W. CARRIGO, San Antonio, Tex. Filed Nov. 23, 1887. Serial No. 256,420. (No model.)

Claim.—1. The combination, with the barrel-head B, having the opening *b*, of the cover C, adapted to close said opening, the bolt D, extending through said cover and into the barrel, the clamping-bar E, longer than the width of said opening in the barrel-head, said bar being centrally pivoted by a rivet, *d'*, to the lower end of said bolt D, and a nut, F, screwed upon the upper end of said bolt for clamping said cover in position, substantially as described.

2. The combination, with the barrel-head B, having the opening *b*, of the cover C, adapted to close said opening for the purpose described, and provided with an irregular-shaped hole, c^4, the bolt D, having an irregular-shaped portion extending through the hole c^4 in said cover and into the barrel, the clamping-bar E, longer than the width of said opening in the barrel-head, said bar being centrally pivoted by a rivet, *d'*, to the lower end of said bolt D, and a nut, F, screwed upon the upper end of said bolt for clamping said cover in position, substantially as specified.

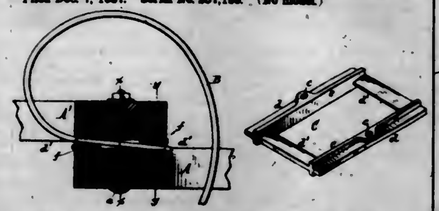
382,511. STOVE. JOHN V. R. CARTER, Rochester, N. Y., assignor of one-third to the Co-Operative Foundry Company, same place. Filed July 30, 1887. Serial No. 245,747. (No model.)

Claim.—1. The combination, with the base of a base-heating stove and with a conduit or chamber for products of combustion with the air-inlet flues, of the air-inlet chamber F, and air-flues G G', extending along the front and side walls of the stove and between said walls and conduit, and the vertical flues H H', arranged to deliver the air immediately below the grate, substantially as specified, whereby the exterior of the stove-base is kept comparatively cool and the air-supply is warmed.

2. The combination, with the base of a base-heating stove, of an air-inlet chamber provided with air-inlet openings on its side and bottom, a suitable damper or slide provided with parts that entirely close the inlets at the side, and others that partially close those at the bottom when said damper is in its shut position, and air-flues extending from said chamber to the space beneath the grate.

3. The combination, with the base of the stove, having an air-inlet, of a damper for such inlet, the damper being of such size relative to the inlet that in its shut position it partially closes said inlet, and a check-draft opening, *i*, provided with damper *f*, substantially as set forth, whereby the stove will always ventilate the room and may be made at will to ventilate it without passing air through the fire.

4. The combination, with the base of a stove, of an air-inlet, exterior front air-flues, G G', the adjacent interior conduit or chamber for products, and a fuel-chamber in communication with said flues and also with the conduit, substantially as set forth, whereby air is preheated and excessive heating of the front of the base is obviated.



5. The combination, with the perforated bottom of the base of a stove, of the chamber F, secured under the bottom and having its interior in communication with the perforations in the bottom, a damper for air-inlets in the chamber, flues G G', extending from the perforations in the bottom around the exterior of the front and sides of the base immediately above its bottom and adjacent to a conduit for products of combustion, and flues H H', extending to the space beneath the grate, substantially as set forth.

382,512. WASH-BOARD. JAMES R. CLUTTON, Xenia, Ohio. Filed Aug. 30, 1887. Serial No. 248,338. (No model.)

Claim.—In a wash-board, the combination of the blank C, having a series of horizontal grooves, *c*, with the round-headed pins D, having shanks *d*, which enter grooves *c* of the blanks, the pins being secured and arranged on the blanks, substantially as and for the purpose described.

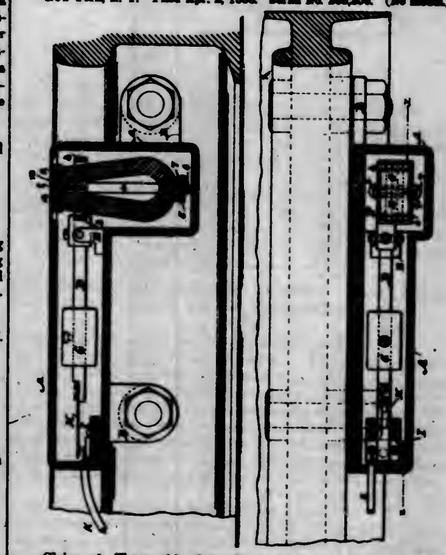
382,513. HARROW. SAMUEL COOPER, Yorkshire Centre, N. Y. Filed Dec. 7, 1887. Serial No. 257,189. (No model.)

Claim.—1. The combination, with the harrow-frame and a harrow-tooth, of a tooth-holder consisting of an open frame secured to the harrow-frame, and composed of side bars and end bars, whereby the tooth can be clamped against either side of the tooth-holder or be passed through the same diagonally so as to bear against opposite sides of the end bars of the tooth-holder, substantially as set forth.

2. The combination, with the harrow-frame and a harrow-tooth, of a tooth-holder consisting of an open rectangular frame having its end bars beveled inwardly, forming inclined seats for the tooth on opposite ends of the frame, substantially as set forth.

3. The combination, with the bars of the harrow-frame provided in their adjacent portions with grooves or depressions for the reception of the teeth, of a tooth-holder secured in said grooves, and a harrow-tooth inserted between the tooth-holder and the adjacent portion of the harrow-frame, substantially as set forth.

4. The combination, with the bars of the harrow-frame, having grooves or depressions for the reception of the teeth, of a tooth-holder secured in said grooves, a harrow-tooth inserted between one side of the tooth-holder and the adjacent portion of the harrow-frame, and a filling-piece inserted between the opposite side of the tooth-holder and the adjacent portion of the harrow-frame, substantially as set forth.



382,514. PIPE-COUPLING. JOHN DAVIS, Allegheny, Pa. Filed Nov. 3, 1887. Serial No. 254,210. (No model.)

Claim.—1. A pipe-coupling consisting of a sleeve or bell having a ring secured thereto, which is provided with a coarse internal screw-thread and a set-screw through its wall, in combination with a pipe having a corresponding coarse screw-thread on its end and provided with a fixed ring or collar, and a packing-ring adjacent thereto, substantially as described.

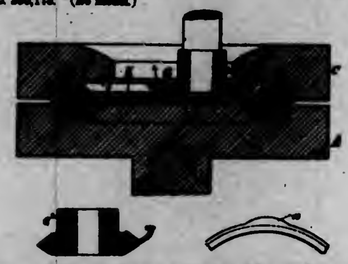
2. A pipe-coupling consisting of a sleeve or bell having a concave portion at its base, in combination with a ring having a convex outer surface and an internal screw-thread, a set-screw extending through the wall of the bell and bearing upon said ring, a pipe having a screw-thread on its end and provided with a fixed ring or collar and a packing-ring, substantially as described.

382,515. ELECTRIC RAILWAY-SIGNAL. COMPANY F. DU RETAIL, New York, N. Y. Filed Apr. 2, 1888. Serial No. 269,356. (No model.)

Claim.—1. The combination, with a closed case, of a lever pivoted within the case, a circuit-closing spring upon the lever, and a magnet supported by such lever and giving motion to the same in consequence of the magnetic attraction between the magnet and the iron of the passing wheels, substantially as set forth.

2. The magnet and a lever with which the magnet is connected and by which it is supported, a circuit-closer upon the lever, and a stationary circuit-closing contact, in combination with the case of non-magnetic material, having a thin plate above the magnet, so that the magnetism is free to act between the magnet and the passing wheels to give motion to the lever and circuit-closing device, substantially as set forth.

3. The combination, with the case, of a lever pivoted within the case, a circuit-closer connected with the lever, a permanent magnet, the poles of which are adjacent to the top of the case, and a frame upon the lever for receiving the magnet, substantially as set forth.



382,516. BUCKLE. GEORGE F. RUSSELMAN, Cleveland, Ohio. Filed Dec. 27, 1887. Serial No. 259,002. (No model.)

Claim.—1. The herein-described buckle, consisting of the frame, the cross-bar located between the end members of the frame, the bent tongue integral with said cross-bar, and a second cross-bar located in a plane below the first cross-bar and forming a loop, substantially as set forth.

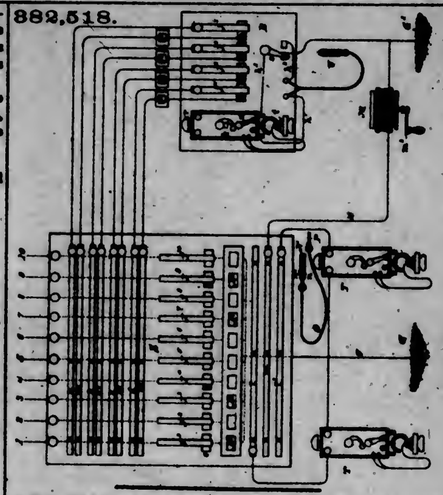
2. The herein-described buckle, consisting of the frame, the cross-bar located between the end members of the frame and provided with the bent tongue and with perforations for permanently attaching a strap-end, and a second cross-bar located in a plane below the first cross-bar and forming a loop, substantially as set forth.

382,517. DIE FOR MAKING WATCH-CASES OR OTHER ARTICLES. FREDERICK BOARDMAN, Brooklyn, N. Y. Filed Jan. 9, 1886. Serial No. 208,173. (No model.)

Claim.—1. The combination, with the holding-shells A and C, of the ring-die D, having an interior surface corresponding to the exterior rim of the watch-case lid or bezel, in combination with the roller G, having an exterior surface corresponding to the interior of the rim, and the shield K, for holding the central portion of the lid, substantially as specified.

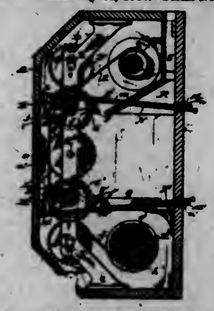
2. The combination, with the roller G, for forming the interior of the rim, of the die D, for forming the exterior of such rim, and the shell C, having a shoulder at 3 for the inner edge of the rim, and the inclined surface 5, with which the inclined portion 4 of the roller G comes in contact, substantially as set forth.

3. The combination, with the ring-die D, of the interchangeable rollers G G² G³, roller G, for shaping the interior of the rim of the lid or bezel, the roller G², for bending up the inner edge of the metallic ring, and the roller G³, for shaping the reflector portion of the bezel, substantially as set forth.



4. The combination, with the ring-die D, for the exterior of the bezel, of the backing-die M, within the bezel, and the roller G³, for shaping the interior of the reflector portion of the bezel, substantially as set forth.

5. A die having an interior shape corresponding to the exterior shape of the rim of the watch-case bezel, in combination with a roller for forcing the metal ring into such die, a roller for bending up the inner edge of the sheet metal and giving to the same the shape of the finished article, and simultaneously forming the groove for the watch-glass, substantially as specified.

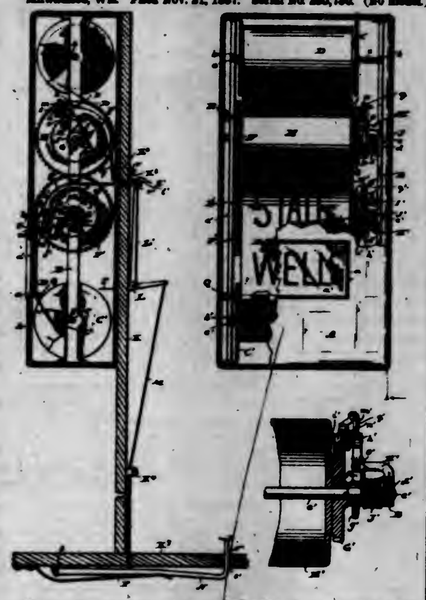


382,518. TELEPHONE-EXCHANGE. ROBERT H. RUSSELL, Boston, Mass., assignor to the Western Electric Company, Chicago, Ill. Filed Mar. 7, 1884. Serial No. 123,261. (No model.)

Claim.—The combination, substantially as hereinbefore set forth, of a series of subscribers' lines converging to a common switch-board, switch apparatus adapted for temporarily connecting any two of said lines, switching and calling mechanism mounted on an operator's table and in a loop connected with said switching mechanism, and indicators to notify the table-operator of connections made on the switch-board with the loop-lines on the table.

382,518.

382,519. STATION AND STREET INDICATOR. JOHN L. FAUS, Milwaukee, Wis. Filed July 11, 1887. Serial No. 243,946. (No model.)



Claim.—1. In a station and street indicator, the combination of a name-band, the opposite ends of which are secured to spring-controlled drums, a pair of friction-rollers between which the name-band passes arranged at an intermediate point between the said drums, and operating-levers and actuating mechanism, substantially as and for the purpose set forth.

2. In a station and street indicator, the combination of a name-band, the opposite ends of which are secured to spring-controlled drums, a pair of friction-rollers at each end of the device between which the name-band passes, and operating-levers and actuating mechanism, whereby the device may be operated for a return trip without adjustment as soon as the initial trip is finished, substantially as set forth.

3. In a station and street indicator, the combination of a suitable casing, interior supporting-brackets, two pairs of friction-rollers, each pair supported by said brackets at opposite ends thereof, gear-wheels on the shafts of said rollers with an intermediate idler communicating therewith, ratchet-wheels and spring-controlled bell-cranks on the shafts of the rollers which are adjacent to the idler, pawls pivotally connected to the bell-cranks, operating-levers connected to said bell-cranks, stops projecting from the casing and from the bracket adjacent thereto, spring-controlled drums located back of each pair of friction-rollers, and a name-band extending from one drum to the other and passing between the adjacent surfaces of each pair of friction-rollers, substantially as set forth.

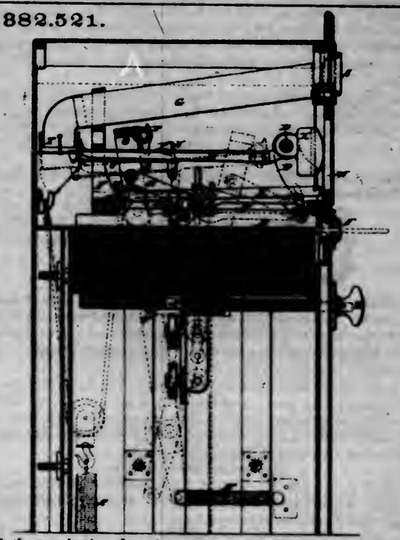
4. In a station and street indicator, the combination of the name-band, two pairs of friction-rollers between which it passes, a train of gears and a bell-crank, and pawl-and-ratchet mechanism connected to each pair of friction-rollers, an operating-lever connected to each bell-crank, and a wire or cord attached to the free end of each pawl, whereby when one of the levers is pulled to operate the pawl connected therewith the wire or cord attached to the other pawl may be pulled to disengage that pawl and prevent its operation, substantially as set forth.

382,520. STATION AND STREET INDICATOR. JOHN L. PATE, Milwaukee, Wis. Filed Nov. 21, 1887. Serial No. 255,730. (No model.)

Claim.—In a station and street indicator, the combination of a suitable casing, interior supporting-brackets, spring-controlled winding-drums supported by said brackets at opposite ends thereof, a pair of friction-rollers, also supported by said brackets between said drums, gear-wheels on the shafts of said friction-rollers in mesh with each other, ratchet-wheels fast with the heads of the friction-rollers, loose sleeves on the shafts of the friction-rollers having stop-arms rigid therewith, said stop-arms terminating in curved arms projecting in opposite directions, one of each of said curved arms carrying a pawl with an arm rising therefrom and the other curved arms serving as cord-guides, cords attached to the said pawl-arms and connected to the actuating mechanism, springs controlling the stop-arms and pawls, adjustable stops on each side of the stop-arms, and a same-band extending from one winding-drum to the other and passing between the adjacent surfaces of the intermediate friction-rollers, substantially as and for the purpose set forth.

382,521. NEWSPAPER-SELLING APPARATUS. CHARLES GALLARD, Lyons, France. Filed Sept. 6, 1887. Serial No. 248,978. (No model.) Patented in France Dec. 24, 1886, No. 180,470, and in England Aug. 6, 1887, No. 10,811.

Claim.—1. In an apparatus for the delivery of newspapers and the like upon the insertion of a coin, the combination, with a case, of a horizontally-guided oscillating needle-carrying bar, L, with the actuating swinging lever O, a rod, N, connecting the needle-bar and the lever, and the knob Z, connected with the lever for swinging the latter forward, substantially as described.



2. The combination, with a case having a coin-receiving orifice, S, and paper-delivery orifice, S', of a horizontally-guided oscillating needle-carrying bar, L, the swinging lever O, the rod N, connecting the lever and needle-bar, a dog for holding the lever retracted until a coin is inserted, and a knob, Z, connected with the lever to swing it forward and advance the needle-bar, substantially as described.

3. The combination, with a case having in its front the coin-receiving orifice S and the delivery-orifice S', of a channel, G, a cup, T, under the end of the channel, an oscillating lever, E, carrying the cup and having a stop, P', and lever V, the lever U, carrying the movable bottom of the cup, the stirrup-lever O, having a pivoted dog, P, a horizontally-guided needle-bar, L, connected with the stirrup-lever, and the knob Z, connected with the latter, substantially as described.

4. In an apparatus for the delivery of newspapers and the like by the insertion of a coin, the combination of the oscillating lever E, carrying a cup, T, having a movable bottom, the stop P' and lever V on the oscillating lever, the lever O, having the dog P, and the needle-bar L, substantially as described.

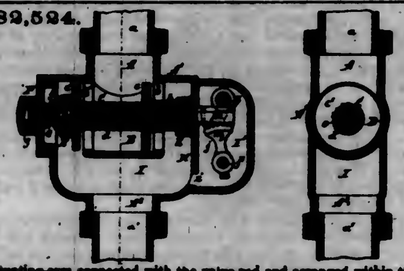
5. The combination, with the oscillating lever E, cup T, channel G, the case having the coin-receiving orifice S, the obturator at said orifice, and the grate R, of the pivoted arm K, connected with said obturator and having a rod, M, projecting down through the grate to bear on the newspapers or the like, substantially as described.

382.521.

382,522. SWEEP. JAMES T. GOSS, Point Peter, Ga. Filed Aug. 20, 1888. Renewed Dec. 27, 1887. Serial No. 259,142. (No model.)

Claim.—In combination with a plow-stock, a cultivating implement having a turning-blade, 2, adapted to enter the soil, a narrow straight sweep-blade, 1, projecting on the side of the stock opposite to the turning-blade, and arranged to scrape the surface of the ground, and the strengthening-piece 3, carried by one of the blades and bearing against the stock, substantially as described.

382,523. WHEELBARROW. WILLIAM H. C. GOSS, Sidney, Ohio, assignor of one-half to Wilbur E. Kilbury, same place. Filed Mar. 16, 1888. Serial No. 267,203. (No model.)



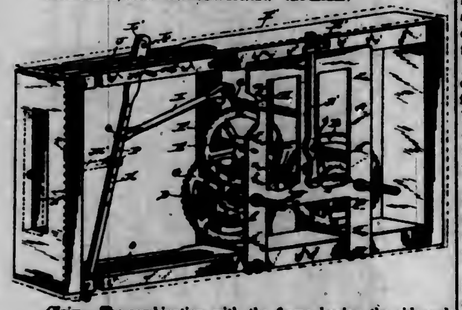
Claim.—1. A seamless metallic wheelbarrow-tray whose sides and ends meet in curves and gradually curve from the top downward into the bottom, substantially as described, and for the purposes stated.

2. A seamless raw-edge wheelbarrow-tray whose sides and ends meet in curves and gradually curve from the top downward into the bottom, the entire tray being beat or stamped up from a single metal blank, substantially as described.

382,524. VALVE. ALDEN H. GRAHAM, Glenwood, Mass., assignor to the Voltar & Fulkerson Manufacturing Company, Buffalo, N. Y. Filed May 25, 1887. Serial No. 239,371. (No model.)

Claim.—1. The combination, with the valve-casing provided with an inlet-passage, A, and two valve-seats, *b b'*, on opposite sides of the inlet-passage, of a valve, C, composed of two disks, *c c'*, and a hollow stem, *d*, and having a spherical socket, *f*, a valve-rod, *e*, passing through the hollow stem and provided with a spherical knuckle, *p*, and an actuating-arm connected with the valve-rod and arranged within the inclosure of the valve-casing, substantially as set forth.

382,524.



2. The combination, with the valve-casing having one of its heads provided with a socket, *g*, of the valve C, provided with a hollow stem, *d*, an actuating-rod, *e*, arranged within the hollow valve-stem and provided with a spherical knuckle, *p*, and a head, E, secured to the end of the valve and provided with a guide-pin, *c*, which enters the socket *g*, the head E and the adjacent portion of the valve being constructed with a spherical socket in which the knuckle of the actuating-rod is seated, substantially as set forth.

3. The combination, with the valve C, provided with a hollow stem, *d*, and guide-pin *c*, of the casing A', provided with sockets *g h'*, in which the valve is guided, an actuating-rod, *e*, arranged in the stem *d*, and an actuating-arm, *j*, substantially as set forth.

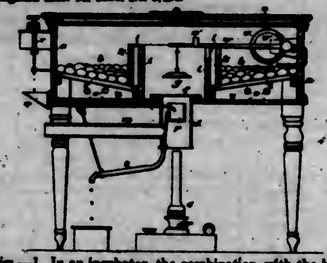
4. The combination, with the valve C, provided with the actuating-rod *e* and the inclosing-casing A', of the actuating-arm *j*, arranged in said casing and provided with a gear-segment, *m*, and a rack-bar, *n*, secured to the rod *e*, substantially as set forth.

5. The combination, with the casing A', the valve C, and its guide, of the actuating-rod *e*, the actuating-arm *j*, provided with a gear-segment, *m*, the rack-bar *n*, secured to the rod *e*, and the guide-roller *g*, bearing against said rack-bar, substantially as set forth.

382,525. MECHANICAL MOTOR. SAMUEL A. HAINES, Cuero, Tex. Filed Oct. 20, 1887. Serial No. 253,737. (No model.)

Claim.—The combination, with the frame having the side and end slots, of the two drive-wheels and their springs, the movable spring-actuated shaft having the central pinion, the pivoted lever, the catch for the same, the crank-shaft formed with the central crank and having the pinion, the connecting-pitman, the pivoted adjustable fan-rod formed with the series of apertures near its upper end and along its central part, the adjustable weight, and the connecting-rod, all substantially as and for the purpose herein set forth.

382,526. PIECE-MACHINE. ALEXANDER V. HARPER, Tower Hill, Ill. Filed Jan. 23, 1888. Serial No. 261,267. (No model.)



Claim.—1. In fence-machines, in combination, the standard *a*, the drive-wheel *c*, having crank-handle *e*, the sprocket-chain *d*, and the twister-wheels *b*, having each a frame, *f f'*, and adjustable hooks A, as and for the purpose set forth.

2. In fence-machines, twister-wheel A having frame *f f'*, and adjustable hooks A, as and for the purpose set forth.

3. In twister-wheels for fence-machines, in combination, a sprocket-wheel, *b*, having slot *b'* and central opening, *b''*, a frame, *f f'*, secured to the face of the wheel, and adjustable hooks A on part *f'* of the frame, as and for the purpose set forth.

382,527. INCUBATOR. WALTER H. HEARN, Rodsworth, England. Filed Feb. 7, 1887. Serial No. 226,703. (No model.) Patented in England Mar. 11, 1886, No. 3,626.

Claim.—1. In an incubator, the combination, with the hatching-chamber, of a hot-air-inlet opening communicating therewith, a valve for controlling the admission of heated air to the hatching-chamber, and a thermostat in the hatching-chamber connected to and operating said valve, substantially as set forth, whereby the admission of heated air is automatically regulated and an equable temperature in the hatching-chamber is maintained.

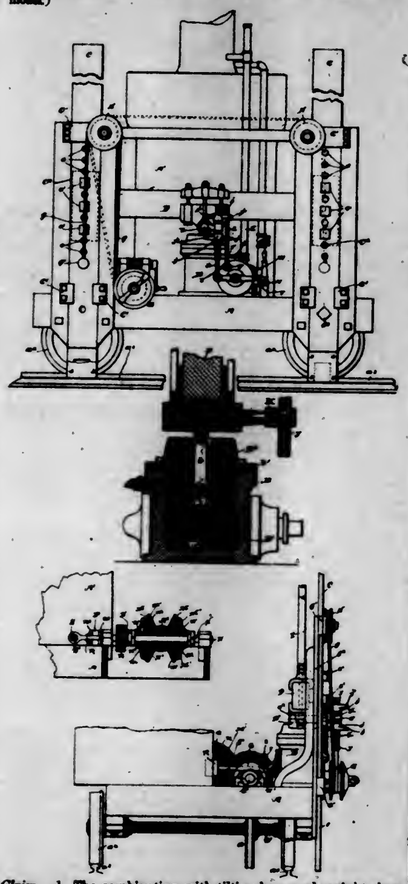
2. In an incubator, the combination, with the hatching-chamber, of a hot-air chamber communicating therewith through an opening, a valve for controlling said opening, and a thermostat in the hatching-chamber connected to and operating said valve, substantially as set forth.

3. In an incubator, the combination, with the hatching-chamber, of a hot-air chamber beneath it, an opening in the bottom of the hatching-chamber for admitting heated air from said hot-air chamber, a flue leading from said opening to the upper part of the hatching-chamber, a valve for controlling said opening, and a thermostat in the hatching-chamber connected to and operating said valve, substantially as set forth.

4. In an incubator, the combination, with the hatching-chamber constructed with a hot-air-inlet opening in its bottom, a flue extending from said opening to the upper part of the chamber, and a partition between said flue and the egg-holder forming an intervening air-space, of a valve for controlling said opening and a thermostat in the hatching-chamber connected to and operating said valve, substantially as set forth.

5. In an incubator, the combination, with the hatching-chamber having an inlet-opening, of a hot-air chamber communicating with said opening, a water-vessel in said hot-air chamber, whereby its vapor moistens the heated air at its entry into the hatching-chamber, and a valve for controlling said opening, substantially as set forth.

6. In an incubator, the combination, with the hatching-chamber having an inlet-opening, of a hot-air chamber communicating with said opening, a water-vessel in said hot-air chamber, whereby its vapor moistens the hot air at its entry into the hatching-chamber, a water-supply for replenishing the water in said vessel, an overflow-tube for removing any excess of water from said vessel, a valve for controlling the passage of heated air through said opening, and a thermostat connected to and operating said valve, substantially as set forth.



7. In an incubator, the combination, with the hatching-chamber having an inlet-opening, of a hot-air chamber communicating with said opening, an escape-flue for conducting away the excess of heated air or gases, a valve for controlling the admission of heated air through said opening, and a thermostat in the hatching-chamber connected to and operating said valve, substantially as set forth.

8. In an incubator, the combination, with the hatching-chamber having an inlet-opening, of a hot-air chamber communicating therewith, a valve for controlling said opening, a thermostat in the hatching-chamber connected to and operating said valve, a radiator-chamber for warming the air in said hot-air chamber, an escape-flue for conducting away the heated gases from said radiating-chamber, and a lamp or equivalent source of heat for heating said radiating-chamber, substantially as set forth.

9. In an incubator, the combination, with the hatching-chamber having an inlet-opening, of a hot-air chamber communicating therewith, a valve for controlling said opening, a balance-lever, to one end of which said valve is connected, and a thermostat within the hatching-chamber connected to said lever and adapted to vibrate it as the temperature varies, substantially as set forth.

10. In an incubator, the combination, with the hatching-chamber having an inlet-opening, of a hot-air chamber communicating therewith, a valve for controlling said opening, a balance-lever to one end of which said valve is connected, a thermostat within the hatching-chamber connected to said lever and adapted to vibrate it as the temperature varies, and a counter-weight adjustable along said lever in order to regulate its initial position, and thereby to determine the normal temperature within the hatching-chamber, substantially as set forth.

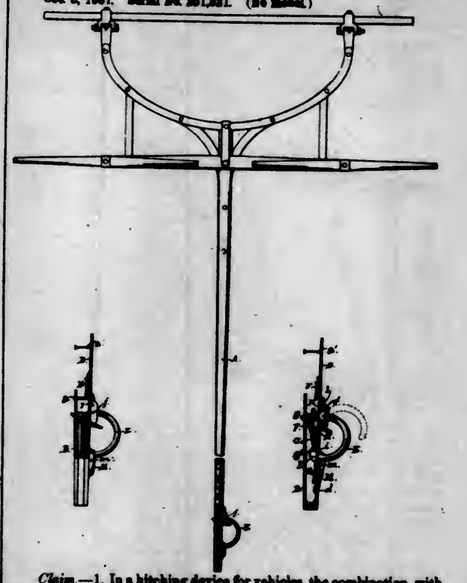
382,528. STONE-CHANNELING MACHINE. JOSEPHUS F. HALLOWAY, New York, N. Y. Filed Sept. 21, 1887. Serial No. 250,212. (No model.)

Claim.—1. The combination, with tilting lever and upright channeling-bars connected with the respective ends of the lever, of trunk-engine for operating the lever and channeling-bars, said engine being connected with the lever between the channeling-bars, and suitable means for holding stationary one channeling-bar while operating the other channeling-bar, substantially as set forth.

2. The combination, with tilting lever and channeling-bars connected with the respective ends of the lever, of wrists connected with the respective channeling-bars for attaching to the lever, said wrist being adjustable lengthwise of the channeling-bars, and a steam-cylinder for operating the lever, substantially as set forth.

3. The combination, with channeling-bars and trunk-engine located between the bars for operating the latter, of tilting lever, the latter being connected at the ends thereof with the respective channeling-bars and connected at the central portion of the lever with the engine for operating the same, and suitable means, substantially as indicated, for fastening the one channeling-bar to furnish a fulcrum for the lever in operating the other channeling-bar, substantially as set forth.

4. The combination, with upright channeling-bars, tilting lever, pivotally attached to the bars, a trunk-engine located midway of the bars for operating the device, of a series of holes in each channeling-bar made at equal intervals, and blocks with securing-bolts made to fit the holes in the channeling-bars to render the blocks adjustable lengthwise of the channeling-bars, said blocks having wrists attached for fastening to the tilting lever, substantially as set forth.



5. The combination, with steam-cylinder of the trunk variety, and a steam-space above the piston-head, of a steam-pipe and hand-valve for admitting steam above the piston-head to cushion the latter on its upstroke, the parts being arranged substantially as indicated, having no exhaust above the piston-head.

6. The combination, with steam-cylinder, channeling-bars, and tilting lever, substantially as indicated, a sleeve connected with the lever, a valve-rod made to slide through the sleeve, said rod having tappets mounted thereon, respectively above and below the sleeve, of a locking-bar for the tappets, said locking-bar being pivoted at the one end and provided with friction-disks at the pivotal bearings, substantially as set forth.

7. The combination, with bevel twin gears and driving-pinion simultaneously engaging both gears, the system of gearing having shrouding to hold the twin gears to the pitch-line as against pressure from without, of shaft, sleeve journaled on the shaft, the twin gears being journaled on the sleeve, and collars mounted on the sleeve outside the twin gears to hold the latter from moving apart, substantially as set forth.

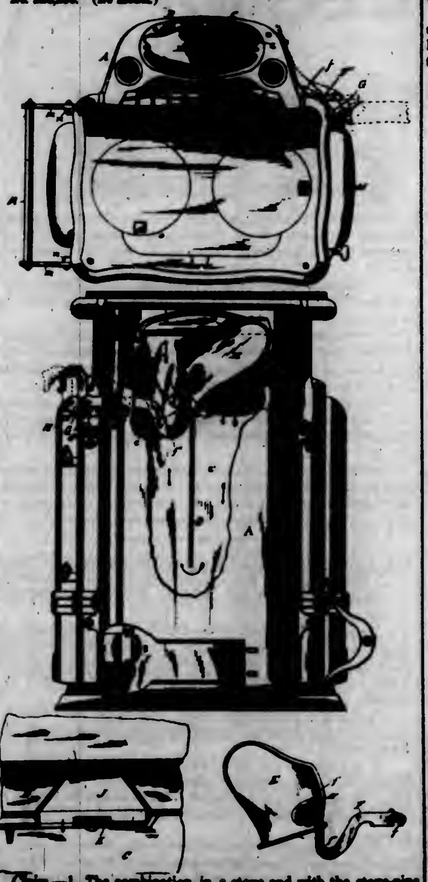
8. The combination, with gearing, shaft, sleeve, and collar, substantially as indicated, of friction-clutches mounted on the shaft and operated, respectively, by the twin gears, and mechanism, substantially as indicated, for moving the shaft endwise to operate the one clutch or the other, substantially as set forth.

382,529. POLE-TIP. THOMAS J. HOUGHTON, Lancaster, Pa. Filed Oct. 5, 1887. Serial No. 251,321. (No model.)

Claim.—1. In a hitching device for vehicles, the combination, with the pole-tip divided into sections, of the clasp E, spring G, triggers L and M, and springs N and O, constructed to operate substantially as described.

2. The combination, in a pole-tip, with the clasp, and a spring connected with and acting to close the same, of two triggers, one engaging with the clasp to keep it open and the other to keep it closed, and springs to force the triggers into such engagement, for the purpose specified.

382,530. LOCKING MECHANISM FOR RAILWAY-SWITCHES. CHARLES H. JOHNSON and CHARLES ALLEN, Chillicothe, Iowa. Filed Dec. 5, 1887. Serial No. 256,603. (No model.)



Claim.—1. In locks for railroad-switches, the combination, with the rock-shaft bearing adjustable dogs designed to turn up alongside the switch-rails and carrying at one end a crank, of a toggle-lever movably connected to said crank, a bell-crank lever movably connected to said toggle-lever, and a curved arm movably connected to said bell-crank lever, the said arm being operated by an upright shaft carrying a hand-lever designed to be held to its position by a bolt or pin, substantially as described.

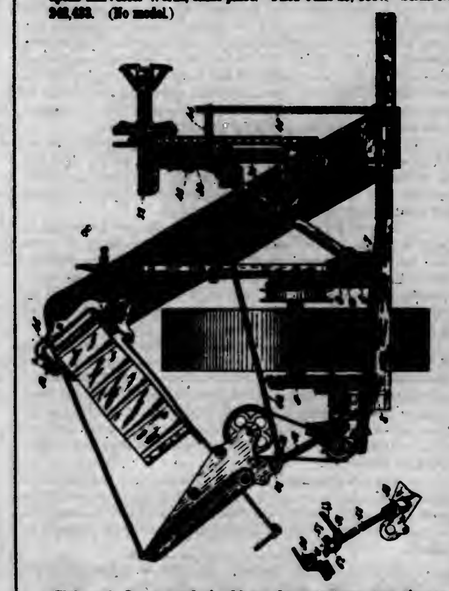
382,530.

2. In locks for railroad-switches, the combination, with the rock-shaft having adjustable dogs thereon and carrying at one end a crank, of a toggle-lever movably connected to said crank, a bell-crank lever, and a curved arm movably and adjustably connected to said bell-crank lever, the upright shaft having a hand-lever moving in arc-shaped guides, and a pin or bolt passing through openings in said guides for holding the parts to their positions when operated in substantially the manner shown and described.

382,531. STOVE. WILLIAM J. KERR, Detroit, Mich., assignor to the Michigan Stove Company, same place. Filed Feb. 13, 1887. Serial No. 228,209. (No model.)

Claim.—1. The combination, in a stove and with the stove-pipe opening, the casing, and the fire-pot thereof, of a vertical air-flue, a divided smoke-flue, substantially parallel therewith, both air and smoke flues being between said fire-pot and casing, a direct passage for the products of combustion to the plate having an opening for the stove-pipe, a strip dividing the smoke-flue, and a damper at the upper end of said strip to cut off the products of combustion from the direct passage, substantially as described.

2. The combination, in a stove having an opening for the stove-pipe, a casing, and a fire-pot, of a vertical air-flue, a divided smoke-flue, substantially parallel therewith, and both air and smoke flues being between said fire-pot and casing, a direct passage for the products of combustion to the opening for the stove-pipe, a strip dividing the smoke-flue, and a curved damper at the upper end of said strip to cut off the products of combustion from the direct passage, substantially as described.



3. The combination, in a stove and with the fire-pot and casing thereof, of a divided smoke-flue, a damper at the upper end thereof, an air-flue of substantially the same width as the stove between the fire-pot and smoke-flue, and opening through the top plate of the stove, substantially as described.

4. The combination, in a stove and with the casing, the fire-pot, the ash-pit beneath the fire-pot, the air-flue behind the same, and the smoke-flue behind the air-flue, of the dust-flue passing through the air-flue and connecting the ash-pit and the space around the fire-pot with the smoke-flue, substantially as described.

5. The combination, in a stove and with the fire-pot, casing, and smoke-flue thereof, of a vertical air-flue running from the top to the bottom of the stove between the fire-pot and smoke-flue, and having an opening through it, mostly on one side of the stove, to allow of the passage of the products of combustion from the fire-pot to the smoke-flue, substantially as described.

6. The combination, in a stove having an ash-pit and air and smoke flues, of two plates forming the walls of the air-flue, and a box held between said plates and forming a dust and check flue, substantially as described.

382,532. SELF-RIDING HARVESTER. SAMUEL V. KENNEDY and CHARLES A. ANDERSON, Minneapolis, Minn., assignors to the Minneapolis Harvester Works, same place. Filed June 25, 1887. Serial No. 242,622. (No model.)

Claim.—1. In a trussed wheel-beam for grain-harvesters, the combination of the following elements: a main supporting-beam, an adjustable straining or truss rod above the same, an adjustable segment-rack for carrying the main frame upon the main wheel and forming a strut for the truss-rod, bolsters at the front and rear ends of the said main beam to connect the same with the front and rear axle, seats in each of the said bolsters for the truss-rods, and adjusting-nuts applied to the ends of the truss-rods which project through the said bolsters respectively.

2. In a trussed wheel-beam for grain-harvesters, the combination of a main supporting-beam, a straining or truss rod above the same, a

segment-rack adjustably mounted upon the said main beam and rigidly secured at its upper end to the truss-rod, and means for adjusting the truss-rod endwise relatively to the ends of the said main beam, for the purpose of securing the upper end of the segment-rack in its proper position.

3. In a trussed wheel-beam wherein a segment-rack which supports the main frame upon the main wheel is used as a strut and is adjustable at its upper end by means of an endwise-adjustable truss-rod, an adjusting-rod for connecting the lower part of the said segment-rack to the main gear-frame, whereby the latter is held in proper relation to the segment-rack, and hence in proper relation to the main spur-wheel mounted upon the axle of the main wheel.

4. A pivotally-adjustable segment-rack for grain-harvesters and an adjusting-rod for the same, the upper part of the rack being provided with a bearing and a clamp for engaging the adjusting-rod, by which the upper end of the segment-rack, when it has been properly adjusted, is rigidly held in position.

5. In a reel-supporting device for harvesters, the gear-frame 35, adapted to be passed over the pinion 36 and bolted to the elevator-frame, the disk 39, adapted to be held in place by the gear-frame 35, and the pinion 36 for driving the reel-gear affixed to the shaft 37, inserted through the hollow hub 38 of the disk 39.

6. In a reel-supporting device for harvesters, the gear-frame 35, provided with the recesses 42, and adapted to be passed over the pinion 36 and bolted to the elevator-frame, in combination with the disk 39, having the projections 41, adapted to fit within the recesses 42, and to thereby hold the disk in place.

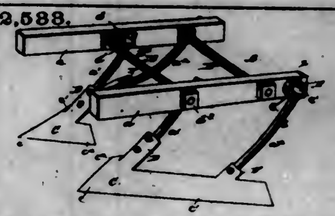
7. In a reel for harvesters, the combination, with the gear-frame 35, of the reel-post 34, the quadrant-rack 33, and the divider 45, having its upper part rigidly connected with the horizontal lug or bar 44, cast upon or otherwise affixed to the said quadrant-rack.

8. In a reel for harvesters, an adjusting and locking device consisting of the reel-supporting arm 21, the rib 24‡, cast on the side thereof, provided with the slot 24, the perforated boss 25, the transversely-perforated and longitudinally-grooved brace 30, and the adjusting latch-arm 26, pivoted upon the horizontal reel-supporting arm and adapted to engage the perforations in the brace 30.

9. In a butt-adjuster for harvesters, the shaft of the roller 48, having affixed to its lower end the pinion 55, and the disk 51, provided with the radially-projecting lip 53, and secured to the lower side member, c', of the frame 47, in combination with the supporting-bracket 46, having the opening 52 and notch 54, through which the pinion 55 and lip 53 may pass, and within which the disk 51 has its seat, whereby the adjuster-frame may be removed from or replaced in its supporting-bracket, as and for the purpose set forth.

10. In a butt-adjuster for harvesters, the shaft of the roller 48, having secured to its lower end a pinion, 55, and the disk 51, the frame 47, to which the disk 51 is fastened, and the supporting-bracket 46, provided with the opening 52, through which the pinion 55 may pass and within which the disk 51 has its seat.

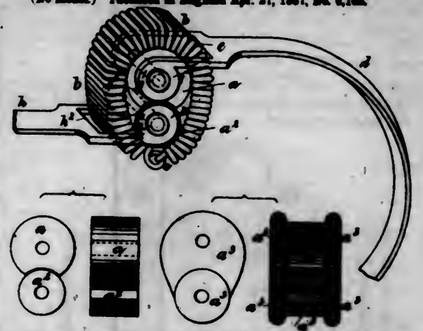
11. In a self-binding harvester, a binder-standard having at its upper end a seat for the binder-supporting pipe 62, and at its lower end a lip, 59, in combination with a part of the main frame provided with a hole, 60, having a groove, 61, as shown, to admit the lip 59, whereby, when the standard is inserted in its seat in the hole 60 and turned to its proper position to receive the supporting-pipe 62, it will be firmly held in place, as described.



12. In a raising and lowering device for harvesters, the windlass 65, having the bearing 64 in the main frame, and extending thence grainward in a direction substantially at a right angle to the plane of inclination of the elevator-frame, whereon the upper end of the windlass-shaft has its bearing, and the operating-lever 67, mounted on the upper end of the said windlass-shaft, whereby the plane of movement of the operating-lever is substantially parallel with the plane of inclination of the elevator.

13. In a grain-harvester, the shoe 46, having a rearward extension provided with the lip 70, and the rear sill, 69, in combination with the plank 71, provided with the transverse grooves 72 and 73, adapted to fit, respectively, the lip 70, and the sill 69, as and for the purpose described.

382,533. COTTON-SWEEP. THADDEUS W. KNIGHT, Kyle, Tex. Filed Feb. 9, 1888. Serial No. 263,491. (No model.)



Claim.—1. The combination, with the frame A, having the longitudinal beams a a, and with the detachable shanks a' a^2, of the blades or points C, each composed of the outer long arm, c', and the inner short arm, c^2, making the front angle, c, of about forty-five degrees with each other, and having their lower front edges sharpened, as and for the purpose specified.

2. In a cotton or corn sweep, the blades or points C, composed of the outer long arm, c', and the inner short arm, c^2, the said arms meeting at the front point or angle, c, with the long arm running rearward and outward therefrom, and the short arm running rearward and inward from said point or angle, as set forth.

3. In a cotton or corn sweep, the blades or points C, each composed of the outer or long arm, c', and the inner or short arm, c^2, said arms meeting each other at the point or angle C, the extension D, extending upward from the angle or point, the extension F on the long arm, the frame, and the standards a' a^2, connected to the frame and arranged on opposite sides thereof, said standards being connected, respectively, to the extensions D F of the blades, as set forth.

382,534. SPRING-SHACKLE. JAMES A. LANGLOIS, Birmingham, County of Warwick, England. Filed Jan. 14, 1888. Serial No. 260,760. (No model.) Patented in England Apr. 27, 1887, No. 6,162.

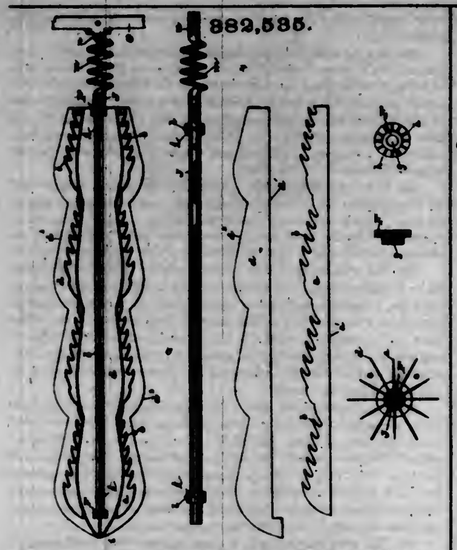
Claim.—1. A shackle composed of a core of elastic material peripherally surrounded by an elastic band or hook consisting of a flattened coil of spring-wire united at its ends, substantially as described.

2. A shackle composed of an inner elastic core consisting of two cylindrical blocks of elastic material and a surrounding elastic band of flattened coiled spring-wire, substantially as described.

3. A shackle composed of an inner elastic core consisting of two cylindrical blocks of elastic material, one of which is provided with a longitudinal groove, as shown and described, and a surrounding elastic band of flattened coiled spring-wire, substantially as set forth.

4. A shackle composed of an inner core consisting of two cylindrical blocks of elastic material, a a^2, having end flanges, a^3, and a surrounding band of flattened coiled spring-wire, substantially as described.

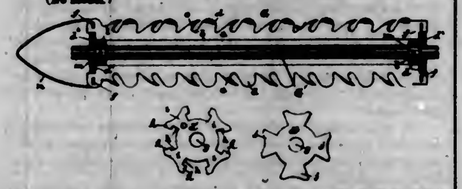
5. The combination, with the elastic blocks a a^2, and the hoop or band b, composed of flattened coiled spring-wire united at its ends, of the forked spring d and forked rod A, connected, respectively, with blocks a a^2 by means of bolts g k, substantially as described.



382,535. PICKER-STEM FOR COTTON-HARVESTERS. WILLIAM L. LANGLEY, Newark, N. J., assignor to The Langley Cotton Harvester Company of New York City. Filed Dec. 20, 1886. Serial No. 222,116. (No model.)

Claim.—1. A cotton-picker stem having its body portion provided with longitudinal toothed plates with undulatory outer edges, said plates having teeth only on those parts of the undulatory edges which incline inward and toward the butt of the stem, substantially as described.

2. A cotton-picker stem having longitudinal tooth-plates and longitudinal guard-plates, the latter provided with undulatory edges, for the purpose set forth.



3. A cotton-picker stem having longitudinal tooth-plates and longitudinal guard-plates, the latter provided with undulatory outer edges, the said plates being arranged in rows on said stem so as to form longitudinal spaces between the tooth-plates and guard-plates, for the purpose set forth.

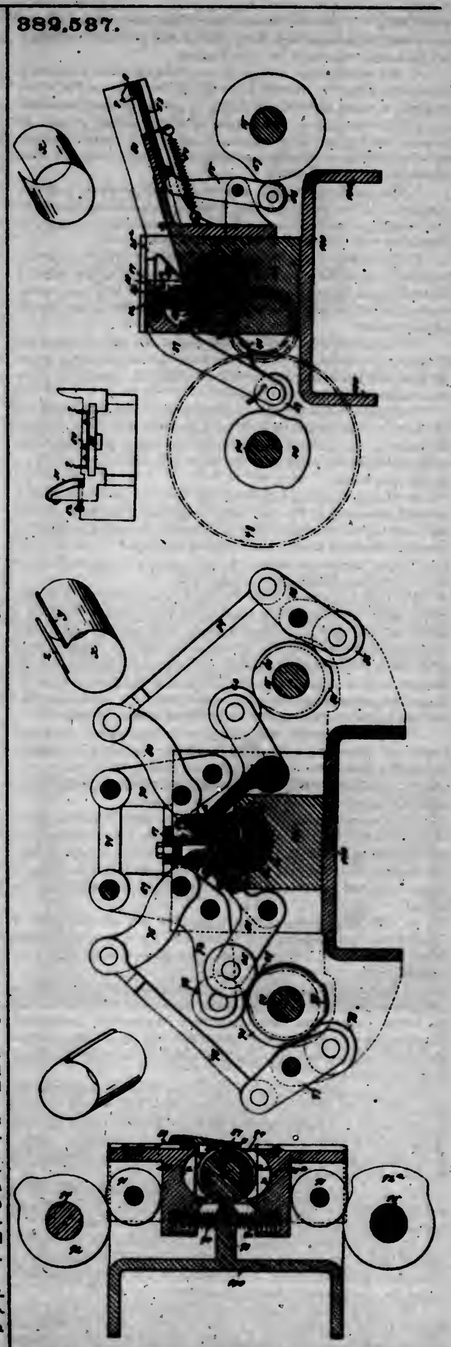
4. A cotton-picker stem consisting of the perforated end a, with holder O connected thereto, the body portion of the stem having heads F, with radial slots A, the longitudinal tooth-plates and guard-plates, and an intermediate spring portion, said perforated end, body portion,

and spring being integral, the whole constructed and arranged to operate as shown and described.

382,536. PICKER-STEM FOR COTTON-HARVESTERS. WILLIAM L. LANGLEY, Newark, N. J., assignor to The Langley Cotton Harvester Company of New York City. Filed May 19, 1887. Serial No. 238,782. (No model.)

Claim.—1. A cotton-picker stem having longitudinal plates which are provided along their outer edges with teeth and guards located alternately, as set forth.

2. A cotton-picker stem having longitudinal plates c secured to end plates and arranged to form between each two longitudinal plates a longitudinal slot or open space, e, and said plates provided with teeth c and guards d, located alternately along the same edge, as set forth.



3. A cotton-picker stem having longitudinal plates provided on one edge with alternating teeth and guards, the said teeth pointing outwardly toward the circumference of the stem and inclined to the radius thereof and at the same time inclined rearwardly.

4. A cotton-picker stem having longitudinal plates provided on one edge with teeth and guards, the said teeth inclining sidewise and differently from the guards, whereby the teeth form a longitudinal row lying in one plane and the guards a row lying in another plane.

5. A cotton-picker stem having longitudinal plates provided with teeth and guards, and having in their ends slots f, and secured together at said ends by two end plates, each having a central hole, g, one of said plates, d, being provided with radial tongs i, having laterally-projecting ears k, and the other plate, d', being provided with tongs j, having radial edges, each laterally-projecting ear k on one end plate occupying the end slot, f, of a longitudinal plate, and a radial tongs, j, of the other plate lying between two of the longitudinal plates, and thereby confining them on the said laterally-projecting ears.

382,537. APPARATUS FOR FORMING SHEET-METAL CAN-BODIES. FRANK H. LEAVEY, Brooklyn, N. Y., assignor to Edwin Norton and Oliver W. Norton, Chicago, Ill. Filed July 6, 1887. Serial No. 243,023. (No model.)

Claim.—1. In a can-body-forming machine, a horn formed with a series of longitudinally-arranged recesses in its upper surface and divided longitudinally into four sections, of which the third section is of less diameter than the other sections.

2. In a can-body-forming machine, a horn divided longitudinally into four sections, A, B, C, and D, the sections A and B being of the same diameter and of a greater diameter than the other sections, the section C being of less diameter than any of the sections, and the rear

tion D being of a diameter between that of the section C and the sections A and B, the said horn being formed with a series of longitudinally-arranged recesses in its upper surface.

3. The combination, with a horn, of feeding-rollers arranged in connection therewith, a means for revolving the rollers, and a former arranged in connection with the rollers, as and for the purpose stated.

4. The combination, with a horn, of feeding-rollers, a means for revolving the rollers, a former arranged in connection with the rollers, and a lip-beading mechanism operating in connection with the horn, as and for the purpose stated.

5. The combination, with a horn, of feeding-rollers, a former mounted in advance of the rollers, a means for revolving the rollers, a lip-beading mechanism, and a lip-locking mechanism arranged in connection with the horn, as and for the purpose stated.

6. The combination, with a horn, of feeding-rollers, a former mounted in connection therewith, a means for revolving the rollers, a lip-beading mechanism, a lip-locking mechanism, and a lip-compressing mechanism, all arranged in connection with the horn, as and for the purpose stated.

7. The combination, with a stepped horn, of a pair of rollers, one of which is journaled in a recess in the larger part of the horn, a means for revolving the rollers, and a former mounted in connection therewith, as and for the purpose stated.

8. The combination, with a stepped horn, of a pair of rollers, one of which is journaled in a recess in the larger part of the horn, a means for revolving the rollers, a former, and a lip-beading mechanism operating after the rollers and upon the larger part of the horn, as and for the purpose stated.

9. The combination, with a stepped horn, of a pair of rollers, one of which is journaled in a recess in the larger part of the horn, a means for revolving the rollers, a former, a lip-beading mechanism operating after the rollers and in connection with the larger part of the horn, and a lip-locking mechanism mounted in connection with the smallest portion of the horn, substantially as described.

10. The combination, with a stepped horn, of a pair of rollers, one of which is journaled in a recess in the larger part of the horn, a means for revolving the rollers, a former, a lip-beading mechanism operating after the rollers and in connection with the largest portion of the horn, a lip-locking mechanism arranged in connection with the smallest section of the horn, and a lip-compressing mechanism arranged in advance of the locking mechanism and in connection with the intermediate section of the horn, substantially as described.

11. The combination, with a horn, of feeding-rollers arranged in connection therewith, a means for revolving the rollers, a former, a lip-beading mechanism operating after the feeding-rollers and former, and a means, substantially as described, for advancing the partially-formed can-bodies, as and for the purpose stated.

12. The combination, with a horn, of a pair of rollers, one of which is mounted in a recess formed in the horn, intermeshing gears carried by the roller-shafts, a driving-shaft, a train of accelerating gearing arranged between said shaft and one of the roller-shafts, and a former mounted in connection with the rollers, substantially as described.

13. The combination, with a horn, of a pair of rollers, one of which is mounted in a recess formed in the horn, a roller-driving mechanism, a former, and a blank-feeding mechanism, substantially as described.

14. The combination, with a horn, of a pair of rollers, one of which is mounted in a recess formed in the horn, a means for driving the rollers, a former and stripping-plate, a blank-feeding mechanism, an adjustable guide arranged in connection with the feeding mechanism, and a spring-guide arranged in advance of the rollers, substantially as described.

15. The combination, with a horn, of a block partially inclosing one section of the horn, an annular space being left between the horn and the block, a shoulder defining the annular space, a roller mounted in the recess formed in the horn, a second roller mounted in connection with the first roller, and a means for revolving the rollers, as and for the purpose specified.

16. In a can-body-forming machine, the combination, with a horn one end of which is held within a chambered block, of a plate connected to the frame and to the horn, substantially as described.

17. In a can-body-forming machine, the combination, with a horn formed with a longitudinal slot, 3, and supported at one end within a chambered block, of a plate, 16, connected to the frame and secured within the slot 3, substantially as described.

18. In a can-body-forming machine, the combination, with a horn formed with longitudinal side grooves, of slides mounted within said grooves, tongues pivotally mounted within recesses formed in the slides, springs arranged in connection with the tongues, and a slide-reciprocating mechanism, substantially as described.

19. In a can-body-forming machine, the combination, with a horn formed with a lip, *c*, of a presser-arm mounted on a movable pivot, a lever formed with a lip, *f*, and an operating mechanism, substantially as described.

20. In a can-body-forming machine, the combination, with a horn formed with a recess, *b*, and a lip, *c*, of presser-arms 63 and 64, the arm 64 being formed with a lip, *e*, levers 69 and 70, that are pivotally connected to the frame, a link by which said levers are connected, levers 75 and 80, that are pivotally connected to the levers 69 and 70, the lever 75 being formed with a lip, *f*, and the lever 80 being formed with a shoulder, *g*, and operating cams and connections, all parts being arranged substantially as described.

21. The combination, with a horn provided with a longitudinal rib or projection, 86, of curved-faced blocks mounted at either side of the horn, a hook carried by one of the blocks, a spring arranged in connection with the hook, and a means, substantially as described, for advancing the blocks toward the horn, as and for the purpose stated.

22. The combination, with a horn provided with a longitudinal rib or projection, 86, of curved-faced blocks mounted at either side of the horn, a hook carried by one of the blocks, a spring arranged in connection with the hook, a stiff metallic plate carried by the other block and extending toward the horn from the upper inner edge of said block, a spring arranged between the blocks, and a means, substantially as described, for advancing the blocks toward the horn, as and for the purpose stated.

23. The combination, with a horn provided with a longitudinal rib or projection, 86, of curved-faced blocks mounted in ways at either side of the horn, a hook carried by one of the blocks, a spring arranged in connection with the hook, a stiff metallic plate secured to the other block and extending outward from the upper inner edge of the block toward the projection 86, a spring arranged between the blocks, rollers carried by the blocks, and cams arranged in connection with the rollers, as and for the purpose stated.

24. The combination, with a horn formed with a longitudinal groove, *i*, of a plate mounted in a recess formed in the horn at one side of the recess *i*, springs arranged in connection with the plate, curved-faced clamping-blocks mounted at either side of the horn, and a means for operating said blocks, a presser-foot mounted above the horn, and a means for operating said foot, all substantially as described.

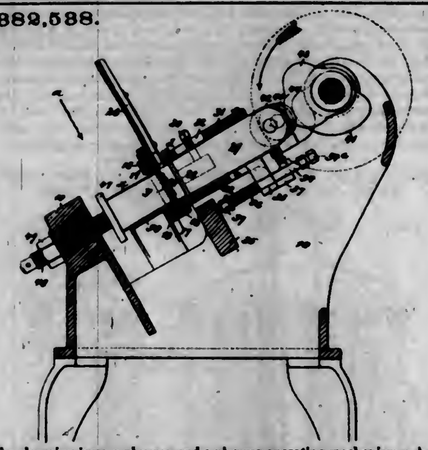
25. The combination, with a horn formed with a recess, *i*, of curved blocks mounted at either side of the horn, a means for operating the said blocks, a plate, 95, mounted within a recess formed at the side of the recess *i*, springs by which said plate is supported, a follower mounted above the horn, a presser-foot carried by the follower, a yieldingly-mounted plate carried by the presser-foot, and a means, substantially as described, for forcing the follower downward, as and for the purpose stated.

26. The combination, with a horn, of a pair of rollers, one of which is mounted in a recess formed in the horn, a former, a means for revolving the rollers, and a means for raising the upper roller, substantially as described.

27. The combination, with a horn, of a roller mounted in a recess formed in the horn, a roller mounted in movable boxes above the horn, a former, a means for revolving the rollers, and a means for raising the upper roller, substantially as described.

28. The combination, with a horn provided with a longitudinal recess having on one edge a projecting lip, of binders or presser-arms engaging the horn at the edges of the recess, one of which binders is provided with a projecting lip, and levers having their points working, the one over the lip on the horn and the other over the lip on the binding-arm, substantially as described.

382,588. CAN-HEADING MACHINE. FRANK M. LEAVITT, Brooklyn, N. Y., assignor to Edwin Norton and Oliver W. Norton, Chicago, Ill. Filed Aug. 26, 1887. Serial No. 247,873. (No model.)



Claim.—1. In a can-heading machine, the combination, with a reciprocating guiding-ring, of clamping and sizing jaws held to slide beneath the ring, a means for feeding the can-heads within the ring, and a means for forcing the can-heads to place, substantially as described.

2. In a can-heading machine, the combination, with a follower and a means for reciprocating the same, of a guiding-ring carried by the follower, sizing and clamping jaws held below the guiding-ring, a means for advancing the jaws, a plunger, and a means for reciprocating the same, substantially as described.

3. In a can-heading machine, the combination, with a follower and a means for reciprocating the same, of a guiding-ring held by the follower, clamping and sizing jaws mounted beneath the guiding-ring, fixed inclined bearing-faces arranged in connection with the clamping-jaws, a plunger, and a plunger-operating mechanism, substantially as described.

4. In a can-heading machine, the combination, with a follower and a means for reciprocating the same, of a chambered guiding-ring held by the follower, clamping and sizing jaws mounted beneath the guiding-ring, fixed inclined bearing-faces arranged in connection with

382,588.

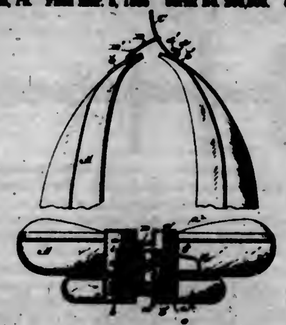
the clamping-jaws, a plunger, and a plunger-operating mechanism, substantially as described.

5. In a can-heading machine, the combination, with a follower, of a plunger mounted therein, a means for imparting an independent reciprocating motion to the plunger and the follower, a guiding-ring carried by the follower, supporting-plates mounted above the guiding-ring, a means for withdrawing the plates, clamping and sizing jaws mounted beneath the guiding-ring, and a means, substantially as described, for advancing said clamping and sizing jaws, as and for the purpose stated.

6. In a can-heading machine, the combination, with a follower, of a plunger mounted therein, a means, substantially as described, for reciprocating the plunger and the follower, a chute connected to the follower, supporting-plates arranged beneath the chute, a means for withdrawing the plates, a guiding-ring supported by the follower beneath the supporting-plates, clamping and sizing jaws mounted to slide beneath the guiding-ring, and a means, substantially as described, for advancing the clamping and sizing jaws, as and for the purpose stated.

7. In a can-heading machine, the combination, with a follower and a means for reciprocating the same, of a guiding-ring held by the follower, clamping and sizing jaws mounted beneath the guiding-ring, fixed inclined bearing-faces arranged in connection with the clamping-jaws, supporting-plates mounted above the guiding-ring, and means for retracting said supporting-plates, a plunger, and a plunger-operating cam, the bearing-faces of which cam is recessed, as and for the purpose stated.

8. In a can-heading machine, the combination, with a driving-shaft provided with cams 41 and 43, of a follower provided with anti-friction rollers 40, which are borne upon by the cams 41, a plunger and head-block mounted within the follower, a roller, 42, carried by the head-block and arranged to be borne upon by the cam 43, a chute, 26, leading to a recess, *d*, plates 22, arranged beneath the recess *d*, levers 23, that are studded to the follower 12, springs arranged in connection with said levers, a chambered guiding-ring, 16, mounted beneath the plates 22, clamping-jaws 17 and 17ª, mounted to slide beneath the ring 16, springs 19, arranged in connection with the clamping-jaws and plates 45, having shoulders *h* and inclined bearing-faces *f*, substantially as described.



382,589. MODEL FOR DENTAL PLATES. PETER J. MALOUF, Altoona, Pa. Filed Jan. 24, 1888. Serial No. 261,777. (Model.)

Claim.—1. A model for dental plates, having a row of depressions or holes formed in the edge of its molding-surface for molding a guide-row of points or heads, as shown and described.

2. A model for dental plates, having a groove formed in the edge of its molding-surface and formed with a row of depressions or holes in the outer edge or side of the groove for molding a guide-row of points or heads for trimming the plate, as shown and described.

382,540. HORSE-COLLAR FASTENER. CLEMENT MARSHALL, Indiana, Pa. Filed Mar. 8, 1888. Serial No. 266,603. (No model.)

Claim.—1. In combination with a collar having strips *b* and *b'* attached thereto, an adjustable loop, B, provided with a movable crossbar, B', a pivoted lever with a cam or curved portion secured to the opposite end of the collar and adapted to engage with a loop, substantially as shown, and for the purpose set forth.

2. In combination with a horse-collar having a lever attached to one side thereof, a loop attached to the opposite side of the collar, and provided with outwardly-bent ends which are adapted to engage with perforations or loops in the opposite end of the collar, and an adjustable bar movable upon said loop for preventing the ends from becoming detached, substantially as shown, and for the purpose set forth.

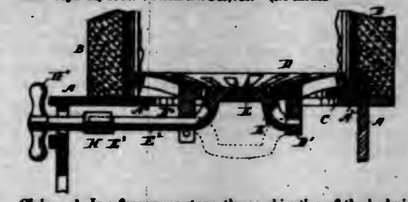
3. In a horse-collar fastener, a loop, B, made of a single piece of wire with outwardly-bent ends which are adapted to be sprung so as to engage with securing means, a lever constructed of a single piece of wire, the side members of which are adapted to be sprung toward each other, and means for pivotally securing the loop and lever to the ends of the horse-collar, the parts being constructed of wire, substantially as shown, and for the purpose set forth.

382,541. FLOUR-SIEVE. HENRY MAHER, Cortland, Ill. Filed Feb. 10, 1887. Serial No. 227,180. (No model.)

Claim.—1. In a flour receptacle and sifter, the combination of a closed case, a horizontal frame with headed pins in its under side, a sieve secured to the upper side thereof, so as to divide the interior of the case into upper and lower chambers, an agitator secured within the case to be reciprocated horizontally in contact with the upper surface of the sieve, and a discharge-funnel having a flange with key-hole slots suspended within the case just below the sieve-supporting frame, so as to be detachable therefrom, the lower portion of the case having in one side a hinged door, substantially as shown.

2. In a flour receptacle and sifter, the combination of a closed case, a horizontal frame and sieve dividing the case into upper and lower chambers, a reciprocating agitator above the sieve, and a discharge-funnel removably secured to the frame, said funnel being provided at its lower end with a hinged bottom for closing the same, substantially as shown.

3. In a flour receptacle and sifter, the combination, substantially as described, of the case, a horizontal ledge projecting inward from the walls of the case between its ends, a sieve secured upon said ledge to divide the case into upper and lower chambers, headed studs projecting from the lower surface of the ledge, and a funnel provided at its lower end with a hinged bottom and at its upper end with a flange having key-hole slots to engage the headed studs of the ledge.



382,542. SHOW-RACK. CHARLES R. MCELROY, Brockton, assignor of one-half to Dudley P. Ladd, Medford, Mass. Filed Mar. 19, 1888. Serial No. 267,663. (No model.)

Claim.—1. The combination of the standard *a*, the series of slides which are adjustable on said standard and are provided with holding set-screws *h*, the sockets *i* on said slides adapted to receive rods or bars *m*, and the rests on said sockets, each adapted to support one end of a bar, *k*, the other end of which is supported by a like rest on another standard, as set forth.

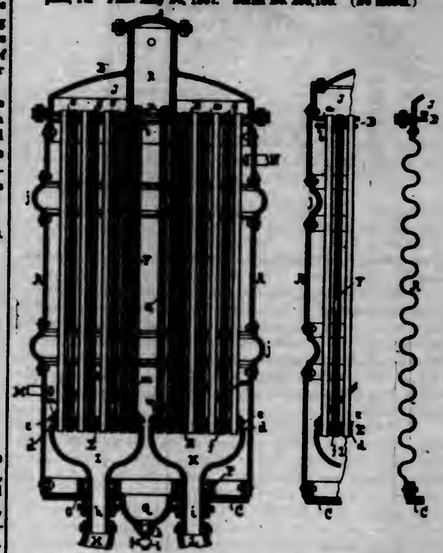
2. The combination of the standard, the series of slides which are adjustable on said standard and are provided with set-screws *h*, which bind them to the standard, the sockets *i i* on said slides adapted to hold bars *m* horizontally, and the rests arranged at right angles to the sockets and above the latter, whereby the rests of two adjacent standards are adapted to support a bar, *k*, at right angles with the bars *m* inserted in the sockets on which said rests are formed, as set forth.

382,543. STOVE-GRATE. ROBERT W. MCNEELY, Somerville, Mass. Filed Sept. 14, 1887. Serial No. 249,719. (No model.)

Claim.—1. In a furnace or stove, the combination of the bed-piece A^1 A^2, the sliding supporting-piece C, having rounded bearings C^1 C^2, the annular grate D, provided with trunnion-sockets D^1 D^2, adjusted to receive said bearings and having downwardly-projecting ears D' D^3, with the central piece, E, having trunnions E' E^2, all arranged to operate together substantially as described, and for the purpose set forth.

2. In a stove-grate, the combination of the annular grate D, having a central opening and downwardly-projecting ears D' D^3, with an inner grate, E, having downwardly-inclined trunnions E' E^2, adapted to throw the grate E out of the center of the opening in the grate D, substantially as described, and for the purpose set forth.

382,544. LUBRICATOR. WILLIAM HILLARD, Indianapolis, Ind. Filed Oct. 6, 1887. Serial No. 251,602. (Model.)



Claim.—The lubricator for crank-wrists consisting of the combination of grease-box 7, having duct 6 communicating with the periphery of the crank-wrist, piston 10, having a screw-threaded stem, 11, ratchet-wheel 12, having a screw-threaded eye, suitably-operated pawl 13 for intermittently rotating the latter, wheel 15, having tappet 14, lever 24, with which the latter is adapted to engage, and wheel and worm gear connection 16, 17, 18, 19, and 20 with the crank-wrist, substantially as set forth.

382,545. TUG-BUCKLE. HERMAN C. MINARD and LAWRENCE C. MINARD, SR., Clarion, Iowa. Filed Feb. 3, 1888. Serial No. 262,576. (No model.)

Claim.—As an improved article of manufacture, the herein-described tug-section, comprising the parallel curved sides A A, having the plain apertures C, and the tapped apertures C' therein, respectively, the loop B, connecting the ends of the sides and forming a crossbar perpendicular to the said sides, the removable rounds D, passing through the plain apertures and having threaded ends engaging the tapped apertures, and the loose sleeves E, mounted on the rounds between the sides A and bearing at their ends against the sides to maintain them in the proper relative positions, substantially as specified.

382,546. FEED-WATER HEATER. EDWARD J. MORRIS, Philadelphia, Pa. Filed May 24, 1887. Serial No. 239,102. (No model.)

Claim.—1. In a feed-water heater, a casing or shell, heating-tubes divided into two groups and attached at their upper ends to a single or continuous tube-sheet and at their lower ends to separate tube-sheets, combined with chambers formed on the under side of the lower tube-sheets, having necks which pass through stuffing-boxes in the lower heater-head, substantially as and for the purpose specified.

2. In a feed-water heater, heating-tubes divided into two groups and attached at their upper ends to a single or continuous tube-sheet and at their lower ends to separate tube-sheets, chambers formed on the under side of the lower tube-sheets, having necks which pass through stuffing-boxes in the lower heater-head, combined with an extensible and contractible outer shell or casing, substantially as and for the purpose specified.

3. In a feed-water heater, one or more of the tube-sheets formed of two plates separated by means of studs, the said tubes being expanded in both of the separated plates, substantially as and for the purpose specified.

4. In a feed-water heater, the lower tube-sheets provided with deflecting-plates to prevent the accumulation of mud on the same and to deflect it to a mud-reservoir, substantially as and for the purpose specified.

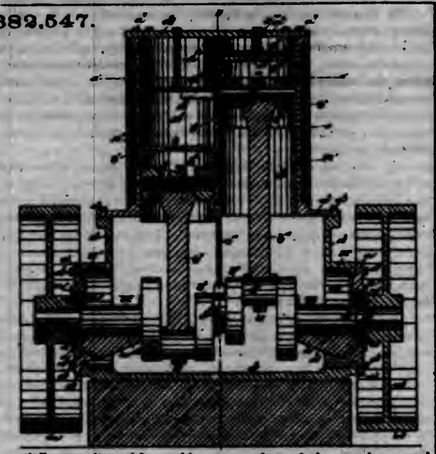
5. In a feed-water heater, the lower tube-sheets provided with deflecting-plates to prevent the accumulation of mud on the said sheets, combined with a mud-receptacle situated below the said deflecting-plates, substantially as and for the purpose specified.

6. In a feed-water heater, a scum-chamber situated near to the top of the heater, having a contracted entrance-aperture in its lower end, substantially as and for the purpose specified.

382,547. STEAM-ENGINE. FREDERICK C. MORTON, Chelsea, Mass. Filed Nov. 15, 1886. Serial No. 218,854. (No model.)

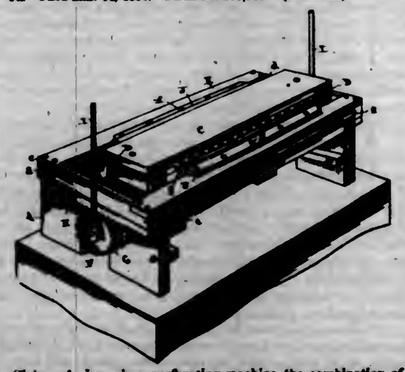
Claim.—1. In a steam-engine, the main shaft A, having cranks set substantially opposite and located in a case or box, a^3, the one-piece metal casting A', cored to form the valve-cylinder A^4, and piston-cylinders A^2 A^5, pistons in said cylinders, and a connecting-rod for each piston, combined with the eccentric-rod c^{10}, having an eccentric-strap pivoted at one end and a spring to keep the parts of the said strap together, substantially as described.

2. In a steam-engine, the main shaft A, having cranks set substantially opposite and located in a case or box, a^3, the one-piece metal casting A', cored to form the valve-cylinder A^4 and piston-cylinders A^2 A^5, pistons in the cylinders A^2 A^5, connected to the main shaft, the piston-valve *v*, the cross-head c^7, connected thereto and having the rod or pin c^9, combined with the eccentric-rod c^{10} and eccentric c^{11}, and with the cap c^{12}, and a spring to keep the cap in contact with the rod or pin c^9 to compensate for wear, as and for the purpose specified.



3. In a steam-engine, the main shaft A, having cranks set substantially opposite and located in a case or box, a^3, having the flange A^{13}, and cover a', secured thereto and provided with inwardly-projecting bearings *a*, each uncovered on its top, combined with the fly-wheel overlapping the cover a', as and for the purpose specified.

4. In a steam-engine, a main shaft, a case to contain oil or other lubricant, and the cover a', secured thereto and to the bearing *a*, combined with the flanged disk *n*, secured to and revolving with the main shaft, and with the flanged disk n', secured to the cover and forming an oil-trap with the disk *n*, substantially as described.

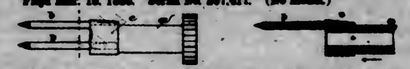


5. In a steam-engine, a main shaft, a case to contain oil or other lubricant, and the cover a', secured thereto and to the bearing *a*, provided with the passage n^5, combined with the flanged disk *n*, secured to and revolving with the main shaft, and with the flanged disk n', secured to the cover and forming an oil-trap with the disk *n* to return the oil into the said case, substantially as described.

6. In a steam-engine, a main shaft, a case to contain oil or other lubricant, and the cover a', secured thereto, combined with the flanged disk *n*, secured to and revolving with the main shaft, and with the flanged disk n', secured to the cover and forming an oil-trap with the disk *n*, substantially as described.

382,547.

382,548. CIGAR-PERFORATING MACHINE. ADEL P. NEWT, Roley Pa. Filed Mar. 11, 1887. Serial No. 230,695. (No model.)



Claim.—1. In a cigar-perforating machine, the combination of a supporting-frame, a mold-board held in suitable guides on the frame, a reciprocating carriage embracing the mold-board and mounted on suitable guides or ways on the frame, two sets of perforating-needles mounted, respectively, on opposite sides or rails of the carriage, and means for reciprocating the carriage on its ways, whereby the two sets of needles are caused to move simultaneously in the same direction and to alternately perforate the two ends of the cigars held in the mold-board, substantially as and for the purpose herein specified.

2. The combination of a supporting-frame, a mold-board held in suitable guides on the frame, a reciprocating carriage embracing the mold-board and mounted on suitable guides or ways on the frame, two needle-plates removably attached to opposite sides or rails of the carriage and respectively provided with sets of perforating-needles, and means for reciprocating the carriage on its ways, substantially as and for the purpose herein set forth.

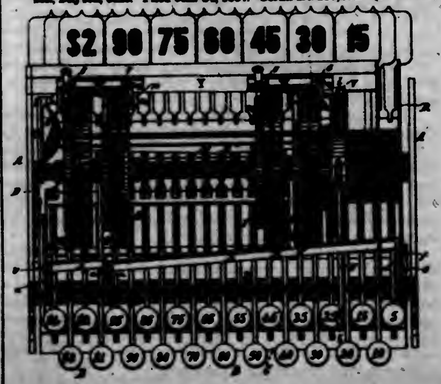
3. The combination, with a supporting-frame provided with vertical guides to engage with the mold-board, a removable mold-board, and the reciprocating carriage, of plates carrying perforating-needles and detachably secured to the longitudinal rails of the said carriage, and means for reciprocating the said carriage, substantially as and for the purpose herein specified.

382,549. FORK FOR FRUIT-PARING MACHINES. WILLIAM A. C. OAKE, ADRIAN, N. H., assignor to the Gould Company, same place. Filed Mar. 16, 1888. Serial No. 267,417. (No model.)

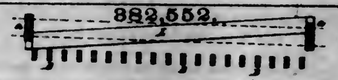
Claim.—1. The improved fork for fruit-paring machines, it comprehending a shaft, a series of independent steel tines provided with lugs or projections at their inner ends, and a ferrule, the lugs or projections of the tines entering recesses, and a portion of the tines near the said lugs entering grooves at or near the end of the fork-shaft, the ferrule retaining the tines in the said recesses and grooves, substantially as described.

2. The fork-shaft, the independent tines provided at their inner ends with lugs or projections, as 4, and tapered or inclined, as described, combined with a ferrule driven upon the said tines and shaft and bent at its end, to lock the ferrule in place against longitudinal movement, substantially as described.

382,550. FIRE-ESCAPE. SIDNEY B. PARKER, Springfield, Mass. Filed Mar. 27, 1883. Serial No. 269,667. (No model.)



Claim.—A fire-escape consisting of a series of links or sections formed of wire and bent to form rings A, twisted shanks B, and hooks C, substantially as and for the purpose set forth.



382,551. MAKING SODIUM CARBONATES BY SULPHIDES OF THE ALKALINE EARTHS. EDWARD W. PARNELL and JAMES SHEPPARD, Liverpool, County of Lancaster, England. Filed July 6, 1887. Serial No. 243,767. (No specimens.) Patented in England Apr. 22, 1887, No. 5,988.

Claim.—The manufacture of bicarbonate of soda by grinding sulphate of lime or baryta, subjecting it to the action of carbonaceous matter, roasting the mixture in a non-oxidizing atmosphere, mixing the sulphuret produced with chloride of ammonium, and heating this mixture and conducting the sulphuret of ammonium evolved, together with carbonic-acid gas, into a solution of chloride of sodium, substantially as described.

382,552. CASH INDICATOR AND REGISTER. JOHN H. PATTERSON, Dayton, Ohio. Filed Jan. 26, 1887. Serial No. 225,203. (No model.)

882,552.

Claim.—1. In a cash register and indicator, the combination with a series of keys of fixed values and a registering-wheel, of a bar located transversely across and inclined relatively to the plane of the keys, and connecting mechanism between said bar and registering-wheel, whereby the operation of any key causes its value to be registered on said registering-wheel, substantially as described.

2. In a cash register and indicator, the combination, with a series of keys of fixed values and a registering-wheel, of a bar extending transversely across the keys and having a vertically-inclined operating side, and connecting mechanism between said bar and registering-wheel, whereby the operation of any key causes its value to be registered on said registering-wheel, substantially as described.

3. In a cash register and indicator, the combination, with a series of keys of fixed values and a registering-wheel provided with a ratchet, of a bar located transversely across and inclined relatively to the plane of the keys, and a pawl actuated by said bar and engaging with the ratchet of the registering-wheel, whereby the operation of any key causes its value to be registered on said registering-wheel, substantially as described.

4. In a cash register and indicator, the combination, with a series of keys of fixed values and a registering-wheel provided with a ratchet, of a bar extending transversely across the keys and having a vertically-inclined operating side, and a pawl actuated by said bar and engaging with the ratchet of the registering-wheel, whereby the operation of any key causes its value to be registered on said registering-wheel, substantially as described.

5. In a cash register and indicator, the combination, with a series of keys of fixed values and a registering-wheel, of a bar located transversely across the keys and inclined relatively to the plane of the keys, and connecting mechanism between said bar and registering-wheel, and brake mechanism applied to said registering-wheel, whereby the operation of any key causes its value to be registered on said registering-wheel, substantially as described.

6. In a cash register and indicator, the combination, with a series of keys of fixed values and a registering-wheel, of a bar extending transversely across the keys and having a vertically-inclined operating side, connecting mechanism between said bar and registering-wheel, and brake mechanism applied to said registering-wheel, whereby the operation of any key causes its value to be registered on said registering-wheel, substantially as described.

7. In a cash register and indicator, the combination, with a series of keys of fixed values and a registering-wheel provided with a ratchet, of a bar located transversely across and inclined relatively to the plane of the keys, a pawl actuated by said bar and engaging with the ratchet of the registering-wheel, and brake mechanism applied to said registering-wheel, whereby the operation of any key causes its value to be registered on said registering-wheel, substantially as described.

8. In a cash register and indicator, the combination, with a series of keys of fixed values and a registering-wheel provided with a ratchet, of a bar extending transversely across the keys and having a vertically-inclined operating side, a pawl actuated by said bar and engaging with the ratchet of the registering-wheel, and brake mechanism applied to said registering-wheel, whereby the operation of any key causes its value to be registered on said registering-wheel, substantially as described.

9. In a cash register and indicator, the combination, with a series of keys of fixed values pivoted upon horizontal axes and a registering-wheel, of a bar extending transversely across the keys, with which the latter engage when moved on their pivots, the portions of said bar with which the different keys engage being arranged at different distances from said keys, and connecting mechanism between said bar and registering-wheel, substantially as described.

10. In a cash register and indicator, the combination, with a series of keys of fixed values, a series a tablet-rods and tablets actuated by said keys for exposing to view the value of any key operated, and a registering-wheel, of a bar located transversely across and inclined relatively to the plane of the keys, and connecting mechanism between said bar and registering-wheel, whereby the operation of any key causes its tablet to be exposed to view and registers its value on said registering-wheel, substantially as described.

11. In a cash register and indicator, the combination, with a series of keys of fixed values, a series of tablet-rods and tablets actuated by said keys for exposing to view the value of any key operated, and a registering-wheel, of a bar having a vertically-inclined operating side located transversely across the keys and connecting mechanism between said bar and registering-wheel, whereby the operation of any key causes its tablet to be exposed to view and registers its value on said registering-wheel, substantially as described.

12. In a cash register and indicator, the combination, with a series of keys of fixed values, a series of tablet-rods and tablets actuated by said keys for exposing to view the value of any key operated, and a registering-wheel provided with a ratchet, of a bar located transversely across and inclined relatively to the plane of the keys, and a pawl actuated by said bar and engaging with the ratchet of the registering-wheel, whereby the operation of any key causes its tablet to be exposed to view and registers its value on said registering-wheel, substantially as described.

13. In a cash register and indicator, the combination, with a series of keys of fixed values, a series of tablet-rods and tablets actuated by said keys for exposing to view the value of any key operated, and a registering-wheel provided with a ratchet, of a bar extending transversely across the keys and having a vertically-arranged operating side, and a pawl actuated by said bar and engaging with the ratchet of the registering-wheel, whereby the operation of any key causes its tablet to be exposed to view and registers its value on said registering-wheel, substantially as described.

14. In a cash register and indicator, the combination, with a series of keys of fixed values, a series of tablet-rods and tablets actuated by said keys for exposing to view the value of any key operated, and a registering-wheel, of a bar located transversely across and inclined relatively to the plane of the keys, connecting mechanism between said bar and registering-wheel, and brake mechanism applied to said registering-wheel, whereby the operation of any key causes its tablet to be exposed to view and registers its value on said registering-wheel, substantially as described.

15. In a cash register and indicator, the combination, with a series of keys of fixed values, a series of tablet-rods and tablets actuated by said keys for exposing to view the value of any key operated, and a registering-wheel, of a bar extending transversely across the keys and having a vertically-inclined operating side, connecting mechanism between said bar and registering-wheel, and brake mechanism applied to said registering-wheel, whereby the operation of any key causes its tablet to be exposed to view and its value to be registered on said registering-wheel, substantially as described.

16. In a cash register and indicator, the combination, with a series of keys of fixed values, a series of tablet-rods and tablets actuated by said keys for exposing to view the value of any key operated, and a registering-wheel provided with a ratchet, of a bar located transversely across and inclined relatively to the plane of the keys, a pawl actuated by said bar and engaging with the ratchet of the registering-wheel, and brake mechanism applied to said registering-wheel, whereby the operation of any key causes its tablet to be exposed to view and registers its value on said registering-wheel, substantially as described.

17. In a cash register and indicator, the combination, with a series of keys of fixed values, a series of tablet-rods and tablets actuated by said keys for exposing to view the value of any key operated, and a registering-wheel provided with a ratchet, of a bar extending transversely across the keys and having a vertically-inclined operating side, a pawl actuated by said bar and engaging with the ratchet of the registering-wheel, and brake mechanism applied to said registering-wheel, whereby the operation of any key causes its tablet to be exposed to view and registers its value on said registering-wheel, substantially as described.

18. In a cash register and indicator, the combination, with a series of keys of fixed values pivoted upon horizontal axes, a series of tablet-rods and tablets actuated by said keys for exposing to view the value of any key operated, and a registering-wheel, of a bar extending transversely across the keys, with which the latter engage when moved on their pivots, the portions of said bar with which the different keys engage being arranged at different distances from said keys, and connecting mechanism between said bar and registering-wheel, whereby the operation of any key causes its tablet to be exposed to view and registers its value on said registering-wheel, substantially as described.

19. In a cash register and indicator, the combination, with a series of keys of fixed values pivoted upon horizontal axes, a series of tablet-rods and tablets actuated by said keys for exposing to view the value of any key operated, and a registering-wheel provided with a ratchet, of a bar extending transversely across the keys, with which the latter engage when moved on their pivots, the portions of said bar with which the different keys engage being arranged at different distances from said keys, and a pawl actuated by said bar and engaging with the ratchet of the registering-wheel, whereby the operation of any key causes its tablet to be exposed to view and registers its value on said registering-wheel, substantially as described.

20. In a cash register and indicator, the combination of a set of keys indicating cents, a wheel registering cents, a bar located transversely across and inclined relatively to the plane of said keys, connecting mechanism between said bar and registering-wheel, a set of keys indicating dollars, a wheel registering dollars, a bar located transversely across and inclined relatively to the plane of said dollar-keys, and connecting mechanism between said bar and dollar-registering wheel, whereby upon operating any key indicating cents its value is registered on the cent-registering wheel, and whereby upon operating any key indicating dollars its value is registered on the dollar-registering wheel, substantially as described.

21. In a cash register and indicator, the combination of a set of keys indicating cents, a wheel registering cents, a bar extending transversely across said keys and having a vertically-inclined operating side, connecting mechanism between said bar and registering-wheel, a set of keys indicating dollars, a wheel registering dollars, a bar extending transversely across said dollar-keys and having a vertically-inclined operating side, and connecting mechanism between said bar and dollar-registering wheel, substantially as and for the purpose described.

22. In a cash register and indicator, the combination of a set of keys indicating cents, a wheel registering cents and provided with a ratchet, a bar located transversely across and inclined relatively to the plane of said keys, a pawl actuated by said bar and engaging with the ratchet of said registering-wheel, a set of keys indicating dollars, a wheel registering dollars and provided with a ratchet, a bar located transversely across and inclined relatively to the plane of said dollar-keys, and a pawl actuated by said bar and engaging with the ratchet of the dollar-registering wheel, substantially as and for the purpose described.

23. In a cash register and indicator, the combination of a set of keys indicating cents, a wheel registering cents and provided with a ratchet, a bar extending transversely across said keys and having a vertically-inclined operating side, a pawl actuated by said bar and engaging with the ratchet of said registering-wheel, a set of keys indicating dollars, a wheel registering dollars and provided with a ratchet, a bar extending transversely across said dollar-keys and having a vertically-inclined lower side, and a pawl actuated by said bar and engaging with the ratchet of the dollar-registering wheel, substantially as and for the purpose specified.

24. In a cash register and indicator, the combination of a set of keys indicating cents, a set of tablet-rods and tablets corresponding in value to said keys and actuated thereby, a wheel registering cents, a bar located transversely across and inclined relatively to the plane of said keys, connecting mechanism between said bar and registering-wheel, a set of keys indicating dollars, a set of tablet-rods and tablets corresponding in value to said dollar-keys and actuated thereby, a wheel registering dollars, a bar located transversely across and inclined relatively to the plane of said dollar-keys, and connecting mechanism between said bar and dollar-registering wheel, substantially as and for the purpose described.

25. In a cash register and indicator, the combination of a set of keys indicating cents, a set of tablet-rods and tablets corresponding in value to said keys and actuated thereby, a wheel registering cents, a bar extending transversely across said keys and having a vertically-arranged operating side, connecting mechanism between said bar and registering-wheel, a set of keys indicating dollars, a set of tablet-rods and tablets corresponding in value to said dollar-keys and actuated thereby, a wheel registering dollars, a bar extending transversely across said dollar-keys and having a vertically-inclined operating side, and connecting mechanism between said bar and dollar-registering wheel, substantially as and for the purpose described.

26. In a cash register and indicator, the combination of a set of keys indicating cents, a set of tablet-rods and tablets corresponding in value to said keys and operated thereby, a wheel registering cents and provided with a ratchet, a bar located transversely across and inclined relatively to the plane of said keys, a pawl actuated by said bar and engaging with the ratchet of said registering-wheel, a set of keys indicating dollars, a wheel registering dollars and provided with a ratchet, a bar located transversely across and inclined relatively to the plane of said dollar-keys, and a pawl actuated by said bar and engaging with the ratchet of the dollar-registering wheel, substantially as and for the purpose described.

27. In a cash register and indicator, the combination of a set of keys indicating cents, a set of tablet-rods and tablets corresponding in value to said keys and operated thereby, a wheel registering cents and provided with a ratchet, a bar extending transversely across said keys and having a vertically-inclined operating side, a pawl actuated by said bar and engaging with the ratchet of said registering-wheel, a set of keys indicating dollars, a set of tablet-rods and tablets corresponding in value to said dollar-keys and operated thereby, a wheel registering dollars and provided with a ratchet, a bar extending transversely across said dollar-keys and having a vertically-inclined operating side, and a pawl actuated by said bar and engaging with the ratchet of the dollar-registering wheel, substantially as described, and for the purpose specified.

28. The combination, with the operating-keys, indicating cents, of the bar L, inclined relatively to the plane of said keys, cent-registering wheel G, provided with a ratchet, J, and dog *d*, actuated by the bar L and engaging with said ratchet J, substantially as and for the purpose described.

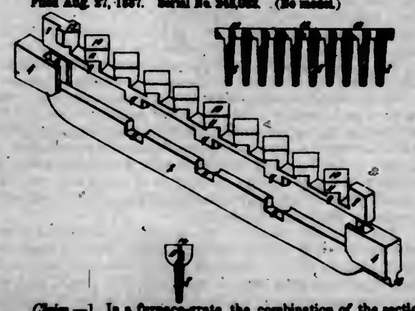
29. The combination, with the set of operating-keys indicating cents and the set of tablet-rods carrying tablets indicating cents, of the bar L, inclined relatively to the plane of said keys, cent-registering wheel G, provided with a ratchet, J, and dog *d*, actuated by the bar L and engaging with said ratchet J, substantially as described, and for the purpose specified.

30. The combination of the set of operating-keys indicating cents, bar L, inclined relatively to the plane of said keys and operated thereby, cent-registering wheel G, provided with a ratchet, J, dog *d*, actuated by the bar L and engaging with said ratchet J, the set of keys indicating dollars, the bar L, inclined relatively to the plane of said keys and operated thereby, the dollar-registering wheel provided with a ratchet, J, and the dog *d*, actuated by said bar L and engaging with the ratchet J of the dollar-registering wheel, substantially as and for the purpose described.

31. The combination of the set of operating-keys indicating cents and the set of tablet-rods provided with tablets indicating cents, bar L, inclined relatively to the plane of and operated by said keys, cent-registering wheel G, provided with a ratchet, J, dog *d*, actuated by the bar L and engaging with said ratchet J, the set of keys indicating dollars, and tablet-rods provided with tablets indicating dollars, the bar L, inclined relatively to the plane of and operated by the dollar-keys, the dollar-registering wheel G, provided with a ratchet, J, and the dog *d*, actuated by said bar L and engaging with the ratchet J of the dollar-registering wheel, substantially as and for the purpose described.

32. The combination, with the registering-wheels G H, each provided with a ratchet-wheel, J, of the rock-shaft W, extending transversely across said registering-wheels and provided at one end with an arm, *n*, adapted to engage with a pin, *m*, upon the registering-wheel G, and upon its opposite end with an arm, *o*, carrying a spring-dog, *p*, engaging with the ratchet-wheel J of the registering-wheel H, substantially as and for the purpose described.

33. In a cash-register, the combination, with a series of operating-keys, the vibrating frame C, actuated by the operation of any one of said keys and provided with a rod, U, of the brake-shoe T and a brake-wheel, S, secured to the hub of the registering-wheel, and with which said shoe is arranged to engage, substantially as and for the purpose described.



34. The combination and arrangement of the wing E, gong-hammer E', gong F, extension C', with its nose *r*, dog *s*, arm *t*, draw-bar D', and vibrating frame C, substantially as and for the purpose described.

35. In a cash register and indicator, the combination, of a series of keys, a vibrating frame operated by said keys, a till-compartment having a hinged lid, and locking and tilting mechanism interposed between said lid and vibrating frame, whereby the operation of any one of the keys unlocks the lid and throws it open, substantially as described.

36. The combination and arrangement of the hinged lid G', till-compartment F', spring-bolt *a'*, draw-bar *b'*, bell-crank *c'*, vibrating arms *d'*, and vibrating frame C, substantially as and for the purpose described.

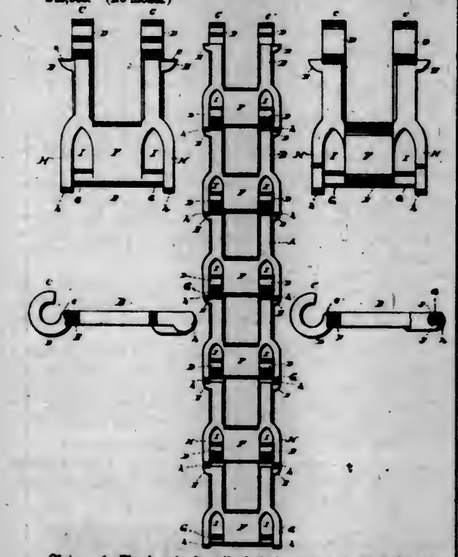
37. In a cash-register, the combination, with a series of keys, a registering-wheel and connections between them, a brake-rim connected with the registering-wheel, and a co-operating brake, of a bar arranged to be operated by all the keys of the series connected with said brake-shoe, whereby upon the operation of any key the brake will be applied, substantially as described.

882,553. SECTIONAL PEDESTAL-GRATE. HENRY PETTIBONE, St. Louis, Mo., assignor of one-half to Christian Andrieu, same place. Filed Aug. 27, 1887. Serial No. 248,082. (No model.)

Claim.—1. In a furnace-grate, the combination of the sectional grate-bars 2 and 9 with surmounting pedestals 10, substantially as and for the purpose set forth.

2. In a furnace-grate, the combination of the bed-section grate-

bar 2, provided with bevel-slots 5 and end slots, 6, in which the bevel-lugs 7 and end pieces, 8, of the renewable section 9 of the grate-bar engage to unite the sections, substantially as and for the purpose set forth.

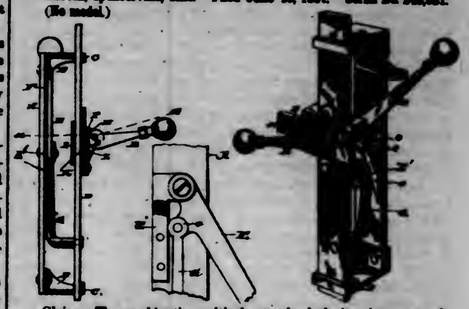


3. In a furnace-grate, the combination of the sectional grate-bars 2 and 9 and the diamond-shaped pedestals 10, arranged to shelter the bars from the heat of the furnace and to direct the draft at various angles and deliver it with varied projectile inclination, so that it may find its way through the lines of intersticos between the coal in the furnace, substantially as and for the purpose set forth.

4. In a furnace-grate, the combination of the bed-section grate-bar, the bevel-feet 3, whose laterally-enlarged ends rest on the bed-walls 1 of the furnace, said grate-bar provided with bevel-slots 5 and slots 6, in which the bevel-lugs 7 and rectangular ends 8 of the renewable sectional bar 9 engage, said bar 9, with its pedestals 10, arranged to shield the bar 2 from the heat, and when burned to be renewable by elevation from the bed-bar and the substitution of a duplicate, substantially as and for the purpose set forth.

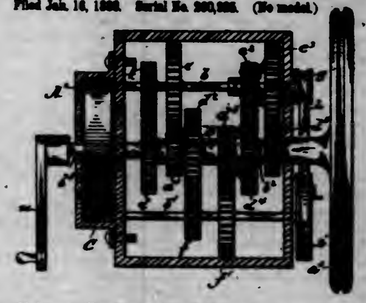
5. In a grate-bar for furnaces, the combination of the bed-section grate-bar 2 and the renewable sectional grate-bar 9, having diamond-shaped pedestals whose angle corners project between the corresponding projecting corners of the adjoining bars, leaving narrow intersticos at varied angles for the ascent of the draft into the furnace, substantially as and for the purpose set forth.

6. In a grate-bar for furnaces, the combination of the renewable sectional grate-bar 9, surmounted and protected by the diamond-shaped pedestals 10, that angularly direct the draft in varied directions, the said bar attachable to the bed-grate bar 2 and renewable when burned out by the substitution of a duplicate, substantially as and for the purpose set forth.



382,554. DETACHABLE-LINK CHAIN. REUBEN F. RISDON and JOSEPH H. RISDON, Spencerville, Ohio. Filed Sept. 14, 1887. Serial No. 249,925. (No model.)

Claim.—1. The herein-described chain composed of similar links, each consisting of parallel side bars, having downwardly-pointing hooks at their disconnected ends and laterally-projecting lugs provided with transverse guide-surfaces on the outer side of said bars at a point where the hooks spring therefrom, a central block connecting the opposite ends of said links, and journals standing transversely from the sides of the outer end of said block and flattened on their upper and lower surfaces to pass easily into the hooks of an adjoining link when held at a little less than right angles thereto and directed by the said guiding-surfaces, substantially as specified.



2. A chain-link composed of the side bars C, the hooks D at the unconnected ends of said bars and having their points downward, the lugs E, provided with the guide and bearing surfaces *e*, the central block, F, connecting the opposite ends of the side bars, C, the journals G, flattened above and below at *g*, and the projections H, provided with the rounded ends A, and forming, with the adjacent edges of the block F, the hook-slots I, aligned with the hooks, all constructed and arranged substantially as and for the purpose specified.

382,555. SAW-MILL DOG. REUBEN F. RISDON and JOSEPH H. RISDON, Spencerville, Ohio. Filed June 10, 1887. Serial No. 240,921. (No model.)

Claim.—The combination, with the standard, the brackets secured to the upper and lower ends thereof, and the slide passing through openings in said brackets, of the bifurcated bracket secured to the inner side of the standard, the weighted lever E, pivoted at its inner end between the arms of said bracket and provided adjacent to its pivotal point with a lug, and the rod G, having its lower end pivoted to the slide, and the ears *e* of its upper end pivoted to said lug, all as arranged that when the lever falls the rod G will bring up against the bracket and stop the descent of the lever just after the pivotal point of the rod has passed its dead-point, substantially as specified.

382,556. SPRING-MOTOR. ALFRED D. SANDERS, Brooklyn, N. Y. Filed Jan. 16, 1888. Serial No. 260,995. (No model.)

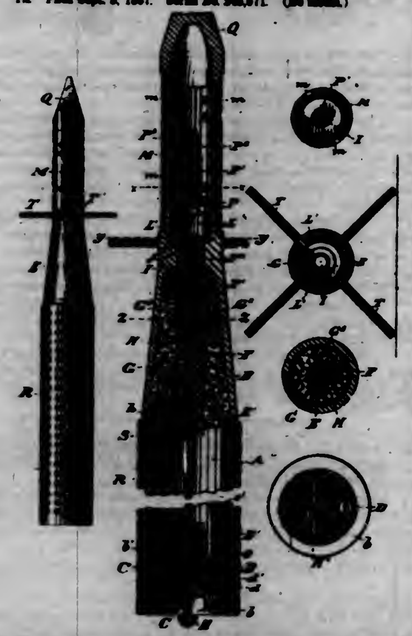
Claim.—1. The herein-described spring-motor, consisting, essentially, in the combination of a main driving-shaft provided upon one end with a hand-crank, a fly or driving wheel secured to said shaft near its opposite end and by which motion is imparted to the mechanism to be driven, a spring secured to the shaft at its end opposite the driving-wheel to actuate the shaft, a pair of secondary shafts journaled on opposite sides of the main shaft, a gear-wheel secured to the main shaft near the end upon which the spring is secured, a pinion secured to one of the secondary shafts and meshing with the gear rigid on the main shaft, a gear-wheel secured to said secondary shaft, a gear-wheel and pinion secured together and loosely mounted on the main shaft, the pinion meshing with the gear-wheel on said secondary shaft, a pinion secured to the opposite secondary shaft and meshing with said gear-wheel loosely rotating on the main shaft, a gear-wheel rigidly mounted on said last-mentioned secondary shaft, and a train of intermeshing gearing loosely mounted on the main shaft and on each secondary shaft between the driving-wheel and the before-mentioned rigid gears, said train of loose gearing receiving motion from the gear-wheel rigidly secured to the last-mentioned secondary shaft, as set forth.

2. In a spring-motor, the combination of a main driving-shaft formed in two sections, one of said sections having a limited longitudinal movement, whereby said longitudinally-movable section can be rotated independently of the other section, a spring secured to the longitudinally-movable section, and a crank to operate said section gearing upon the other section, and a driving or fly wheel upon said section, substantially as described.

3. The combination, with the main shaft, of secondary shafts, gearing connecting said main shaft and secondary shafts, a brake-pulley upon one end of a secondary shaft and provided with radial slots in its face, a treadle, a rod connecting the treadle and brake-pulley, and a locking-latch adapted to enter one of said slots in the brake-pulley, substantially as described.

4. The combination, in a motor adapted to actuate a sewing-machine, of a main shaft, secondary shafts, gearing connecting said shafts, a brake-pulley upon one end of a secondary shaft, a shaft journaled on the under side of the machine-table, a pulley on said shaft, a brake-strap engaging the under face of the brake-pulley and passing upward and secured to the pulley beneath the machine-table, a ratchet-wheel on said shaft journaled to the machine-table, a pawl to hold the same, and a lever whereby said shaft can be rotated and the tension of the brake-strap on the brake-pulley regulated, substantially as described.

5. In a spring-motor, the combination, with the main driving-shaft, the spring to actuate the same, secondary shafts journaled upon each side of said main shaft, gearing connecting said main shaft and secondary shafts, a brake-pulley secured to the end of a secondary shaft, a brake-strap, a pulley to which one end of said strap is secured, and a pawl-and-ratchet mechanism to regulate the tension of said strap on the brake-pulley, substantially as described.



382,557. HOSE-CLAMP. FREDERICK GESSNER, Westchester, N. J., assignor of one-half to William H. Schroeder, New York, N. Y. Filed Feb. 1, 1888. Serial No. 262,617. (No model.)

Claim.—1. A hose-clamp consisting of a circular band provided with overlapping ends, said ends having interlocking teeth or serrations, a longitudinal slot in the overlapping end, and a projecting portion or abutment on the underlapping end extending into the slot of the overlapping end, substantially as set forth.

2. A hose-clamp composed of a circular band having overlapping ends, both ends being provided with interlocking teeth or serrations, the overlapping end having a longitudinal slot and the underlapping end an abutment, and an eye with a transverse spring-key, so as to engage and retain the overlapping end, substantially as set forth.

382,558. SOLDERING-IRON. ROBERT SHEARMAN, Allegheny, Pa. Filed Sept. 3, 1887. Serial No. 248,671. (No model.)

Claim.—1. In a soldering-iron, the combination of a reservoir, said reservoir being provided with an opening to admit oil and a plug for closing said opening, the inner end of the plug and the side thereof being provided with openings which communicate, the inner end of said plug being also provided with a tubular extension whose opening is in communication with the openings aforesaid, substantially as specified.

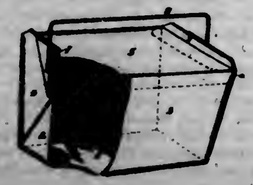
2. In a soldering-iron, the combination of a reservoir, said reservoir being provided with an opening to admit oil and a plug for closing said opening, the inner end of the plug and the side thereof being provided with openings which communicate, the inner end of said plug being also provided with a tubular extension whose opening is in communication with the openings aforesaid, and a stop to limit the outward movement of said plug and extension, substantially as specified.

3. In a soldering-iron, the combination of a reservoir and a casing secured around said reservoir, leaving an annular space between the outer side of the reservoir and the inner side of the casing, substantially as specified.

4. In a soldering-iron, the combination of a reservoir and a perforated casing secured around said reservoir, leaving an annular space between, substantially as specified.

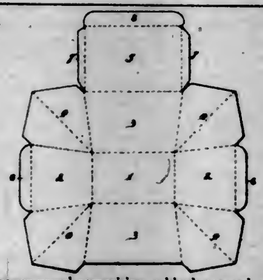
5. In a soldering-iron having a burner, the combination of a reservoir, a casing having a chamber provided in one end with an absorbent material and having a flexible material in its other end, the end in which the flexible material is located being provided with an opening, and a tube engaged in said opening, said tube extending through the chamber aforesaid, substantially as specified.

6. In a soldering-iron having a burner, the combination of a reservoir having a casing secured thereto and separated therefrom by a perforated partition, a tube extending into said casing, the side of said tube being provided with openings in communication with the chamber in the casing aforesaid, a valve-seat located in one end of the said tube, and a valve-stem and valve, the said stem being within the tube and reservoir aforesaid, the outer end of the stem being outside the reservoir, substantially as specified.



7. In a soldering-iron having a burner, the combination of a reservoir having a casing secured thereto and separated therefrom by a perforated partition, a tube extending into said casing, the side of said tube being provided with openings in communication with the chamber in the casing aforesaid, a valve-seat located in one end of the said tube, and a valve-stem and valve, the said stem being within the tube and reservoir aforesaid, the outer end of the stem being outside the reservoir, said outer end being provided with a handle, substantially as specified.

8. In a soldering-iron having a burner, the combination of a reservoir having a casing secured thereto and separated therefrom by a perforated partition, a tube extending into said casing, the sides of said tube being provided with openings in communication with the chamber in the casing aforesaid, a short tube having a valve-seat in its outer end, the short tube being seated in one end of the tube aforesaid, and a valve-stem and valve, the said stem being within the tubes and reservoir aforesaid, the outer end of the stem being outside the reservoir, substantially as specified.

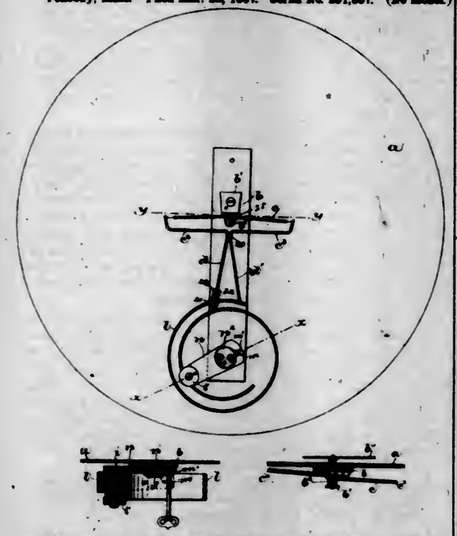


9. In a soldering-iron having a burner, the combination of a reservoir having a casing secured thereto and separated therefrom by a perforated partition, a tube extending into said casing, the sides of said tube being provided with openings in communication with the chamber in the casing aforesaid, a short tube having a valve-seat in its outer end, the short tube being seated in one end of the tube aforesaid, and a valve-stem and valve, the said stem being within the tubes and reservoir aforesaid, the outer end of the stem being outside the reservoir, the body of the stem having an enlarged screw-threaded portion in engagement with a screw-threaded opening in one end of the main tube aforesaid, substantially as specified.

10. In a soldering-iron having a burner, the combination of a reservoir having a casing secured thereto, a hollow perforated neck secured to said casing, and a soldering-point secured to the outer end of said neck, said casing being provided on its inner side with a tube having side openings and with a valve-seat, a hollow burner located in the neck aforesaid, and a chamber located between said burner and tube, the walls of said chamber being provided with openings for the admission of air, and a valve and stem, the stem being located within the reservoir and tube aforesaid, substantially as specified.

382,559. PAPER VESSEL. THEODORE F. W. SCHMIDT, Dayton, Ohio, assignor of one-half to Lenbach & Hönigs, same place. Filed Feb. 16, 1888. Serial No. 264,182. (No model.)

382,559.



Claim.—A paper vessel comprising a blank creased and bent to form the bottom 1, ends 2, sides 3, and lid 5, having the flap 8 for fastening it in a closed position, said ends having their top edges turned inward below the top edges of the ears and sides to support the lid below said ears and ends, substantially as described.

382,560. ELECTRIC-LAMP FILAMENT. CARL SIEG, Berlin, Germany. Filed June 16, 1888. Serial No. 205,340. (No model.)

Claim.—In an incandescent lamp, a carbon thread characterized by an inner layer of carbon, *c*, in the shape of angle-iron, a second layer of silicate, *c'*, and a regulating-layer of carbon, c^2, at the outside for the purpose of equalizing the resistances, all substantially as described.

382,561. METALLIC THERMOMETER. THOMAS WM. SHEPHERD, Peabody, Mass. Filed Mar. 28, 1887. Serial No. 231,857. (No model.)

Claim.—1. In a thermometer, the combination of a Y-shaped yoke, a cord or chain suspended between its ends, and the pointer-operating shaft or arbor directly engaged by the said cord or chain, and a supporting-arm for the yoke, and a bimetallic strip, to which the supporting-arm is attached, substantially as described.

2. In a thermometer, the combination of a Y-shaped yoke, a cord or chain suspended between its ends, and the pointer shaft or arbor engaged by the said cord or chain, and the supporting-arms *d d'*, one of which, as *d*, is made adjustable, and the bimetallic strip, to which the said arms *d d'* are attached, substantially as described.

3. In a thermometer, the combination of a Y-shaped yoke composed of the two arms c^2 c^2 and the two supporting-arms *d d'*, respectively forming a part of the arms c^2 c^2, and pivoted together at their point of intersection, and the bimetallic strip, to which one of the arms, as *d'*, is rigidly connected, and the other arm, as *d*, is adjustably connected, substantially as described.

4. In the thermometer, the yoke and supporting-arm, to which the said yoke is attached in a plane at a slight angle with relation to the plane of rotation of the shaft or arbor, the cord or chain combined with the shaft or arbor for operating the pointer thereon, around which the cord or chain passes spirally, substantially as described.

5. A bimetallic thermal strip adjustably suspended at one end, the free end of the said strip being made narrower than the fixed end, substantially as and for the purpose set forth.

6. In a thermometer, the combination of a bimetallic thermal strip and the standard *i*, formed with the dovetailed recess in its outer side, in which the said bimetallic thermal strip is clamped adjustably, as set forth.

7. In a thermometer, the combination of a bimetallic strip and its pivoted supporting-arm *n*, and a clamp to hold the arm *n* in fixed position, and means, substantially as described, for moving the arm when released by the clamp to adjust the pointer by movement of the bimetallic strip, as set forth.

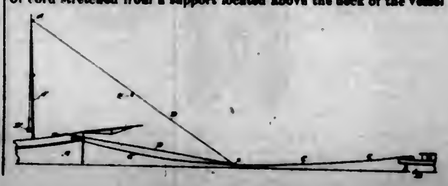
8. In a thermometer, the combination of a bimetallic strip, its pivoted supporting-arm *n*, and the toothed disk or clamp n^3, and the key *m*, engaging the supporting-arm and turning about the disk n^3, for moving the said supporting-arm on its pivot, as set forth.

9. In a thermometer, the combination of a bimetallic strip, its pivoted supporting-arm, and a clamp detachably secured to the pivot of the supporting-arm for holding said arm in fixed position, substantially as described.

382,562. THILL-COUPLING. THEOPHILUS A. SMITH, Coalburgh's, Pa. Filed Aug. 17, 1887. Serial No. 247,180. (No model.)

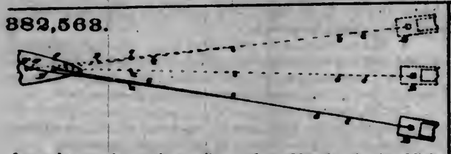
Claim.—1. In a thill-coupling, the combination, with a cylindrical axle-bearing provided with partially-circumferential flanges, arranged as described, of a ring-shaped thill-iron located thereon between the flanges, substantially as described.

2. In a thill-coupling, the combination, with a cylindrical axle-bearing having parallel flanges, arranged as described and shown, of a ring-shaped thill-iron broken away at one point for a distance equal to the length of one flange, and shorter than the other, to enable the thill-iron to be placed on the bearing between the flanges, substantially as described.



3. In a thill-coupling, the combination, with a ring-shaped thill-iron having a part of its periphery broken away, of a cylindrical axle-bearing having flanges thereon of such length and so positioned as to permit the thill-iron to be placed thereon when the shafts are elevated and prevent its removal at all other times, substantially as described.

4. The combination, with a cylindrical bearing, beveled at *d*, of a ring-shaped thill-iron, B, broken away at *b*, having arms C, and beveled at *f*, substantially as described.



5. The combination, with a cylindrical bearing consisting of sections A and A', beveled at *d* and having flanges *a* and *a'*, of the thill-iron B, broken away at *b*, having arm C, and beveled at *f*, substantially as described.

382,563. STEERING VESSELS. THOMAS SKINNER, Chicago, Ill., assignor of one-half to Albert R. Ramsey, Cleveland, Ohio. Filed Jan 30, 1888. Serial No. 262,282. (No model.)

Claim.—1. The combination, with vessel and connected tow-line, of cord stretched from a support located above the deck of the vessel forward to a point on the tow-line, such cord bearing the signal-light, substantially as indicated, whereby such signal-light follows approximately the lead of the tow-line, and thereby indicates the direction for steering the vessel, substantially as set forth.

382,563.

2. The combination, with vessel, mast, and tow-line, of cord connected, respectively, with the mast and tow-line in position to follow approximately the lead of the tow-line, and a signal-light supported by such cord between the extremes of the latter, substantially as set forth.

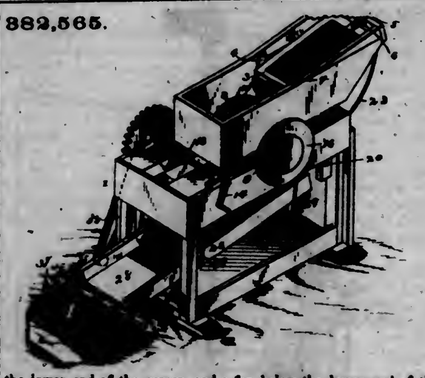
3. The combination, with vessel, mast, and tow-line, of cord connected, respectively, with mast and tow-line, a weight connected with the free end of the cord, and a signal-light connected with the cord between the mast and tow-line in position to move laterally with the lateral lead of the tow-line, substantially as set forth.

4. The combination, with vessel, mast, and tow-line, of cord connected with the vessel and extending from thence forward to a snatch-block on the tow-line, and leading from thence to a snatch-block located at or near the mast-head, and leading from thence downward, a weight connected with the depending end of the cord, and a signal-light connected with the cord between the mast and tow-line in position to move laterally with lateral lead of the tow-line, substantially as set forth.

382,564. VALVE FOR STEAM-ENGINES. FRANK L. SMITH, Holton, Mich., assignor of one-half to William S. Clark, same place. Filed Sept. 12, 1887. Serial No. 249,673. (No model.)

Claim.—1. As an improvement in steam-engine valves, an outer valve acting as a steam-induction valve, in combination with the inner valve acting as an exhaust-valve, both valves having a simultaneous independent and positive motion in the same direction, in combination with the steam-cylinder having separate induction and exhaust ports opening into the steam-passage, and each port covered by its own valve, substantially as shown and described.

2. As an improvement in steam-engine valves, the combination of the inner and outer valves, each having toothed racks, with the rock-shaft traversing the steam-chest above the valves and connected therewith by toothed segments engaging the toothed racks of the valves and adapted to give a greater movement to the exhaust than the steam valve, substantially as specified.



3. As an improvement in steam-engines, the cylinder provided with separate steam and exhaust ports, a sliding steam-valve and a sliding exhaust-valve inclosed within the steam-valve, and the rock-shaft for moving said valves, in combination with the valve-rod, adjustable cross-head, oscillating guide-bar, eccentric-rod, and eccentric, all operating conjointly to reciprocate the valves, as set forth.

382,565. TOBACCO-GRANULATING MACHINE. WILLIAM W. SMITH, Hartley, Pa. Filed Dec. 27, 1887. Serial No. 260,131. (No model.)

Claim.—1. The combination of a frame, a toothed cylinder journaled upon the frame, a feed-box upon the frame, one end of which is above the cylinder and the other end is provided with an inclined feed-board, an inclined screen above the feed-board, two hangers pivotally secured to the side of the box and to the inner end of the screen, an operating-rod secured to the other end of the screen and passed through the end of the feed-box, a shaft below the inclined feed-board having an arm, a rod or carved pitman connecting the arm with the end of the operating-rod, and a rod for connecting the shaft with the cylinder-shaft.

2. The combination of a frame, a cylinder journaled across its top, a feed-box above the cylinder, one end of which is provided with an inclined feed-board, an inclined screen above the feed-board, a vibrating screen below the cylinder, a drawer below this screen and the inner end of the feed-board, a trough secured transversely across the lower end of the screen, and a fan below the lower end of the screen.

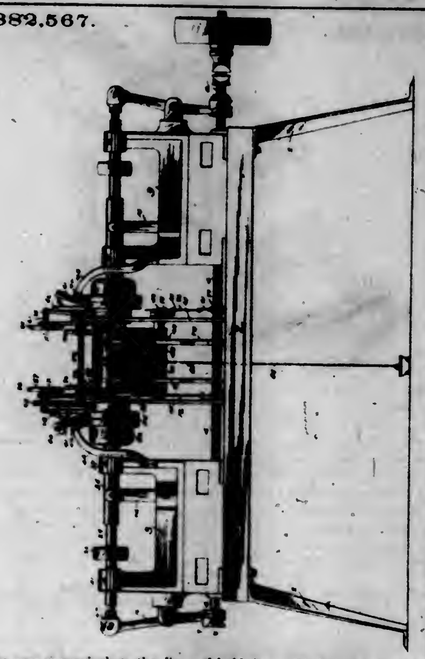
382,565.

3. The combination of a frame, a cylinder journaled across its top, a feed-box, a vibrating screen in one end of the box, one end of which is provided with an operating-rod which projects through the end of the box, a vibrating screen within the frame below the cylinder, a shaft journaled in the frame below the screen in the feed-box and at the end of the screen in the frame, two arms upon the shaft—one of which is connected with the operating-rod of the screen in the feed-box and the other arm is connected with the screen within the frame—and a rod for connecting this shaft with the shaft of the cylinder.

382,566. REGULATING-VALVE FOR GAS-BURNERS. GEORGE R. SNOW, Buffalo, N. Y. Filed Apr. 6, 1887. Serial No. 233,866. (No model.)

Claim.—1. The combination, in a heating-gas burner, of a mixing-tube, a valve-casing, a shut-off valve, a perforated tubular stem connected to said valve and provided with a central passage, and an opening, D, smaller than the interior of the valve-casing, in which the tubular stem has a cylindrical fit, whereby the flow of gas through the opening D is regulated, substantially as described.

2. In a heating-gas burner, the combination of a mixing-tube, a valve-casing extended into the mixing-tube and provided with the escape-opening D, a shut-off valve, a tubular stem connected therewith and provided with the passage E and orifices *e*, said stem being arranged in the casing to leave a space around it and having a cylindrical fit in the escape-opening, whereby when the valve is opened a jet of gas will pass into the mixing-tube from the central passage, E, and also from the space around the tubular stem, substantially as described.



382,567. CAN-HEADING MACHINE. JOHN SOLOMS, Baltimore, Md. Filed Nov. 16, 1886. Serial No. 189,081. (No model.)

Claim.—1. In a can-heading machine, a pair of reciprocating dies placed opposite to each other, fitted to receive the ends of the can-body and hold them in proper shape while the heads are placed thereon, said dies having open slots to admit the can-heads, independently-reciprocating plungers in the dies to force the head upon the can-bodies, and mechanism for operating the dies and plungers, all substantially as described.

2. In a can-heading machine, a pair of reciprocating dies placed opposite to each other and fitted to receive the ends of the can-body and hold them in proper shape while the heads are placed thereon, said dies having open slots to receive the heads, independently-reciprocating plungers in the dies to force the heads upon the can-body, chutes for delivering the heads to the dies, and operating mechanism for these parts, all substantially as described.

3. In a can-heading machine, a pair of reciprocating dies placed opposite to each other and fitted to receive the ends of the can-body and hold them in proper shape while the heads are placed thereon, independently-reciprocating plungers in the dies to force the heads upon the body, and an intermediate carrier having a series of arms fitted to receive the cans, and having an intermittent motion to bring

882,567.

the cans successively to the dies and hold them with their ends in position to be acted on by the dies and plungers, substantially as described.

4. In a can-heading machine, a pair of reciprocating dies placed opposite to each other and fitted to receive the ends of the can-body and hold them in proper shape while the heads are placed thereon, independently-reciprocating plungers in the dies to force the heads upon the body, said plungers being on shafts provided with mechanism for giving them rotary motion, crimping-disks, and means for forcing said disks upon the can, all substantially as described.

5. In combination, the reciprocating die fitted to the can-body, having an open slot to receive the can-head, the reciprocating plunger located in the die and fitted to the can-head, mechanism for operating the die and plunger, and a carrier for the can-body, all substantially as described.

6. The combination of the die 34, reciprocating tubular stem 36, plunger 32, and a longitudinal reciprocating shaft, 29, as set forth.

7. The combination of the die 34, tubular shaft 36, pivoted lever 14, cam 12, with plunger 32, shaft 29, pivoted lever 10, and cam 8, as set forth.

8. The combination, with a can-heading machine having a trough for feeding the cans to the headers, of a fluxing-machine mounted over said trough and constructed and arranged to discharge the fluxed cans directly into the trough, as set forth.

9. The combination of the disks 51 52, adapted to receive a can-body between them, a pan for containing fluxed material, and rotary brushes 53, arranged in proper relation to the disks and pan for distributing the material upon the edges of the can-body, substantially as described.

10. The combination, with the plungers 32, shafts 29, and means for retaining them and forcing them together, of the crimping-disks 70, arranged in relation thereto, as described.

11. The combination of the dies having slots 39, and the plates 40 and 41, the latter being hinged to the dies and having mechanism for tilting them to discharge the can-heads through the slots, as and for the purpose set forth.

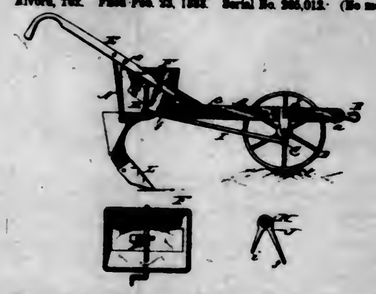
12. The combination, with the slotted pivoted lever 10, fork 24, rod 26, collar 27, and a bored shaft, 29, carrying the head 32, of mechanism for oscillating the lever 10 on its pivot, as set forth.

13. The combination of the can-carriers 49, having fingers 78, trough 50, and dies 34 35 36, as set forth.

14. The combination of plunger 36, die-cup having slot 39, and means for giving them reciprocating movement, the plate 40, hinged plate 41, having crank 42, and the bar 43, attached to the rigid portion of the machine, as set forth.

15. The combination of the die-cup and the plunger with mechanism whereby the die-cup is reciprocated and the plunger reciprocated and rotated, as set forth.

16. The combination of plungers 32, their stems, and their rotating and reciprocating mechanism, with the crimping-disks 70, mounted on frame 67, and the cam-operated levers for bringing them into contact with the can-body held between plungers 32, as set forth.



17. The combination of the disks 51 and 52 upon suitable shafts, the supports x x', the bent lever 62, and spring 61, the gears 58 and 59, the shaft 54, and the brushes 53, substantially as set forth.

382,568. CORN-HUSKER. JOSEPH SPENCE, near New Lisbon, Ohio, assignor to Lydia A. Spence, same place. Filed Oct. 12, 1885. Serial No. 179,718. (No model.)

Claim.—An implement for husking corn, consisting of the pivoted handles or levers A A', curving away from each other from their pivotal point, and having the lateral extensions B B', the cutting-blade D, provided with the curved projections I, the platform C, and the spring H, having its ends secured to the levers A and A', respectively, substantially as and for the purpose set forth.

382,569. CORN AND COTTON PLANTER. LOUIS TEDDER, near Alvord, Tex. Filed Feb. 23, 1888. Serial No. 265,012. (No model.)

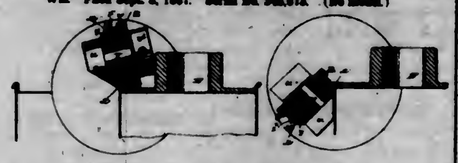
Claim.—The combination, with the hopper, the wheel, the crank-shaft carrying said wheel, the rock-shaft journaled in said hopper, and the pitman connecting the crank-shaft with the rock-shaft, of a slide within said hopper, and the agitator J, on said rock-shaft, within the hopper, and formed with two arms of different lengths and extending in different vertical planes, the longer arm engaging an opening in the slide and extended through the opening in the bottom of the hopper and the other arm working in the hopper in proximity to the slide, substantially as shown and described, and for the purpose specified.

382,570. OX-YOKE. JULIUS S. VALENTINE, Albion, Mich. Filed Mar. 3, 1888. Serial No. 266,509. (No model.)

Claim.—1. The combination, in a neck-yoke for oxen, of a slotted bar A, provided on its upper side with a frame carrying a central pinion and rollers o o, neck-pieces C C, having blocks c' and plates D, and rack-bars F F, attached to the plates D, substantially as shown, and for the purpose set forth.

2. The combination, in a neck-yoke for oxen, of a bar, A, having end slots, neck-pieces C C, carrying bows E, rack-bars F, meshing with the central pinion, and rollers o o, for holding the rack-bars against the pinion, the parts being organized substantially as shown, and for the purpose set forth.

3. The combination, in a neck-yoke for oxen, of a bar, A, provided with end slots, B B, a frame carrying a pinion and rollers attached to the central portion of the bar A, and depending block I, neck-pieces C C, having blocks c', and plates D, bows carried thereby, and rack-bars secured to the plates D, the parts being organized substantially as shown, and for the purpose set forth.



382,571. BIRD-CAGE SPRING. REUBEN WAGNER, Washington, D. C. Filed Feb. 20, 1888. Serial No. 265,717. (No model.)

Claim.—1. In a device for supporting bird-cages, the combination of the coiled springs A and A', the cross-piece B, having eye b, and the cross-piece C, having hook c, all substantially as described.

2. The combination of the springs A A', the upper cross-piece, B, the lower cross-piece, C, and the guard-wire, all arranged substantially as and for the purpose specified.

382,572. SEAMING-MACHINE. FRANCIS A. WALSH, Milwaukee, Wis. Filed Sept. 3, 1887. Serial No. 248,572. (No model.)

Claim.—1. In a machine for seaming sheet-metal vessels, a roll or former having a seaming-groove at an acute angle to its axis, and means, substantially as described, for actuating said roll or former with relation to a vessel, whereby the operation of seaming is accomplished, as set forth.

2. In a machine for seaming sheet-metal vessels, a roll or former having a seaming-groove at an acute angle to its axis and a finishing-face approximately parallel to said axis, and means, substantially as described, for actuating said roll or former with relation to a vessel, whereby the operation of double-seaming may be accomplished, as set forth.

3. In a machine for seaming sheet-metal vessels, a roll or former having a seaming-groove at an acute angle to its axis, a finishing-face approximately parallel to said axis, and a shoulder at an angle to the finishing-face, and means, substantially as described, for actuating said roll or former with relation to a vessel, whereby the operation of seaming is accomplished, as set forth.

4. In a machine for seaming sheet-metal vessels, a roll or former made in two sections, said sections so constructed and arranged that a groove at an acute angle to the axis of the roll or former is left between the opposing surfaces of said sections, and means, substantially as described, for actuating said roll or former with relation to a vessel, whereby the operation of seaming may be accomplished, as set forth.

5. In a machine for seaming sheet-metal vessels, a roll or former made in two sections, so constructed and arranged that a groove at an acute angle to the axis of the roll or former is left between the opposing surfaces of the sections, and means, substantially as described, for holding one of said sections against rotation and for actuating said roll or former with relation to a vessel, whereby the operation of seaming is accomplished, as set forth.

6. In a machine for seaming sheet-metal vessels, a roll or former provided with a seaming-groove and beveled on one side of this groove to form a finishing-face, and means, substantially as described, for actuating said roll or former, whereby the operation of seaming is accomplished, as set forth.

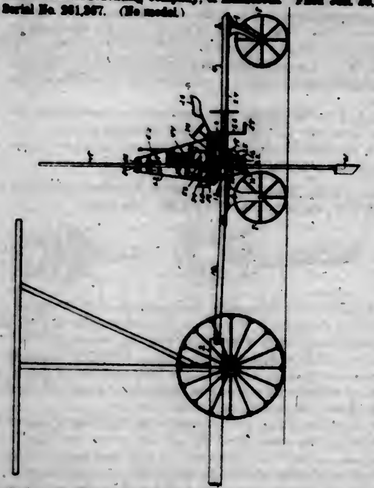
7. In a machine for seaming sheet-metal vessels, a bifurcated rock-shaft, a stud or support adjustable in the bifurcation of the shaft, a seaming-roll or former arranged on said stud or support, and means, substantially as described, for actuating said shaft with relation to a vessel, whereby the operation of seaming may be accomplished, as set forth.

8. In a machine for seaming sheet-metal vessels, the combination of a chucking mechanism, a shaft, a roll or former carried by the shaft, and mechanism, substantially as described, connecting the shaft and chucking mechanism, whereby the shaft is rocked and the chucking mechanism is reciprocated at predetermined intervals, as set forth.

9. In a machine for seaming sheet-metal vessels, the combination of a chucking mechanism, a shaft provided with a pinion, a roll or former carried by the shaft, a toothed segment arranged to mesh with the pinion, and suitable mechanism for actuating the segment, substantially as set forth.

10. In a machine for seaming sheet-metal vessels, the combination of a live-spindle carrying a chuck, another spindle in line with the live one and having its opposing end provided with a bore, a spring seated in the bore, a block loosely arranged above the spring, a chuck having a stem that fits said bore and rests upon the block, and a seaming mechanism, substantially as set forth.

11. In a machine for seaming sheet-metal vessels, the combination of a live-spindle carrying a chuck, another spindle in line with the live one and having its opposing end provided with a bore, a spring seated in the bore, a block loosely arranged above the spring, a chuck having a stem that fits said bore and rests upon the block, mechanism for bringing the latter spindle to and from the former, and seaming mechanism, substantially as set forth.



12. In a machine for seaming sheet-metal vessels, the combination of two oppositely-arranged and movable spindles, a chuck carried by each spindle, a shaft carrying two cams having a portion thereof timed alike, a lever mechanism connecting each spindle with one of the cams, and a seaming mechanism, substantially as set forth.

13. In a machine for seaming sheet-metal vessels, the combination of two oppositely-arranged and movable spindles, a chuck carried by each spindle, a shaft carrying two cams having a portion thereof timed alike, a lever mechanism connecting each spindle with one of the cams, a shaft carrying a roll or former, a segment geared to the shaft, a lever mechanism connected to the segment, and a cam for actuating the lever mechanism, substantially as set forth.

14. In a machine for seaming sheet-metal vessels, the combination of a shaft carrying a roll or former and provided with a pinion, a toothed segment arranged to mesh with the pinion, a lever-arm, a rod adjustably connected to the segment and lever-arm, and a cam for actuating said lever-arm, substantially as set forth.

15. In a machine for seaming sheet-metal vessels, the combination of a main standard, a block pivoted to the standard and provided with an arm, a bearing arranged on the block, a rock-shaft journaled in the bearing, a roll or former carried by the rock-shaft, and a cam arranged to impinge against the arm of said block and move the latter on its pivot at predetermined intervals, substantially as set forth.

382,573. CUTTING DEVICE FOR SEWERS AND OTHER EXCAVATIONS. WILLIAM WAGNER, Minneapolis, Minn., assignor to the National Sewer Excavating Company, of Minnesota. Filed Jan. 30, 1888. Serial No. 261,967. (No model.)

Claim.—1. The combination, in a machine of the class described, of a suitable truck-frame, a carriage arranged to slide longitudinally of the said frame, a platform arranged to slide laterally on said carriage, means for moving said carriage and said frame, the rolls mounted on said platform, the vertically-sliding cutter-bar arranged between said rolls, and means for driving said rolls in either direction, substantially as described.

2. The combination, in a machine of the class described, of a suitable truck-frame, a carriage arranged to slide longitudinally of said frame, a platform arranged to slide laterally on said carriage, a shaft journaled upon said carriage and operated from said platform, the rolls or sheaves upon said shaft, the cable or rope passing around said sheaves and having its ends secured to the truck-frame, the rolls mounted on said platform, the vertically-sliding cutting-bar arranged between said rolls, and means for driving said rolls in either direction, substantially as described.

3. The combination, in a machine of the class described, of a suitable truck-frame, a sliding carriage on said frame, a platform supporting the operating mechanism of the machine and sliding on said carriage, means for operating said carriage from said platform, consisting of the shaft 16, revolving in bearings on the carriage and connected to the frame by the cable 23, the gear 20 on the shaft 16 moving with the platform, and a suitable pinion-shaft and hand-wheel secured to the platform for operating the gear 20, substantially as described.

4. The combination, in a machine of the class described, of a suitable truck-frame, a sliding carriage on said frame, a platform supporting the operating mechanism of the machine and sliding on said carriage, the cable 42, having its ends secured to the carriage, the spool or sheave 40, around which the cable is turned, and by which the said cable is gripped, the shaft 36, journaled upon the platform, and the hand-wheel 38, for operating said shaft, whereby the platform and the operating mechanism of the machine are moved upon the carriage, substantially as described.

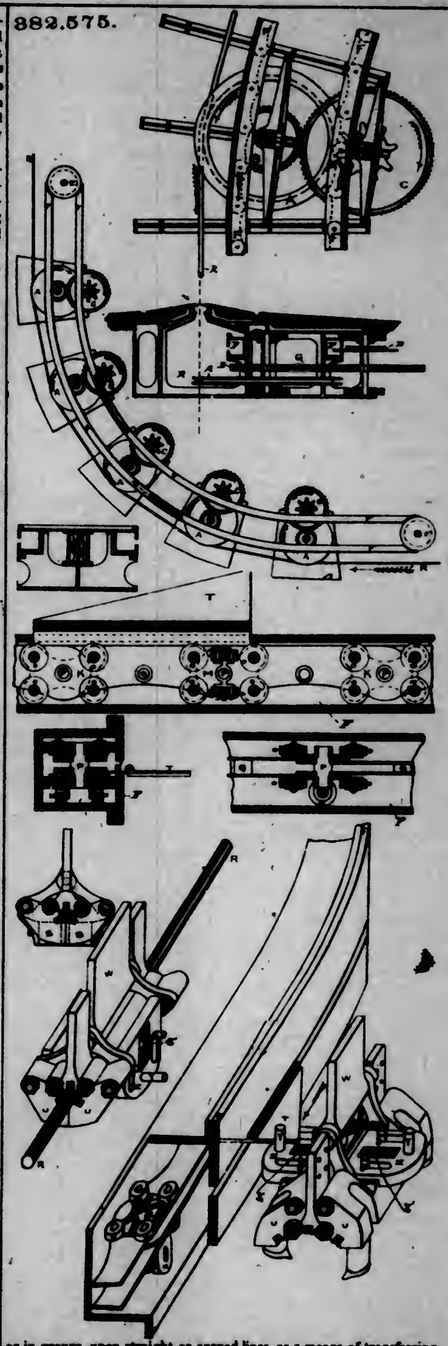
5. In a machine of the class described, the combination, with a suitable truck-frame, of a carriage sliding longitudinally on said truck-frame, a platform sliding laterally on said carriage, a friction-wheel mounted in fixed bearings upon said platform, a friction-wheel mounted in movable bearings, also supported upon said platform, a cutter-bar arranged to pass between the faces of the two friction-wheels, means for operating the movable friction-wheel against said bar, and means for driving said friction-wheels in either direction, substantially as described.

6. In a machine of the class described, the combination, with the platform sliding in two directions at right angles to each other, of one or more cutter-bars, 48, provided with the picks or cutters 61, the friction-wheels 46, mounted in stationary bearings, the movable friction-wheels 47, the faces of the said wheels so arranged as to be brought in contact with the bars 48, the eccentric bearings 52, in which the shaft of the movable wheel is mounted, the lever 56, fulcrumed upon the platform and connected to a lever or arm on the eccentric box, whereby, by operating the said lever, the movable friction-wheel is clamped against the bar 48, substantially as described.

7. In a machine of the class described, the combination, with a suitable platform and a driving mechanism located thereon, of the cutter-bar 48, the friction-wheels 46 and 47, actuated by said driving mechanism for raising said bar, the rolls 66, located above the friction-wheels in contact with the side of the bar 48, the standards 62, for supporting and bracing said rolls, and the rolls 68 in contact with the edge of the bar and mounted in the adjustable yoke 72, supported upon a frame, 70, secured to the standards 62, all substantially as described.

8. In a machine of the class described, the combination, with the sliding cutter-bar and the friction-rolls actuating said bar, of an adjustable platform, 81, supporting said rolls, and means for raising and lowering said platform, substantially as described.

382,574. FIRE-ESCAPE. FRANK A. WHITEHOUSE, Port Jervis, N. Y. Filed Jan. 31, 1888. Serial No. 261,694. (No model.)



Claim.—1. In a fire-escape, the combination of the frame composed of the two parts A B, loosely connected together at their upper ends and provided with the ears F, with the lever I, provided with bearings to catch in the ears, an opening, J, through its upper end for the rope L to catch in, a handle on its lower end, and an arm or projection on its inner upper corner to force the two parts of the frame tightly against the rope C, substantially as shown.

2. In a fire-escape, the combination of the frame A B, provided with the legs and projections D E, and the ears or bearings F, with the rope C, and the lever I, provided with an opening for the rope or strap which supports the weight of the person descending, an arm which bears against the side of the part B of the frame, and the handle upon the lower end of the lever, substantially as described.

382,575. CABLE ROAD AND MACHINERY FOR OPERATING THE SAME. BROWN J. WHEELER, San Francisco, Cal. Filed July 11, 1881. Serial No. 57,694. (No model.)

Claim.—1. A sheave or series of sheaves or pulleys, either singly

382,575.

or in groups, upon straight or curved lines, as a means of transferring power from cables used on cable roads to an endless chain, or other mechanical device, for the purpose of enabling cars or dummies on cable roads to travel on curves to pass from one cable or track to another cable or track or to cross other cables, substantially as described.

2. In a cable railway, a system of gear-wheels as a means of actuating and regulating the speed of an endless chain in proportion to that of the cable or rope from which its power is derived, substantially as described.

3. A toothed wheel or series of toothed wheels, in combination with a main sheave or sheaves as a means of transferring power from cables used on cable roads to an endless chain, either with or without a system of intermediate gearing mechanism, substantially as described.

4. In combination with a cable road and dummy or cars, a tube, either straight or curved in plan view, having a side slot, and a supplemental endless chain within the tube adapted to make a connection with the dummy or cars of the cable road, substantially as described.

5. An endless chain traveling inside a tube, said tube being either straight or curved in plan view and having a slot throughout its length, through which slot a certain number of the links of which said chain is composed, or attachments to said links, project beyond the outside of the tube for the purpose of connecting with the cars or dummies in use on cable roads, the said parts being combined and arranged substantially as described.

6. A grip in which the part surrounding the cable is divided into three equal parts of one hundred and twenty degrees of a circle, each of which parts may either come in immediate contact with the cable, in which case a gripping action would be brought to bear upon the whole of its circumference, or fitted with movable shoes or dies, so as to allow of gripping action on three equidistant points in its circumference, the central portion being fixed to a shank or portion of the grip-frame projecting downward through the slot in the tunnel or tube of said cable road, and thus connected with the car or dummy, and the side portions being hinged to the center at the points V, and connected by projecting lugs and connecting-links with an upright bar, W, having a vertical movement and operated by the grip-handle K^1 and connecting-link J^1, substantially as described, and having a projecting pin, Y, arranged upon the sides of the grip by the mechanism, substantially as described, for connecting with a supplementary endless chain, and having rollers revolving upon a fixed spindle, called "finger-rollers," arranged upon the lower portion of the sides of the grip, substantially as described, for the purpose of picking up the cable, and of carrying said cable suspended when the grip is partly open.

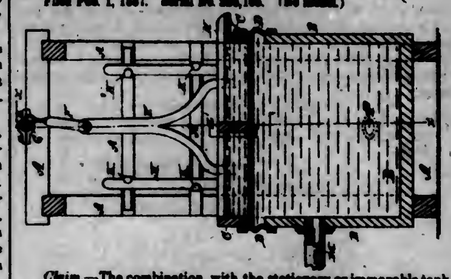
7. An automatic device for disengaging the grip from the cable on cable roads, comprising a cam-plate arranged within or upon the tunnel or tube, a lever or bar arranged upon the grip to be actuated by said cam-plate, and mechanism for connecting said bar with the spring handle or catch, and to disengage the same from the segmental rack, substantially as described.

8. An automatic device for disengaging the grip from the cable, comprising a cam-plate arranged within or upon the tunnel, a spring handle or lever-formed catch, a lever or bar arranged upon the grip to be actuated by said cam-plate, and mechanism for connecting said bar with the spring handle or catch.

9. A grip for cable railways comprising a fixed jaw combined with swinging jaws pivoted to grasp the cable and move it toward the fixed jaw to clamp it by the three jaws, substantially as described.

10. A grip for cable railways comprising a series of connected jaws, two of said jaws being pivoted to swing in a radius to grasp the cable to move it toward another jaw to clamp it between the series of jaws, substantially as described.

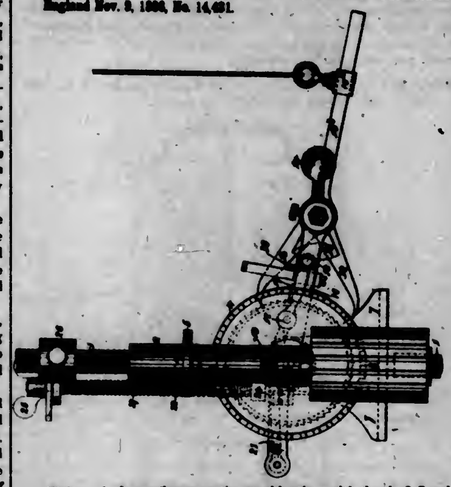
11. In a cable railway which passes around a curve, an independent subsidiary cable having its driving-sheave connected with the shaft of a sheave by which the direction of the main cable is changed and deriving its power therefrom.



12. In a system for propelling cars by means of an endless rope or cable moving in an underground slotted tube or tunnel, the method of moving cars around curves, which consists in connecting them to a supplementary chain or cable which is driven by power derived from the movement of the main cable.

13. The improvement in moving cars around curves in cable railways, which consists in mounting a supplementary endless chain or cable on pulleys beneath a track, and providing the endless chain with arms which engage with a shank or projection extending downward from the car through a slot into the tunnel.

14. The improvement in the method of passing curves or other obstructions in cable railways, which consists in arranging a supplementary endless chain at a different level from the main cable, and to travel parallel with the curve of the track, and adapted to be connected with the grip of a car in lieu of a main cable while passing a curve, as set forth.



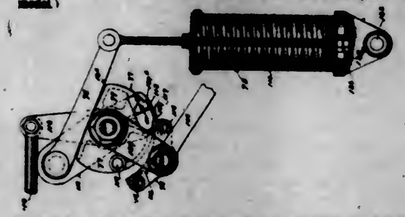
15. The method of passing curves or other obstructions in cable railways, which consists in connecting the car to a supplementary endless chain traveling along said curve or obstruction and conducting the main cable around such portion of the line at a lower level than said supplementary chain.

382,576. ORE-CONCENTRATOR. JAMES WEST, Silver City, Ore. Filed Feb. 1, 1887. Serial No. 226,163. (No model.)

Claim.—The combination, with the stationary or immovable tank of an ore-concentrator having a suitable water-inlet and an outlet for the concentrates, of a jig-box supported above said tank, a strip of a flexible water-tight material connecting the lower edge of said box with the upper edge of said tank, and means for vibrating said box, substantially as described.

382,577. APPARATUS FOR CONTROLLING THE SPEED OF STEAM-ENGINES. RICHARD WILEY, Birkhill, County of York, England. Filed Nov. 30, 1887. Serial No. 256,931. (No model.) Patented in England Nov. 9, 1886, No. 14,491.

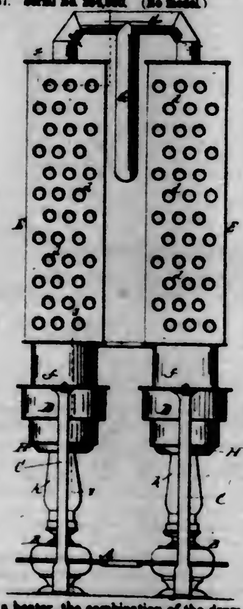
Claim.—1. In a valve-gear, the combination, with the shaft 6 and its gear-wheel 4, of the ratchet-wheels 8 and 9, mounted on said shaft, the vibrating frame 10, the shaft 11 in said frame, the pawls 12 and 13, loosely mounted on said shaft 11, the pawl-reliever, and arm 16, secured on said shaft 11, the lever 17, mounted in frame 10 and coupled to said arm 16, the arm 21, its free end resting on a pin in lever 17, and the operating-rod 22, for depressing arm 21, said rod being actuated by the governor of the engine, whereby the governor by its action controls the engagement of the pawls with the ratchet-wheels, substantially as set forth.



2. In a valve-gear, the combination, with the screw-threaded valve-stem 1, the long nut 2 on said stem, the pinion 3 on said nut, the operating-rod 22, coupled to and moving with said valve-stem, the shaft 6, the wheel 4 thereon meshing with pinion 3, the ratchet-wheels 8 and 9 on said shaft 6, the vibrating frame 10, the pawls carried by said frame and adapted to engage at proper times the said ratchets, the shaft 11 in said frame 10, the pawl-reliever 15, actuated by the partial rotation of shaft 11, and the intermediate gearing between rod 22 and shaft 11, whereby the movements of said rod are imparted to said shaft.

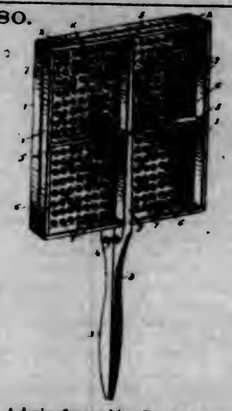
3. In a valve-gear, the combination, with the shaft 6, the ratchet-wheel 9 thereon, the vibrating pawl-frame, the pawl 13, carried by the same and adapted to engage said ratchet-wheel 9, the worm 26 on shaft 6, the worm-wheel 29 in mesh with said worm, and the releasing arm or finger 30 on the shaft of said worm-wheel and arranged

under said pawl, whereby the pawl is lifted out of engagement with the ratchet-wheel when shaft 6 shall have made a predetermined number of revolutions.



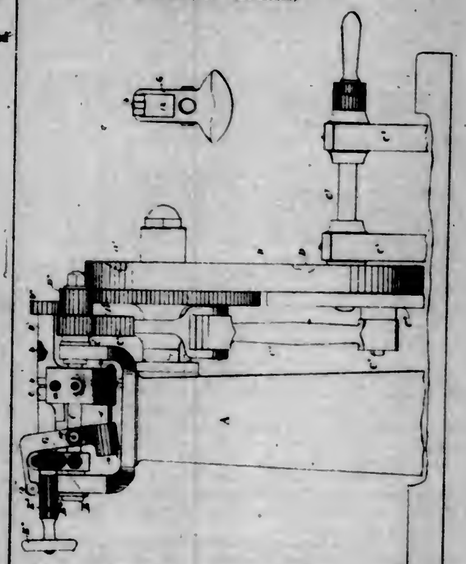
4. In a valve-gear, the combination, with the valve-stem 1 and its arm 26, of the operating-rod 23, which passes through said arm and is provided with a collar, 24, and lock-nuts 25, the spring 27 on said rod, between said arm and collar, and the intermediate arm, 21, which is actuated by said rod 23, whereby said valve-stem is enabled to move independently of the operating-rod by compression of said spring.

382,578. VALVE MECHANISM FOR ENGINES. STEPHEN WILCOX, Brooklyn, N. Y. Filed Mar. 21, 1887. Serial No. 231,653. (No model.)



Claim.—In an induction-valve-operating mechanism by which a rocking movement is imparted to effect the valve-stroke, the combination of a valve-stem cam having a curved surface, substantially as shown, with a cam-lever and lever-spring, whereby the rotating movement actuating said valve is opposed in either direction from the normal, and the closed position of the latter is resumed and maintained by the action of the said spring and cam-lever when the valve is released from the opening mechanism.

382,579. LAMP-STOVE. JOHN R. WILSON, Rochester, N. Y. Filed Apr. 13, 1887. Serial No. 234,602. (No model.)



Claim.—In a heater, the combination of the drum D, open at its bottom and provided with the draft-opening *b* at its top, the radiator E, resting on the drum, the basket-shaped hood H, resting in the drum, open at its top, and provided with an opening, *g*, in its bottom to admit the lamp-chimney, and the convex packing-plate I, resting loosely in the hood and around the lamp-chimney, said hood being fitted to move vertically in the drum to allow it to be adjusted to contact with the packing-plate when fitted to the chimney, as shown and described, and for the purpose specified.

382,580. DEVICE FOR CATCHING FLIES. SAMUEL P. WILSON and F. ASHLEY WILSON, Bridgeport, Conn. Filed Feb. 20, 1888. Serial No. 264,956. (No model.)

Claim.—A device for catching flies and other insects, consisting of a two-part frame the parts of which are fitted to fold over upon themselves and are provided with cross-pieces, and having between the parts thereof a piece of open-work material covered with suitable sticky substance.

382,581. BURNISHING-MACHINE. CHARLES J. ABBY, Malden, assignor to the Tapley Machine Company, Boston, Mass. Filed Mar. 16, 1888. Serial No. 267,343. (No model.)

Claim.—1. In a burnishing-machine, an oscillating shaft, its attached swing-block or collar, and the arm B^3, combined with the equalizing-lever pivoted to move with the said shaft in its oscillations, substantially as described.

2. The oscillating shaft, its attached swing-block or collar, and the arm B^3, combined with the equalizing-lever pivoted to move with the said shaft in its oscillations, and with the rotating but jointed tool-carrying shafts E^3 b', bearings therefor, and burnishing-tool, to operate substantially as described.

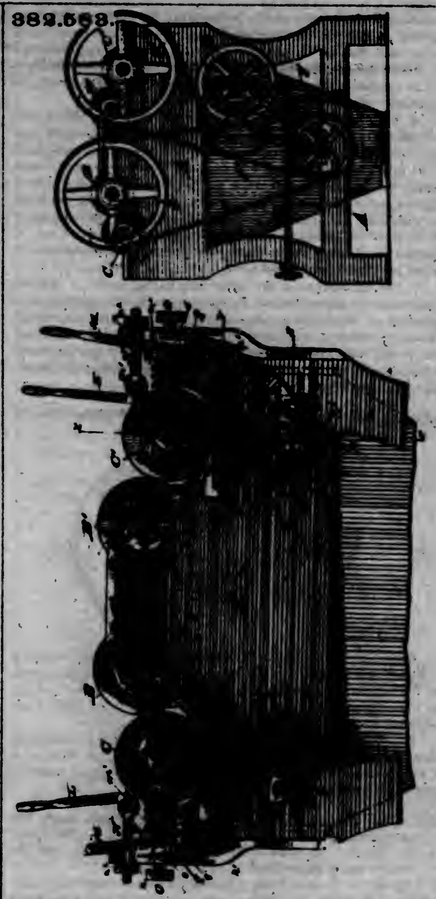
3. In a burnishing-machine, the oscillating shaft provided with a pinion, the sector-lever to engage said pinion and oscillate the said shaft, means to vibrate the said sector-lever, the intermediate pinion, D^4, loose on the said oscillating shaft, the toothed gear to rotate the said pinion D^3, and the pinion b^4, rotated by the pinion D^4, combined with the swing-block, the arm B^3, and the connected shafts B^3 and b', bearings therefor, and tool, to operate substantially as described.

382,582. THEATRICAL APPLIANCE. JOSEPH ARDEN, New York, N. Y. Filed Oct. 13, 1887. Serial No. 252,021. (No model.)

Claim.—1. The combination of a stage, a mechanical structure representing an engine-house, interior beds supported by said structure having clothes laid thereon, lines attached to said clothes and to a common beam suspended above the structure, and a single hoist-rope attached to said beam leading over pulleys suspended above the stage, and provided with an attached counterpoise-weight, all arranged to operate substantially in the manner and for the purpose herein set forth.

2. The combination of a stage, a mechanical structure representing an engine-house interior, a series of beds supported by said structure having clothes laid thereon, independent lines attached to the clothes of each bed, a single beam suspended above the structure, to which said lines are attached, a single hoist-rope attached to said beam leading over pulleys suspended above the stage, and a counterpoise-weight attached to said hoist-rope, all adapted to operate substantially as shown and described.

3. The combination of a stage, a mechanical structure representing an engine-house interior, an engine, harness attached to said engine, crabs sustaining said harness connected by independent lines with a horizontal beam above the structure, and a hoist-rope attached to said beam passing over pulleys suspended above the stage and provided with a counterpoise-weight, all arranged substantially as and for the purpose herein set forth.



4. The combination, with a stage, of a mechanical structure representing an engine-house interior provided with a horizontal partition dividing the same into an upper and lower story, the upper story provided with a series of beds having covers, the lower story provided with an engine and attached harness, and means, substantially as shown and described, for simultaneously lifting the clothes from all the beds, and for retaining the harness in an elevated position, substantially as shown and described.

382,583. ROLLER-MILL. BERAH A. BARHAM, Moline, Ill., assignor to the Barnard & Leas Manufacturing Company, same place. Filed Oct. 27, 1886. Renewed Dec. 10, 1887. Serial No. 256,891. (No model.)

Claim.—1. The combination, in a roller-mill, of the pairs of rolls B B^2 C C, the rolls B C having pulleys on their extended journals on the same side of the mill, a counter-shaft journaled in the main frame and driven by the main belt at one end, endless belts *f f'*, unequal in length, connecting said counter-shaft at its other end with rolls B C, and a belt-tightening pulley located outside of belts *f f'*, and adapted to be engaged against the outer portion of one belt and the inner portion of the other belt, whereby both belts can be tightened simultaneously, or to be entirely released from the belts, substantially as and for the purpose specified.

2. The combination of the four rolls, a counter-shaft having two pulleys on the same end thereof, the pulleys on the journals of one roll of each pair of rolls, the belts *f f'*, of unequal length, converging from the pulleys on the roll-journals to the pulleys on the counter-shaft, with

382,583.

the idler-pulley journaled in a bifurcated bracket pivoted on the main frame to one side of the belts and counter-shaft, and the adjusting screw-rod, whereby the bracket can be shifted to cause the idler-pulley to impinge against the adjoining sides of the belts at one point of its periphery and regulate the tension of both belts simultaneously, substantially as and for the purpose described.

3. The combination of the counter-shaft provided with a pulley at one end rotated by the main driving-belt, the two equal-sized pulleys on the other end of the counter-shaft, the two pairs of rolls, the two equal-sized pulleys, one on the end of an adjustable roll of one pair of rolls and the other on the adjacent end of the stationary roll of the other pair, the belts *f f'*, of unequal length, actuating each of said pulleys from one of the pair of pulleys on the counter-shaft, with the belt-tightening device comprising a bracket, *g*, pivoted to the main frame on the side of and below the larger belt, *f'*, the idler-pulley G, and the adjusting screw-rod *g'*, engaging said bracket and an arm of the main frame, and adapted to adjust the bracket and cause the idler-pulley G to impinge against the slack outer portion of belt *f'* and against the slack inner portion of belt *f* at the same point of its periphery, whereby both belts can be simultaneously tightened thereby, all substantially as and for the purpose described.

4. The combination of the main frame, the stationary roll journaled upon the main frame, the adjustable roll, the bearing-blocks for the adjustable roll, the friction-rollers journaled in said bearing-blocks, blocks sliding vertically on the main frame, the cam-disks with their peripheries bearing on the peripheries of said rollers, shafts carrying said cam-disks and journaled in said blocks, and a lever-handle secured to said shaft, whereby the cam-disks can be partially rotated to raise or lower the adjustable roll, all substantially as specified.

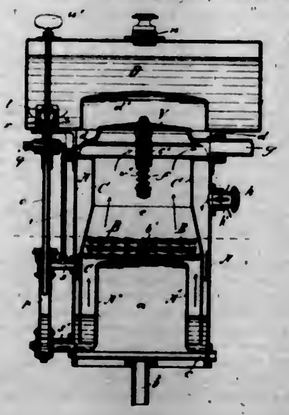
5. In a roller-mill, the combination of the stationary roll, the ad-

justable roll, the bearing-blocks for the latter, the friction-rollers journaled in said blocks, the vertically-sliding cam-disks and lever-handle on the shaft thereof, the eccentric disks supporting the cam-disks, and the lever-handle on the shafts of the eccentric disks, whereby the same can be rotated to raise or lower the cam-disks, and consequently the adjustable roll, all substantially as specified.

6. In a roller-mill, the combination of the stationary roll, the adjustable roll, the bearing-blocks for the latter, the friction-rollers journaled in said blocks, the vertically-sliding cam-disks and lever-handles on the shaft thereof, the eccentric disks and lever-handle on the shaft thereof, the brackets *k'*, secured to the main frame, and the vertical adjusting-screws passing through threaded openings in said brackets, and with their ends impinging upon and supporting the bearings of the shaft of the eccentric disks, whereby the adjustable roll can be brought parallel to the stationary roll by turning the said vertical screws, all substantially as set forth.

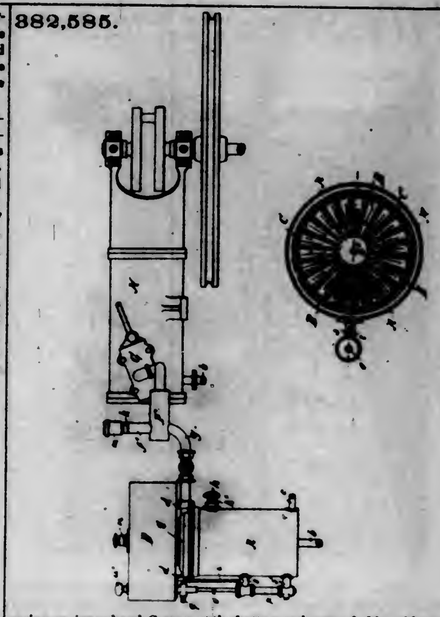
7. The combination of the main frame having an arm, *n'*, the stationary roll, the adjustable roll, the bearing-blocks having projections extending out from their peripheries, the bolts having their inner ends pivoted to said projections and engaging with arm *n'*, the adjusting-nuts on said bolts, and the springs bearing against the bearing-blocks and the arm *n'* and their adjusting-nuts, the whole arranged to operate substantially to adjust the rolls.

382,584. PROP FOR TOP-BUGGIES. ISAAC BATEMAN, PITT, PA. Filed Dec. 5, 1887. Serial No. 257,202. (No model.)



Claim.—1. As a new article of manufacture, the buggy-top prop hereinbefore described, the same being made of a volute-shaped spring and having the square socket *a* formed on its inner and lower end and the curved spring-arms *b* on its outer and upper end, the whole being constructed integrally, as shown and described.

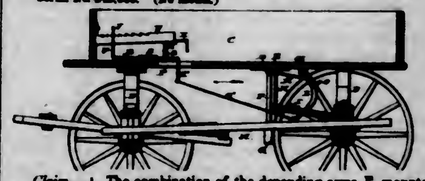
2. A buggy-top prop consisting of a spring of volute form whose lower portion—that is to say, the portion below the plane of the point of attachment—is made thinner than the upper portion, to render it more elastic, as and for the purpose specified.



382,585. CARBURETOR. CARL BENZ, Mannheim, Baden, Germany, assignor to Benz & Co., same place. Filed Oct. 24, 1887. Serial No. 253,198. (No model.) Patented in France Mar. 26, 1888, No. 178,037, and in England Apr. 26, 1888, No. 5,789.

Claim.—1. In carbureting apparatus, the combination of a hood, C, suspended within the casing A, with the disks B, said disks being fastened to the top of dome A' and being slit, and the slotted parts being bent at an angle to the horizontal plane of the disks, and the mixer F, substantially as and for the purpose set forth.

2. In carbureting apparatus, the combination of an outer casing, A, with a screw-valve, A, for regulating the admission of air into said



382,585.

casing, an inner hood, C, open at the bottom and suspended in said casing A, said hood being provided with an outlet, *g*, for the generated vapors generated from the liquid in the hood C and casing A, and the disks B within the hood C, substantially in the manner and for the purpose set forth.

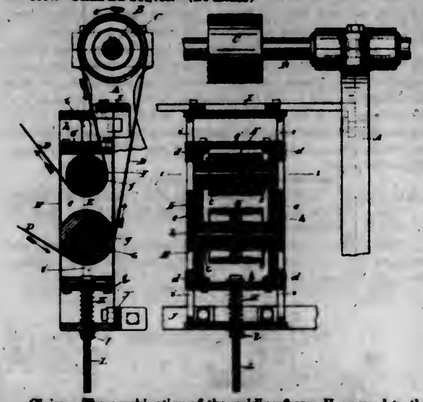
3. In carbureting apparatus, the combination of a feeding device consisting of a pipe, *o*, connecting the reservoir D with the casing A, and a valve-spindle, *u*, passing through the tank D, and provided with a handle, *s'*, and screw *u*, for regulating the valve *x*, and with the groove *v*, in connection with the gage-glass *p*, communicating with the reservoir D by the pipe *o* and with the casing A by the pipes *o* and *o'*, substantially in the manner and for the purpose set forth.

382,586. VEHICLE-BRAKE. DONALD B. BOWLBY, Lynchburg, and FRANK O. RAMSEY, Alleghany Springs, Va. Filed June 30, 1887. Serial No. 243,009. (No model.)

Claim.—1. The combination of the depending arms F, mounted upon a rock-shaft and carrying the brake shoes or blocks at their lower ends, the springs to normally press the brake-shoes against the wheels, and the lever-connection to move the brake-shoes from the wheels against the tension of the springs, substantially as described.

2. The combination of the depending arms F, mounted upon a rock-shaft and carrying the brake shoes or blocks upon their lower ends, the springs to normally press the brake-shoes against the wheels, the lever in connection with the said brakes to move the same from the wheels, and the detent W, engaging the said lever to lock the same, as set forth, substantially as described.

3. The combination of the rock-shaft having the arms F, the brake-block attached to the said arms, the springs to normally press the brake-blocks against the wheels, the lever connected to the rock-shaft to turn the same, and thereby move the brake-blocks from the wheels, the slide connected to the said lever, and the ratchet bar or detent engaging the said slide, for the purpose set forth, substantially as described.



4. The combination of the rock-shaft having the arms F, the brake-blocks secured to the said arms, the springs to normally apply the brake-blocks to the wheels, the arm K, projecting rearward from the rock-shaft, the lever L, fulcrumed to the said arm and having the anti-friction roller at its short end to bear against the bottom of the

vehicle-body, the longitudinally-movable slide connected to the long arm of the lever, and means, substantially as set forth, to engage the slide, substantially as described.

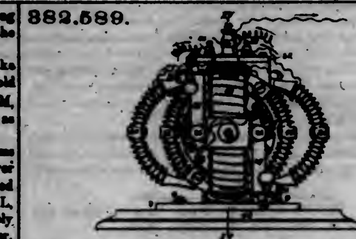
5. The combination, with the rock-shaft, of the arms F, the brake-blocks or shoes connected to the same, the springs to normally hold the brake-blocks against the wheels, the lever L, having a roller, M, the link K, and the connections to operate the lever L, substantially as described.

6. The combination of the rock-shaft E, the two depending arms F, secured thereto and carrying brake blocks or shoes at their lower ends, the levers H, connected to the rock-shaft, the springs I, connected to the lower ends of the levers H and to the wagon-frame, the lever L, having a frictional roller, M, at its upper end, the link K, adjustably connected to the lever L at one end and to the rock-shaft at the other, the rod N, the lever T, and the detent W, substantially as described.

382,587. BELT-TIGHTENER. JOHN H. BRENNAN, Albany, N. Y., assignor of one-half to William H. Furey, same place. Filed July 19, 1887. Serial No. 244,788. (No model.)

Claim.—The combination of the guiding-frame H, secured to the machine and provided with slots *i i*, the pulley-frame E, carrying pulleys F, and G, and provided with projections *d d*, working in said slots, adjusting-bolt L, and spring K between said guiding-frame and the pulley-frame, with the pulley C of the wheel operating shaft B and the belt D, substantially as and for the purpose set forth.

382,588. ANTI-FREEZING DEVICE FOR WATER-PIPES. WALKER G. BROWNE, Atlanta, Ga., assignor to the United States Automatic Water Cut-Off Company, of Georgia. Filed Mar. 18, 1887. Serial No. 231,040. (No model.)



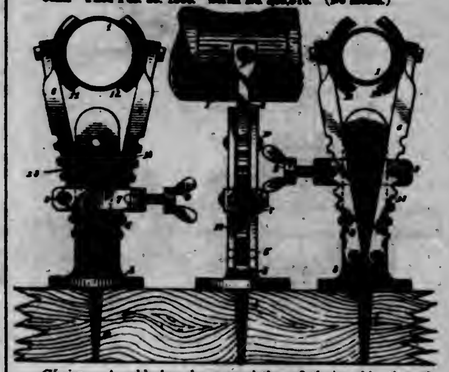
Claim.—The combination of the compound plates *x y*, the valve-stem *d'*, the different-sized valves C C', so arranged as to allow the pressure of the water to help open them after being started by the compound plates, the guide *d''*, the valve-shell, and the lug G.

382,589. ELECTRIC MOTOR. GEORGE F. CARD, Covington, Ky., assignor to the George F. Card Manufacturing Company, same place. Filed Aug. 3, 1887. Serial No. 245,694. (No model.)

Claim.—1. The combination, in an electric motor, of the following elements, to wit: a rotatable armature, two diametrically-remote pole-pieces which embrace three sides of the armature-bobbins, and which are magnetically connected by a pair of limbs in the plane of the armature-shaft, and which constitute its journal-bearings, and one or more limbs in the plane of rotation, all of said limbs being wound in series with one another and with the armature and the outer circuit, substantially as set forth.

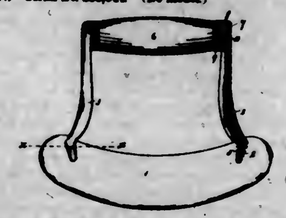
2. In an electric motor, the combination, with armature 18, of three pairs of electro-magnetic limbs, 18 18', 19 19', 20 20', that on diametrically-opposite sides of the armature unite in pole-pieces N S, which embrace three sides of the armature-bobbins, said limbs being

382,589.



so wound as to be in series with each other and with the armature and the external circuit and to produce contrary polarity in said pole-pieces.

3. In an electric motor, the combination, with an armature, 18, of three pairs of electro-magnetic limbs, 18 18', 19 19', 20 20', that on diametrically-opposite sides of the armature unite in pole-pieces N S, one pair being fixed at right angles to the other two, and all being wound as to be in series with each other and with the armature and the external circuit, and so as to produce opposite polarity in said pole-pieces.

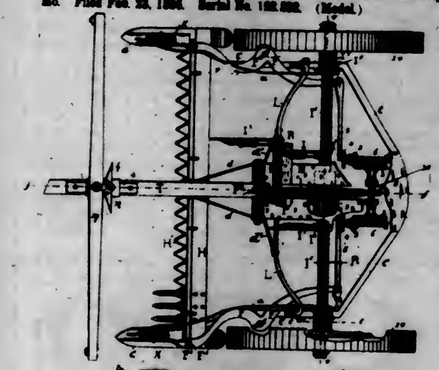


4. In an electric motor, the combination of clamp-ring 8, rubbered foot 5, field-ring N S, 19 19', non-magnetic saddle 31, and the non-conducting cap 32, supporting the binding-posts 33, 34, 35, and 36.

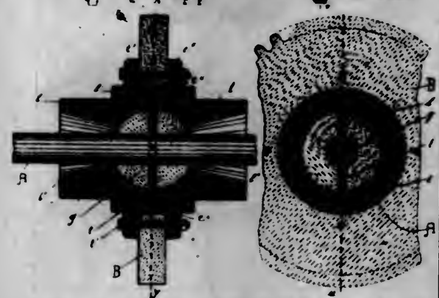
382,590. SOLDERING-CLAMP. WILLIAM H. CLAY, Waterbury, Conn. Filed Feb. 25, 1888. Serial No. 265,316. (No model.)

Claim.—A soldering-clamp consisting of the combination of a base, 3, having a holding-screw, 4, a bifurcated standard, 5, consisting of two separated side pieces rigidly connected near their upper ends, two clamping-jaws, 6, provided with notches 13 and grasping portions 11, and a holding device, 7, having cross-pin 8 and thumb-screw 9, substantially as set forth.

382,591. KNIFE. MARTIN COWLES, Bridgeport, Conn. Filed May 28, 1887. Serial No. 239,044. (No model.)



Claim.—1. The improvement in the art of attaching shanks to blades, which consists in forming slots in the blades and grooves in the shanks, then inserting the ends of the shanks into the slots with the edges of the slots resting within said grooves, and, finally, applying lateral pressure to the metal of the shanks on lines perpendicular to the plane of the blade, thereby forcing said metal against the inner faces of the slots, and by the same operation compressing it against the lateral faces of the blade in proximity to the slots.



2. The method of attaching shanks to blades, which consists in forming slots in the blades having overhanging portions *b*, and form-

ing grooves on opposite sides of the shanks, then inserting the ends of the shanks into the slots with the edges of the overhanging portions resting in the groove, and, finally, applying lateral pressure to the metal of the shanks on lines perpendicular to the blade, thereby forcing said metal against the inner faces of the slots and beneath said overhanging portions, and at the same time compressing it against the lateral faces of the blade in proximity to the slots.

3. The combination, with a blade having a slot with overhanging portions 5, of a malleable shank having grooves on opposite sides and a solid central compressed portion between said grooves, substantially as set forth.

382,592. MOWING-MACHINE. JOSEPH DAIN, Jr., Kansas City, Mo. Filed Feb. 23, 1886. Serial No. 192,892. (Model.)

Claim.—1. In a mowing-machine, the combination of the main axle, a ball fixed thereon and rotating therewith, a gear-wheel mounted on the ball and provided with transversely-projecting hubs, through which said axle passes, and the framing of the machine which carries the cutter mechanism and its driving-gear mounted on said hubs, substantially as described.

2. The combination of the main axle A, the ball *g*, fixed thereon, a pin, *l*, projecting beyond the surface of the ball, and a surrounding casting provided with an oblong recess, in which the projecting end of said pin vibrates, said recess having its longest diameter parallel with the main axle, for the purpose substantially as described.

3. A mowing-machine having the frame which carries the cutter mechanism and its driving-gear centrally pivoted to the main-wheel axle, whereby they are allowed a lateral rocking movement thereon, in combination with stirrups secured at the sides of said framing, and provided with lifting-levers having cams which engage anti-friction rollers upon the axle, whereby either end of the cutter-bar can be alternately raised and lowered, substantially as described.

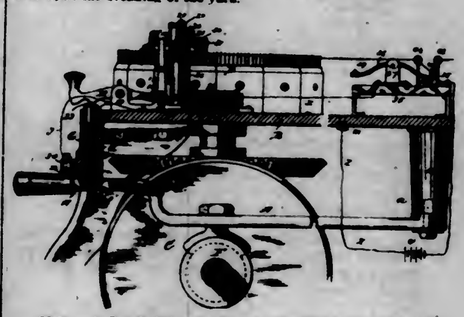
4. In a direct-draft mowing-machine having a continuous thrust-framing, the combination of the framing and an arch-bar having its end attached to the side bars of the framing, and supporting the forward end of the platform of the machine at its arch, substantially as described.

5. The combination of the main driving-wheels and their axle, the spherical support upon the axle, said support being provided with a pin projecting from its surface, a casting, *b*, having flaring bores and oblong recesses and mounted upon said spherical support, and the cutter and driving-gear frames supported by said casting, all arranged and adapted to operate as described.

6. In a mowing-machine, the combination of the main driving-wheels and their axle, a ball mounted upon the axle and provided with a pin projecting from its surface, the casting *b*, loosely mounted upon the ball, said casting being provided with oblong recesses *f*, and encircled by a main gear-wheel, B, and having the cutter and gear frames mounted thereon, all arranged and adapted to operate substantially as described.

7. The combination of the main gear B, the pinion 1, mounted on transverse shaft 20, bevel-gears 2, also mounted on said shaft, bevel-pinions 3, mounted on longitudinal shafts 6 and meshing with the bevel-gears, and cranks 4, mounted on the forward ends of shafts 6, substantially as set forth.

8. In combination with the axle A, the roller I' on the shaft, the cam I', formed on or secured to the shaft I', and the operating-lever I, substantially as and for the purpose set forth.



9. In a mowing machine, the combination of the tongue T, the toothed casting P', the pinion P, having flanges and opposite recesses *r* in said flanges, the shaft P', pins *p*, and an operating-lever, substantially as described.

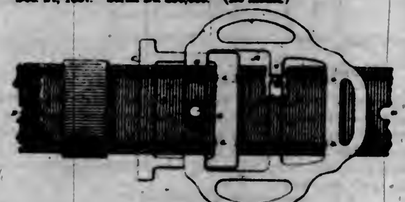
10. In a mower, the combination of the supporting-wheels, the axle, the main gear-wheel mounted loosely thereon, so as to rotate therewith and rock laterally thereon, and the gear and cutter carrying frames mounted upon said wheel, substantially as described.

11. A mower wherein the cutter-bar is rigidly connected at both ends to the thrust-frame, said thrust-frame being rigidly attached to the gear-carrying frame and the latter being mounted on the main gear-wheel, and said gear-wheel mounted loosely on the main axle of the machine, so as to rotate therewith and have a lateral motion thereon, whereby the cutter-bar may conform to the undulations of the ground independent of the supporting-wheels and axle, substantially as described.

382,598. ELECTRIC STOP-MOTION FOR KNITTING-MACHINES. CHARLES DRAPER, Springfield, Mass. Filed Jan. 28, 1886. Serial No. 191,076. (No model.)

Brief.—The invention consists in an improved arrangement and combination of electrically-operated devices for releasing the shipper-lever upon the breaking of the yarn.

Claim.—1. In a knitting-machine, the combination, with the shipper-lever A, the spring-actuated bolt G, the pivoted lever 12, and the pivoted angular lever 15, of the pivoted lever comprising the hooked leg 19 and the leg 30, the rocking shaft 25, provided with an armature and the arm 29, engaging said lever-leg 30, the electro-magnet 28, contact-plate 35, and the adjacent tilting arm 36, located in the line of travel of the yarn and adapted for being engaged and supported from said contact-plate thereby, a battery, *v*, and suitable electrical connections for forming a circuit, substantially as described, for the purpose set forth.



2. In a knitting-machine, the combination, with the shipper-lever A, the spring-actuated bolt G, the pivoted lever 12, and the pivoted angular lever 15, of the pivoted lever comprising the hooked leg 19 and the leg 30, the rocking shaft 25, provided with an armature and the arm 29, engaging said lever-leg 30, the electro-magnet 28, contact-plate 35, and the adjacent tilting arm 36, provided with the eye 40, the yarn supporting and guiding eyes 41 42, a battery, *v*, and suitable electrical connections for forming a circuit, substantially as and for the purpose described.

3. In a knitting-machine, the combination, with the shipper-lever A and the spring-actuated bolt G, the pivoted lever 12, and the pivoted angular lever 15, of the pivoted lever comprising the hooked leg 19 and the leg 30, the rocking shaft 25, provided with an armature and the arm 29, engaging said lever-leg 30, the electro-magnet 28, contact-plate 35, and the adjacent tilting arm 36, located in the line of travel of the yarn and adapted for being engaged and supported away from said contact-plate thereby, the contact-plate 34, arranged in relation to the said shipper-lever, substantially as described, a battery, *v*, and suitable electrical conductors between said battery and said contact-plate 34, between said tilting arm 36 and the electro-magnet, the latter and said contact-plate 34, and said shipper-lever and battery, substantially as and for the purpose described.

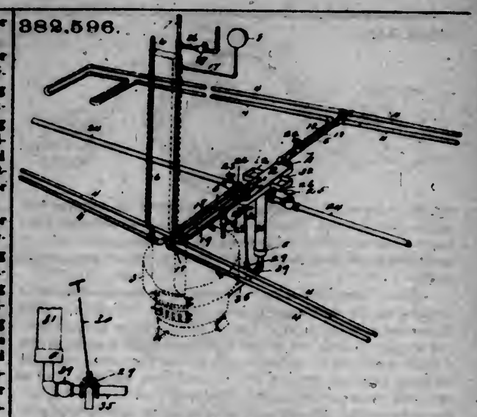
4. In a knitting-machine, the combination, with the shipper-lever A and the spring-actuated bolt G, the pivoted lever 12, and the pivoted angular lever 15, of the pivoted lever comprising the hooked leg 19 and the leg 30, the spring 31, bearing against the latter, the rocking shaft 25, provided with an armature and the arm 29, engaging said lever-leg 30, the electro-magnet 28, contact-plate 35, and the adjacent tilting arm 36, located in the line of travel of the yarn and adapted for being engaged and supported away from said contact-plate thereby, a battery, *v*, and suitable electrical connections for forming a circuit, substantially as and for the purpose described.

5. In a knitting-machine, the combination, with the shipper-lever A and the spring-actuated bolt G, the pivoted lever 12, and the pivoted angular lever 15, of the pivoted lever comprising the hooked leg 19 and the leg 30, the spring 31, bearing against the latter, the rocking shaft 25, provided with an armature and the arm 29, engaging said lever-leg 30, the electro-magnet 28, contact-plate 35, and the adjacent tilting arm 36, provided with the eye 40, the yarn supporting and guiding eyes 41 42, the contact-plate 34, arranged in relation to the said shipper-lever, substantially as described, a battery, *v*, and suitable electrical conductors between said battery and said contact-plate 34, between said tilting arm 36 and the electro-magnet, the latter and said contact-plate 34, and said shipper-lever and battery, all substantially as and for the purpose described.

382,594. BUCKLE. GEORGE F. RUSSELL, Cleveland, Ohio. Filed Dec. 27, 1887. Serial No. 259,089. (No model.)

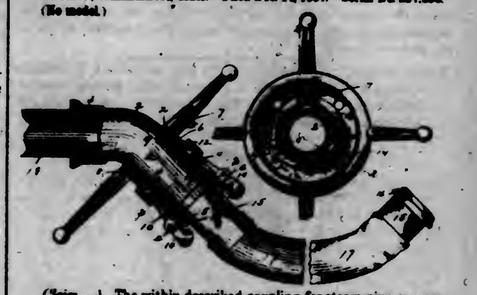
Claim.—A trace-buckle the cross bar or bars of which are provided with grooves, which latter register with the stitching of the trace, substantially as set forth.

382,595. STEAM COOKING UTENSIL. JAMES G. RUSSELL, Springfield, Mass. Filed Dec. 6, 1887. Serial No. 257,311. (No model.)



Claim.—A cooking utensil comprising the outer water-chamber, A, the cooking-chamber B, fitting therein and provided with a tube, E, opening at its upper and lower ends, and at the former end provided with the annular groove *e*, and the chambered cover C, for closing said cooking-chamber, provided with the tube *d*, adapted to extend downwardly into said tube E and having the downwardly-projecting annular flange *f*, adapted to extend into the said annular groove *e*, and also having the perforations A A, all substantially as described and shown, for the purpose specified.

382,596. STEAM-HEATING APPARATUS FOR RAILWAY-CARS. JAMES RUSSELL, Springfield, Mass. Filed Oct. 17, 1887. Serial No. 252,569. (No model.)



Claim.—1. In a car-heating apparatus, the combination, with the receiver 2, having the chamber *c* and the four separated chambers, *a*, therein, of two lines of steam-pipes, 4, one above the other, a branch, 5, connecting said chamber *c* with the upper of said lines 4, two branches, 18, connecting the lower of said lines 4 with two of said chambers *a*, and a steam-pipe connected with chamber *c* of the receiver supplying live steam thereto and to said pipes 4, substantially as set forth.

382,596.

2. In steam-heating apparatus for railway-cars, the receiver 2, having a chamber, *c*, therein to receive and distribute steam to the heating-pipes of a car, several separated chambers, *a*, therein to receive the water of condensation from said pipes, and a pending drip-pocket thereon having a series of pipes, 38, pending therein, each of which is connected by one end with said chambers *a*, combined with a main steam-conduit, 24, connected with said chamber *c* of the receiver, the heating-pipes 4 of a car having steam and drip connections with said receiver, and a drip-cock connected thereto, substantially as set forth.

382,597. STEAM-HEATING PIPE-CONNECTION FOR CARS. JAS. RUSSELL, Williamsett, Mass. Filed Dec. 14, 1887. Serial No. 257,696. (No model.)

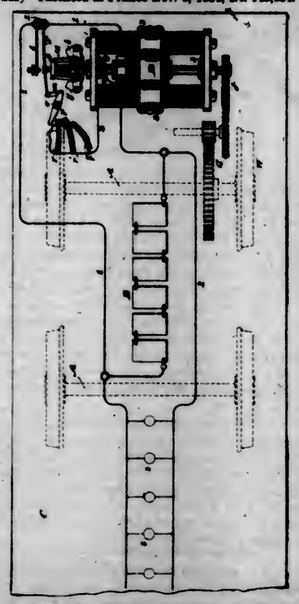
Claim.—1. The within-described coupling for steam-pipe connections between railway-cars, consisting of a coupling-tube, as described, having means for connecting the same with a steam-pipe, combined with a screw threaded sleeve, 6, capable of a rotary motion on said tube, a sleeve, 10, having a screw-thread engagement with said sleeve 6, whereby said sleeve 10 has a longitudinal reciprocating movement on said coupling-tube, a series of hook-levers pivoted on said longitudinally-moving sleeve, and a cam-stud fixed in said tube under the rear end of each of said levers, substantially as set forth.

2. The coupling-tube 2, having the outturned head *a* on its end, combined with the screw-threaded sleeve 6, having a hand-wheel thereon, the sleeve 10, having a screw engagement with said sleeve 6, and the hook-levers 14, pivoted on said sleeve 10 and having engagement with said head, whereby their hooked ends are swung outwardly, substantially as set forth.

3. The coupling-tube 2, the screw-threaded sleeve 6, capable of a reciprocating rotary motion on said tube, the sleeve 10, having a screw engagement with said sleeve 6, whereby it is given a longitudinal motion on said tube, the cam-studs 4, fixed in the tube 2, combined with the hook-levers 14, pivoted on said sleeve 10, having their ends engaging with the ends of said studs, and a hose-nozzle capable of engagement with one end of said coupling-tube with which the hooks on said levers engage, substantially as set forth.

382,598. MECHANISM FOR STRIPPING THE TOP-FLATS OF CARDING-MACHINES. ALONZO FALLS, Lowell, Mass., assignor of one-half to Alexander G. Cumnock, same place. Filed July 20, 1887. Serial No. 245,022. (No model.)

Brief.—In order that the stripping mechanism may have a quicker motion while operating upon a flat than while passing from

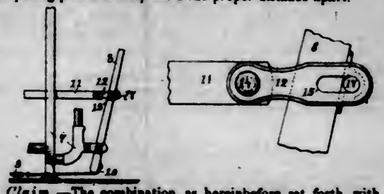


382,598.

one flat to the next, a portion of the periphery of the stripping cam-gear is provided with double teeth, and the actuating-pinion has a member provided with a single tooth, which at the proper time engages said double teeth and imparts to the stripping cam-gear a slower motion.

Claim.—The combination of the main shaft, the supporting-frame swinging on said shaft, a double actuating-pinion, one pinion of which is provided with spur-teeth of uniform pitch arranged at equal intervals around the same, and the other pinion of which is provided with a single spur-tooth of the same pitch as said first-named teeth, the stripping cam-gear provided with a cam-groove and with a set of spur-teeth corresponding in pitch with the teeth of said actuating-pinion, and provided also with a set or row of double teeth adapted to be engaged by the single tooth of said actuating-pinion, said sets of teeth of said cam-gear being continuous with each other, the stripping-arm provided with a stripper and with a projection which engages said cam-groove, the lifting-cam secured to said cam-gear, the lifting-rod provided with pins to engage said lifting-cam, and means, substantially as described, for imparting to said actuating-pinion a continuous and uniform rotary motion, the traverse-rack, the traverse-pinion engaging said rack, and another pinion secured to said traverse-pinion concentrically therewith and engaging a third set of teeth with which said cam-gear is provided, said sets of teeth on said cam-gear being arranged, as described, so that said cam-gear and said lifting-cam are rotated at a greater speed while said lifting-rod is being raised and while the stripper is being operated and at a less speed when the stripping mechanism is traversing from one flat to another, as and for the purpose specified.

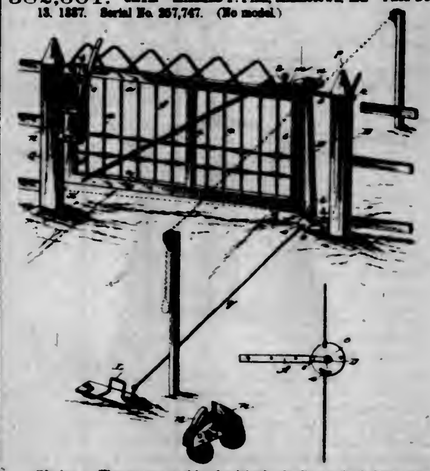
382,599. AUTOMATIC SWITCH FOR SECONDARY BATTERIES. CAMILLE A. FAURE, New York, N. Y., assignor to the Electrical Accumulator Company, of New York. Filed Nov. 16, 1887. Serial No. 255,309. (No model.) Patented in France Nov. 9, 1881, No. 145,081.



Claim.—1. The combination of a car or vehicle, a dynamo-electric machine, a secondary battery in circuit therewith, a switch or circuit-closer in the main circuit, and a mechanical device, arranged as described, controlled by centrifugal force and operating in a vertical plane to close said switch when the speed of rotation reaches a predetermined point, whereby the effect of jars and jolts upon the switch is avoided.

2. The combination of a dynamo-electric machine having its field-coils in a separate circuit, a switch or circuit-changer in said circuit, a switch or circuit-changer in the main circuit, and a device operated by the centrifugal force due to the speed of rotation controlling both said switches.

3. The combination of a dynamo-electric machine having its field-coils in a separate circuit, a switch or circuit-changer in said circuit, a switch or circuit-changer in the main circuit, and a mechanical device for automatically controlling both switches.



382,600. PICKING SWEEP-STRAP CONNECTION FOR LOOMS. EDWIN H. J. FIELDEN, Providence, R. I. Filed May 10, 1887. Serial No. 237,690. (No model.)

Brief.—The connection consists of two pieces projecting longitudinally from the sweep-strap at opposite sides thereof, which are slotted to engage projecting guide-pins fastened to the rear of the picker-stick. The said connecting-pieces are provided at their ends with spacing-pieces to keep them the proper distance apart.

Claim.—The combination, as hereinbefore set forth, with the picker-staff 8, having secured thereto the plate 16, provided with the lugs 17, of the sweep-strap 11, having mounted thereon by means of tie-bolt 14 the two-part sweep-strap connection 12, provided with the spacing-pieces 13, and having the opening 18, and formed with the lateral guideways 15 for the lugs 17, substantially as and for the purpose herein described.

382,601. GATE. MILLARD F. FINK, Middletown, Md. Filed Dec. 13, 1887. Serial No. 257,747. (No model.)

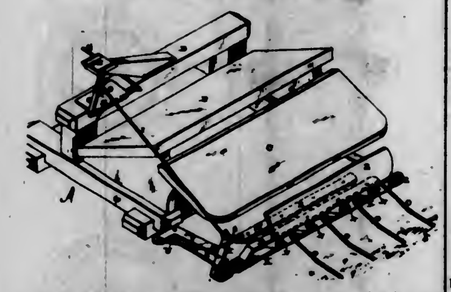
Claim.—The gate, combined with the inclined shaft D, having arm *l* and pivot 1 on the lower end and longer straight arm on the upper end, the lower pivot being near and the upper pivot farther from the end of the gate, a disk on the shaft D and devices for turning it, a double catch on the post C, and a horizontal-moving arm on the gate, all substantially as described.

382,602. CAR-COUPLING. THOMAS GAMBIN, Arcadia, Fla. Filed Sept. 26, 1887. Serial No. 250,807. (No model.)

Claim.—1. A car-coupling consisting of hooks C C, having their front faces curved upwardly and pivoted to work vertically, combined with horizontal bolts B B, a shoulder or support in front of the bolts for holding the hooks up, and suitable draw-heads, substantially as and for the purpose described.

2. The combination, with the coupling-hook C, of the link-arm F, horizontally-sliding rock-shaft G, with rigid arm G' and lug *l*, and the

382,602.



internally-notched keeper H, substantially as and for the purpose described.

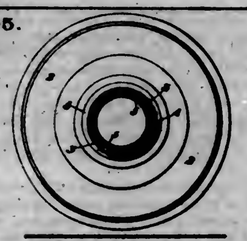
3. A frame-plate attachment for car-bumpers having automatic car-coupling devices thereon and provided with an opening in the middle registering with the pin-hole of the bumper, in combination with a bolt going through said registering holes and a U-shaped strap-iron passing around both the car-bumper and the coupling attachment, substantially as shown and described.

4. The frame-plate A, having a central hole, *b*, notches *d d*, and ears *a a*, in combination with the horizontal bolt B, fastened in said ears, and a vertically-swinging coupling-hook hung upon said bolt, substantially as and for the purpose described.

382,603. SCRAP-CARRIER. GEORGE H. GOSSE, Rahway, Me. Filed July 19, 1887. Serial No. 244,769. (No model.)

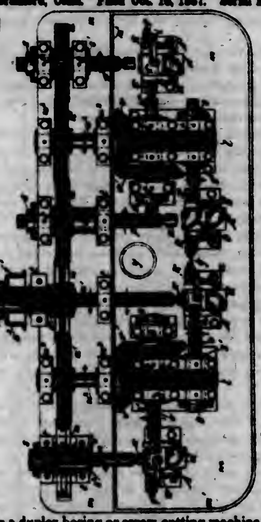
Claim.—1. The combination of the frame-work, the foot-lever, the connecting-rod operated by the foot-lever, the partially turning and supporting shaft K, which is journaled in suitable arms or bearings secured to the frame and operated by said connecting-rod, the bent levers which are pivoted upon this arm-supporting shaft and provided with arms, and which are connected at their inner ends by the endwise-moving rod P, a connecting-rod connected to the rod P, the pivoted cranked lever for moving the rod P endwise and causing the levers N to turn upon their pivots, and the connecting-rod which unites the angular lever with the crank on the arm-supporting shaft, substantially as shown and described.

2. The combination of a partially-revolving arm-supporting shaft, K, mounted in suitable bearings, L, provided therefor, the rod R, which forms the upper bearing for the pivoted levers N, provided with the arms O, and the inclined board Z, which deflects the bundles outward as they drop from the inclined surface C, substantially as described.



382,604. FERTILIZER. STEPHEN L. GODDALE, Saco, Me. Filed Feb. 21, 1887. Serial No. 228,204. (No specimens.)

Claim.—In the manufacture of fertilizing material, the herein-described process of making hydrated aluminic and ferric phosphates available as a plant-food, which consists in first mixing with pulverized crude mineral containing said phosphate carbonaceous matter and sulphuric acid and then heating the compound, substantially as set forth.



382,605. COLLAR FOR LAMPS. ANDREW GUTTERSALE, Martin's Ferry, Ohio. Filed June 9, 1887. Serial No. 240,744. (No model.)

Claim.—A lamp whose neck is threaded and provided with an indentation or recess, b, in combination with a threaded collar of soft metal screwed on the neck and having a portion of its body forced into the recess after the collar has been screwed on the neck, whereby the collar is locked, substantially as and for the purpose described.

382,605.

382,606. MACHINE FOR TAPPING PIPE-ELBOWS. THORVALD F. HANSEN, Branford, Conn. Filed Oct. 10, 1887. Serial No. 251,863. (No model.)

Claim.—1. In a duplex boring or screw-cutting machine, the combination of a group of rotary and reciprocating spindles consisting of a pair, *n n'*, and a pair, *o o'*, arranged at right angles to the former, and converging at their tool-fitted ends at two corners, with two chucks, A A, placed at said corners, with a similarly-arranged group of spindles, such as *p p'* and *r r'*, and chucks A' A', arranged adjacent to the former group, with connecting-gearing between the spindles of each group and between the two groups, substantially as herein set forth, whereby the four spindles of one group revolve in one direction, while the four spindles of the other group revolve in the other direction, substantially as herein shown and described.

2. In a boring or screw-cutting machine, the combination of a pair of rotary and reciprocating spindles, such as *n n'*, and a second pair, such as *o o'*, arranged at right angles to the former, with directly-meshing spur-gears *l l* on the spindles *o o'*, spur-gears *u u* on the spindles *n n'*, and intermediate spur-gear, *u'*, meshing on opposite sides with the gears *u u*, a bevel or miter gear, *v*, driven by the intermediate wheel, *u'*, and a miter-wheel, *v'*, meshing therewith and driving the spindle *o*, substantially as herein shown and described.

3. In a boring or screw-cutting machine, the combination, with the rotary and reciprocating spindles *n n'* and *o o'*, arranged in one group, with the spindles *p p'* and *r r'*, arranged in an adjacent group, and chucks A A A' A', arranged at the convergence of the spindles in the respective groups, of the spur-gears *l l* on the spindles *o o'* and *r r'*, meshing directly together, the miter-wheels *v' v'* on the spindles *o r*, the spur-wheels *u* on the spindles *n n'* and *p p'*, the wheel *u* of the spindle *n'*, meshing directly with the wheel *u* of the spindle *p*, with the intermediate spur-wheels *u' u'*, meshing between the wheels *u u* of the spindles *n n'* and *p p'*, and the miter or bevel wheels *v* on the axis of the wheels *v'* meshing with the miter-wheels *v* of the spindles *o r*, arranged and operating substantially as herein shown and described.

4. A self-discharging chuck constructed with an upper fixed jaw and an underlying movable dumping or gravitating jaw hinged or swung at a point below and back of the upper fixed jaw, whereby it may be thrown down into an inclined position to dump the finished work, and thrown up into a parallel position to clamp the succeeding article, with a suitable operating device connected with the said dump-

ing-jaw to raise and lower the same, substantially as herein set forth.

5. In a chuck or vise, the combination, with a sustaining-frame having a fixed jaw and a conforming socket on said jaw, of a movable dumping-jaw having a flat or level face adapted to be dumped or depressed at a sliding angle or incline, and to receive the blank at the top of the incline, with a movable stop projecting between the jaws near the end of the inclined jaw in the path of the descending blank, to arrest the sliding blank under the fixed jaw, and an operating device for raising or lowering said movable jaw, substantially as herein set forth.

6. In a vise or chuck, the combination, with the sustaining-frame having a fixed jaw, of the underlying pivoted inclining or dumping jaw *d*, pivoted at a point back of or beyond the fixed jaw, leaving a free throat or passage between the pivotal end of the movable jaw and the fixed jaw to admit a blank, and an operating device for raising the movable jaw into a parallel or dropping it into an inclined position, substantially as and for the purpose herein shown and described.

7. In a chuck or vise, the combination, with the cheeks or standards *b b'*, of the fixed jaw *c*, the conforming socket *e*, movable dumping-jaw *d*, pivoted at the end remote from the socket, and a manipulating-lever operatively connected with the jaw *d* to raise or lower the same, substantially as shown and described.

8. The combination, in a vise or chuck, with the sustaining-frame and a fixed jaw thereon, of a dumping-jaw underlying the same and a yielding stop arranged to project in the path of the jaw when depressed and in front of the succeeding blank sliding down the dumping-jaw to arrest the same under the fixed jaw, with a manipulating device connected to the movable jaw, adapted to raise the same, remove the stop, and clamp the arrested blank between the two jaws, and vice versa, substantially as herein shown and described.

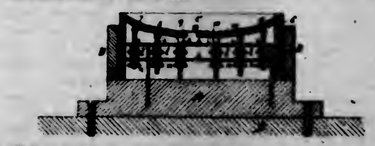
9. The combination, with the sustaining cheeks or standards *b b'*, of the fixed jaw *c*, having conforming socket *e*, the dumping-jaw *d*, stop *k*, and a manipulating device operatively connected to the jaw to raise or lower the same, substantially as herein set forth.

10. In a vise or chuck, the combination, with the sustaining-frame having the fixed jaw, of the movable dumping-jaw *d*, toggle-cam *f*, rock-shaft *g*, and operating-lever *i*, substantially as shown and described.

11. In a chuck or vise, the combination, with the fixed and movable jaws, of the cam *f*, rock-shaft *g*, and lever *i*, and elastic or yielding supports on which said rock-shaft is mounted, substantially as and for the purpose set forth.

12. In a chuck or vise, the combination, with the fixed and movable jaws, of the rock-shaft *g*, an operating-lever extending from said rock-shaft, and a cam or projection extending from said rock-shaft to engage the movable jaw, with the spring *h*, supporting the bearings of the rock-shaft, substantially as set forth.

13. The combination, in a chuck or vise, with the fixed and movable jaws, of the rock-shaft *g*, lever *i*, and cam *f*, with the spring *h*, supporting the bearings of the rock-shaft, and screw *h'*, for adjusting said spring.



14. The combination, in a chuck or vise, with a sustaining-frame and a fixed jaw thereon, of the pivoted or movable dumping-jaw *d*, the rock-shaft *g*, lever *i*, cam *f*, boxes *g'*, supporting-spring *h*, and adjusting device *h'*, substantially as and for the purpose set forth.

15. In a vise or chuck, the combination, with the frame and fixed jaw, of the movable jaw *d*, cam *f*, and tongue *g*, with an operating-lever, *i*, connected to the cam *f*, substantially as and for the purpose set forth.

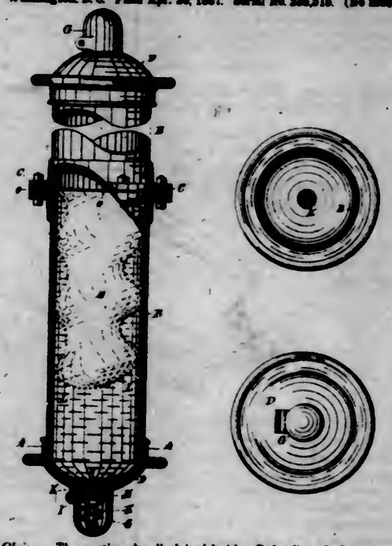
382,607. PLASTIC COMPOUND. LEAH F. HEAD, Germantown, Pa. Filed July 15, 1887. Serial No. 244,837. (No specimens.)

Claim.—The new plastic compound consisting of stearine, with talc and gum-shellac, substantially as set forth and described.

382,608. MOLD FOR MEASURING AND PARTLY SHAPING CIGAR-FILLERS. SIMON HENRY, Brooklyn, N. Y. Filed Aug. 22, 1887. Serial No. 247,580. (No model.)

Claim.—1. The combination, with the mold for measuring and partially shaping cigar-fillers, of a bottom for the mold, made of hinged sections, and screws for raising or lowering the sections to vary the quantity of tobacco measured in the mold, substantially as set forth.

2. The removable mold for measuring and partially shaping cigar-fillers, in combination with hinged sections forming the bottom, adjusting-screws, stationary plates through which the screws pass, and adjusting-nuts, substantially as set forth.



3. The combination, with the stationary bottom and the mold that rests over such bottom and measures and partially shapes the cigar-filler, of the case surrounding the mold and adapted to slide vertically as the mold is lifted, substantially as set forth.

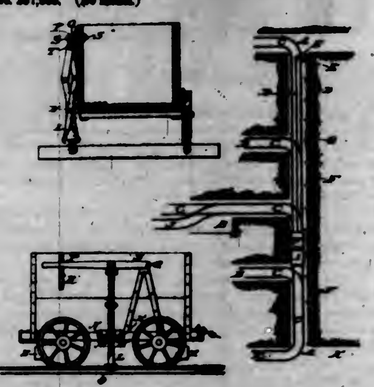
382,609. DENTAL ANEARING-DISK. CHARLES W. P. HOLBROOK, Newark, N. J. Filed Jan. 20, 1888. Serial No. 261,276. (No model.)

Claim.—In a dental disk, an opening shaped to fit the head of the mandrel or disk-carrier, re-enforced by a metal binding composed of a single piece of metal lapping over the edges and pressing both the upper and lower face of the disk.

382,610. APPARATUS FOR TRANSPORTING AND TRANSFERRING GASES OR LIQUIDS UNDER PRESSURE. JOSEPH R. HOLMES, Washington, D. C. Filed Apr. 20, 1887. Serial No. 235,515. (No model.)

Claim.—The sectional cylindrical holder B for liquefied ammoniacal gas or other like fluids under pressure, consisting of two sections each having a flanged portion, C, with means for fastening the sections together, and heads D, which are provided with inlet and outlet pipes with valves E, chamber I, and perforated passage K, in combination with the flexible elastic diaphragm L, having a re-enforcement, N, arranged in said holder, substantially as and for the purposes set forth.

382,611. SNAP-HOOK. ROBERT L. HOWE, Cleveland, Ohio. Filed Dec. 27, 1887. Serial No. 259,033. (No model.)



Claim.—In a snap-hook, the combination, with reverse rigid hooks integral with a shank, of a spring-actuated push-bar connected with such shank and serving as a mousing for the hooks, substantially as set forth.

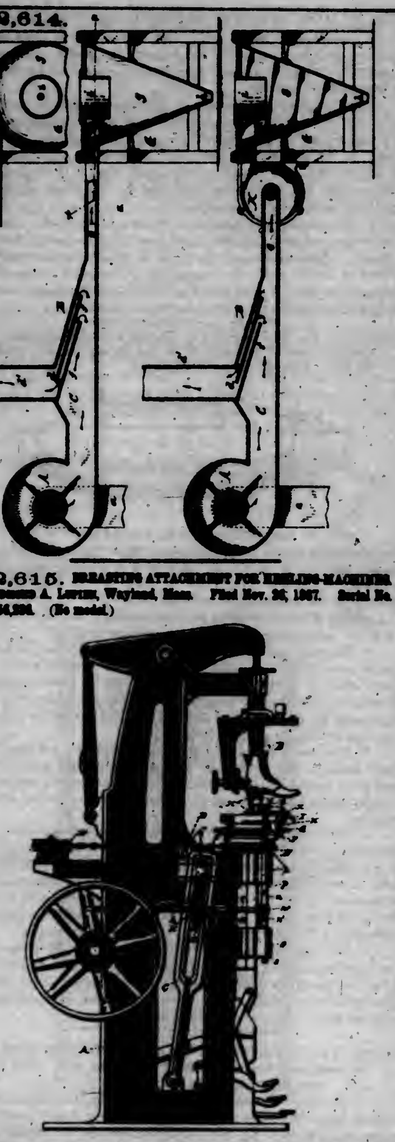
382,612. COMBINED CLOD-CRUSHER AND LAND-ROLLER. C. LOUIS JESSEN, Milwaukee, Wis. Filed Dec. 27, 1887. Serial No. 258,994. (No model.)

Claim.—1. The combination of a frame comprising the parallel beams A, provided with the studs 1, and the angular castings B, united by the beams, and one of these castings provided with an eye, the shafts E F, journaled in the frame, the disks P, arranged on the shafts, the wheels J, for engagement with the studs on said beams, and the center-wheel L, having its shank adapted to fit the eye K on the casting above named, substantially as set forth.

2. The combination of a frame comprising the parallel beams A, castings B, uniting the ends of the beams and provided with ears F, the braces C, that cross each other and are connected at their ends to the ears on said castings, the shafts E F, journaled in the frame, and the disks P, arranged on the shaft, substantially as set forth.

382,613. APPLIANCE FOR OPERATING INCLINED PLANES. FREDERICK G. KIMBERLY, Uniontown, Pa. Filed Dec. 12, 1887. Serial No. 257,993. (No model.)

Claim.—The combination, in the operating of an inclined plane, of the suspended track F, the back-balanced G, and the grip-car H, as shown by Fig. 1.



382,614. DUST-COLLECTOR. CHARLES B. KNEISBOECKER, Jackson, Mich., assignor to the Knickerbocker Company, same place. Filed Mar. 1, 1886. Serial No. 293,943. (No model.)

Claim.—1. The combination, with a preliminary separating-chamber provided with an inlet for the dust-laden air, an exit for the separated air, and an exit for the reduced volume of air containing the dust, of a subsequent separating-chamber having its inlet connected with the exit through which the reduced volume of air containing the dust issues from the preliminary chamber, and provided with an exit for the separated air and an exit for the dust, substantially as set forth.

2. The combination, with a preliminary separating-chamber provided with an inlet for the dust-laden air, an exit for the separated air, and an exit for the reduced volume of air containing the dust, of a subsequent separating-chamber having an exit for the separated air and an exit for the dust, a conduit connecting the exit of the preliminary separating-chamber for the reduced volume of air containing the dust with the inlet of the subsequent separating-chamber, and a fan arranged in said conduit, substantially as set forth.

3. The combination, with a preliminary dust-separating chamber provided with an inlet for the dust-laden air, an exit for the separated air, and an exit for the reduced volume of air containing the dust, of a circular subsequent separating-chamber having an exit for the separated air, an exit for the dust, and a tangential inlet-spout connected with the exit through which the reduced volume of air containing the dust issues from the preliminary separating-chamber, substantially as set forth.

382,615. BREASTING ATTACHMENT FOR HEELING-MACHINES. EDWARD A. LEWIS, Wayland, Mass. Filed Nov. 26, 1887. Serial No. 256,393. (No model.)

Claim.—1. In breasting attachments for heeling-machines, the combination, with the vertically-reciprocating knife, and the guard having its upper end bent over at or near the same level as the edge of the knife, and both knife and guard reciprocating simultaneously, of mechanism, substantially as described, whereby said knife and guard are moved to their highest points when the head of the machine has made one-half of its rotation, substantially as specified.

2. In breasting attachments for heeling-machines, the combination, with the knife and guard secured to and reciprocating with a vertical bar, the knife and guard being vertically adjusted on said bar, of the toggle-joint attached to the lower end of said bar and connected with the main frame of the machine, and mechanism, substantially as described, to actuate said toggle-joint, substantially as specified.

3. In breasting attachments for heeling-machines, the combination with the knife and guard-bearing bar reciprocating vertically in a guide opening in the main frame, of the toggle-joint attached to the

lower end of said bar and connected with the main frame, the double-armed cam-lever journaled on a bearing secured to the main frame and connected by links to the toggle-joint, and means, substantially as described, whereby said lever is vibrated to actuate the toggle-joint, substantially as specified.

4. In breasting attachments for heeling-machines, the combination, with the vertically-reciprocating knife and guard-bearing bar, the toggle-joint attached to said bar and connected with the main frame, of the double-armed cam-roller connected to the toggle-joint by suitable links, the actuating-chain for the rotation of the head, the chain-carrier, the chain-carrier lever, and the cam-roller attached to said lever, substantially as specified.

5. In breasting attachments for heeling-machines, the combination of the reciprocating bar P, the guard Q, attached thereto and vertically adjustable thereon, the knife R, attached to and vertically adjustable on the same, the toggle-joint N, the plate V, the coiled spring O, the plate W, and adjusting-screw S, all constructed and arranged substantially as and for the purposes specified.

382,616. HEATING-DRUM. Walter Markle, Tonganoxie, Kans., assignor of one-half to Francis M. Vanden, Kansas City, Mo. Filed Mar. 26, 1887. Serial No. 232,327. (No model.)

Claim.—1. The combination of the heating chamber or drum and the ventilating-chamber K, having an air-inlet opening, *k*, and a protector-plate located within said chamber K opposite its inlet-opening, a passage or passages being provided between the protector-plate and the wall of the ventilating-chamber and laterally to the opening *k*, for the passage of the air entering through opening *k* into the ventilating chamber, substantially as and for the purposes specified.

2. The combination of the heating chamber or drum and a ventilating-chamber, K, having an opening, *k*, and provided with a protector-plate, O, combined with a valve whereby to close said opening at will, the plate O being extended past the opposite sides of opening *k*, passages for the inlet of foul air being provided laterally to said opening *k*, as and for the purposes specified.

3. The combination of the stand G, having legs *g* and ring G', the drum fitted in said stand, and the lugs *a a*, projected laterally from said drum and on opposite sides of the legs *g*, whereby to prevent any turning of the drum in the stand, substantially as and for the purposes specified.

4. The combination of the chamber B, the ventilating-chamber K, mounted on chamber B, and having an opening, *k*, the protector-plate O, located within chamber K and having its ends extended to opposite sides of and past the opening *k* and separated at its ends from the walls of chamber K, forming openings for the passage of the air entering through opening *k*, the lower chamber, A, and tubes connecting said chambers A B, substantially as and for the purposes specified.

5. The combination of the heating chamber or drum, the chamber K, having opening *k*, and having end plates provided on their inner sides with grooves *o o*, the connection uniting said end plates, and the protector-plates O, held in said grooves, all being arranged substantially as and for the purposes specified.

382,617. FRUIT-DRIER. Lacheen W. Merithew, Grand View, Ind., assignor of one-half to Loren F. Gage, same place. Filed Oct. 18, 1887. Serial No. 252,704. (No model.)

Claim.—1. In a fruit-drier, the combination of a main frame or support, ways therein for the fruit-trays, the trays fitted to said ways and movable thereon into and out of the drier, the sides fitted to the main frame and hinged at their upper ends to said frame, whereby they may be turned in to close said frame or out to form scaffolds whereon to support and expose the trays, and supports whereby said sides may be held elevated when opened, substantially as and for the purposes specified.

2. In a fruit-drier, the combination of the main frame or support having ways for the fruit-trays, the removable top, the sides hinged at one of their ends to the support, and uprights for securing the other ends of the sides elevated, substantially as set forth.

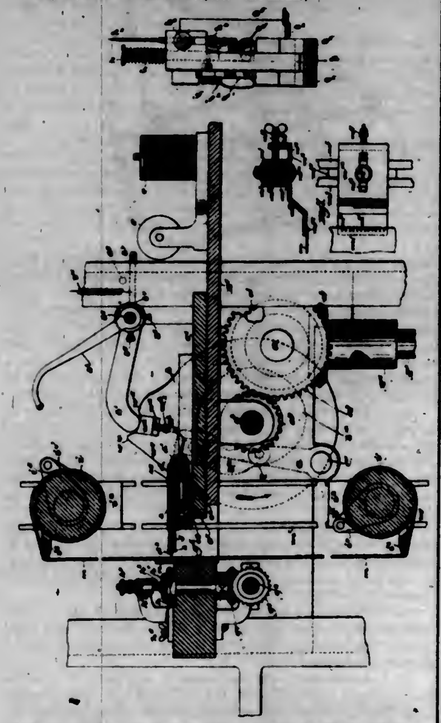
3. In a fruit-drier, the combination of the main frame or support, the sides hinged thereto, and consisting of the frame-bars 1 and the weather-board sections secured to the outer sides of said bars, and the upright bars hinged at one end alongside the frame-bars 1, whereby the said uprights may be turned up alongside the frame-bars and against the weather-boards, all substantially as and for the purposes specified.

4. In a fruit-drier, the main frame having guides or ways for the fruit-trays, such guides being arranged in a number of series, each of such series being arranged at right angles to the adjacent ones, combined with the sides hinged at one end to the main frame, whereby they may be turned outward from said frame, and supports for the outer ends of said sides, substantially as set forth.

5. In a fruit-drier, the combination of the main frame or support having ways for the fruit-trays, the removable top, and the adjustable sides arranged to be opened to form scaffolds whereby to support the trays for open-air drying, substantially as set forth.

6. In a fruit-drier, substantially as described, the removable top provided with side boards having openings *j*, combined with the scaffold-frames having their bars *l* fitted at one end to enter said openings, and having such ends notched on their under sides at *l'*, substantially as set forth.

7. In a fruit-drier, the combination of the main frame or support, the sides hinged at one of their ends to said main frame or support, and the cap or top fitted on the support or main frame and having depending portions overlapping the sides in the closed positions thereof, substantially as set forth.



382,618. DEVICE FOR MOVING BARRELS. E. Hicks Mott, Oneida, N. Y. Filed Feb. 23, 1888. Serial No. 265,060. (No model.)

Claim.—1. A device for the purpose described, consisting of a lever, a shoe secured to one end thereof, a depending lug, C, on the under side of said lever, and a holding-hook adjustable on the lever, as and for the purpose set forth.

2. The combination, with the lever cut away, as at *c*, forming a recess, and a shoulder, *d*, of the shoe having a loop seated in said recess and engaging said shoulder and the screws engaging said loop and securing it to the lever, substantially as shown and described.

382,619. EMBROIDERING-MACHINE. James G. Perlaw, Lynn, Mass., assignor of one-half to Benjamin H. Dorman, same place. Filed July 26, 1886. Serial No. 209,206. (No model.)

Claim.—1. In a machine for stitching and embroidering, the combination, with the sliding cross-head c^2, a series of needle-carriers attached thereto, the shaft a^3, connected with the said slide to actuate the latter, and mechanism for rotating said shaft, of the shaft g^3, geared to the said shaft a^3, a series of hook-shafts geared to the shaft g^3, a series of rotary hooks carried by the hook-shafts, a stretcher-frame having rollers to hold the material, and a pantograph to operate the said frame, substantially as set forth.

2. In a machine for stitching or embroidering, the reciprocating cross-head, an attached block, and a needle-carrier pivoted to the latter, combined with a locking device to hold the carrier to the block, substantially as described.

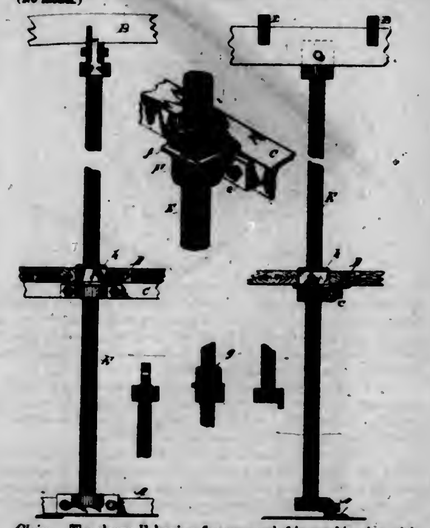
3. The reciprocating cross-head, connected block, and adjusting-screw f^3, combined with the carrier *d*, pivoted to the block, and the presser-foot sustained in the said carrier, substantially as described.

4. The reciprocating cross-head, connected block, and the needle-carrier pivoted to the block and holding the presser-foot, and provided with an eccentric screw or stud, combined with means to adjust the carrier with relation to the block and with the latch *f'*, to operate all substantially as described.

5. The combination, with the needle-carrier and needle, of the holding-screw d^3, tapped in the side of said carrier and abutting against the side of the needle, and the adjusting-screw d^3, tapped in the carrier above the needle and abutting against the top or end of the shank of the latter, substantially as set forth.

6. The cross-head, its attached blocks, needle-carriers pivoted on the said blocks, the shaft a^3, and cams *b*, combined with the rock-shaft b^3, its arms b', and series of take-up levers b^2, substantially as described.

7. In a machine for stitching or embroidering, the suspended universally-movable stretcher-frame and rollers *i i'*, having their journals in bearings on the said frame, combined with adjustable stretcher-bars i^2 at or near each roller and adjustable toward and from the axes of the latter, and with the needle-hole plate to permit the material to be adjusted to the face of the needle-hole plate, substantially as described.



8. The stretcher-frame, its attached yokes, plates and guides at the corners of the stretcher-frame, and the rollers *i i'*, and boxes secured to the stretcher-frame to hold the journals of the said rolls, combined with the levers n^3, counterbalancing-weight n^7, and sheaves on which the said yokes rest and move, substantially as described.

9. In a machine for stitching or embroidering, the shaft g^3, a series of hook-shafts, hooks thereon, gearing, substantially as described, to rotate the said hook-shafts, the bobbin-holders to hold bobbins in the face of each hook, and the throat-plate, the reciprocating cross-head, its attached blocks, the needle-carriers attached to the blocks and slotted at one side, the presser-feet having their shanks inserted in the said carriers loosely, springs to surround the shanks of the pressers, and means, substantially as described, to govern the extent of outward movement of the presser-feet, combined with means, substantially as described, to reciprocate the said cross-head and carrying the presser-feet against the material while the needle is in the material, and removing the said presser-feet from the material when the needles are withdrawn from and the material is being moved for a new stitch, substantially as described.

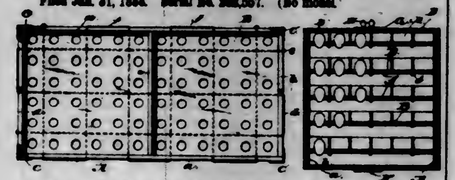
10. The stretcher-frame, means, substantially as described, to suspend it, the rollers *i i'*, mounted thereon, the cross-head, its attached blocks and carriers containing the needles and presser-feet, the shaft a^3, means, substantially as described, actuated by it to move the cross-head, the hooks *h*, their shafts g^3, the shaft g^3, gearing between it and the hook-shafts to rotate the latter, and gears *g* and *g'*, combined with a clutch and with means, substantially as described, whereby the shaft a^3 is arrested after the completion of each stitch by any one needle and hook, in order to permit the stretcher-frame and material to be moved for the proper distance in any direction in a vertical plane for the next stitch to be made, substantially as described.

11. In a sewing-machine, a take-up lever, its shaft, and arm *b'*, combined with the cam *b*, having the adjustable block a^3, to provide more or less slack thread, according to the length of the stitch, substantially as described.

382,620. SECURING STANCHIONS OF VESSELS IN PLACE. Thomas M. Rees, Pittsburg, Pa. Filed Oct. 31, 1887. Serial No. 253,042. (No model.)

Claim.—The sleeve F, having flanges *e* and *f*, in combination with the beam C, floor D, and stanchion E, substantially as herein described, and for the purpose set forth.

382,621. INKSTAND. Henry A. Reinhard, Columbus, Ohio. Filed Jan. 21, 1888. Serial No. 261,461. (No model.)



Claim.—The combination of the foot A, the stem B, provided with a shoulder, F, the rod C, and nut D, with the revolving base G, which

is held between the foot and the shoulder, and the pen-holder O, placed between the two parts of the stem, substantially as shown and described.

382,622. EGG CRATE AND TRAY.

JOHN L. RITTER, Milnes, Va. Filed Jan. 31, 1888. Serial No. 262,857. (No model.)

Claim.—1. An egg-tray having a bottom of wires, a perforated sheet of pasteboard or like material resting on the wires, and egg-cells resting on the board, as set forth.

2. An egg-crate composed of a series of superimposed trays each having a bottom of wires, a perforated sheet of pasteboard or like material resting on said wires, and cell-cases resting on said board, as set forth.

3. An egg-crate consisting of a series of superimposed trays vertically perforated at the ends, a top, a perforated plate on the bottom tray and having a threaded opening, a perforated plate on the top, and a rod passing through said perforations, threaded at its lower end to engage said bottom plate and threaded at its upper end to receive a clamp-screw, substantially as specified.

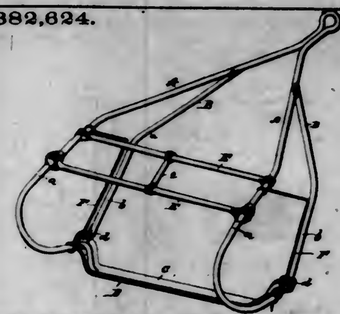
382,623. PAPER-HOLDER.

CALVIN W. SHERWOOD, Chicago, Ill. Filed Feb. 14, 1888. Serial No. 263,998. (No model.)

Claim.—1. A paper-holder comprising, in combination, a base, A, provided at one end with a flexible extension forming a reversible hinge, *g*, and a clamp, B, secured at one edge to the hinge to have its jaws project in the direction of the said extension, whereby a paper held by the clamp will lie practically to its full length flat upon either side of the base, substantially as described.

2. A paper-holder comprising, in combination, a base, A, provided at one end with a flexible hinge, *g*, and a spring-clamp, B, secured at one edge to the hinge *g*, and having its jaws normally closed, and a key for opening the jaws, substantially as described.

3. A paper-holder comprising, in combination, a base, A, provided at one end with a flexible hinge, *g*, and a spring-clamp, B, secured at one edge to the hinge *g*, and having its jaws normally closed, and a key for opening the jaws permanently attached to the clamp, substantially as described.



4. A paper-holder comprising, in combination, a base, A, provided at one end with a flexible hinge, *g*, and a spring-clamp, B, secured at one edge to the hinge *g*, provided with a channel, *c*, and having its jaws normally closed, and a key to turn in the channel to open the jaws, substantially as described.

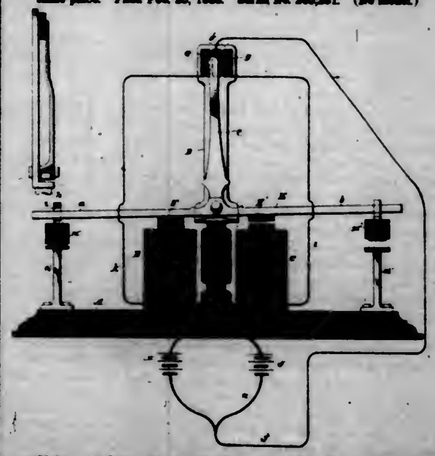
5. In a paper-holder, the bases A, flexibly hinged together at corresponding edges to open and lie back to back to form a practically single base, a flexible extension forming a reversible hinge, *g*, and a clamp, B, secured at one edge to the hinge *g*, to have its jaws project in the direction of the said extension, whereby a paper held by the clamp will lie practically to its full length upon either side of the base, substantially as described.

382,624. OYSTER-DREDGE.

WILLIAM A. STEWART, Critchell, Md., assignor of one-half to James F. Lockman, same place. Filed June 8, 1887. Serial No. 240,626. (No model.)

Claim.—1. The herein shown and described dredge, composed of the four corner bars, A A and B B, united at their upper ends and diverging from top to bottom, and having their lower ends bent to form parallel portions *a a* and *b b*, and the lower ends of the bars A A curved forward and secured to the ends of the bars B B, the scrape-bar C, extended between the lower ends of the bars B B, the cross-rods E E, uniting the bars A A near their bends and braced by short stay *c*, the wire D, located on the rear of and parallel with the scrape-bar, and the wires F, having a portion parallel with the bars B and a portion extended across the space between the bars B and A and secured to the bars A, substantially as described, and for the purpose specified.

2. In a crab-catcher and oyster-dredge, side pieces composed of an upper bar, a runner of substantially the same length as the upper bar, and standards a^2, connecting the upper bar and runner, combined with cross-rods connecting the two side pieces and adapted to receive the net, and the wires F, arranged between the upper bar and the runner and placed close to the said runner, substantially as and for the purpose described.



3. A crab-catcher and oyster-dredge composed of side pieces composed of upper bars, A, united at their forward ends, runners B, vertical stays between the upper bars and runners, cross-stays between the side pieces, the scraper-bar, and the wires F in the side pieces, substantially as and for the purpose described.

4. The side pieces having the upper bars, runners, and uprights for connecting the said upper bars and runners, combined with wires or rods F, arranged just above the runners, substantially as and for the purpose described.

5. In a crab-catcher and oyster-scraper, side pieces composed of the upper bars, A, the runners B, and the uprights a^2, connecting said upper bars and runners, the runners being extended forward from the uprights and connected to the upper bars, substantially as shown, to form supports for the side pieces essentially coextensive with their length.

382,625. AUTOMATIC ELECTRICAL SWITCH.

FREDERICK SEITZ, Louisville, Ky., assignor to the American Sanaphore Company, same place. Filed Feb. 25, 1888. Serial No. 265,231. (No model.)

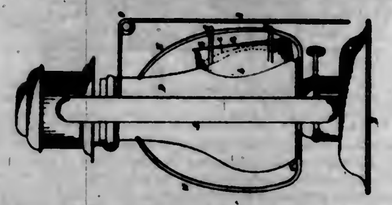
Claim.—1. In an electrical switch, the combination, with electro-magnets, of a pivoted lever carrying a counterbalance-weight at each side of its fulcrum, and contact-blocks with which an arm of said lever is adapted to make contact, substantially as set forth.

2. In an electrical switch, the combination, with two electro-magnets, of a pivoted lever carrying armatures to be actuated by said magnets, adjustable weights on the lever at opposite sides of its fulcrum, and contact-blocks with which an arm of said lever is adapted to make contact, substantially as set forth.

3. In an electrical switch, the combination, with two electro-magnets, of a lever pivoted between said magnets and carrying armatures, adjustable weights carried by the lever at opposite sides of its fulcrum, and a series of contact-blocks with which an arm of the lever is adapted to make contact, substantially as and for the purpose set forth.

4. In an automatic electrical switch, the combination, with two electro-magnets and two batteries, of a lever pivoted above said electro-magnets and carrying armatures, adjustable weights carried by the lever at opposite sides of its fulcrum, contact-blocks with which an arm of the lever makes contact, and conductors connecting the contact-blocks with the batteries and coils of the magnets, substantially as set forth.

5. In a switch, the combination, with two electro-magnets and two batteries, of a pivoted lever carrying a weight at each side of its fulcrum, three contact-blocks mounted on a suitable support and electrically connected with the batteries and coils of the electro-magnets, and an arm of the lever adapted to connect the contact-blocks in pairs alternately as the device operates, substantially as set forth.



6. In an electrical switch, the combination, with two electro-magnets, of a pivoted lever above said magnets and carrying weights on opposite sides of its fulcrum, a series of contact-blocks with which an arm of the lever is adapted to make contact, and two batteries electrically connected with the contact-blocks and coils of the magnets, whereby when one battery becomes weak it will be cut out and the other battery switched into circuit automatically when the arm of the lever moves over the contact-blocks, substantially as set forth.

7. In an electrical switch, the combination, with two electro-magnets, of a lever pivoted above said magnets and carrying a weight at each side of its fulcrum, and having slotted cheeks through which the arms of the lever pass, supporting-posts mounted on a base beneath the weights, and contact-blocks with which an arm of the lever is adapted to engage, substantially as set forth.

8. In an electrical switch, the combination, with two electro-magnets, of a lever having three arms pivoted above said magnets and carrying armatures, and weights on two arms of the lever at opposite sides of its fulcrum, the third arm of said lever being made thin and adapted to bear with a yielding pressure upon a series of contact-blocks, substantially as set forth.

382,626. TUBULAR LANTERN.

JOHN H. SIMMS, Hamilton, Ontario, Canada. Filed Apr. 17, 1888. Serial No. 270,910. (No model.)

Claim.—1. The combination, with a tubular lantern, of a removable reflector, G, having its flange *b* cut to conform to and fit the shape of the globe, substantially as specified.

2. The combination, with a tubular lantern, of a reflector, G, having its flange *b* cut to conform to and fit the round shape of the globe, and secured to the guard E by hooks *d*, substantially as specified.

382,627. WATCH-CHAIN ATTACHMENT.

HENRY M. STOVER, Olathe, Kans. Filed Sept. 6, 1887. Serial No. 248,943. (No model.)

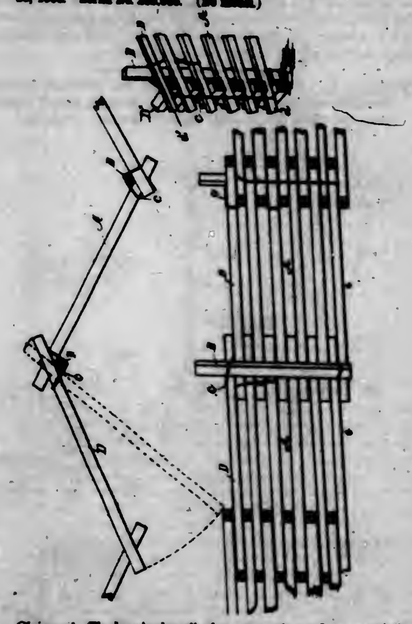
Claim.—1. A lock for watch chains or guards herein described, consisting of a metallic yoke having slotted arms, and provided with a spur or toothed bar and cam-lever for locking the same to a vest or other garment, substantially as herein set forth.

2. A lock for watch chains or guards herein described, consisting of a metallic yoke or U-shaped piece, one end of which has a locking-lever, in combination with an escutcheon or other ornament attached to the other limb, substantially as herein set forth.

382,628. UNDERWAIST.

EMMA D. WATSON, Prattsburg Corners, N. Y. Filed Aug. 20, 1887. Serial No. 247,467. (No model.)

Claim.—1. In an underwaist, the body A, provided with horizontal incisions or openings in its back, in combination with an elastic or yielding connection extending across the slits or openings.



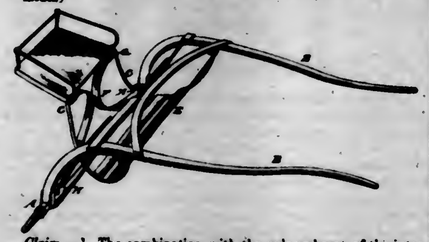
2. In an underwaist provided with shoulder-straps, the horizontal incisions or openings in the back, and the elastic connecting-pieces, as G, applied to the openings.

3. In an underwaist provided with shoulder-straps B B, flaps C D, adapted to be connected at the back, a horizontal incision, F, in each flap, and elastic G, applied to the incisions, all substantially as shown.

4. In an underwaist, the body *a*, provided with elastic portions G in its back, strengthening-strips H, buttons or fastenings at the upper and lower ends of the strips, and shoulder-straps B B, secured to the fastenings at the upper ends of the strips, all substantially as shown.

382,629. FENCE.

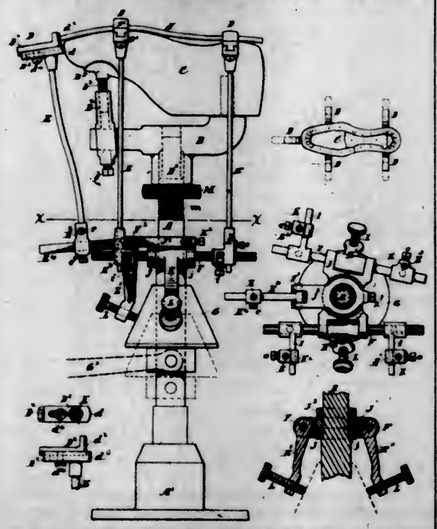
CHARLES E. WILSON, Dunn, Ind. Filed Feb. 20, 1888. Serial No. 265,092. (No model.)



Claim.—1. The herein-described worm or zigzag fence, consisting of the horizontal rails forming the intersecting panels, upright posts placed in each inner angle at the ends and on opposite sides of the panel, and binding-wires securing the rails and panels together and firmly clamping the upright posts against the rails and into the angles, as set forth.

2. In a worm or zigzag fence, the combination of the rails forming the intersecting panels, an upright post or brace located in each inner angle formed by the intersecting panels, binding-wires to clamp the rails together and secure the posts or braces in the angles, and a locking-lever rail in each panel adapted to twist the wire at one end of the panel and thus firmly lock the panels and upright posts together, substantially as described.

3. In a worm or zigzag fence, the combination of the horizontal rails forming the intersecting panels, an upright post or brace located in each obtuse angle formed by the intersecting panels, a binding-wire securing the panels and upright post together at such angle, said binding-wire being secured at one end to the lower portion of the post, from thence passing upwardly in the angle on the opposite side of the fence, and from thence passed back around the post, and being secured to one of the rails near the top, and a locking-lever rail in each panel adapted to twist the wire at one end of the panel and thus firmly bind the post and panels together, substantially as described.



382,630. VEHICLE-SPRING. WILLIAM H. WEBSTER and HIRAM DUFFEY, Cortland, N. Y. Filed Jan. 14, 1888. Serial No. 260,770. (No model.)

Claim.—1. The combination, with the axle and seat, of the interposed C-springs loosely connected to shackles adjustable in clips secured upon the axle, whereby the springs may be adjusted to accommodate heavy and light weights, substantially as and for the purpose specified.

2. The combination, with the springs and axle, of the shanked shackles having shoulders with projecting lugs, the slotted plates or loops having recesses for the reception of the lugs, and the screw bolts and nuts whereby the shackles may be adjusted, and with them the springs, substantially as and for the purpose specified.

382,631. SOLE-FITTING MACHINE FOR BOOTS OR SHOES. WILLIAM AVERY, Spencer, Mass., assignor of one-half to Jonas B. Prouty, same place. Filed Mar. 5, 1888. Serial No. 266,134. (No model.)

Claim.—1. The machine herein described for fitting on outsoles to boots or shoes, comprising a main standard having a vertically-adjustable shoe-supporting head or jack, in combination with a series of backwardly and forwardly movable gages that guide the edges of the outsole, a series of levers or bars respectively carrying said gages fulcrumed in bearings on said standard, and an actuating wedge or expander whereby movement is imparted to said levers for advancing said gages to embrace the soles, for the purpose set forth.

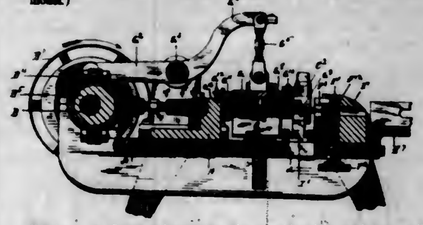
2. The combination of the jack or support for holding a boot or shoe, and a series of movable gages having surfaces *d* to bear against the upper and surfaces d^3 for gaging the projection of the outsole, and operating-supporters for carrying said gages toward and from the axis of said jack, substantially as and for the purpose set forth.

3. The combination, with the standard A and the shoe-supporting jack B, mounted thereon, of the series of movable sole-gages D, gage-supporting bars or levers E, with fulcrum-pivots F F' and actuating-arm E', and the expander or wedge G, movable on said standard, for operating said levers to advance the gages to their work.

4. The combination, with the gages for indicating the position of the outsole, of the shoe support or jack having its toe-pad B^3 fitted with a screw-thread, to be outwardly and inwardly adjustable on the toe-piece B^2 by rotation of said pad, substantially as set forth.

5. The standard A, having the screw-threads *m*, the shoe-supporting head or jack B, movably socketed upon said standard, and the adjusting-nut M, fitted to said screw-thread, in combination with the sole-gages and gage-supporting fingers, for the purpose set forth.

6. In a machine for fitting on outsoles, the gage D, composed of two parts, as D' and D^2, said part D^2 being adjustable upon the part D', and a screw or binder for retaining the same at positions of adjustment, for the purpose set forth.



7. The lateral swinging fulcrum-bearings J, free to assume different positions, in combination with the standard A, carrying the shoe-supporting jack and the side gages and gage-operating levers, substantially as and for the purpose set forth.

8. The combination, with the sole-gage D, its fulcrum-axle F, supporting-finger E, and actuating-arm E', of the arm I, connecting-slide E^2, and binders or set-screws *e* and *i* for clamping the parts at positions of adjustment, substantially as set forth.

9. The toe-gage having its supporting-finger provided with an adjustable joint-head, E^5, and the actuating-arm fulcrumed at F on the fixed bearing J', and provided with an outward extension, E^4, whereon said joint-head is adjustably secured, in combination with the jack-carrying standard A and operating-wedge.

10. The actuating-arms E', provided with adjusting thumb-screws L, in combination with the fulcrum-axles F, gage-bearings D, carrying-fingers E, and expander G, substantially as and for the purpose set forth.

382,632. WIRE-NAIL MACHINE. WILLIAM F. RANDOLPH and HARLEY A. STORY, Worcester, Mass.; said Story assignor of one-half his right to said Randolph. Filed Feb. 19, 1887. Serial No. 228,264. (No model.)

Claim.—1. In a nail-machine, the combination, with an anvil-block to receive the force of the blow in heading the nail and a vertically-adjustable plate carrying the wire-gripping dies, of a tube held in said vertically-adjustable plate with one end of said tube in contact with said wire-gripping dies and the opposite end of said tube in contact with the anvil-block, whereby said tube is vertically adjustable simultaneously with said gripping-dies, substantially as set forth.

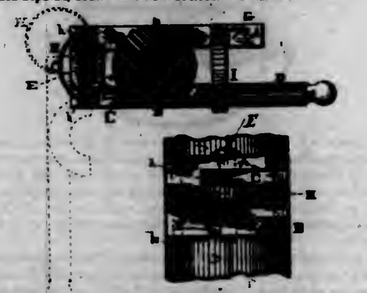
2. In a nail-machine, the combination of an anvil to receive the force of the blow in heading the nail, a die-holding block vertically adjustable in ways on said anvil, a fixed die held in said die-holding block, a lever pivoted in said die-holding block and carrying a movable wire-gripping die, and an actuating-cam by which said lever is vibrated and the wire-gripping dies closed, substantially as described.

3. In a nail-machine, the combination, with a fixed and movable gripping-die and a pivoted lever actuating said movable die, substantially as described, of a cam acting on said pivoted lever, the face of said cam being so formed as to effect the three successive movements of said pivoted lever, as described, whereby, first, the gripping-dies are opened and the wire released; second, the gripping-dies are partially closed and the wire held with a moderate pressure, and, third, the gripping-dies are completely closed and the wire firmly seized, substantially as described.

4. The combination of the vertically-adjustable block F', pivoted lever F^4, gripping-dies F^5 F^6, adjusting-screws F^9, and actuating-cam D', as and for the purpose set forth.

5. The combination of blocks I', sliding on horizontal ways, intermediate die-carrying blocks, I^2, gibs I^3, binding-screws I^4, and adjusting-screws I^5, substantially as described.

6. The combination of the vertically-sliding block G, horizontally-sliding block G^3, provided with a groove to receive the header, header G^9, held in said groove, and eyebolt G^{10}, as and for the purpose set forth.



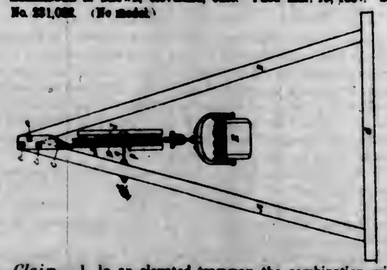
7. In the heading mechanism of a nail-machine, the combination of the vertically-sliding block G, a horizontally-sliding plate carrying a nail-header, a screw-threaded rod held in the vertically-sliding block and provided with an adjusting-nut, whereby the rearward motion of the header is limited, and a retractile spring by which said horizontally-sliding block is held against said adjusting-nut, substantially as described.

8. In the heading mechanism of a nail-machine, the combination of the vertically-sliding block G, horizontally-sliding block G^3, carrying a nail-header, and cushioning-springs G^2 to check the downward movement of said vertically-sliding block, substantially as described.

9. In the heading mechanism of a nail-machine, the combination of a vertically-sliding block, G, a horizontally-sliding block, G^3, a binding-bolt, G^{10}, carried by said sliding block G^3, and a nail-header, G^9, held by said binding-bolt, substantially as described.

10. The combination, with a vertically-sliding block and a horizontally-sliding block sliding in said vertically-sliding block and carrying the header, of a screw-threaded rod held in said vertically-sliding block and passing through a lug on said horizontally-sliding block, an adjusting-nut on said screw-threaded rod, and a spring applied to said horizontally-sliding block to hold it against said adjusting-nut, substantially as described, whereby the position of the header is adjusted relatively to the end of the wire.

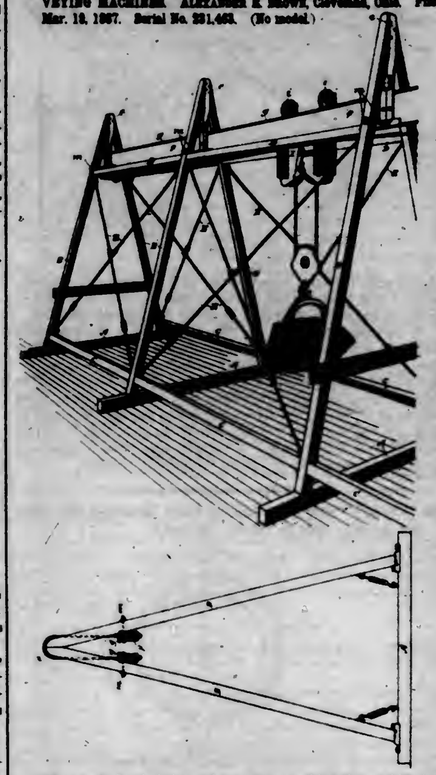
382,633. METAL MOLD. CHARLES S. BELL, Hillsborough, Ohio. Filed Sept. 24, 1887. Serial No. 250,602. (No model.)



Claim.—1. The herein-described mold composed of opposite halves hinged together by a loose hinge, and held together normally independently of the hinge by springs, to permit the halves to separate as the casting expands, substantially as specified.

2. The combination, in a metal mold, of the opposite equal halves loosely hinged together and provided with handles D G, with the closing-springs H I, whereby the parts are held together normally, but allowed to separate during the expansion of the casting, substantially as specified.

3. The combination, in a mold, of the halves B *b*, provided, respectively, with hinged lugs C and F, and handles D G, the lug C having its hinge-bolt opening enlarged, as described, with the hinge-bolt E, the fixed closing-spring H, connecting the lugs C and F, and the hook-spring I, for connecting the handles D and G, all constructed and arranged substantially as specified.

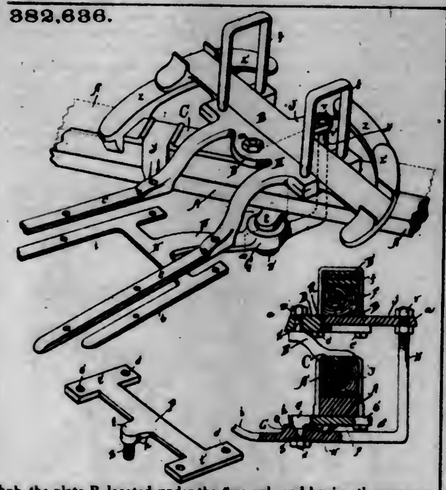


382,634. TRAMWAY FOR CARRYING ELEVATED LOADS. ALEXANDER E. BROWN, Cleveland, Ohio. Filed Mar. 15, 1887. Serial No. 231,082. (No model.)

Claim.—1. In an elevated tramway, the combination, with a series of A-frames, of a single track beam or stringer and a series of depending metallic suspender-like devices, which are secured at their upper ends to the apices of the said A-frames and at their lower ends carry the single track-beam, all in the manner specified, for the purpose set forth.

2. In combination with a series of A-frames and a track beam or stringer located in the space between the converging sticks of said frames, a metallic suspender device, C, composed of plate metal and having a loop-like upper portion which is saddled on the apex of the A-frame, and having its lowermost portion twisted or bent so as to both vertically and laterally support the track-beam, all substantially as hereinbefore set forth.

382,635. ELEVATED TRAMWAY FOR HOISTING AND CONVEYING MACHINES. ALEXANDER E. BROWN, Cleveland, Ohio. Filed Mar. 19, 1887. Serial No. 231,463. (No model.)

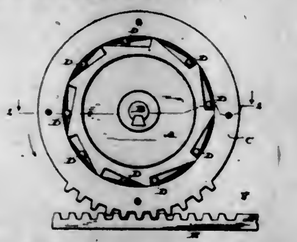


Claim.—1. In a hoisting and conveying machine, the combination, with a series of A-frames, of, first, a suitable track or railway located or arranged intermediately of the legs of said A-frames, and, second, a series of vertically-depending metallic straps or suspender-like devices, which are secured at their upper ends to the apices of the said A-frames, and which are attached at their lower ends to the track or railway, so as to securely support the latter, the whole constructed and operating in substantially the manner hereinbefore set forth.

2. In combination with the series of A-frames suitably braced and connected together, a tramway composed of two track stringers or beams, and a series of suspender-like devices which depend from the apices of the said frames and sustain the duplex track or tramway intermediately of the legs of said frames, all in the manner and for the purpose hereinbefore described.

382,636. RUNNING-GEAR FOR VEHICLES. STEPHEN BURNALL, Fremont, Ohio, assignor to John V. Beery and David Davis, same place. Filed Jan. 21, 1888. Serial No. 261,402. (No model.)

Claim.—1. In combination with the fore axle, the fifth-wheel plate B, the detachable perch-head H, having one or more rearwardly-extending perch-prongs, and rear extension, D, with hole *e*, the fifth-wheel plate C, having the rearwardly-extending arm E, said arm being pivoted to the extension D of the perch-head, the perch-head H', having one or more rearwardly-extending perch-prongs and forward extension, W, the hub G, formed therein and having a hole through said

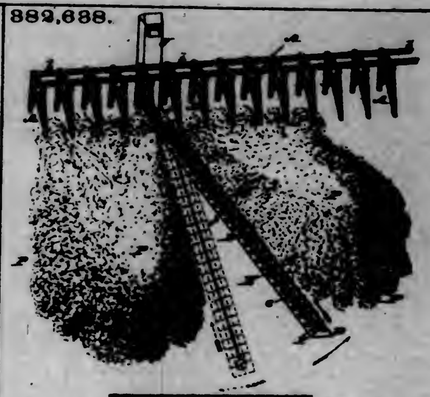


382,636.

hub, the plate P, located under the fore axle and having the rear extension, *t*, with depending bolt S, said bolt being pivotally connected to the hub G and having the nut *n*, as and for the purposes specified.

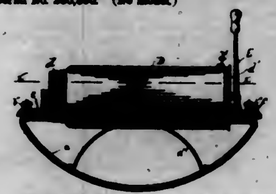
2. In combination with the fifth-wheel plate B, the detachable perch-head H, having the rearwardly-extending ledge D, and the fifth-wheel plate C, having the rearwardly-extending arm E, said arm having a pivotal connection with the ledge D of the perch-head, and the plate P, having the rear extension, *t*, with depending prong S, the perch-head H', having the forward extension pivotally connected to the prong *t* of the plate P in the rear of the axle, and its vertical prong N, pivoted to the nose J of the fifth-wheel plate B in advance of said axle, substantially as and for the purposes specified.

382,637. RATCHET. JOHN L. CURTIS, Milwaukee, Wis. Filed Oct. 24, 1887. Serial No. 253,175. (No model.)



Claim.—1. The combination of a ratchet-wheel fast on a shaft and having planes in the form of two intersecting inclines at right angles to each other at any point on the line of their intersection, a chambered disk or collar surrounding the ratchet-wheel, a series of balls interposed between this disk or collar and the planes of said ratchet-wheel, and means, substantially as described, for imparting a reciprocative movement to said disk or collar.

2. The combination of a ratchet-wheel fast on a shaft and having its planes in the form of two intersecting inclines at right angles to each other at any point on the line of their intersection, a chambered disk or collar surrounding the ratchet-wheel, a series of balls interposed between this disk or collar and the planes of said ratchet-wheel, a face-plate for retaining the balls in position, and means, substantially as described, for imparting a reciprocative movement to said disk or collar.

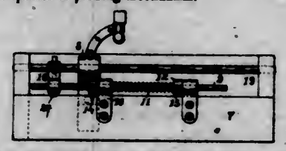


382,638. CHAIN CONVEYER FOR HANDLING COAL. JAMES M. DODDS, Philadelphia, Pa. Filed Oct. 18, 1887. Serial No. 252,494. (No model.)

Claim.—A conveyer composed of suitable flights and an endless carrier therefor mounted on suitable wheels, and a duplex conveyer-trough having two opposite open sides adapted to permit the feeding of the particles of material from a pile or piles into either of its compartments, substantially as and for the purpose hereinbefore set forth.

382,638.

382,639. CHURN. HERSHIAH DOTY, San José, Cal. Filed Jan. 16, 1883. Serial No. 260,892. (No model.)

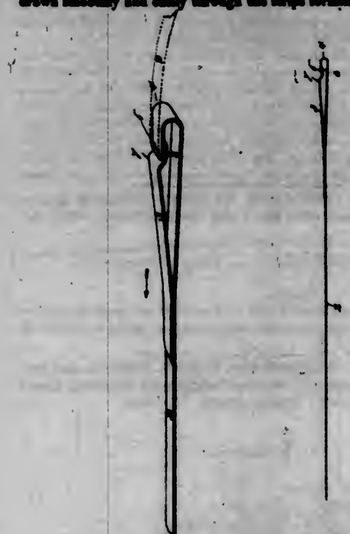


Claim.—1. In a churn, the combination of the rockers having the curved supporting bars or plates, the supporting-frame secured thereon, having a central opening provided with beveled side walls, the cream-receptacle, and the adjustable plates having slotted horizontal portions, through which thumb-screws project, the vertical portions of said plates fitting against the end of said receptacle, substantially as shown and described.

2. The combination, with the rockers, of the supporting-frame secured thereon, having a central opening and beveled side walls, the adjustable plates having screws working in holes or apertures of said frame, the receptacle, and the operating-handle secured to one of said adjustable plates, substantially as shown and described.

382,640. PICKER-CHECK FOR LOOMS. WILLIAM DENVER, Manville, R. I. Filed Aug. 20, 1887. Serial No. 248,128. (No model.)

Brief.—The check-rod is supported in hangers on the shuttle-box, against one of which hangers rests a spring which encircles the rod and bears against a stop on the rod which is adjustable thereon, thereby permitting the regulation of the tension of the spring. The stop on the rod is adjustable thereon, and is made in various forms to adapt it to the different species of picking mechanism.



Claim.—1. The combination, with the shuttle-box, of a reciprocating check-rod provided with a check for receiving the blow of the picker, secured to the check-rod by a clamp to adjust the same and mounted in bearings, a spring mounted on the check-rod and abutting with one end against one of the said bearings, and a stop adjustable by means of a set-screw for engaging the other end of the spring and for regulating the tension of the spring by means of its adjustment, substantially as and for the purpose herein described.

2. The combination, with the shuttle-box 7, of the spring-actuated reciprocating check-rod mounted in bearings 10, and the check 16, adjustably mounted on the check-rod by means of the set-screw 24, and comprising the members 20 and 21, substantially as and for the purpose herein described.

3. The combination, with the shuttle-box 7 and the picker 8, provided with the guiding-spindle 19, of the spring-actuated reciprocating check-rod 9, mounted in bearings 10, and the check 16, adjustably mounted on the check-rod by means of the set-screw 24, and comprising the members 20 and 21, having the perforation 23 to receive the spindle 19, substantially as and for the purpose herein described.

382,641. WEAVING-NEEDLE. FREDERIC G. RAILEY and HENRY BAILEY, Springfield, Mass.; said Bailey assignor to said Railey. Filed Sept. 6, 1887. Serial No. 248,797. (No model.)

Brief.—The needle is used in plaiting or making mats of paper strips and the like, and is intended to hold a strip and permit it to be drawn smoothly and easily through the strips forming the warp.

Claim.—1. A weaving-needle consisting of a body having a head in the form of a hook, and a spring-latch rigidly secured by one end to one side of said body, having its free end extending under and bearing against the end of said hook, and a shoulder, 7, thereon higher than the adjoining end 5 thereof, substantially as set forth.

2. A weaving-needle consisting of a body having a head in the form of a hook, and a spring-latch rigidly secured by one end to one side of said body, having its free end extending under and bearing against the end of said hook, substantially as set forth.

382,642. HYDRANT. CHARLES G. HUTZ, St. Louis, Mo. Filed Aug. 3, 1887. Serial No. 246,493. (No model.)

Claim.—In a hydrant, a nozzle-section having the valve-seat and all of the valve-working parts of the hydrant located within the nozzle-section, in combination with a main water-pipe and a lower outer casing made in sections, which lower outer casing strengthens and forms an enlarged bearing for the hydrant, and extends from the nozzle-section to and slightly below the ground-line, substantially as described.

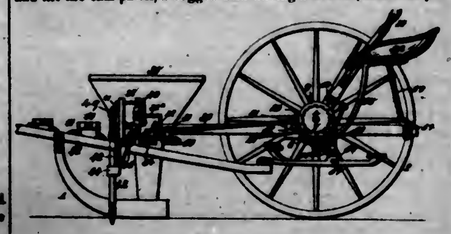
382,643. SAFETY-VALVE. WILLIAM R. FOX, Grand Rapids, Mich. Filed Sept. 30, 1887. Serial No. 251,253. (No model.)

Claim.—1. In combination, the chamber A, a main valve having a hollow stem, a piston, B', carried thereby within the closed chamber, a spring for closing said valve, an independent valve and spring within the hollow stem, said spring being of less tension than the spring of the main valve, and openings between said stem and the space below the piston B', whereby, when the supplemental valve is lifted, steam is admitted below the piston to operate the same, substantially as described.

2. In combination, the case A, the main valve B', having a hollow stem, a piston, B', carried thereby and inclosed within the case A, a spring for operating the valve B' against steam-pressure, a diaphragm, D, a chamber, F, between it and the piston B', openings from the hollow stem to the chamber F, a valve for controlling the entrance of steam to said chamber, and a chamber, E, with openings for the blowing off of steam, substantially as described.

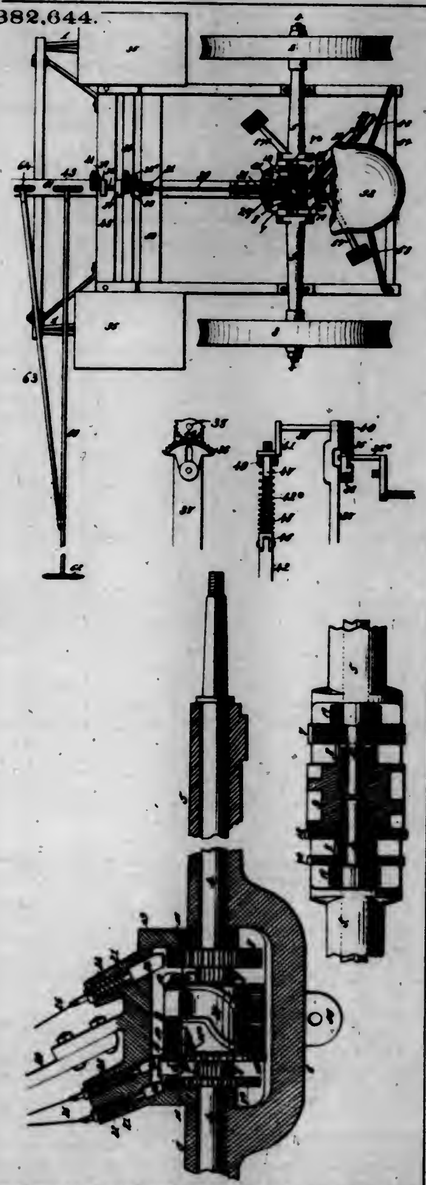
3. In a safety-valve, the main valve having a hollow stem, and a supplemental valve within the hollow stem, said valves being kept to their seats against the pressure of the steam by independent springs varying in tension, the steam-pressure operating to open both valves, but one in advance of the other, by reason of the variation in the tension of the springs, substantially as described.

4. A safety-valve consisting of a main valve and a supplemental valve, both valves being kept to their seats wholly by regulated pressure against the pressure of the steam, the steam-pressure operating to open both valves.



5. In a safety-valve, the main valve having a hollow stem, a supplemental valve within the stem, and pressure-springs or their equivalents for the valves, whereby they are held to their seats, and devices for regulating the said pressure against the steam-pressure, the said steam-pressure operating to open both valves.

382,644. WHEEL-PLANTER. WILLIAM H. GROVE, Circleville, Ohio, assignor of one-half to Clifton B. Drudrach, same place. Filed Dec. 15, 1887. Serial No. 257,905. (No model.)



Claim.—1. In a wheeled planter, the combination, with a divided axle from which the seed-dropping devices are actuated, and ground-wheels and pinions secured to said axle, of a lever loosely mounted on the divided axle and provided with pawls to engage said pinions, whereby the axle and ground-wheels can be revolved forward or back to move the machine into position to bring the seed-boxes in line with rows already planted, substantially as described.

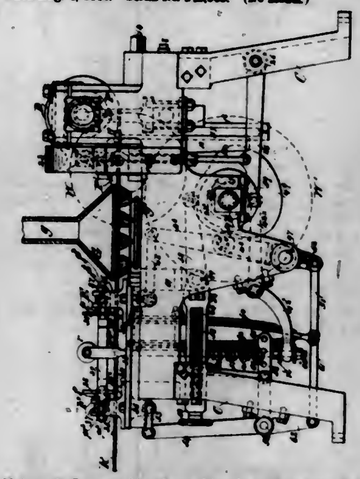
2. In a wheeled planter, the combination, with a divided axle and ground-wheels and ratchet-gears secured to said axle, of a cam loosely mounted on the axle to actuate a marker and seed-dropping devices, and pawls pivoted on each side of the cam to engage said ratchet-gears, substantially as described.

3. In a wheeled planter, the combination, with a divided axle, ratchet-gears secured to the axle, and a cam mounted loosely on the axle and provided with pawls to engage the ratchet-gears, of a pin supported transversely in the cam and having eccentrics to engage and lift the cam-pawls, a cogged disk having a slot to permit the pas-

382,644.

5. In a wheeled planter, the combination of a divided axle, ground-wheels and ratchet-gears secured to said axle, pawls pivoted to the sides of the cam to engage said ratchet-gears, a seed-dropping mechanism actuated by a slide-bar, a rock-shaft engaged with said cam and slide-bar, a vertically-movable marker, and means for actuating the marker from the rock-shaft, substantially as described.

6. In a wheeled planter, the combination, with a vertically-movable marker, a cam on the planter-axle, and a rock-shaft actuated by said cam, of a segment-gearing and crank-connection located between said marker-rod and rock-shaft, whereby the marker is forced into the ground, and a spring and movable collar on the marker-rod to render it yielding and prevent breakage, substantially as described.



7. In a wheeled planter, the combination of a vertically-movable hill-marker located between opposite seed-boxes, and a line-marker or indicator having a hinged connection with the draft-pole and capable of being turned to project from either side of the planter, whereby it can be made to register on one side of the planter with the impression made by the hill-marker centrally between the hills last planted, and then be turned to the other side of the planter to indicate the proper distance for the hills on the next return-row, substantially as described.

382,645. PICKER-STICK FOR LOOMS. STEPHEN M. HAMBLIN, Plymouth, Mass. Filed Mar. 6, 1886. Serial No. 194,343. (No model.)

Claim.—A picker-stick split or formed of two parts or members and having a bridge interposed between the said parts, as and for the purpose set forth.

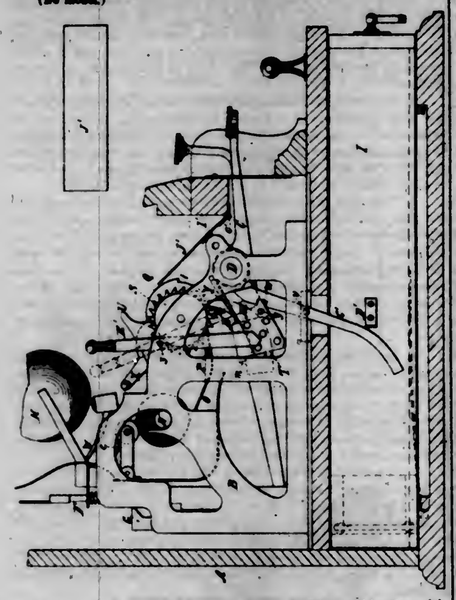
382,646. HORSESHOE-NAIL MACHINE. SIGVART HANSEN, Jobs, Christiania, assignor to Christian Christophersen, Christiania, Norway. Filed Aug. 1, 1887. Serial No. 245,905. (No model.)

Claim.—1. In a machine for making horseshoe-nails, the combination, with the forging devices, the nail-rod-feeding devices, and the cutter interposed between said devices, of a dog operating to dog the nail-rod in position for forging, said dog having a reciprocating motion timed to withdraw the nail-rod from the forging devices and carry the same to the cutter to sever the forged nail therefrom, substantially as and for the purposes specified.

2. In a machine for making horseshoe-nails, the combination, with the forging devices and the cutter, of a nail-rod-feeding device comprising a dog operating to dog the rod in position, said dog having a rectilinear motion toward and from the forging devices to feed the nail-rod thereto, and a releasing mechanism to disengage the dog from the nail-rod and allow it to return to its normal position, substantially as described.

3. In a machine for making horseshoe-nails, the combination, with the forging devices and a feeding device operating to feed the nail-rod to the forging devices, of a cutter interposed between the forging and feeding devices, and a dog operating to hold the nail-rod while a nail is being forged, said dog having a rectilinear motion toward and from the cutter and forging devices and operating to withdraw the nail-rod from the forging devices and carry the nail thereof to the cutter, substantially as and for the purpose specified.

sage of one end of said pin, and a pawl and lever to engage the cogged-disk and actuate the pin so as to throw the cam out of gear, substantially as described.



4. In a wheeled planter, the combination, with a divided axle, ground-wheels, pinions, and ratchet-gears secured to said axle, a cam loosely mounted on the axle to actuate a seed-dropping mechanism, and pawls pivoted to both sides of the cam to engage the ratchet-gears, of a pin passed transversely through said cam and having eccentrics to engage the pawls, a cogged-disk mounted loosely on the hub of the cam and engaged with one end of the eccentric-pin, and a pawl and lever to engage and actuate said disk for throwing the cam out of gear and setting it forward or back to start the seed-dropping devices at the right moment to drop the seed in line with former rows, substantially as described.

4. In a machine for making horseshoe-nails, the combination, with the forging devices and the nail-rod-feeding devices, and a cutter interposed between said devices, of a dog operating to hold the nail-rod in position while a nail is being forged, said dog having a rectilinear motion toward and from the cutter, and forging devices timed relatively to said devices to carry the nail end of the rod from the forging devices to the cutter, and a releasing mechanism operating to release the dog from the nail-rod when the nail is severed therefrom and permit the feeding devices to feed said rod to the forging devices, substantially as and for the purpose specified.

5. In a machine for making horseshoe-nails, a hammer comprising a stock and a hammer adjustable thereon, substantially as and for the purpose specified.

6. In a machine for making horseshoe-nails, forging devices for forging a nail, comprising a vertically-adjustable anvil, a forging-roller revoluble above the anvil, and two hammers on opposite sides of said anvil, said hammers being adjustable toward and from each anvil, substantially as and for the purpose specified.

382,647. CASH INDICATOR AND RECORDER. JOHN F. READY and JOHN H. PATTERSON, Dayton, Ohio, assignors to the National Cash Register Company, same place. Filed Nov. 16, 1887. Serial No. 256,310. (No model.)

Claim.—1. In a cash indicator and recorder, the combination, with the recording-paper and a series of keys representing odd multiples of five above the first power, of a five-cent bar provided with a puncturing-pin and arranged to be actuated by said keys, whereby upon operating any one of said keys said bar is actuated to cause its pin to puncture the recording-paper, substantially as described.

2. In a cash indicator and recorder, the combination, with the recording-paper provided with a five-cent space and a series of spaces indicating even multiples of five, and a series of keys indicating even and odd multiples of five above the first power, and each provided with a puncturing-pin, of a five-cent bar provided with a puncturing-pin and arranged to be actuated by each of the keys representing an odd multiple of five, substantially as and for the purpose described.

3. In a cash indicator and recorder, the combination, with the recording-paper provided with a five-cent space and a series of spaces indicating even multiples of five, a series of keys representing five and the even and odd multiples thereof, and a series of puncturing-pins, one on each of said keys excepting the five-cent key, of a five-cent bar provided with a puncturing-pin and arranged to be actuated by each of the keys representing an odd multiple of five, substantially as and for the purpose described.

4. In a cash indicator and recorder, the combination, with the recording-paper, a series of keys representing odd multiples of five above the first power, and a series of tablet-rods and indicating-tablets, one for each key, of a five-cent bar provided with a puncturing-pin and arranged to be actuated by said keys, substantially as and for the purpose described.

5. In a cash indicator and recorder, the combination, with the recording-paper provided with a five-cent space and a series of spaces indicating even multiples of five, a series of keys representing even and odd multiples of five above the first power, and each provided with a puncturing-pin, and a series of tablet-rods and indicating-tablets, one for each key, of a five-cent bar provided with a puncturing-pin and arranged to be actuated by the operation of any one of said keys representing an odd multiple of five, substantially as and for the purpose described.

6. In a cash indicator and recorder, the combination, with the recording-paper provided with a five-cent space and a series of spaces indicating even multiples of five, a series of keys representing five and the even and odd multiples thereof, a series of puncturing-pins, one for each key, excepting the five-cent key, and a series of tablet-rods and indicating-tablets, one for each key, of a five-cent bar provided with a puncturing-pin and arranged to be actuated by each of the keys representing odd multiples of five, substantially as and for the purpose described.

7. In a cash indicator and recorder, the combination, with a series of keys provided with puncturing-pins, of a bar extending across said keys and arranged to be vibrated by the operation of any one of them, and an auxiliary puncturing-pin actuated by said vibrating bar to puncture the recording-paper whenever any key is operated, substantially as and for the purpose described.

8. In a cash indicator and recorder, the combination, with a series of keys provided with puncturing-pins, of a vibrating frame extending across said keys and arranged to be vibrated by the operation of any one of them, substantially as described, and an auxiliary puncturing-pin actuated by said vibrating frame to puncture the recording-paper whenever any key is operated, as and for the purpose specified.

9. In a cash indicator and recorder, the combination, with a series of keys pivoted on a through-shaft at the front of the machine, a series of tablet-rods and indicating-tablets operated by said keys, and recording mechanism for recording the values of the keys operated, of a vibrating frame extending transversely across the top of said keys in rear of their pivotal support, substantially as and for the purpose described.

10. In a cash indicator and recorder, the combination, with a series of keys pivoted on a through-shaft at the front of the machine, a series of tablet-rods and indicating-tablets operated by said keys, recording mechanism for recording the values of the keys operated, and a gong and gong-hammer, of a vibrating frame extending transversely across the top of said keys in rear of their pivotal support, and connecting mechanism between said vibrating frame and gong-hammer, whereby whenever any one of the keys is operated the vibrating frame is lifted to cause the sounding of the gong, substantially as described.

11. In a cash indicator and recorder, the combination, with a series of keys pivoted on a through-shaft at the front of the machine, a series of tablet-rods and indicating-tablets operated by said keys, recording mechanism for recording the values of the keys operated, gong mechanism which is sounded whenever any key is operated, a spring-projected money-drawer, a locking-bolt for locking said drawer in its closed position, and a bolt-lever connected to said locking-bolt, of a vibrating frame extending transversely across the top of the keys in rear of their pivotal support, and connecting mechanism between said vibrating frame and bolt-lever, whereby when said vibrating frame is lifted by the operation of any key the bolt-lever is actuated to unlock the drawer, substantially as described.

12. In a cash indicator and recorder, the combination, with a series of keys pivoted on a through-shaft at the front of the machine, a series of tablet-rods and indicating-tablets operated by said keys, and recording-paper carried on a supply-roll and a rewinding-roll, of a vibrating frame extending transversely across the top of said keys, in rear of their pivotal support, and connecting mechanism between said vibrating frame and rewinding-roll, whereby the lifting of said vibrating frame by the operation of any key causes the partial rotation of said rewinding-roll, as and for the purpose specified.

13. In a cash indicator and recorder, the combination of a series of keys of fixed values, a series of tablet-rods and indicating-tablets operated by said keys, a supporting-wing for holding said tablets exposed to view, a gong and gong-hammer, a supply and a rewinding roll for carrying the recording-paper, a vibrating frame actuated by the operation of any one of the keys, connecting mechanism between said vibrating frame and rewinding-roll, and connecting mechanism between said rewinding-roll and said gong-hammer and supporting-wing, whereby the operation of the rewinding-roll through the medium of the vibrating frame causes the hammer to strike the gong and the wing to be thrown back to permit the passage of a tablet-rod whenever any key is operated, substantially as described.

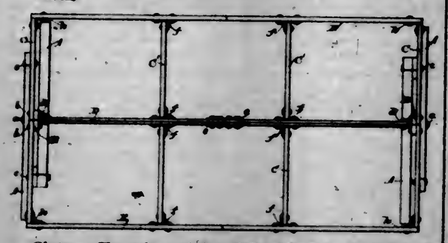
14. In a cash indicator and recorder, the combination with the rewinding-roll, its actuating-dog, and overriding holding-dog provided with a laterally-projecting pin, of a spring-pressed cam-lever pivoted by the side of said ratchet and arranged to engage with said dogs, whereby upon turning said cam-lever both dogs are thrown out of engagement with the ratchet, and whereby upon subsequently operating any key of the machine the cam-lever is thrown back to its normal position and both dogs re-engaged with the ratchet, as and for the purpose specified.

15. In a cash register and indicator, the combination, with a series of operating-keys, a vibrating frame actuated whenever any key is operated, and a money-drawer with locking mechanism which is released when any key is operated, of a pivoted weighted latch adapted to engage with said frame to lock it when the drawer is opened or partially opened, and normally held out of engagement with said frame by the drawer when the latter is closed, substantially as described.

16. In a cash indicator and recorder, the combination, with a series of operating-keys, a vibrating frame actuated whenever any key is operated, and a money-drawer with locking mechanism which is released when any key is operated, of a latch arranged to engage with said vibrating frame when the drawer is opened or partially opened, and to be thrown out of engagement when the drawer is closed, and a lever for holding said latch out of engagement when desired, whereby the latch may be allowed to engage with the vibrating frame to hold the machine locked from operation while the drawer is open, or may be held constantly out of engagement with the vibrating frame to allow the machine to be operated at all times, substantially as described.

17. The combination and arrangement of the spring *f*, wing G, gong-hammer lever V, engaging with the wing G and provided with an extension, *c*, dog U, having a rear extension engaging with the extension *c*, pin *j*, cam-lever X, provided with a cam projection, *k*, and shoulder *l*, the rewinding-roll Q, provided with the ratchet S, with which the dog U engages, the operating-dog T, vibrating frame E, and keys C, substantially as and for the purpose described.

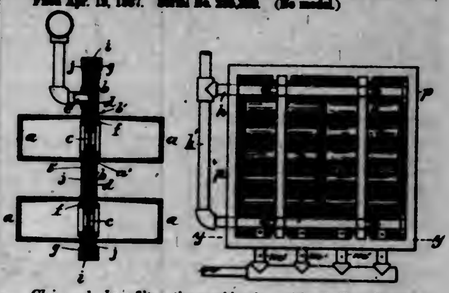
18. The combination, with the supply and rewinding rolls, the latter provided with wheel S, of the vibrating frame E, the keys operating to vibrate it, and the dog T, pivoted upon said frame, engaging the ratchet S and provided with the puncturing-pin *m*, arranged to operate on the paper passing between the rollers, substantially as described.



19. The combination, with the series of operating-keys, each provided with a puncturing-pin, the record-paper, and means for supporting the same, of the five-cent bar Y, provided with a puncturing-pin, *p*, and extensions *o* engaging the odd-numbered keys, substantially as described.

20. The combination and arrangement, with the operating-keys, of the drawer I, provided with the shoulder *D'*, the pivoted latch C', having the notch *w*, and the vibrating frame E, provided with the pin *y*, substantially as and for the purpose described.

21. The combination and arrangement, with the operating-keys, of the drawer I, provided with the shoulder *D'*, the pivoted latch C', having the notch *w*, the lever E', and the vibrating frame E, provided with the pin *y*, substantially as and for the purpose described.



22. In a cash indicator and recorder provided with a supply and a rewinding roll, the combination, with the paper carried on said rolls, of the serrated cutter-bar J', extending transversely across the machine and hinged, as at *c'*, to the bar I' of the case, and adapted when swung into vertical position to cover the end of the paper drawn across it, and adapted when turned down to shield and hide the mechanism beneath, substantially as described.

382,648. PORTABLE FOLDING HAMMOCK-STAND. EVERETT EMERY, Hudson, Mass. Filed Sept. 24, 1887. Serial No. 250,576. (No model.)

Claim.—The ends consisting of the oblique standards A A, the short standard B, all three pivoted together by bolt *a*, and the oblique arms C C, bolted to the standards A A B, in combination with the central ridge-pole, D, made in two pieces and secured together by the fish-plates *c c*, the longitudinal side bars, E E, hinged in their middles at *g*, and the arms C', secured to the pole D and bars E E, and the braces *i*, having the hammock-hooks *j*, the whole forming a rigid and yet separable and portable frame, as set forth.

382,649. FOROUS FILTER-CUP. JOHN W. ELSEY, Newark, N. J. Filed Apr. 13, 1887. Serial No. 235,202. (No model.)

Claim.—1. In a filter, the combination, with a hollow filter-plate provided with a series of apertures, as set forth, of porous battery-cups attached by cement to such plate, with their mouths over such apertures, a filter-casing to inclose the plate and cups, and an outlet-pipe from the interior of the filter-plate, as and for the purpose set forth.

2. In a filter, the combination, with a series of porous cups, of a flat plate provided with apertures to withdraw the liquid from the interior of the cups, annular flanges around the apertures to fit within the cups, and flanges upon the plate exterior to the cups, and cement applied to the plate between the inner and outer flanges to secure the mouths of the cups thereto, as and for the purpose set forth.

3. In a filter, the combination, with a series of porous cups, of a flat plate attached to the mouths of the cups by cement and provided with apertures to withdraw the liquid from the interior of the cups, and annular flanges around the apertures within the cups, the apertures being arranged in diagonal rows across the plate, and the plate being sustained in a vertical position within a filter-casing having granular abrading material mixed with the unfiltered fluid and agitated by fluid introduced below the porous cups, as and for the purpose set forth.

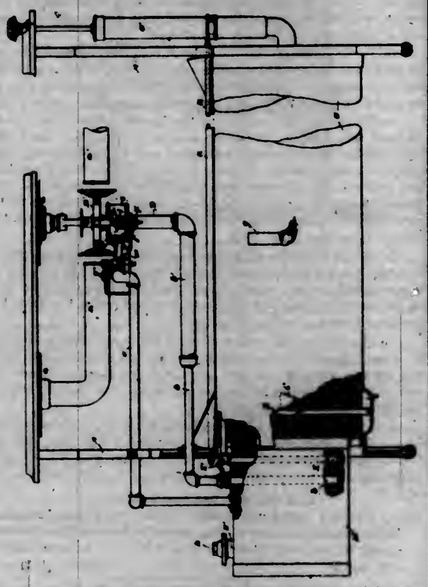
4. In a filter, the combination, with two flat plates provided with apertures, as set forth, and attached together with an intermediate space, of annular flanges about each apertures, porous cups secured to the plate over said apertures, a casing to inclose the plate and cups, an outlet-pipe from the space between the plates, and granular abrading material mixed with the unfiltered fluid within the casing, the whole arranged and operated substantially as herein set forth.

5. In a filter, the combination, with a filter-plate provided with an internal water-space and an outlet-pipe, as set forth, of apertures in the plates connected with such water-space, porous cups secured over such apertures, and a filter-casing provided with vertical ribs upon its sides to guide and retain the plate movable in a vertical position, and granular abrading material mixed with the unfiltered fluid within the casing, the whole arranged and operated substantially as set forth.

382,650. WIRE-DRAWING DIE. JOHN B. JENKINS, Pittsburg, assignor of one-half to D. S. Carroll, Allegheny City, Pa. Filed Aug. 4, 1887. Serial No. 246,093. (No model.)

Claim.—1. A drawing-die having a space or chamber in the metal around the die-hole and water or air feeding and discharge connection therewith, substantially as and for the purposes set forth.

2. A drawing-die having an annular space or chamber around the die-hole, and inlets and outlets from said chamber, substantially as described.



3. In a drawing-die, the combination of a die having a die-hole therein with a die-block having a seat for said die and an annular groove or channel in said seat, and an outlet and inlet from said channel, substantially as and for the purposes set forth.

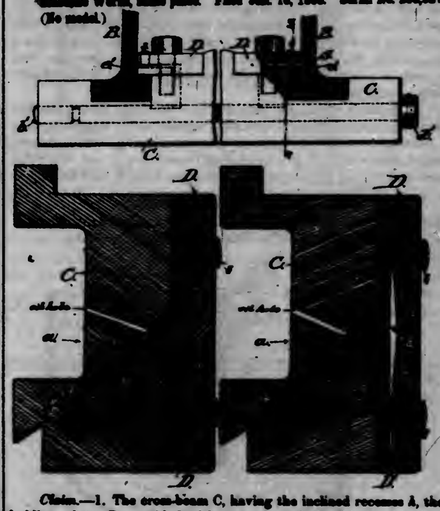
382,651. SHOE-FASTENING. CHARLES KNOTT, Winona, Minn. Filed Feb. 13, 1888. Serial No. 264,494. (No model.)

Claim.—The combination, with a shoe, of a series of levers or slotted links arranged on one side of the opening in proper relation to the button-holes on the opposite side, so as to adapt the said levers to pass through the said button-holes and interlock each other, substantially as specified.

382,652. VAPOR-BURNER. FREDERICK A. LUHAN, Cleveland, Ohio. Filed June 6, 1887. Serial No. 240,676. (No model.)

Claim.—1. The combination, with mechanism for supplying carbureted air, substantially as indicated, and an oil-supply pipe, of a lighting-pipe for discharging the carbureted air to the burner, said lighting-pipe having two outlets, a valve located in the lighting-pipe for simultaneously controlling both outlets, a movable heating-chamber having a nozzle, and arm D, substantially as set forth.

2. The combination, with an air-reservoir, a pump for supplying air to same, gasoline-container, substantially as indicated, and a pan-like receptacle located within the air-container, of an air-pipe connecting these two vessels, one end of the air-pipe being located at or near the bottom of the gasoline-container and the other end of said pipe terminating near the bottom of the receptacle, substantially as set forth.

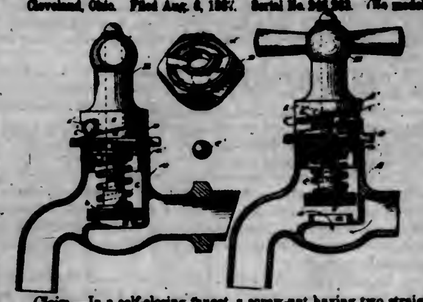


3. The combination, with a reservoir, an air-pump, and a gasoline-container, of an air-supply pipe leading from the reservoir into the container, said air-pipe having an overflow-vessel connected with the induction end of the pipe, substantially as set forth.

4. The combination, with a lighting-pipe having two discharging-nozzles, of a retort, the arm D, a rotating casing, the latter being mounted on the retort and having a receiving-nozzle and a lighting-cup, the latter having an upwardly-projecting head, substantially as set forth.

5. The combination, with a retort and a lighting-pipe adapted to discharge into the receiving-nozzle of the rotating casing, of a rotating casing mounted on the retort, the casing having a receiving-nozzle attached, and arm D, substantially as set forth.

6. The combination, with an arm, D, a lighting-pipe, a valve therein, a retort, and a rotating casing provided with a receiving-nozzle, of a lighting-cup rigidly attached to the rotating casing, the said cup being connected by a link with the valve-handle of the lighting-pipe, whereby the cup is operated by the movement of the valve, substantially as set forth.



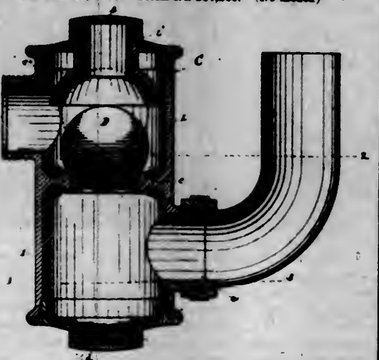
382,653. CLAMPING DEVICE FOR CROSS-BEAMS OF PLANERS. GEORGE I. MARBLE, Fitchburg, Mass., assignor to the Fitchburg Machine Works, same place. Filed Jan. 16, 1888. Serial No. 260,987. (No model.)

Claim.—1. The cross-beam C, having the inclined recesses *h*, the holding-plates D, provided with recesses, and the friction binding-plates seated therein, in combination with the operating-rod *b'*, passing through said beam and provided with eccentrics *l l*, and the loosely-seated plungers *i i* in said inclined recesses actuated by said eccentrics to produce a pressure upon the adjacent ends of the binding-plates, substantially as herein described.

2. The uprights B B and cross-beam C, having recesses *f f*, in combination with frictional binding-plates *g g*, plungers *i i*, provided with eccentrics *l l*, rod *b'*, and handle *d'*, all constructed, arranged, and operated as set forth.

382,654. SELF-CLOSING FAUCET. HARRY C. MONTGOMERY, Cleveland, Ohio. Filed Aug. 4, 1887. Serial No. 246,262. (No model.)

Claim.—In a self-closing faucet, a screw-nut having two straight inclines on its face, each extending half-way round and each incline terminating abruptly in a shoulder, in combination with a key having two straight inclines, each extending half-way round and terminating abruptly in a shoulder, the inclines on said nut and key running in parallel spiral lines, anti-friction balls between the opposite shoulders of the inclines above and below, which separate the key and nut slightly from each other, and a spring to press the nut against the key, substantially as set forth.



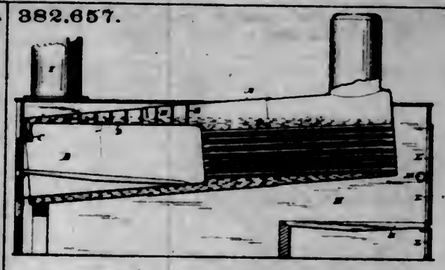
382,655. CHECK-VALVE. Harry C. Montgomery, Cleveland, Ohio. Filed Oct. 22, 1887. Serial No. 253,061. (No model.)

Claim.—1. In check-valves, a spherical rubber valve having a tube extending through its center, said tube being closed at its lower end and open at its upper, in combination with a casing having a single valve-seat, a plug set into said casing from the top and having a stem projecting inwardly therefrom and into the tube of the valve aforesaid and guiding the same, whereby, when pressure upon the valve from beneath is removed, the valve will automatically seat itself, substantially as set forth.

2. In check-valves, the combination of the casing having the diaphragm C, with a valve-seat on its upper surface, a reversible ball-valve, A, provided with a tube, B, through its center and having the flanged head *b* at its bottom, and a screw-plug, D, set in the casing above the valve and having a stem projecting into the tube B, substantially as set forth.

382,656. SEWER GAS-TRAP. Harry C. Montgomery, Cleveland, Ohio. Filed Mar. 15, 1888. Serial No. 267,209. (No model.)

Claim.—1. In a sewer-trap, a body part having the form of a section of cylindrical tubing and caps closing the ends of said body, a diaphragm extending across the interior of the said body at or near its center and having a valve-seat, a ball-valve above the diaphragm seating itself by gravity, an inlet at the side of the body below the diaphragm, and an outlet above the diaphragm having its lower edge raised about one-third the diameter of the valve above the valve-seat, whereby a water seal is formed above said valve-seat, substantially as set forth.



2. In a sewer-trap, a substantially-cylindrical body having its ends open the full width of the body and directly opposite each other, and screw-caps for closing the ends, a central diaphragm dividing the body into two separate chambers, an inlet-port below the diaphragm, and an outlet-port above the diaphragm at the sides of the body, a gravity-valve, and a guide and a stop therefor, substantially as set forth.

3. A reversible sewer-trap consisting, essentially, of a body part having a diaphragm at its center provided with opposite valve-seats, openings for the induction and eduction of water at equal distances from said diaphragm near the respective ends of the body part, and the ends of the body part closed by removable caps with a ball-valve, substantially as set forth.

4. In sewer-traps, a reversible trap having substantially the following distinguishing features: a body part with a diaphragm at its center having valve-seats on each side, fluid inlet and outlet ports on either side of the diaphragm at equal distances therefrom and about midway between the said diaphragm and the ends of the body part, whereby a water seal is maintained about the valve and a sediment-chamber is formed in the bottom of the trap, a ball-valve above the diaphragm, and a guide therefor, substantially as set forth.

382,657. STEAM-BOILER. Joseph A. Mumford, Hadspert, Nova Scotia, Canada. Filed Oct. 22, 1887. Serial No. 253,113. (No model.)

382,657.

Claim.—1. The combination, with the inclined cylindrical boiler, of the inclined partly-cylindrical fire-box located in the same, having the triangular-shaped substantially flat level top section, as set forth.

2. The combination, with the inclined cylindrical boiler provided with the water-front, as described, of the inclined cylindrical fire-box located therein, having the triangular-shaped substantially flat top section, and flues connecting the rear end of the fire-box with the rear end of the boiler, substantially as described.

3. The combination, with an inclined boiler having the fire-box in its lower end and flues connecting said fire-box with the rear raised end, of a combustion-chamber located beneath its raised end, with an air or steam supply therein and a smoke-exit, substantially as described.

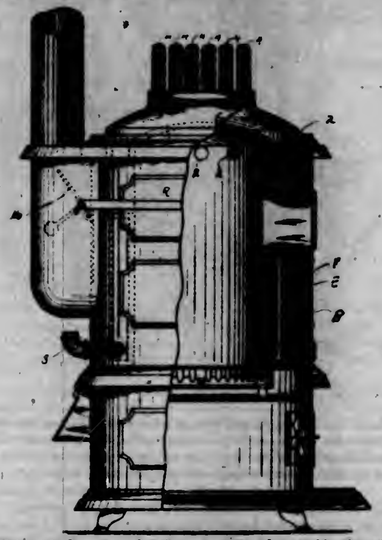
4. The combination, with an inclined boiler, a fire-box located in its lower end, and flues connecting said fire-box with the raised end, of a chamber located beneath said raised end, with air or steam supply therein, and a smoke-exit above its lower end, whereby the smoke and products of combustion pass from the fire-box through the flues beneath the forward end of the boiler, commingling with the air or steam therein, thence around over the outside of the boiler, and out over its lower end, as set forth.

5. The combination, with an inclined boiler, a fire-box located in its lower end, and flues connecting said fire-box with the raised end, of a secondary fire-box located beneath said raised end through which the products from the first-named fire-box pass before reaching the smoke-exit, substantially as described.

6. The combination, with an inclined boiler, a fire-box located in its lower end, and flues connecting said fire-box with the raised end, of a grate located beneath said raised end, and doors at the rear of said boiler for supplying fuel to said last-named grate and for removing the ashes, substantially as described.

7. The combination, with an inclined cylindrical boiler having the fire-box in its lower end, and flues connecting said fire-box with the raised end, of a grate and combustion-chamber located beneath said raised end, and a smoke-exit above its lower end, substantially as described.

382,658. METALLIC WHEEL. Fred. A. Hoerneon, Springfield, Mass., assignor, by mesne assignments, to the Warwick Cycle Manufacturing Company, same place. Filed Aug. 29, 1887. Serial No. 248,130. (No model.)



Claim.—1. A tubular metallic wheel-rim made from a strip of metal, having the solid thickened rib 4, to which the ends of the spokes are connected, that portion of said strip on one side of said rib forming one side of the tire-groove of the rim, and having the hook-shaped edge *e*, the portion of said strip on the opposite side of said rib forming the side *c* of the rim and having its edge offset to form with said hook-shaped edge a lap-joint on one edge of the rim, substantially as set forth.

2. In combination with a hollow metallic wheel-rim having a rib, 4, and with a wheel-spoke, 5, having a screw-threaded end, a hollow nut, 6, screwing into said rib, and a headed bushing, 7, passing through said nut and engaging therewith and screwing onto said spoke, substantially as set forth.

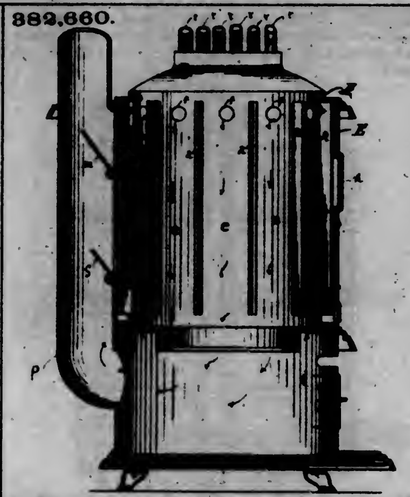
3. In combination with a hollow metallic wheel-rim having a rib, 4, and with a wheel-spoke, 5, having a screw-threaded end, a hollow longitudinally-slotted nut, 6, screwing into said rib, and a bushing, 7, having a head whose under side is tapered passing through said nut and engaging with the slotted end of said nut and screwing onto said spoke, substantially as set forth.

382,659. HOT-WATER BOILER. Oscar W. Noble, Lynn, Mass., assignor to the Noble Stove Company, Manchester, N. H. Filed Sept. 1, 1887. Serial No. 248,492. (No model.)

Claim.—1. In a water-heating apparatus, the combination of a fire-pot with a water-jacket extending down to the grate and over the top of the fire-pot, as shown, and provided with a fuel-receiving opening, as shown, and the casing surrounding said jacket and having an opening therein coinciding with the fuel-opening, and a valved exit-opening opposite the fuel-opening and connecting the combustion-chamber directly with the smoke-flue, substantially as described.

2. In a water-heating apparatus, the combination of a fire-pot with a water-jacket extending down to the grate and over the top of the fire-pot, as shown, and provided with a fuel-receiving opening, as shown, and the casing surrounding said jacket and having an opening therein coinciding with the fuel-opening, and a valved exit-opening opposite the fuel-opening and connecting the combustion-chamber directly with the smoke-flue, a door for covering the fuel-opening, a latch for operating the same, a damper for covering the direct-exit passage, and mechanism between the damper of the exit and the door-latch, whereby a normal movement of the door-latch for releasing the door will operate to displace the damper and open the exit prior to the opening of the door, substantially as described.

382,660. HOT-WATER BOILER. Oscar W. Noble, Lynn, Mass., assignor to the Noble Stove Company, Manchester, N. H. Filed Sept. 1, 1887. Serial No. 248,491. (No model.)



Claim.—1. A hot-water heating apparatus having a fire-pot and hot-water jacket surrounding the same, and a series of independent channels extending through the water-jacket and down the outside thereof for conducting heat and products of combustion out of the fire-pot and down the outer surface of the water-jacket to the ash-chamber and smoke-pipe, substantially as described.

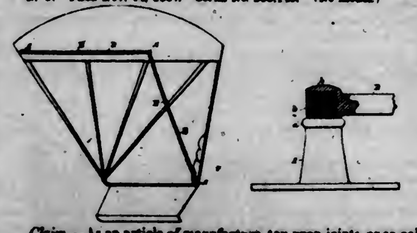
2. In a hot-water heating apparatus, the combination of a fire-pot, A, a water-jacket, B, having apertures *f*, the outside casing, E, and the plates *e*, arranged to form channels *c*, communicating at one end with the aperture *f* and at the opposite end with the ash-chamber and smoke-pipe, substantially as described.

3. In a hot-water heating apparatus, the combination of the fire-pot, the water-jacket surrounding the same, the apertures *f* therein, the plates *e*, the channels *c* between the plates, the outer casing, E, the draft-openings *s* in the plate M, and movable dampers N for covering the same, substantially as described.

4. In a hot-water heating apparatus, the combination of a fire-pot, the water-jacket surrounding the same, having apertures *f*, the outer casing, E, and the plates *e*, arranged to form the channels *c*, said casing E being provided with apertures above the channels *c* for the introduction of a cleaning-rod and corresponding apertures in the plate M at the bottom of said channels for the exit of soot, substantially as described.

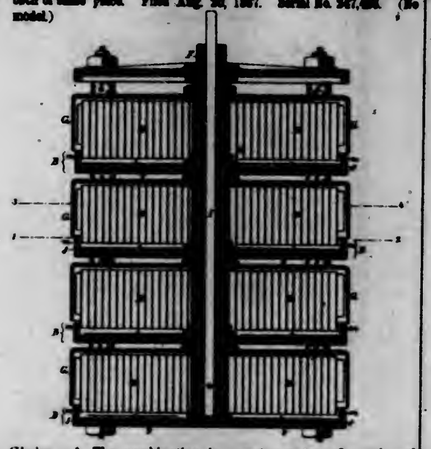
382,660.

382,661. PROCESS OF ORNAMENTING METALLIC SURFACES. Dexter W. Parker and Lewis F. Griswold, Meriden, Conn., assignors to the Charles Parker Company, same place. Filed July 19, 1886. Serial No. 208,206. (No model.)



Claim.—1. The process of ornamenting metallic surfaces, which consists of the following steps: first, applying plastic metallized ornaments to the surface; next, coating that part of the surface not covered by such ornaments with a resistant to electroplate, omitting or removing said resistant around the border of the ornament, and, finally, electroplating so as to attach the ornament to the part of the surface thus made or left bare, substantially as set forth.

2. The process of ornamenting surfaces, which consists in applying to a surface a plastic body having the form of the ornament desired, and plating by deposit said plastic body and certain parts of said surface, the plate connecting said surface and the ornament, substantially as set forth.



3. An article having a metallic surface and provided with an electroplated plastic ornament, which is attached to said surface by the plating, substantially as set forth.

382,662. TOP-PROP JOINT FOR VEHICLES. John G. Parsons, Columbus, Ohio, assignor of one-half to Edward Storm, Poughkeepsie, N. Y. Filed Nov. 14, 1887. Serial No. 255,149. (No model.)

Claim.—As an article of manufacture, top-prop joints, or so-called "top-braces," for vehicles, the same having screw-threaded eyes for screwing onto the top-props, substantially as set forth.

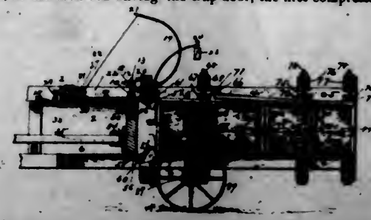
382,663. SPRING-MOTOR. JOHN R. POWELL, Philadelphia, Pa., assignor of one-fourth to Daniel P. Dieterich and Richard M. Popham, both of same place. Filed Aug. 20, 1887. Serial No. 247,493. (No model.)

Claim.—1. The combination, in a spring-motor, of a series of springs, located one above another, with a supporting-frame having rollers upon which the springs are directly supported, all substantially as specified.

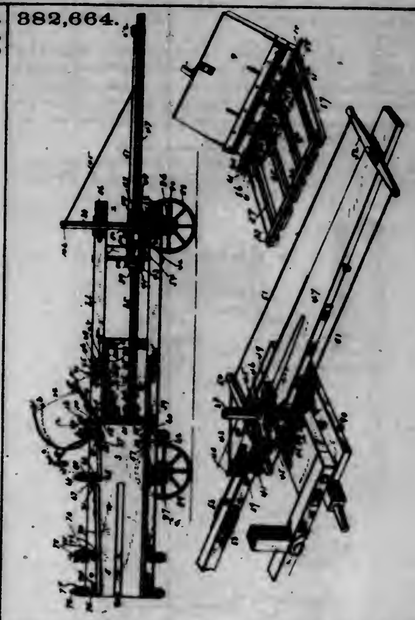
2. The combination of a series of springs located one above another, an arbor composed of a series of sections connected together through the medium of the springs, and a supporting-frame having rollers upon which the springs are directly supported, all substantially as specified.

3. The combination of a series of springs located one above another, an arbor composed of a series of sections connected together through the medium of the springs, and a supporting-frame having conical rollers upon which the springs are directly supported, all substantially as specified.

4. The combination of a series of springs located one above another, a frame having a series of spiders, each carrying anti-friction rollers directly supporting the spring above it, and an arbor made in sections connected together through the medium of the springs, and each having a flange or collar bearing upon the hub of the spider, all substantially as specified.



5. The combination, in a spring-motor, of a series of springs located one above another, a fixed frame having annular bearing-rims, a sectional arbor, and cages connected to the arbor-sections and to the outer ends of the springs, and having adjacent to said spring-connections anti-friction rollers having a lateral bearing upon the annular rims of the fixed frame, all substantially as specified.



6. The combination, in a spring-motor, of a series of springs located one above another, a series of supporting-frames, each having trough-shaped arms, and rollers mounted in said trough-shaped arms and directly supporting the springs, all substantially as set forth.

382,664. HAY-PRESS. REGAN PRENDEL, Oakland, Cal.; Helena G. Prendel executrix of said Regan Prendel, deceased. Filed Nov. 21, 1887. Serial No. 255,763. (No model.)

Claim.—1. In a portable press, the combination, with a reciprocating plunger, of the feed-box having the trap-door, the first compression-chamber having the hinged top, the set-screws for adjusting the said top plate, and the tying-chamber and last converging box having the slotted bottom and the slotted hinged top plate, and the adjusting-screws for the said top plate, and the followers having the side slots, substantially as set forth.

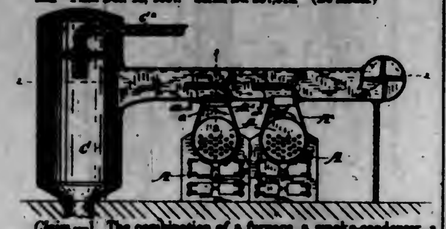
2. In a portable press, the combination, with the reciprocating plunger, of the feed-box having the trap-door, the first compression-

chamber having the hinged slotted adjustable top plate, the tying-chamber and last converging box having the slotted bottom and the slotted hinged adjustable top plate, and the followers having the side slots and the top projections or horns, substantially as set forth.

3. The combination, with the reciprocating plunger having the wedge-blocks adjustably secured upon its rear upper portion, as described, of the hinged feed-box trap-door, the hinge-lever having the adjustable weight on its rear end portion, the cord or rope connecting the forward end of the said spring-lever with the hinged trap-door, and the catches pivoted in the cross-piece of the press-frame, having the beveled pointed rear ends and the weighted depending forward ends having the smaller rollers journaled in their lower extremities.

4. The combination, with the reciprocating plunger having the upper and lower slots in its inner end, of the feed-box having the trap-door, the upper and lower spring-actuated retainers connected at their outer ends by the transverse rods, the first compression-box having the hinged slotted top plate, the set-screws for adjusting the said plate, the tying-chamber and the last converging box having the slotted bottom and the slotted hinged top plate, the adjusting-screws for adjusting the said top plate, and the followers having the side slots and the top projections or horns, substantially as set forth.

5. In a hay-press, the combination, with the sliding plunger and the connecting-pitman, of the swinging crank formed of the upper and lower plates having the shoulders formed at their inner ends, the vertical shaft, and the lever having the collar and the lugs at its wide inner end, substantially as set forth.



6. In a hay-press, the combination, with the sliding plunger, of the connecting-pitman, the swinging crank consisting of the lower and upper plates formed at their inner ends with the shoulders, the upper plate having the set-screw, the vertical shaft, and the lever having the collar and lugs at its wide inner end, substantially as set forth.

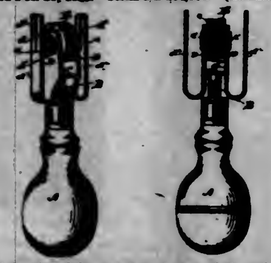
7. In a hay-press, the combination, with the sliding plunger, of the connecting-pitman having the elastic cushions on each side of its forward end portion, the swinging crank consisting of the lower plate and the upper plate having the set-screw and the cross-handle, the vertical shaft, the lever having the collar and lugs at its inner wide end, and having the pivoted cross-handle near its outer end, and the turning-ropes, substantially as set forth.

8. The herein-described portable hay-press, consisting of the outer frame mounted upon the supporting-wheels, the feed-box having the hinged trap-door, the spring-lever having the adjustable weight and connected by a rope to the trap-door of the feed-box, the spring-actuated retainers having their outer ends connected by the cross-rods, the first compression-box having the slotted hinged top plate, the set-screws for adjusting the same, the tying-chamber and last converging box having the slotted bottom, the slotted sides, and the hinged slotted top plate, the set-screws for adjusting the said top plate, the followers having the side slots and the top projections, the catches pivoted in slots in the forward cross-piece of the press-frame, the sliding plunger having the solid inner end, the solid top having the wedge-blocks secured upon it, said the solid side wings, the connecting-pitman pivoted to the head of the plunger below the center of the same and having the elastic side cushions, the swinging crank consisting of the bottom plate and the top plate having the shoulders and the set-screw and the cross-handle, the vertical shaft, the lever having the collar and the lugs at its wider end, and the forward cross-handle, the inclined brace-rods, and the turning-ropes, substantially as set forth.

9. The combination of the feed-box trap-door and the top plate of the first converging box, each having the end hinges, the transverse hinge-rod, the end plates, the spring-bolt or brace-rod having the apertures and the recesses in its lower side, and the brace-bolts having the end nuts, substantially as set forth.

382,665. SMOKE-CONSUMER. BENJAMIN HARRIS, Indianapolis, Ind. Filed Dec. 13, 1887. Serial No. 257,512. (No model.)

Claim.—1. The combination of a furnace, a smoke-condenser, a conduit arranged to conduct the smoke from said furnace to said condenser, and means for introducing a blast of air from the outside into the apparatus behind the smoke-entrance, substantially as shown and described.

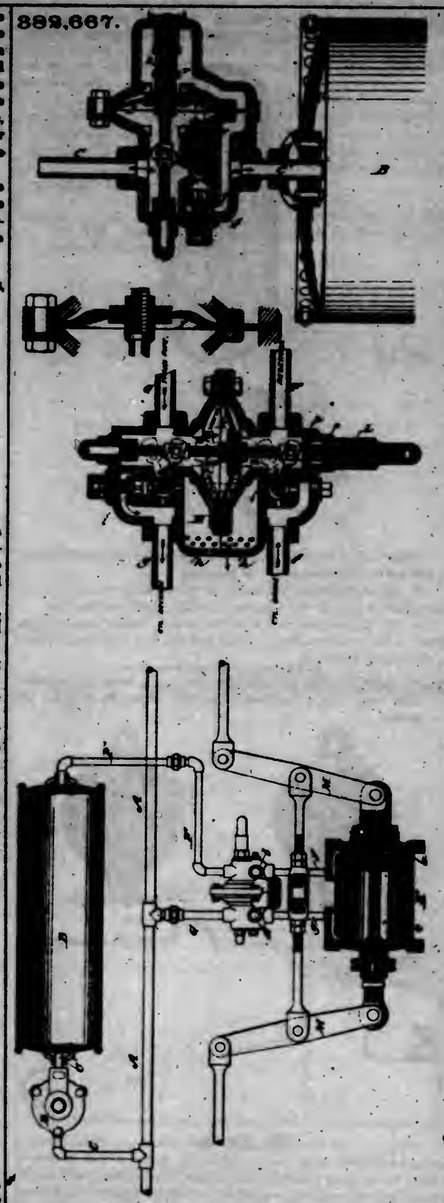


2. The combination of a smoke-condenser, a furnace, a breeching or conduit connecting them, and a blast-fan arranged at the rear end of said conduit behind said furnace, substantially as set forth.

3. The combination of the furnace, condenser, conduit connecting them, a blast-fan arranged at the rear end of said conduit, and a hood arranged within said conduit over the smoke-entrance thereto, substantially as set forth.

4. The combination of the furnace, the condenser, the conduit or breeching connecting them, a damper arranged in the path of the smoke, an imperforate hood over the smoke-entrance to the conduit, and the air-blast, substantially as set forth.

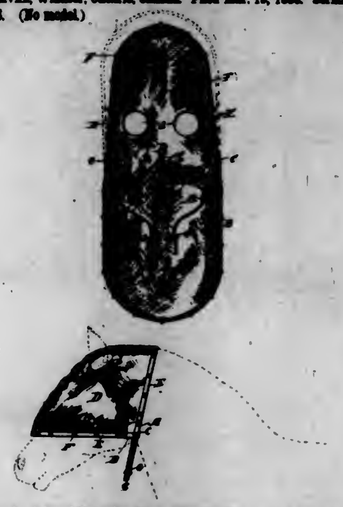
5. The combination of the furnace, condenser, conduit connecting said furnace and condenser, an imperforate hood arranged within said conduit over the smoke-entrance thereto, and means for introducing a blast of air behind said smoke-entrance, substantially as described, and for the purposes specified.



382,666. WIRE-TWISTING TOOL. CHARLES P. ROBERTS, Homer, N. Y. Filed Feb. 23, 1888. Serial No. 264,969. (No model.)

Claim.—A hand-tool for twisting wire, consisting of the handle, the slotted bearing-plates, the slotted wire-holding arms, and the slotted twister-wheel, its circumference extending beyond the bearing-plates and in such relation to the latter that the wheel can be rotated by the thumb of the hand engaging the handle, substantially as described.

382,667. AUTOMATIC AIR-BRAKE. REUALDO SELARS, Brooklyn, N. Y., assignor of two-thirds to John W. Howard and David R. Morse, same place. Filed Nov. 8, 1887. Serial No. 254,371. (No model.)

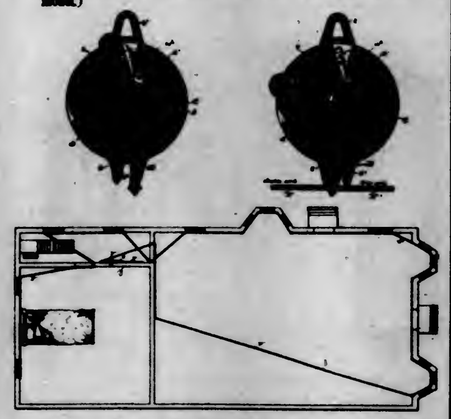


Claim.—1. The combination, with an independent reservoir-charging valve, located as described, of an actuating-diaphragm (or equivalent) permanently exposed on one side to the reservoir-pressure and on its opposite side to the train-pipe pressure, and adapted to operate said charging-valve, for the purposes set forth.

2. The combination, with an independent reservoir-charging valve, located as described, and valve-actuating diaphragm, (or equivalent,) of a closing-spring adapted to close said charging-valve slightly in advance of the equalization of the lower (reservoir) pressure with the predominating exterior (train-pipe) pressure, as and for the purposes set forth.

3. The combination, with the herein-described oscillating reservoir-charging valve and valve-actuating diaphragm, of a supplemental check-valve intercepting the communication between said charging-valve and the storage-reservoir, adapted to open toward the latter and to check return of pressure therefrom irrespective of said charging-valve movements when train-pipe pressure is reduced, as set forth.

382,668. HOOD FOR HORSES. CHARLES A. SULLIVAN and JOHN D. SULLIVAN, Windsor, Ontario, Canada. Filed Mar. 19, 1888. Serial No. 267,882. (No model.)

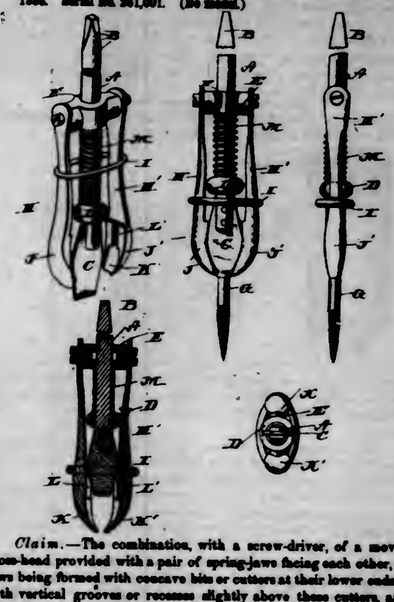


Claim.—1. A hood for animals provided with an expansible frame, A, and canvas D, substantially as described.

2. The combination, in a hood for horses, of a frame, A, a supplementary frame, B, and a canvas, D, substantially as described.

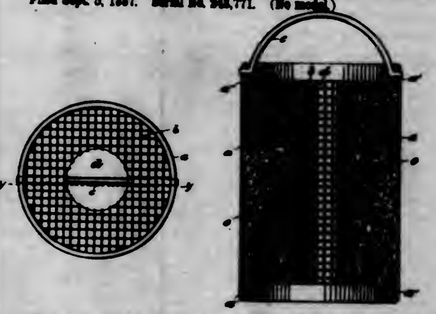
3. The combination, in a hood for horses, of the canvas D, the frame A, the supplementary frame B, and the link G, all substantially as shown and described.

382,669. BURGLAR-ALARM. WILLIAM I. SWAN, Lansing, Mich. Filed Dec. 9, 1886. Renewed Oct. 3, 1887. Serial No. 251,252. (No model.)



Claim.—1. In a burglar-alarm, the combination of the inclosing casing having the inner flange or shoulder provided with a circular cavity, the hammer pivoted to the center of said casing, and having a cam-like inner end with a shoulder or flange against which bears one end of a bow-shaped spring, the spring-actuated trigger pivoted in close proximity to the inner end of said hammer and having one arm engaging therewith, the loosely-pivoted trigger-trip, and the elastic cord or spring and trip-cord connected to the lower end of said pivoted trigger-trip, all arranged substantially as shown and described.

2. The combination, with the pivoted hammer having the cam-like end, the spring bearing against said hammer, the trigger engaging with said cam-like end, and the pivoted trigger-trip having the elastic cord or spring and trip-cord connected to its lower end, of the inclosing casing having an oblong aperture in one side thereof for insertion and removal of a blank cartridge or cap, and the flange or shoulder having a circular cavity in alignment with said oblong aperture, substantially as shown, and for the purpose described.

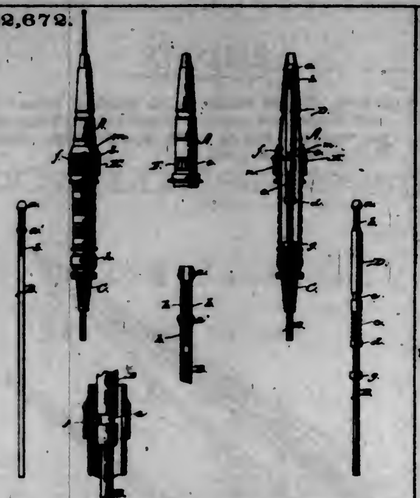


3. The combination, with the spring-actuated hammer, the trigger engaging with a shoulder on the inner end of said hammer and the trigger-trip, of the elastic cord or spring connected to the lower end of said trigger-trip, and the trip-cord, also connected to said end and extending in opposite direction to the elastic cord or spring, substantially as shown and described.

382,670. COMBINED SCREW-HOLDER, SCREW-DRIVER, AND COUNTERSINK. JAMES C. TROVILLION, Sunbury, Ill. Filed Jan. 17, 1888. Serial No. 261,091. (No model.)

Claim.—The combination, with a screw-driver, of a movable cross-head provided with a pair of spring-jaws facing each other, said jaws being formed with concave bits or cutters at their lower ends and with vertical grooves or recesses slightly above these cutters, and a link or keeper for forcing the said jaws together, substantially as set forth.

382,671. FUEL-CARTRIDGE. JOHN T. WHEELER, Chicago, Ill. Filed Sept. 5, 1887. Serial No. 248,771. (No model.)

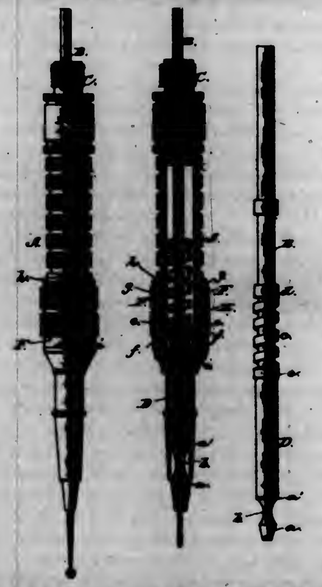


Claim.—1. A fuel-cartridge formed of a cylindrical outer shell of sheet metal, provided with annular wire-cloth ends, and a central open-end wire-cloth cylinder held by said annular heads, substantially as specified.

2. A fuel-cartridge formed of a cylindrical outer shell of sheet metal, provided with annular wire-cloth heads set back within the ends of said shell, and central wire-cloth tube, substantially as specified.

3. A fuel-cartridge formed of a cylindrical outer sheet-metal shell provided with annular wire-cloth heads set back within the ends of said shell, and a central wire-cloth tube held in place by the inturned ends of the outer shell, substantially as specified.

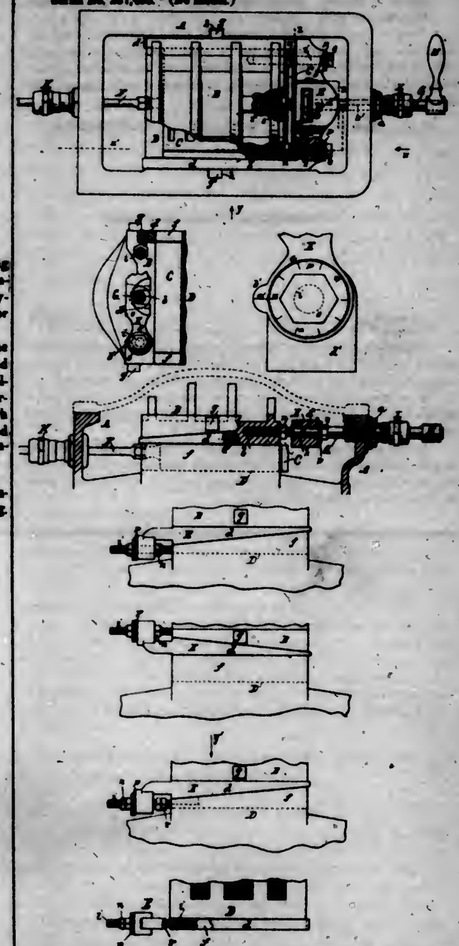
382,672. DENTAL HAND-PIECE. WALTER D. WILLIAMS, Camden, N. J., assignor of one-half to A. J. Fellmer, same place. Filed Jan. 20, 1887. Serial No. 225,091. (No model.)



382,672.

Claim.—1. In a hand-piece for dental engines, an outer casing having openings therein and provided with a stationary outer cam-collar, and a cam-sleeve engaging with said cam-collar, having inwardly-projecting lugs, and the spindle having a movable sleeve thereon, for the purposes specified, substantially as described.

2. In a hand-piece for dental engines, the combination, with the hollow casing, of a tool-holding spindle having a conical outer end, and a series of jaws having conical projections thereon, an adjustable collar situated near the inner end of said spindle, a spring and sleeve surrounding said spindle, a cam-sleeve having lugs projecting through openings in said casing and surrounding the same, and a screw-threaded collar situated at the end of said casing and adapted to come in contact with said adjustable collar, substantially as described.



382,673. DENTAL HAND-PIECE. WALTER D. WILLIAMS, Camden, N. J., assignor of one-half to A. J. Fellmer, same place. Filed Aug. 27, 1887. Serial No. 248,001. (No model.)

Claim.—1. In a dental hand-piece, the outer casing having a rigid collar and an adjustable collar thereon, a female screw-threaded sleeve surrounding the casing and closely fitted between the collars, a male screw-threaded sliding sleeve surrounding the casing inside the other sleeve, having lugs which project inwardly through openings in the casing, and the spindle having a spring-actuated sleeve, substantially as described.

2. In a dental hand-piece, and in combination with the outer casing provided with the screw-threaded sleeves E and F, the spindle B, formed in one continuous piece and provided with the spring-actuated sleeve D, with which engages the said screw-threaded sleeves E and F upon the outer casing, substantially in the manner and for the purpose specified.

382,674. ADJUSTING RELIEF-PLATE WEDGES OF HAIR-VALVES. DANIEL A. WOODBURY, Rochester, N. Y. Filed May 7, 1887. Serial No. 237,498. (No model.)

Claim.—1. In combination with a relief-plate and cylinder, wedges interposed between said cylinder and relief-plate for controlling the latter, and adjusting-ties connecting said wedges on the one hand and said relief-plate or cylinder on the other hand, said ties having bearings at one end in said wedges and at the other end in said relief-plate or cylinder, substantially as shown and described.

2. In combination with a relief-plate and cylinder, interposed wedges, adjusting-ties connecting said wedges and said relief-plate or cylinder, and marked adjusting-disks.

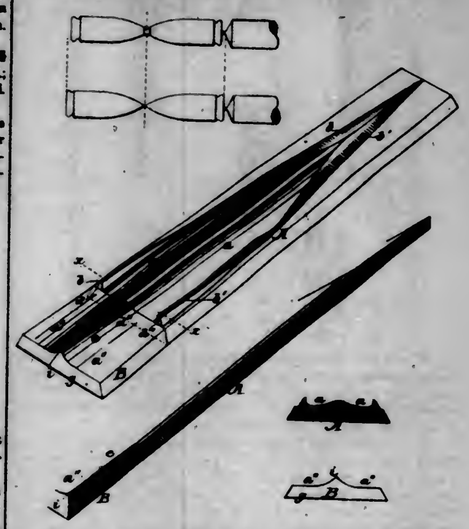
3. A relief-plate and cylinder in combination with wedges for controlling said relief-plate, adjusting-ties connecting said wedges and said relief-plate or cylinder, and an adjustable stop for said wedges.

4. A relief-plate and cylinder, in combination with interposed wedges and adjusting-ties for said wedges and said relief-plate or cylinder, said adjusting-ties being held to have free longitudinal motion in said wedges or in said relief-plate or cylinder.

5. In combination with a relief-plate and cylinder, wedges interposed between said cylinder and relief-plate for controlling the dotter, and ties for said wedges, said ties having bearings at one end in said wedges and at the other end in said relief-plate or in said cylinder, and held to turn on their respective axes without moving longitudinally in their bearings at one end and to be free to move longitudinally in their bearings at the other end, substantially as described and shown.

382,676. LATCH-NEEDLE AND COVERING OR TRANSFERRING POINT FOR KNITTING-MACHINES. WILLIAM H. ABEL, Lowell, N. H.; George A. Bauman administrator of said William H. Abel, deceased. Filed Mar. 22, 1877. (Model.)

Brief.—The object of the invention is to so construct and arrange the needle and point that they can be readily attached to the other parts of the machine, and when in operation can be so united and disunited as to perform all the functions requisite for each in plain knitting and fashioning.



Claim.—1. A latch knitting-needle having the eye or enlarged slot therein between the latch-pivot and hook for the reception of the covering or transferring point, substantially as shown and described.

2. A latch-needle having the eye or enlarged slot therein between the latch-pivot and hook and the regulating-bar or tail-piece, as shown and described.

3. The covering or transferring point constructed as shown and stated, in combination with the latch-needle having the eye or enlarged slot therein between the latch-pivot and the hook for the reception of said covering or transferring point.

REISSUES.

10,928. DIE FOR MAKING ROLLED FORGINGS. Gurdon P. Simmons, Fitchburg, Mass., assignor to the Simonds Rolling Machine Company, same place. Filed Apr. 3, 1883. Serial No. 91,409. Original No. 264,859, dated Mar. 1, 1867.

Claim.—A die for making rolled forgings, having the duplex forming-surface *a a*, and spreading and reducing surfaces *b b'*, in combination with the extension-faces *a' a'*, and interposed projected rib *c*, substantially as and for the purpose set forth.

NORRIS PETERS

DECISIONS
OF THE
COMMISSIONER OF PATENTS
AND OF
UNITED STATES COURTS IN PATENT CASES.

COMMISSIONER'S DECISIONS.

WELLS *v.* BOYLE.

Decided April 2, 1888.

The filing of a bill in equity in the circuit court of the United States by the defeated party to an interference will not operate to stay the issue of patent to the successful contestant, nor will it justify the Commissioner of Patents in delaying or withholding it until such proceeding in equity is terminated.

ON petition.

WATER-CLOSETS.

Application of Frank A. Wells filed October 15, 1885, No. 179,931. Application of James E. Boyle filed December 20, 1884, No. 150,822.

Mr. Charles S. Burton for Wells.
Messrs. A. C. Fraser & Co. for Boyle.

HALL, *Commissioner:*

This case comes up on a petition filed by Boyle to withhold the issue of patent to Wells. These applicants have been in interference, and award of priority was made to Wells, whose application is now in condition to be passed to issue.

Boyle has filed a bill in equity in the circuit court of the United States to obtain, if possible, the judgment of that court that he is the party entitled to the patent, and he now comes to the Commissioner of Patents and requests that he will exercise his authority and direct that no patent issue to Wells until the suit thus instituted shall be decided.

I am compelled to refuse this request. There is nothing in the patent law which suggests anything in the nature of a *supersedeas* upon the filing of a bill in equity by the defeated party in interference in the circuit court of the United States. The fact that there is no such provision in the statute and nothing relating thereto in any of the rules of practice furnishes conclusive evidence, to my mind, that under the present circumstances when an application has received the final sanction and approval of the Commissioner of Patents, and in his official judgment applicant is entitled to a patent, the Commissioner has no longer any power or discretion to withhold the issue of such patent from the party so entitled. There is no more discretion lodged in him to deny what he believes to be a right of an applicant at that stage of the procedure than at any other, and unquestionably it would be the exercise of arbitrary power should the Commissioner attempt to stay or delay the granting of a patent to a party without any lawful reason or legal cause when, in his judgment, the party was legally and lawfully entitled to his patent. This view of the subject is supported by a decision of the Secretary of the Interior, made in 1877, found in the OFFICIAL GAZETTE, volume 12, page 475, and in the Commissioner's decisions for 1877, page 125. The whole question is exhaustively discussed, and, in my opinion, the reasoning is conclusive upon the subject. I therefore decline to grant the request, and dismiss the petition.

DECISIONS OF THE U. S. COURTS.

Supreme Court of the United States.

WEIR *v.* MORDEN *et al.*

Decided March 19, 1888.

1. WEIR—RAILROAD-FROGS.

Reissued Letters Patent No. 8,914, dated September 30, 1879, granted to Frederick C. Weir, for an improvement in railroad-frogs, adjudged to be invalid as to the second claim for lack of invention.

2. PATENTABLE INVENTION—WHAT IS NOT.

In a prior patent describing a U-shaped trough for the purpose of connecting outer rails, leaving the central rails to be secured by means of a V-shaped recess in the bed of the plate at the wide end of the trough, there was no invention in dividing the trough into two, so as to connect the central rails on each side by means of a separate U-shaped trough with the outer rail exterior to them.

APPEAL from the Circuit Court of the United States for the Northern District of Illinois.

STATEMENT OF THE CASE.

This is a bill in equity to restrain the alleged infringement of Reissued Letters Patent No. 8,914, dated September 30, 1879, for an improvement in railroad-frogs, the original patent, No. 215,548, dated May 20, 1879, having been issued on an application filed February 4, 1879, to Frederick C. Weir, the complainant. In his specification the patentee describes the invention generally as follows:

My invention relates to the class of frogs made by the bending of the overlapping ends of the rails themselves, and the junction of the same with the central rails constituting the point by rivets or bolts through separating-pieces; and my invention consists, first, in such a formation and connection of the two rails which make up the angular point as that one of the rails extends unbroken and uncut directly across the path of the other, and in itself makes a solid end to the point, with a full-width flange, which is overlapped by the flange of the other rail, and thus a flange of double thickness is afforded at a point where strength is particularly needed, and the cutting away of the flanges (as is the usual custom) is avoided entirely; second, in an improved manner of connecting the two rails of the point together, and to channel-iron pieces, to which the outer rails are connected.

One of the objects of this invention is to furnish a firm lateral support upon each side of the V-shaped rails by means of channel-irons, which at the same time unite and hold the center rails forming the V to the wing-rails firmly, uniting and holding all the parts in their proper relative position.

The drawings accompanying the specification are as follows:

Fig. 1.

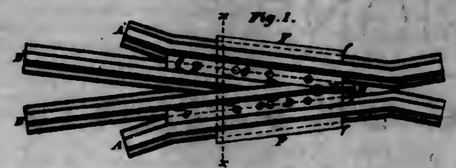


Fig. 3.

Fig. 4.

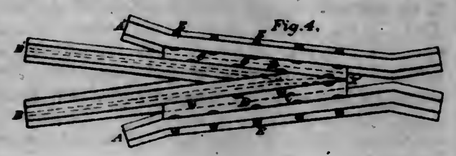

Fig. 2.

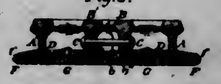

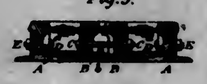

Fig. 5.

The specification explains the drawings as follows:

In the accompanying drawings, Figure 4 is a plan of a frog embodying my improvements. Fig. 5 is a cross-section of the same on line *x x*. Fig. 3 is a plan of the under side of the frog, showing the continuations of the main point-rail with a full-width flange throughout, also showing the riveted extension of the flanges of the channel-irons beyond the points.

It will not be necessary to describe the devices shown in Figs. 1 and 2, as they are fully described in division B of this reissue.

A A′ are the outer or wing rails of the frog, and B B′ are the two rails which compose the acute angle or point.

In place of cutting away both the flanges of the rails B B′, so as to make a joint between the two rails midway between the lines of the angle of the frog, as is common now, and I may say usually practiced, I continue the flange of the rail B of full width intact clear along the junction of the two rails to the point where it strikes the flange of the outer rail, as shown in Fig. 3, which is almost immediately under the point X′ of the frog, and I swage up the flange b^1 of rail B′ on one side, as shown in Figs. 5 and 3, so that it lies over the flange of rail B, this flange of rail B′ being cut away angularly on the edge to properly meet the line of the web b^2 of the rail B.

I connect the point-rails B B′ together by rivets C, which, while they secure these rails together, also secure pieces of channel-iron D to said point-rails, the channel-iron making the separating medium between the point-rails B B′ and wing-rails A A′, and giving a means for attaching said wing-rails.

The adjacent flanges of the channel-irons of the point may be extended beyond the point and riveted, as shown in Fig. 3.

With channel-iron I attach the wing-rails in the manner shown in Fig. 5, the outer flanges of the iron being notched at *d* for the passage, before the outer rails are attached, of the long rivets C, the bolts E, which connect the outer rails, being placed between the notches *d*.

The claims are as follows:

1. A frog having one of its point-rails extending with a full-width flange along the junction of the two rails, and the flange of the other point-rail overlying the flange of the first-mentioned one, substantially as and for the purpose specified.

2. A frog composed substantially of the two center rails, B B′, joined to form the V-shaped point, united to outside diverging or wing rails by means of two channel or U irons, D D, one wing of which channel or U iron is shaped to fit the web of the abutting rails, combined to form the point of the frog, and upon the other side fitting the web of the wing or diverging rail, respectively, and secured by bolts or rivets passing through the webs of the rails and the sides of the channel-bars, substantially as shown.

3. In combination with the point-rails B B′, fitted to each other as described, the channel-pieces D, extending and bolted or riveted together beyond the point of the frog, and connecting-rivets C, which extend entirely through the two point-rails and the channel-pieces, substantially as and for the purpose specified.

The only claim involved in this suit is the second, no infringement being alleged of either the first or third. Separate answers were filed by the defendants, respectively, which were, however, in substance the same. The defenses are that the reissued letters patent are null and void as not being for the same invention as set forth and described in the original letters patent; that the defendants do not infringe, and that the alleged invention of the complainant was not a patentable novelty, in view of the state of the art at the time of the alleged invention, as shown in certain prior letters patent specifically mentioned. The answer of Morden, adopted by the others, also sets out the following:

And this defendant, further answering, says, on information and belief, that he is the original and first inventor of a U-shaped plate in combination or connection with a railroad-frog, and that said invention was secured to him by said Letters Patent of the United States No. 173,804 and No. 178,694, and that by virtue of said letters patent he has the sole and exclusive right to said U shape in a railroad-frog, and that, while the complainant is engaged in the manufacture and sale of railroad-frogs, he uses a V-shaped plate so secured to your defendant, as before stated, and in said manufacture and sale has copied from defendant's invention in substantial and material parts secured to defendant by his letters patent aforesaid and in infringement of the same; and this defendant, in this connection, would state that prior to the filing of complainant's bill he, the defendant, filed a bill in this honorable court against said complainant for infringement of his said Letters Patent No. 173,804 and said wrongful acts, and praying relief on account of said wrongful acts by the complainant, which said bill is now pending against him in this court. Some days after this defendant filed his bill as aforesaid, the said complainant filed his bill, seeking thereby, as defendant is advised and states, on information and belief, to harass and annoy defendant in his said suit and to delay accounting to defendant for said wrongful acts of him, the said complainant.

On final hearing a decree was rendered dismissing the bill for want of equity, to reverse which the present appeal has been taken.

Mr. Edward Boyd, *Mr. E. E. Wood*, and *Mr. C. A. Seward* for the appellant.

Mr. C. K. Offield for the appellees.

Mr. Justice MATTHEWS delivered the opinion of the Court.

The question of infringement depends upon the proper construction of the second claim. The proof shows that the defendants did not infringe either the first or the third. They did not form and connect the two rails, making up the angular point as a part of the frog, so that one of the rails would extend unbroken and uncut directly across the path of the other, and in itself make a solid end to the point with a full-width flange overlapped by the flange of the other rail, thus affording a double thickness and avoiding the cutting away of the flanges, as was customary. If there is an infringement, it consists in the use of the channel-irons of a U shape, uniting the two center rails, forming the V-shaped point of the frog, to each other, and the two thus united to the two diverging rails on each side by means of bolts or rivets passing through the webs of the rails and the sides of the channel-bars. The question was disposed of by the circuit court in favor of the defendants, as follows:

The question of fact as to infringement depends upon whether the "two center rails, B B′, joined together to form the V-shaped point," mentioned in the second claim, necessarily mean the two center rails which are described in the specification, or does it mean any center rails joined together in any manner to form a V-shaped point? The answer to this question seems to me to be found in the complainant's own specification. He says:

"My invention consists, first, in such a formation and connection of the two rails which make up the angular point as that one of the rails extends unbroken and uncut directly across the path of the other, and in itself makes a solid end to the point with a full-width flange, which is overlapped by the flange of the other rail, and thus a flange of double thickness is afforded at a point where strength is particularly needed, and the cutting away of the flanges (as is the usual custom) is avoided entirely."

In his description of the drawings he says:

"A A′ are the outer or wing rails of the frog, and B B′ are the two rails which compose the acute angle or point."

And in his description of the mode of constructing his device he says:

"In place of cutting away both the flanges of the rails B B′, so as to make a joint between the two rails midway between the lines of the angle of the frog, as is common now, and I may say usually practiced, I continue the flange of the rail B of full width intact clear along the junction of the two rails to the point where it strikes the flange of the outer rail, as shown in Fig. 3, which is almost immediately under the point X′ of the frog, and I swage up the flange b^1 of rail B′ on one side, as shown in Figs. 5 and 3, so that it lies over the flange of rail B, this flange of rail B′ being cut away angularly on the edge to properly meet the line of the web b^2 of the rail B."

It will thus be seen that minute directions are given as to the construction of the two center rails, B and B′, to form a V-shaped point, and I am of opinion that the two center rails, B and B′, described in the second claim, are the rails constructed and joined according to the description given in the patent. The language of the claim is "the two center rails, B B′, joined to form the V-shaped point;" and any two center rails joined to form a V-shaped point. The V-shaped point made by embedding one rail underneath and upward directly across the path of the other, and thereby making a solid end to the point, and with the flange of the rail B′ swaged up, so as to lie upon or overlap the flange of the rail B, seems to me to be an essential element of other contrivances supposed to be invented, and therefore the two center rails, B B′, mentioned in the second claim, refer to and mean the two center rails which he has particularly described in his specification. The proof in this case wholly fails to show that the defendant formed the V-shaped point in his frog in the manner that complainant forms his point.

The construction of the second claim contended for by the appellant is, that it embodies separately and distinctly that part of the invention which, in the general description in the preliminary part of the specification, is stated to be—

an improved manner of connecting the two rails of the point together and to channel-iron pieces, to which the outer rails are connected—

without reference to the manner in which the two rails of the point are formed, so as to constitute the first part of the invention. If this construction be admitted, the second claim would cover every case of two center rails joined to form the V-shaped point, which were united to outside diverging or wing rails by means of channel-irons of a U shape, bolted or riveted, as therein described, without reference to the manner in which the two center rails were combined to make the angular point or V shape. In our opinion, the construction placed upon this claim by the circuit court is right, and is required by the language of the specifications and claim. The claim does not on its face profess to cover a mere mode of connecting, by means of U-shaped channel-irons, the intermediate with the external rails. It is in form a claim for a combination of parts which together constitute a frog of peculiar construction. The elements of that combination, as stated in the claim, are, first, the two center rails, B B′, joined to form the V-shaped point; second, the outside diverging or wing rails; third, the channel-irons of a U shape, uniting the center rails together and also to the outside or wing rails, so that the whole shall constitute a frog with the characteristics imparted by the features of this combination. This coincides with the statement contained in the brief of counsel for the appellant, who say, speaking of the invention as described in the second claim:

The elements constituting the invention in controversy are: First, two outside diverging wing and main rails; two inside V-shaped point rails, the four rails being united and joined together by two channel-irons bolted to these rails by three lines of rivets or bolts, to wit: one line of bolts, bolting one channel-iron to one wing-rail; another line of bolts, bolting another channel-iron to the other outside wing-rail, and the third line of bolts passing through the two inside wings of the two channel-plates and through the webs of the point-rails, thereby making one structure or machine. In this construction the cut-away rail forming the point is re-enforced on each side by the vertical wings of the channel-irons. The claim is for this frog or machine so constructed, a frog composed substantially of the elements above named.

The claim refers specifically to the—

two center rails, B B′, joined to form the V-shaped point.

This points explicitly to the drawings, on which the two center rails are designated by the letters, and also to the mode in which they are shown by the drawings and the description in the specification to be joined, and excludes the idea of constructing a frog, such as is intended to be covered by the second claim, of any other center rails than those thus pointed out and described. The patentee by this mode of description and of claim has made the center rails, formed and connected in the manner described to make up the V-shaped point, an essential part of the invention intended to be secured by the second claim.

An argument against this construction, made by the counsel for the appellant, is based upon the language of the third claim. That claim is for the channel-pieces D, extending and bolted or riveted together beyond the point of the frog, and connecting-rivets C, which extend entirely through the two point-rails and the channel-pieces—

in combination with the point-rails B B′, fitted to each other, as described.

It is admitted that the language of that claim limits it to the point rails formed and connected together so as to make the V-shaped point, according to the specific manner described in the specification and shown in the drawings, and that it does not cover center rails of any other description. This limitation is based upon the words—

fitted to each other, as described.

It is argued that as this phrase is omitted from the second claim the contrary inference must prevail, so that that claim may be permitted to extend so as to embrace all center rails joined to formed the V-shaped point, however they may be fitted to each other; but this variation of language does not seem to us so significant. The second claim, by the use of the phrase at its close—

substantially as shown—

limits its application quite as effectually to the particular kind of center rails described in the specification and covered by the first claim; and the reference therein to—

the two center rails, B B′, joined to form the V-shaped point—

can only mean such point rails as are shown in the drawings marked B B′, and joined to form the V-shaped point referred to in the drawings and described in the specification—

substantially as shown.

If this construction of the second claim needed corroboration, that would be found in the state of the art at the time of the alleged invention, as shown by the proof in the present case. The frogs exhibited in evidence as infringements of the complainant's patent were manufactured by the defendants, as they claimed, under Patent No. 148,264, dated March 3, 1874, issued to George Thomas and William Miller, under whom they claim, and also under Patent No. 173,804, dated February 22, 1876, issued to Morden, one of the defendants, as inventor. Morden's patent of February 22, 1876, showed a connection of the wing-rails for use as frogs by means of a U-iron or "trough-plate," the upturned sides of which—

are made to conform to the curve of the side rails, as well as to the form of the neck and base of the rails, and are firmly secured to the neck of the rails by bolts or rivets.

Instead of holding the V-shaped point in place by the use of channel-irons, he provided a V-shaped recess in the channel or trough plate, into which the point of the frog was inserted and held; but in applying his device to railroad-crossings instead of switches he used channel or U-shaped irons to connect the points and wing-rails. It is true, as suggested by counsel for the appellant, that a crossing of railroad-tracks is a very different device from a switch, where the latter is used by means of a frog to shift the engine and

train from one line of tracks to another; but the use of channel-irons is analogous in the two cases, and it would require no more than ordinary mechanical skill to transfer the channel-irons used upon a crossing to firmly hold the parts in place to a similar use in a frog to unite firmly in their respective positions the center rails with the exterior rails. Independently, however, of this use of channel-irons on crossings, we think that the patent to Morden, of February 22, 1876, for an improvement in railroad-frogs, considered in itself, leaves no room for invention in the application of channel-irons in uniting the V-shaped point-rails with the exterior rails. In that patent the invention consisted in forming a metallic plate into a U-shaped trough for the purpose of connecting the outer rails, leaving the V-shaped ends of the point-rails to be secured by means of a V-shaped recess in the bed of the plate at the wide end of the trough. There seems to be no invention in dividing that trough into two, so as to connect the center rails on each side by means of a separate channel-iron or U-shaped trough with the outer rail exterior to them.

For these reasons the decree of the circuit court is affirmed.

U. S. Circuit Court—Southern District of New York.

BABCOCK & WILCOX COMPANY *v.* PIONEER IRON WORKS.

Decided March 22, 1888.

1. CRAWFORD—STEAM-GENERATORS.

   Letters Patent No. 90,506, dated May 25, 1869, granted to Benjamin Crawford, for an improvement in steam-generators, adjudged valid as to the first, second, third, and fifth claims and to have been infringed.

2. BABCOCK AND WILCOX—STEAM-GENERATORS.

   Letters Patent No. 175,548, dated April 4, 1876, granted to Babcock and Wilcox, for an improvement in sectional steam-generators, adjudged invalid as to the first claim for lack of invention in the same.

3. PATENTABLE INVENTION—WHAT IS NOT.

   Where there was merely a good selection from among known joints and involved good workmanship and apparently nothing more, there was no patentable invention.

4. CLAIMS—CERTAINTY OF TERMS OF.

   Where a claim covered the combination of one element named with another element named, "or other part," these last words would mean some other equivalent part and the claim would be sufficiently certain.

5. SETTLEMENT OF SUIT BY ONE OF SEVERAL DEFENDANTS WHERE THE INFRINGEMENT WAS JOINT DISCHARGES ALL OF THE DEFENDANTS.

   Where in a suit against two defendants for a joint infringement one of the defendants had made a settlement by a writing under seal for the costs and damages by the infringement of such defendant, but by such writing the other defendant was expressly not included in such settlement, the settlement was a satisfaction of the infringement by both defendants both as to damages and costs.

6. INJUNCTION AGAINST DEFENDANT NOT INCLUDED IN TERMS OF SETTLEMENT.

   An injunction, however, may be granted against the defendant who was not included in terms by the writing of the settlement.

Mr. Samuel R. Betts and *Mr. Benjamin F. Thurston* for the complainant.

Mr. Edward N. Dickerson and *Mr. Edward N. Dickerson, Jr.*, for the defendant.

WHEELER, *J.*:

This suit is brought upon three patents—No. 90,506, dated May 25, 1869, and granted to Benjamin Crawford, for an improvement in steam-generators; No. 98,490, dated January 4, 1870, and granted to Griffith, Wundram, and Muller, for an improvement in sectional steam-generators, and No. 175,548, dated April 4, 1876, and granted to Babcock and Wilcox, for an improvement in sectional steam-generators. On the argument, infringement of the first, second, third, and fifth claims of the first and the first claim of the last is relied upon. The first claim of the last patent is for a tube connecting the steam-drum with other parts united to them by expanded instead of screw joints. The expanded joint appears to a slight extent to be like a ball-and-socket joint and to admit of small movements of the parts without causing a leak. Such a joint seems to be peculiarly useful in those connections, on account of necessary changes in the relative position of the parts, caused by expansion and contraction and otherwise; but such joints and their advantages are conceded to have been old and well known before, so that the only new thing done was to use one in this place. This was merely a good selection from among known joints, and involved good workmanship and apparently nothing more. It does not seem to come up to a patentable invention. (*Pennsylvania Railroad Co.* v. *Locomotive Truck Co.*, 110 U. S., 490; *Miller* v. *Foree*, 116 U. S., 22.)

These generators are of that class in which the water is contained in a series of tubes inclined upward from the fire-front. Active circulation of the water through the heated parts of the tubes is necessary to success in making steam, and, as there is no room for steam in the tubes, it must be carried to a chamber above, and some water will go with it. If this water is left to fall back toward the high ends of the tubes from which the steam comes, it impedes the circulation. Prior to Crawford's invention there was no arrangement, so far as has been made to appear, to compel it to go to the lower end of the tubes and take its place with water from the supply in the circulation upward through the tubes again. He made the ends of the tubes to open into chambers, called "boxes," which communicated with one another, and the chambers at the high end to communicate with the steam-chamber above, and he placed the reservoir of supply above and communicating downward into the chambers at the lower end, and connected the lower part of the steam-chamber with this reservoir. This arrangement takes the water from the steam-chamber to the supply and into the circulation forward, and effectually prevents the obstruction which it would cause by being left to take the other course. The invention described in English Letters Patent No. 662, granted to one Inglis in 1863, comes nearest to this arrangement of anything shown as an anticipation. In that, as understood, the water carried with the steam into the steam-chamber or accumulated there by condensation might find its way into the chamber at the lower end of the tubes and be drawn into the upward circulation through the tubes again, and might fall back the other way and obstruct the circulation. The first two claims relate principally to the boxes forming the communicating chambers at the

ends of the tubes. Such communicating devices are shown to have been known before. The third claim is for the water-reservoir connected with the steam-drum, or other part, in combination with the inclined tubes, substantially as described. Some question is made about the exactness of this claim on account of the expression "or other part." The connection would not be substantially as described unless the connection should be between the water-reservoir and the steam-drum, or some other part similar to the steam-drum. Therefore, that is what is understood by that expression, which, with that understanding, creates no uncertainty. That claim appears to cover this new arrangement and to be valid. The fifth claim brings other parts into a combination with the same arrangement, and would appear to be valid so far as it is included in the third. The steam-generator of the defendants has the inclined tubes, the communicating chambers, the steam-drum connected at the lower part with the water-reservoir, and their description of its operation in their circular put in evidence is the same as that mentioned of the invention of Crawford. The location of the parts is somewhat different; but they appear to accomplish the same thing by the same means in substantially the same way, and to have thereby infringed the third claim of this patent. Whether they infringe the fifth or not is not material, for an infringement of that would be an infringement of this, and the consequences of an infringement are not varied, so far as known, by the number of claims infringed.

This patent has expired and no occasion for an injunction against further infringement of it is made to appear. No question of liability or relief is left except as to profits and damages. With reference to those the defendant, Pioneer Iron Works, appears by written stipulation with the orator under seal to have settled with the orator since the suit was brought and while it was in readiness for final hearing, and to have paid to the orator six thousand five hundred dollars—

in cash to cover the costs of the complainant in this suit against said Pioneer Iron Works and all damages for the infringement by the said Pioneer Iron Works of the letters patent sued on—

but—

not to discharge or license any parties who may have used or may hereafter use any infringing apparatus heretofore or hereafter made by the Pioneer Iron Works except as herein expressly stated, nor shall it release the Safety Steam Generator Company, all such claims and demands being expressly reserved.

The defendant, the Steam Generator Company, insists that this settlement is a full answer to any further claim by the orator against that company on account of this infringement. The bill charges a joint infringement, which—

said defendants are jointly concerned in and connected to—

by the manufacture by the Pioneer Iron Works, for sale made by the Safety Steam Generator Company, of steam-generators containing each and all of the inventions contained in each and all of these Letters Patent. The answer denies all infringement. The evidence meagerly shows that the generators of the defendants contain the invention of this third claim. The infringement of a patent is in the nature of a trespass upon the exclusive rights of the owner of the patent secured by it for which an action would lie at common law. (Buller's N. P., 76.) The action would be an action on the case, as for a tort, in which all who participate are principals, and for which they are jointly and severally liable for the whole. (1 Chitty's Pl., 141; 2 Green. Ev., section 467.) This is the form of action mentioned in the statutes. (Rev. Stat. U. S., section 4919; *Moore* v. *Marsh*, 7 Wall., 515; *Mowry* v. *Whitney*, 14 Wall., 620.) Littleton, section 276, laid down this:

Also, if two men do a trespass to another, who releaseth to one of them by his deed all actions personalls, and notwithstanding such an action of trespasse against the other, the defendant may well shew that the trespasse was done by him, and by another his fellow, and that the plaintife by his deed (which he sheweth forth) released to his fellow all actions personals, and demaund the judgment, &c., and yet such deed belongeth to his fellow and not to him.

This seems to be good law to this day. (2 Green. Ev., section 30; *Eastman* v. *Grant*, 34 Vt., 387.) A plaintiff is entitled to but one satisfaction of his cause of action, whether but one or many may be liable, or whatever the form of action may be. (2 Saund., 480; *Lovejoy* v. *Murray*, 3 Wall., 1.) If the damages are actually paid by one, that is a sufficient satisfaction for all. If such payment is acknowledged by deed, the actual consideration cannot be inquired into. If the plaintiff had brought suit against the Pioneer Iron Works alone on the proofs in this case, as here understood and considered, judgment would have been recovered for all the infringement involved. After the satisfaction of such judgment no action could be maintained against the Safety Steam Generator Company for the same infringement, because the plaintiff would be fully satisfied for that. The infringement by one is the same as that by the other, and when satisfaction is made for that the whole is satisfied. The payment and acknowledgement of it cover all damages for the infringement by the Pioneer Iron Works, and that includes all the infringement involved in this case and covers all damages for it. The agreement expressly provides that the Safety Steam Generator Company shall not be released; but whether released or not the orator has no unsatisfied claim to recover upon against that company. This case differs in this respect from *Chamberlin* v. *Murphy*, (41 Vt., 110,) where part satisfaction was received from some of the defendants and they were discharged without affecting the liability of the others for the residue. There the payment was received for but a part and the rest of the cause of action was expressly reserved. Here the payment is received for all the damages and only the liability of the other defendant so far as this case is concerned is reserved. That liability was reduced to nothing when all the damages were paid. The orator urges that the recovery of damages from a manufacturer for infringement does not relieve a seller or user afterward from liability, and that even the recovery of damages from a seller would not relieve a subsequent user, and argues from these premises that the Safety Steam Generator Company is or may be liable beyond the Pioneer Iron Works. (*Birdsall* v. *Shaliol*, 112 U. S., 485.) But as this case now stands both of the defendants were liable for all the infringement by either as maker, seller, or user, and all the damages for all of this have been paid. Nothing is left in that or any other view which has been presented or suggested itself. This result may not have been, and probably was not, intended by the orator and the Pioneer Iron Works in

doing what they did. Still the conclusion that such is the legal effect of it seems to be unavoidable. As there is no relief to which the orator appears to be entitled against the Safety Steam Generator Company, the bill must be dismissed as to that company. This conclusion would have rendered any inquiry into the original liability of that company unnecessary but for the question of costs. There are no costs for which one defendant was liable that the other was not that are made to appear. All the costs for which one defendant was liable are paid. There are none for which the other was liable remaining to be recovered or paid. But both were liable for costs and neither was entitled to any, as the case has turned, when the costs were incurred. For that reason neither has ever become entitled to costs. The stipulation provides for an injunction against the Pioneer Iron Works. Witnesses appear to have been examined as to some prior patents which are material to questions of anticipation and which were not set up in the answer nor formally put in evidence, but have been treated as regularly in the case for that purpose on the argument and in the consideration of the case. Motion was made and submitted with the case for the amendment of the answer and the allowance of these patents as being formally in evidence. That motion is granted to make the case complete.

Let an order be entered for the amendment of the answer and the allowance of these patents in evidence, and let a decree be entered for an injunction against the Pioneer Iron Works according to stipulation, and dismissing the bill as to the Safety Steam Generator Company without costs, and without prejudice to the validity of the third claim of the Crawford patent.

U. S. Circuit Court—Northern District of New York.

PALMER *v.* JOHNSTON.

Decided March 20, 1888.

COWELL—SASH-BALANCES.

The second claim of Patent No. 126,031, granted to John J. Cowell, April 23, 1872, for an improvement in sash-balances, adjudged to be valid, and to have been infringed by a construction such as is described in Patent No. 135,309, granted to John Vetterlein, December 12, 1876, for a sash-pulley case.

WALLACE, *J.*:

The second claim of letters patent granted to John J. Cowell, April 23, 1872, for an improvement in sash-balances, is in controversy in this suit. The invention in question relates to a cast-metal pulley-box, and consists in forming the box with two or more semi-tubular swellings, one at each end of the box, adapted to fit auger-holes bored in the frame for inserting the box. The specification points out the advantages of such a pulley-box as follows:

> In inserting this casing in the window-frame it is only necessary to bore auger-holes corresponding with the swellings and chip out between the holes. The swellings fit snugly in the auger-holes, and it is not necessary to cut away wood neatly between the two auger-holes, as the sides of the box are less in diameter than the diameter of the swellings. The boxes can, by reason of this construction, be more easily and cheaply inserted in window-frames, and will be held just as securely and snugly in place as if the sides were more neatly fitted to the wood.

The defendant is manufacturing pulley-boxes made conformably to a patent granted to John Vetterlein, December 12, 1876. That patent describes the alleged infringing device as follows:

> My improvement relates to the case B, made with an external surface composed of segments of cylinders C at opposite sides, so placed that they are adapted to enter mortises formed by holes bored in wood, such holes intersecting so that the interior of the opening made in the wood will be corrugations corresponding with the corrugations upon the surface of the case.

In other words, the defendant's device is provided with semi-tubular swellings, not only at each end, like that of Cowell's pulley-box, but with the intermediate semi-tubular swellings, which practically connect with each other.

When Cowell made his improvements in pulley-boxes, it was customary to insert pulley-boxes in the frame by making an auger-hole at each end of the proposed recess and cutting away the intermediate wood; and a patent had been granted to Simon Drum, of the date of May 21, 1867, which described this method of inserting pulley-boxes, and described an oblong pulley-box with rounded ends, the arch of which would correspond with the arch of the auger-holes. The pulley-box of this patent did not, however, have the semi-tubular swellings of Cowell's device. This was the nearest approach in the prior state of the art to the pulley-box of Cowell, and Cowell was the first to recognise the advantage in the saving of time and attention to details in inserting pulley-boxes which would result from employing the peculiar form of pulley-box which his patent describes and claims. Cowell's improvement was a very simple one; and it is easy to assert now that any competent mechanic in that department of industry could have made it by the exercise of ordinary mechanical skill. Indeed, it seems surprising now that no one had made it; but no one had, although many kinds of pulley-boxes had been made and some had been patented; and as soon as this one was made and introduced its advantages were manifest, and it commended itself to the public as a practical and desirable device and a better one than those which had preceded it. These circumstances afford a safer criterion of inventive novelty than any subsequent opinion of an expert or intuition of a judge.

The defendant has appropriated the invention of the Cowell patent, and a decree is therefore ordered for an injunction and an accounting.

Fraudulent Practices by Attorneys.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., April 16, 1888.

The attention of this Office having frequently been called to circulars and communications of persons pretending to have access to the records of this Bureau, and claiming to possess information of the pendency of applications for patents, notice is hereby given the public that all such persons in so advertising themselves are acting under false representations and are guilty of unprofessional conduct, and should not be entitled to credit.

The Office has also received information that certain attorneys disbarred from practice under section 487 of the Revised Statutes are continuing to prosecute applications for patents under the names of other persons.

Hereafter a list will be published in the OFFICIAL GAZETTE containing the names and addresses of all such persons, and the public warned against employing them or intrusting applications or interests to their charge.

BENTON J. HALL, *Commissioner.*

The Office has information that *Isaac S. McGiehan, No. 155 Broadway, New York*, a disbarred attorney, has been practicing under the name of *Alexander Melhado.*

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., May 5, 1888.

Messrs. Horn & Son, No. 606 Eleventh street Northwest, Washington, D. C., having satisfied the Commissioner of Patents that a circular issued by them to the effect that their attention had been directed at the Patent Office to specifications on file was not intended to create the impression that they possessed facilities for acquiring information concerning pending applications, and having assured the Commissioner that they will discontinue the publication of such circular, notice is hereby given that the condemnation of *Messrs. Horn & Son*, published in the OFFICIAL GAZETTE of May 1 and May 8, 1888, is hereby withdrawn, the language used in such circular having been an inadvertence on their part and not a matter of intention.

BENTON J. HALL, *Commissioner.*

Publishers' Catalogues.

This Office would be pleased to receive from manufacturers and publishers such catalogues, circulars, price-lists, or other advertisements relating to the sciences and mechanical arts as are published by them for gratuitous distribution; but notice is hereby given such manufacturers or dealers who feel disposed to send these publications that not less than three copies should be forwarded in order that the contents may be properly indexed, classified, and embodied in the Scientific Library for convenient and ready reference.

Issue of May 15, 1888.

DESIGNS.

18,806.—CLOCK-DIAL.—*Archibald Bannatyne*, Waterbury, Conn., assignor to *The Waterbury Clock Company*, same place. Application filed February 24, 1887. Serial No. 228,735. Term of patent 7 years.

18,807.—CLOCK-DIAL.—*Archibald Bannatyne*, Waterbury, Conn., assignor to *The Waterbury Clock Company*, same place. Application filed May 3, 1887. Serial No. 237,012. Term of patent 7 years.

18,808.—CARPET.—*John Christie*, Halifax, England, assignor to *John Crossley & Sons*, New York, N. Y., and London, England. Application filed February 25, 1888. Serial No. 265,309. Term of patent 3½ years.

18,809.—BOTTLE.—*Adelbert M. Foster*, Chicago, Ill. Application filed March 14, 1888. Serial No. 267,168. Term of patent 14 years.

18,310.—RADIATOR.—*Henry C. Hodges*, Detroit, Mich., assignor to *The Detroit Steam Radiator Company*, same place. Application filed June 10, 1887. Serial No. 240,950. Term of patent 7 years.

18,311.—RADIATOR ORNAMENTATION.—*Charles H. Hodges*, Detroit, Mich., assignor to *The Detroit Steam Radiator Company*, same place. Application filed June 10, 1887. Serial No. 240,951. Term of patent 7 years.

18,312 and 18,313.—RADIATOR.—*Charles H. Hodges*, Detroit, Mich., assignor to *The Detroit Steam Radiator Company*, same place. Applications filed June 10, 1887. Serial Nos. 240,952 and 240,953. Term of patents 7 years.

18,314.—RADIATOR ORNAMENTATION.—*Charles H. Hodges*, Detroit, Mich., assignor to *The Detroit Steam Radiator Company*, same place. Application filed June 10, 1887. Serial No. 240,954. Term of patent 7 years.

18,315 and 18,316.—SPOON, FORK, &c.—*Robert H. Klingel*, Bridgeport, assignor to *The Holmes & Edward Silver Company*, West Stratford, Conn. Applications filed March 27, 1888. Serial Nos. 268,679 and 268,680. Term of patents 14 years.

18,317 and 18,318.—LADY'S COSTUME.—*Ellen Moran*, New York, N. Y., assignor to *The Butterick Publishing Company*, (*Limited*,) same place. Application filed April 20, 1888. Serial Nos. 271,347 and 271,348. Term of patents 3½ years.

18,319.—MISS'S APRON.—*Lizzie Roys*, New York, N. Y., assignor to *The Butterick Publishing Company*, (*Limited*,) same place. Application filed April 20, 1888. Serial No. 271,344. Term of patent 3½ years.

18,320.—WALKING-SKIRT.—*Lizzie Roys*, New York, N. Y., assignor to *The Butterick Publishing Company*, (*Limited*,) same place. Application filed April 20, 1888. Serial No. 271,346. Term of patent 3½ years.

18,321.—LADY'S COSTUME.—*Jennie Sheils*, New York, N. Y., assignor to *The Butterick Publishing Company*, (*Limited*,) same place. Application filed April 20, 1888. Serial No. 271,349. Term of patent 3½ years.

18,322.—DESK-CABINET.—*Frank S. Thomas*, Topeka, Kans. Application filed March 1, 1888. Serial No. 265,867. Term of patent 14 years.

18,323.—LADY'S BASQUE.—*Mary Turner*, New York, N. Y., assignor to *The Butterick Publishing Company*, (*Limited*,) same place. Application filed April 20, 1888. Serial No. 271,345. Term of patent 3½ years.

18,324 to 18,338, inclusive.—RAILWAY-RAIL.—*William Wharton, Jr.*, and *Edward Sumner*, Philadelphia, Pa., assignors to *William Wharton, Jr., and Company*, (*Incorporated*,) same place. Applications filed April 20, 1888. Serial Nos. 271,337 to 271,341, inclusive. Term of patent 14 years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upward are registered under the act of March 3, 1881.]

15,453.—GATE-VALVES.—*The Arthur Company*, New York, N. Y. Application filed March 24, 1888. Used since September 1, 1880.

"The words 'ARTHUR'S ANNULAR' arranged between concentric circles."

15,454.—LIQUID TONIC FOR WOMEN.—*Edward William Austen*, Oswego, N. Y. Application filed March 19, 1888. Used since December, 1887.

"The number '51797.'"

15,455.—CULTIVATOR.—*A. Baldwin & Co.*, New Orleans, La. Application filed March 23, 1888. Used since February 1, 1888.

"The words 'WHIT'S IMPROVED LADOW' and the letters 'A B &' in monogram, with the word 'Co.' just under same."

15,456.—OUTER CLOTHING AND OVERCOATS.—*Bierman, Heidelberg & Co.*, New York, N. Y. Application filed March 26, 1888. Used since January, 1887.

"The representation of a shield with a bear and an Arab in standing position at either side of the shield."

15,457.—COFFEE.—*Chase & Sanborn*, Boston, Mass. Application filed March 16, 1888. Used since October, 1887.

"The word 'SANRIKA.'"

15,458.—JAPAN AND OOLONG TEA.—*Cobb, Wight & Co.*, Rockland, Me. Application filed April 17, 1888. Used since February 1, 1888.

"The word 'SUNBEAM.'"

15,459.—OLIVE-OIL.—*Cusimano Bros.*, New Orleans, La., and Palermo, Italy. Application filed March 19, 1888. Used since January 2, 1888.

"The representation of an eagle with wings open and with feet upon a twig."

15,460.—ROASTED COFFEE.—*The Enterprise Coffee Company*, Baltimore, Md. Application filed March 30, 1888. Used since January, 1873.

"The word 'ENTERPRISE.'"

15,461.—MIXED TEA.—*The Enterprise Coffee Company*, Baltimore, Md. Application filed March 30, 1888. Used since August, 1878.

"The word 'RA-JAH.'"

15,462.—ROASTED COFFEE.—*The Enterprise Coffee Company*, Baltimore, Md. Application filed March 30, 1888. Used since January, 1875.

"The word 'CHESAPEAKE.'"

15,463.—HORSE AND MULE SHOES.—*Greenwood Horse Shoe Company*, Philadelphia, Pa. Application filed March 22, 1888. Used since December 18, 1886.

"The words 'CRANBERRY PATTERN.'"

15,464.—BEER.—*Arthur Guinness, Son & Company*, (*Limited*,) London, England. Application filed March 13, 1888. Used since March 29, 1886.

"The representation of a harp."

15,465.—CIGARS.—*Horace R. Kelly & Co.*, New York, N. Y. Application filed April 12, 1888. Used since April 2, 1888.

"The word 'SOGNA.'"

15,466.—BOOT AND SHOE BLACKING.—*C. T. Kenney, John Donovan*, and *Will. K. Rodney*, Griggsville, Ill. Application filed March 19, 1888. Used since December 28, 1887.

"The word 'LEADER' surmounted with a blacking-brush."

15,467.—REMEDY FOR DISEASES OF THE URINARY SYSTEM.—*William T. Lindley*, Chicago, Ill. Application filed December 17, 1887. Used since August 1, 1887.

"The word-symbol 'BRIGHTINE.'"

15,468.—FLOUR.—*Marshall, Kennedy & Co.*, (*Limited*,) Pittsburg, Pa. Application filed April 7, 1888. Used since January 1, 1876.

"The words 'ST. LOUIS FAVORITE.'"

15,469.—TOILET-WATER SACHET-POWDER.—*R. H. McDonald Drug Company*, New York, N. Y. Application filed March 19, 1888. Used since February 1, 1888.

"The word 'ODORA.'"

15,470.—REMEDY FOR CHICKEN-CHOLERA.—*David F. McKittrick*, Marysville, Ohio. Application filed September 1, 1887. Used since May 31, 1887.

"The words 'NOX ALL.'"

15,471.—EMOLLIENT COMPOUND.—*Joseph Olcovich*, San Francisco, Cal. Application filed March 29, 1888. Used since September 15, 1887.

"The words 'SUN ANOINTING.'"

15,472.—MANUFACTURED TOBACCO, CIGARS, AND CIGARETTES.—*James Allen Patterson*, Birmingham, Ala. Application filed March 8, 1888. Used since September 1, 1887.

"The words 'RED BEET.'"

15,473.—SCREWS, BOLTS, RIVETS, TACKS, AND SIMILAR METALLIC FASTENINGS.—*Shelton Company*, Birmingham, Conn. Application filed April 2, 1888. Used since December 1, 1886.

"The representation of a bolt bent into the form of the letter S."

15,474.—DENTAL GOODS AND MATERIALS OF ALL KINDS.—*The S. S. White Dental Manufacturing Company*, Philadelphia, Pa., Chicago, Ill., New York and Brooklyn, N. Y., and Boston, Mass. Application filed May 19, 1883. Used since the year 1867.

"The monogram of the letters 'S S W.'"

15,475.—VEGETABLE PREPARATION FOR ASSIMILATING FOOD, PROMOTING DIGESTION, AND REGULATING THE BOWELS.—*James H. Vadakin*, Bethany and Peoria, Ill. Application filed March 29, 1888. Used since January, 1888.

"The word 'CASTEROLE.'"

LABELS.

5,501.—Title: "RHEUMATIC CURE."—*Lawrence Abbott, James Abbott*, and *Frank I. Abbott*, Chicago, Ill. Application filed April 18, 1888.

5,502.—Title: "BLUME'S TOKAYER GRAPE AND FRUIT WINE."—*William M. Blume*, New York, N. Y. Application filed April 16, 1888.

5,503.—Title: "BLUME'S TOKAYER GRAPE AND FRUIT WINE."—*William M. Blume*, New York, N. Y. Application filed April 16, 1888.

5,504.—Title: "LA SOGNA," (FOR CIGARS AND CIGARETTES.)—*Horace R. Kelly & Co.*, New York, N. Y. Application filed April 19, 1888. (Trade-Mark Registered.)

5,505.—Title: "THE NIAGARA WHITE GRAPE COMPANY."—*The Niagara White Grape Company*, Lockport, N. Y. Application filed March 24, 1888. (Trade-Mark Registered.)

5,506.—Title: "SEARCHING SYRUP." (FOR A COUGH.)—*William Shafer*, Camden, N. J. Application filed April 16, 1888.

5,507.—Title: "WOOLDRIDGE'S WONDERFUL CURE."—*Stiner, Heumber & Co.*, Columbus, Ga. Application filed April 16, 1888.

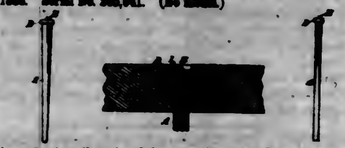
5,508.—Title: "CARSON'S CELEBRATED REMEDY FOR PURIFYING THE BLOOD."—*William K. Vandergrift*, Jamestown, N. Y. Application filed April 23, 1888.

5,509.—Title: "SURE VENEREAL CURE."—*Wright, Hollig & Co.*, Salisbury, N. C. Application filed April 14, 1888.

DISCLAIMER.

296,373.—*James G. Wilson*, New York, N. Y. IMPROVEMENT IN CORRUGATED-METAL ROLLING SHUTTERS. Patent dated April 8, 1884. Disclaimer filed May 8, 1888.

Enters his disclaimer to that portion of the specification in lines 42 to 50 of the printed specification, in words as follows:



"I propose, also, to use the shields for repairing and strengthening old shutters, for riveting on patches, or for covering up such small holes as time or accident may have occasioned.

"I do not confine myself to any particular part of the shutter for affixing my shields, but intend placing them on any part where extra strength may be required."

PATENTS

GRANTED MAY 15, 1888.

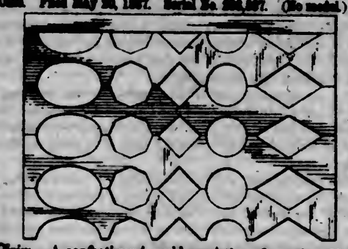
382,676. HAIL. WILLIAM R. ALLEN, Brooklyn, N. Y. Filed Feb. 28, 1888. Serial No. 265,941. (No model.)

Claim.—1. A nail or brad having the point E formed upon its head, substantially as and for the purpose specified.

2. A nail or brad provided with a point upon its head or driving end, said point being substantially of the form as shown and described, and for the purpose specified.

382,677. HARVESTER AND BINDER. JACOB RAMMAH, Stony Run, Pa. Filed Oct. 12, 1886. Serial No. 215,903. (No model.)

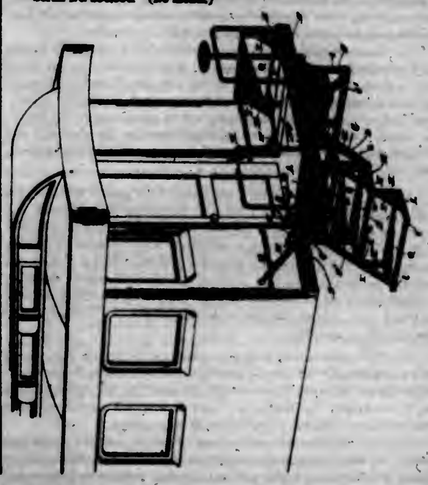
Claim.—1. In a harvester, the combination of the non-revolving delivery-cylinder shaft having its central portion cut away upon one side, the cylinder K, comprising a series of disks suitably connected together by bolts passing through holes K^4 and revolving upon the said shaft, and the stripping-teeth P, pivoted on pins projecting from the said disks and provided with heels P', so that the teeth are pressed outward by the circumference of the shaft, substantially as and for the purpose set forth.



2. In a harvester, the combination of the tubular non-revolving delivery-cylinder shaft, having its central portion cut away on one side, the cylinder K, comprising a series of disks provided with recesses K^5 and pins K^3, the said pins in each disk being spirally in advance of the pins in the next disk, and the disks being connected together by bolts passing through holes K^4 and revolving upon the said shaft, and the stripping-teeth P, pivoted on the pins projecting from the said disks and provided with heels P', so that the teeth are pressed outward by the circumference of the shaft, substantially as and for the purpose set forth.

3. In a harvester, the combination of a supporting-frame secured to the binding-deck, a shaft journaled in brackets projecting from the said frame, the arms C and V, secured upon the said shaft, the arm F, loose upon the shaft and having lugs F^2 upon its sleeve, the spring H, projecting between said lugs and retaining the arm in position, and a cam secured to the shaft for raising the spring and freeing the arm F when the shaft has partially revolved, substantially as and for the purpose set forth.

4. In a harvester, the combination of a supporting-frame secured to the binding-deck, a shaft journaled in brackets projecting from the said frame, the arms C and V, secured upon the said shaft, the arm F, loose upon the shaft and having lugs F^2 upon its sleeve, the spring H, projecting between said lugs and retaining the arm in position, a cam secured to the shaft for raising the spring and freeing the arm F when the shaft has partially revolved, a lug projecting from the cam and bearing against one of the lugs on said sleeve, and the spring I and link S, connected to the cam for raising the arms to their original positions, substantially as and for the purpose set forth.



5. In a harvester, the combination of a supporting-frame secured to the binder-deck, the shaft C, having a bent central portion and journaled in brackets B, the arm C, the arm V, provided with a sail, V^2, the slotted link S, connecting said sail with the trip mechanism, the arm F, loose on shaft C and having lugs F^2 upon its sleeve, the spring H, projecting between said lugs and retaining the arm in position, and a cam secured to the shaft for raising the spring and freeing the arm F when the shaft has partially revolved, substantially as and for the purpose set forth.

382,678. CONFECTIONER'S MOLD. SAMUEL R. BALL, Dayton, Ohio. Filed May 20, 1887. Serial No. 238,327. (No model.)

Claim.—A confectioner's mold consisting of a series of heavy disconnected bars or plates with wide flat upper and lower faces and indented edges, said bars constructed, as described, of a weight and size by which they are adapted to remain in operative position by gravity on the mold-table and without the employment of connecting devices.

382,679. FOLDING STEP FOR CARS. ALBERT J. BARNES, Boston, N. Y., assignor to Martin V. Teeter, same place. Filed Nov. 30, 1887. Serial No. 256,593. (No model.)

Claim.—1. In combination with the platform of a car, the folding steps connected thereto for simultaneous operation, whereby when the steps are folded they form a continuation or extension of the car-platform, substantially as specified.

2. The combination, with a platform, of the swinging arms pivoted thereto, the steps having the risers secured to the arms, and the treads pivoted to the arms and adapted to assume a horizontal position flush with the platform when the arms are sprung upward, substantially as specified.

3. The combination, with a car-platform having the openings B B at the sides, of the swinging arms F G, pivoted to the sides of the openings and having the risers secured thereto, the swinging arms I, having the bottom treads, Q, attached thereto, and the treads P and O, pivoted to and connecting the said arms, whereby when the steps are raised or closed they will fill the openings B and form extensions to the platform, and the bottom treads, Q, will form guards at the sides of the platform, substantially as specified.

4. In combination with a car-platform, the folding steps connected together for simultaneous operation, and adapted when folded to come on a horizontal line with the platform and form a continuation thereof, the lowest tread of the steps standing in a vertical position at the end to form a guard, as set forth.

5. The combination, with a car-platform, of the arms F F, having the top riser attached thereto, the arms G G, having the second riser attached thereto, the top tread pivoted between the arms F and G, the arms I I, having the lowest tread attached thereto, and the tread P, pivoted to the arms G and I, whereby all the arms move simultaneously and the treads and risers form an extension to the platform, substantially as specified.

6. The combination, with a platform, of the arms F F, the arms G G, pivoted on the same level as the arms F, the tread pivoted to the lower ends of the arms F and the intermediate points of the arms G, the arms I I, pivoted at their upper ends under the upper ends of the arms G and having a tread attached rigidly thereto, and the tread P, pivoted to the lower ends of the arms G and intermediate points of the arms I, substantially as specified.

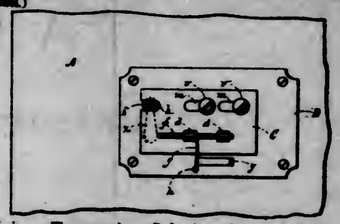
7. The combination, with a car-platform, of the swinging arms F, G, and I, connected together and having the treads attached thereto, the handle attached to one of the arms, and means, substantially as described, to lock the handle when the steps are raised, substantially as specified.

8. The combination, with a car-platform, of the swinging arms I, the arms G, connected thereto and having a handle, R, the arms F, connected to the arms G by the links S, the treads attached to the said arms, and the bracket attached to the car-platform and adapted to engage the said handle, substantially as specified.

9. The combination, with a car-platform, the swinging arms connected together and having the treads attached thereto, the handle attached to one of the arms, and the bracket T, having a notch, U, to receive and engage the said handle, substantially as and for the purpose specified.

10. The combination, with a car-platform, of the swinging arms F and G, the arms I, having the forks K at their free ends, the tread Q, attached to the said forks, the treads P and O, attached to the arms and connecting them together for simultaneous operation, and the handle attached to one of the arms, substantially as specified.

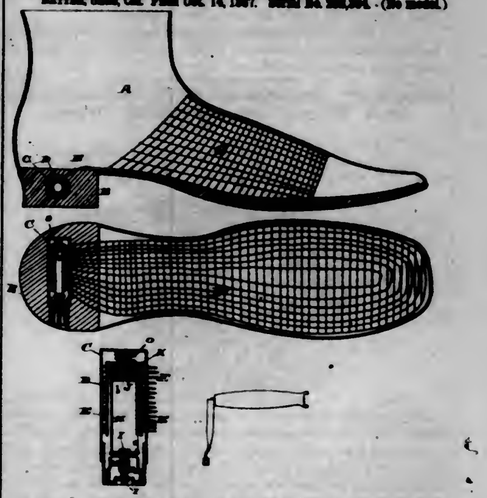
11. The combination, with a car-platform, of the arms F F, having the risers secured thereto, the arms G G, bent forward at their lower ends to form the arms M M, and having the riser P secured thereto, the arms I, having the forks K K at their lower ends, and the bars L, connecting the arms of the said forks, the tread secured to the bars L, the treads O and P, pivoted, respectively, between the arms F G and G I, and the handle attached to one of the arms, substantially as specified.



12. The combination, with a platform, of the arms F G I, the links N, pivoted to the arms G and I, the links H, pivoted to the arms F and G, and the treads attached to the said links, substantially as specified.

13. The combination, with a car-platform, of the arms I I, having the bars L on their lower ends provided with the flanges *l*, the arms G, connected to the arms I by the links N, having flanges *n*, the arms F, connected to the arms G by the links H, having the flanges *h*, and the treads O, P, and Q, secured to the flanges *h*, *n*, and *l*, respectively, substantially as specified.

14. The combination, with a car-platform, of the arm F, provided with a bracket, F', the arm G, provided with a bracket, G', the arm I, connected to the arm G, the treads attached to the said arms, the link S, connecting the brackets F' and G', and the operating-handle attached to the bracket G', substantially as specified.



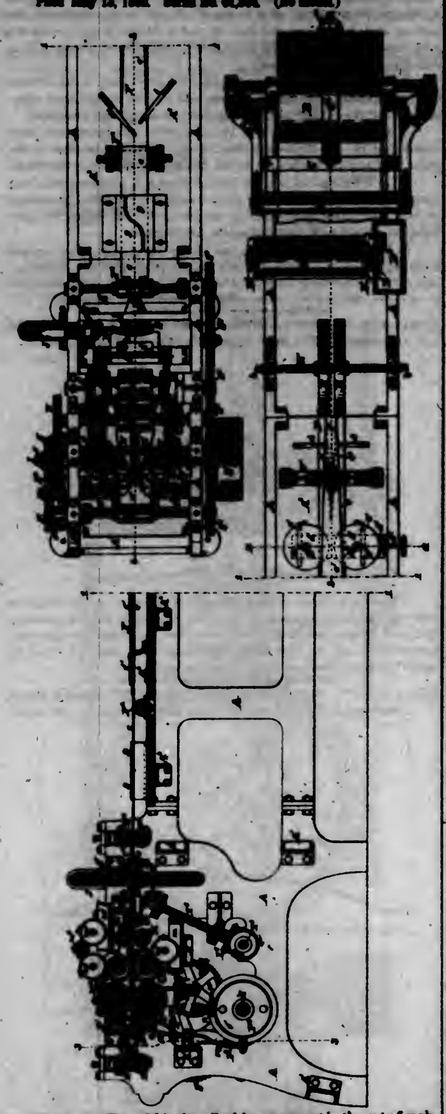
15. The combination, with a car-platform and the depending frame C, of the folding steps adapted in the lowered position to bear against the depending frame and in the raised position to form an extension to the platform, substantially as specified.

382,680. KEY-FASTENER. EDWARD BARRETT and HARRY G. BAKER, Fall River, Mass. Filed Feb. 3, 1888. Serial No. 262,882. (No model.)

Claim.—The escutcheon B, having a key-hole therein, and the locking-flange *y*, secured thereto, in combination with the plate C, having recess *k*, adapted to register with the shank portion of said key-hole, and also having slots *m*, the headed screws *v*, passing through said slots and into the escutcheon, the lugs *d d* upon said plate, the rod *f*, sliding in said lugs, and the arm connected to said rod between said lugs, and adapted to be sprung over either end of said locking-flange for locking the plate in operative or inoperative position, substantially as described.

382,681. HEATING APPARATUS FOR BOOTS OR SHOES. FRANK BAUER, Hilda, Cal. Filed Oct. 14, 1887. Serial No. 252,204. (No model.)

Claim.—1. A shoe having a chamber formed within the heel and a heater in said chamber, in combination with wires extending therefrom and passing through the sole or around the foot between the lining and the outer leather, substantially as herein described.



2. In a boot or shoe, the flexible conducting-wires concealed between the soles of the shoe or between the lining and the upper and connected with a heating-chamber formed within the heel of the shoe, substantially as herein described.

3. In a boot or shoe, the chamber formed within the heel of the shoe, having a metallic lining, a second concentric chamber fitted within the first and surrounded by conducting-wires which lie between the two, said wires extending thence through the soles or around the foot, in combination with the interior artificial or frictional heating devices, substantially as herein described.

4. In a boot or shoe, the concentric cylinders with the coils of conducting-wires lying between them and extending between the soles or around the foot, the interior cylinder having the concave frictional metallic surface formed in the inner end, in combination with the inner rotary cylinder having its end fitted to the concave surface and its outer end provided with a stem or shank, to which a key or crank may be attached for rotating it, substantially as herein described.

5. In a boot or shoe, the concentric cylinders with the frictional end pieces fitted into the heel of a shoe and adapted to be operated by the rotating key or crank, in combination with the spring by which the frictional surfaces are held in contact, and the conducting-wires arranged with relation to the cylinders, substantially as herein described.

382,682. APPARATUS FOR AND METHOD OF MAKING PAPER BAGS. LEANDER D. BENSON, Galesburg, Ill., assignor, by mesne assignments, to the Union Paper Bag Machine Company, Philadelphia, Pa. Filed May 12, 1886. Serial No. 201,904. (No model.)

Claim.—1. The within-described improvement in the art of making square or satchel bottom bags, the same consisting in folding and pasting a strip of paper longitudinally to form a tube, bending in the sides of said tube on central lines to form bellows-folds, severing the tube transversely to leave ends of the infolded portions projecting beyond the edges of the flat portions, and bending down each folded corner and pasting the same upon the body, substantially as set forth.

2. In the manufacture of square-bottom bags, the mode described of making the blanks with sides extending beyond the edges of the body, top, and bottom portions, the same consisting in forming a tube, folding in the side portions, and then severing the tube across the body portions upon nearly straight lines and across the folded portions upon lines in advance of the severed edges of the body portions, substantially as specified.

3. The mode described of folding a tube with projecting side portions, *e*, to form a square bottom, the same consisting in folding part of the body portion on each side against the side portions having the projecting ends, turning the side portions at right angles to the body, thereby bringing the tube to an H shape in cross-section, and then bending down each corner on an oblique line and pasting it to the part upon which it is folded, substantially as set forth.

4. The mode described of forming the bottoms of square bags, the same consisting in folding a tube to an H shape in cross-section, and then turning down the corners and pasting them to the parts beneath, as specified.

5. The combination, in a paper-bag machine, of devices, substantially as described, for folding in the sides of a tube, severing-plates *e E'*, creasing the body portions of the tube, severing-plates *i i'*, creasing the folded portions of the tube with their edges in advance of the plates *e E'*, and a striker, H, substantially as set forth.

6. The combination of plates having edges of different lengths arranged at angles to each other to cover a tube transversely on different lines, with a bent striker formed to carry different portions of said tube successively against different portions of said edges, substantially as set forth.

7. The combination, with devices, substantially as described, for folding in the sides of the tube and for feeding the blanks cut therefrom longitudinally, of curved guides N N and rollers O O for bringing the blank to an H shape and appliances, substantially as described, for turning down the corners, substantially as specified.

8. The combination, with the devices, substantially as described, for bringing the blank to an H shape in cross-section, of guides N, having recesses *o* and blades *n*, and appliances, substantially as described, whereby said blades are brought against the sides of the blanks to force them into said recesses, substantially as specified.

9. The combination, with devices, substantially as described, for bringing the blanks to an H shape in cross-section, of blades *g*, devices, substantially as described, for carrying them across the sides of the blanks to turn in the corners, and feeding appliances, substantially as described, whereby the blanks are fed forward after the turning in of the corners, substantially as set forth.

10. The combination, with devices, substantially as described, for folding the blanks to an H shape and for turning and pasting down the corners, of plates *r' r''*, adapted to fold down the sides of the bag as the same is fed forward, substantially as set forth.

11. The former F, having its forward end composed of the serrated plates *c*, *i*, and *i'*, the beveled filling-pieces *h* and *h'*, and the smooth-edged plate *c''*, all constructed and arranged substantially as described.

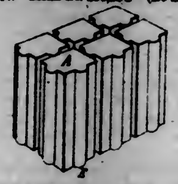
12. The combination of the serrated plates *c*, *i*, and *i'*, the beveled filling-pieces *h* and *h'*, the smooth-edged plate *c''*, and the wedge-shaped guides G G, all constructed and arranged to operate substantially as described.

13. The combination of the former F, having its front end composed of the serrated plates *c*, *i*, and *i'*, the beveled filling-pieces *h* and *h'*, and the smooth-edged plate *c''*, with the independent stationary serrated plate h^2, the wedge-shaped guides G G, and a revolving striker adapted to strike off a section of the paper tube from which to form a bag, substantially as described.

14. The combination of the striker, feed-rolls, plates *h* and *h'*, plates h^2 h^3, arranged between the striker-arm and feed-rolls K K to guide the paper tube from the point of cut-off to said feed-rolls K K, substantially as described.

15. The guide-plates h^2 h^3, in combination with the plates h^2 h^3, and the revolving pasters M and M', constructed, arranged, and adapted to operate substantially as described.

16. The guide-plates h^2 h^3, terminating at their front ends in the spirally-surfaced guides N N, in combination with feed-rolls for feeding the paper tube, substantially as described.

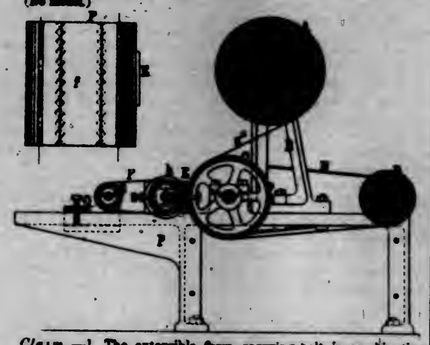


17. The combination of the pasting devices, spirally-surfaced guides N N, and feed-disks O O, arranged intermediate of said guides and adapted to operate substantially as described.

18. In a paper-bag machine, the combination, with forming, feeding, and guiding devices, substantially as described, of two sets of pasting apparatus arranged to apply paste to opposite sides of the bag-blank at the same time, substantially as and for the purposes described.

19. The combination of the two spirally-surfaced guides N N, each provided upon its inner face with two grooves, *o o*, arranged obliquely in opposite directions, the four crossing-fingers *n n* and *n' n'*, the levers P^2 P^3, and the cam-wheels P^4, provided with the cam-throws *p p'*, all constructed, arranged, and adapted to operate substantially as described.

20. The combination of the two spiral guides N N, provided with the oblique grooves *o o*, the crossing-fingers *n n* and *n' n'*, mechanism for reciprocating said fingers *n* and *n'*, the fingers *q q*, levers Q Q, and the cams P^4, provided with the cam-throws p^2 and p^3, all constructed, arranged, and adapted to operate substantially as described.



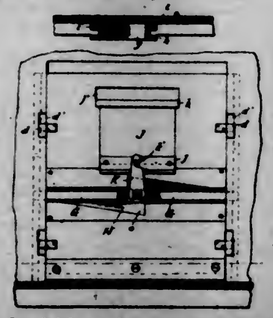
382,683. PAVEMENT. WILLIAM BUSSELL, Nebraska City, Nebr. Filed May 24, 1887. Serial No. 239,264. (No model.)

Claim.—1. A brick for paving provided on each of two adjacent sides with a rib for separating the blocks in use, said ribs being located at a distance from the corners, substantially as specified, whereby, when several bricks are placed together in a pavement, a continuous space will be provided around the corners.

2. A pavement consisting of bricks provided on each of two adjacent sides with a rib to separate the bricks, said ribs being located at a distance from the corners, whereby, when several bricks are placed together in a pavement, a continuous space will be provided around the corners, and a filling of concrete in the spaces between the bricks, all placed on a suitable road-bed, substantially as specified.

382,684. PRINTING-MACHINE. THOMAS S. BOWMAN, St. Louis, Mo. Filed Apr. 19, 1887. Renewed Feb. 27, 1888. Serial No. 265,432. (No model.)

Claim.—1. The extensible form-carrying belt, in combination with the impression-cylinder, as and for the purpose described.



2. The combination of the extensible form-carrying belt, the roller H, and the cylinder C, substantially as described.

3. The combination of the adjustable roller G, the extensible form-carrying belt, the roller H, and the cylinder C, substantially as described.

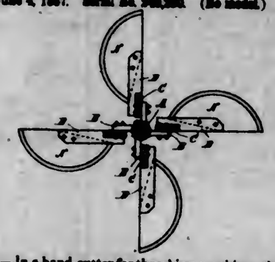
4. The combination of the shaft *a*, uprights B B', the cylinder C, the extensible form-bearing belt, the roller H, and the adjustable roller G, substantially as described.

5. The combination of the cylinder C, having the continuous surface *c*, with the rollers G H, and the extensible form-carrying belt, substantially as described.

382,685. FREIGHT-CAR. PERRY BROWN, Louisville, Ky. Filed Aug. 28, 1887. Serial No. 247,893. (No model.)

Claim.—1. In a freight-car, the combination of the side wall having the lower half permanently closed and the upper half permanently closed, of a door having a vertically-movable hinged connection at the top, and a rabbeted lock at the bottom for tightly closing said closed portion, substantially as and for the purpose specified.

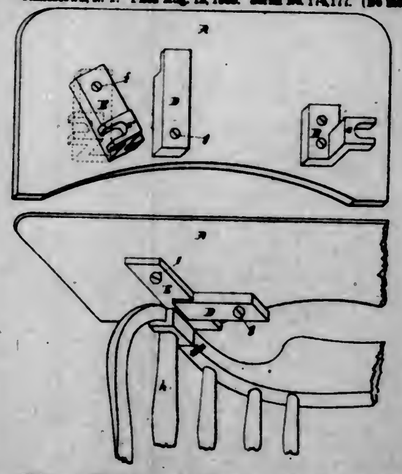
2. In a freight-car, the combination, with the car-body having an opening in its side wall, of a frame, F, hinged to said side wall, the slats on said frame, and the door E, and a double hinge connecting said frames and also hinging the frame F to the wall, substantially as and for the purpose specified.



3. In a freight-car, a door having a rabbeted lock at the bottom, locking means near its vertical center, and holding means upon opposite sides of the central lock, substantially as shown and described.

4. In a freight-car, a door provided with a supplemental door, and means for simultaneously locking said supplemental door to the main door and the main door to the frame, substantially as described.

5. In a freight-car, a door provided with a supplemental door, combined with transverse bolts on the main door, a bolt constructed to lock said supplemental door to the main door, and means for operating all of said bolts simultaneously, as set forth.



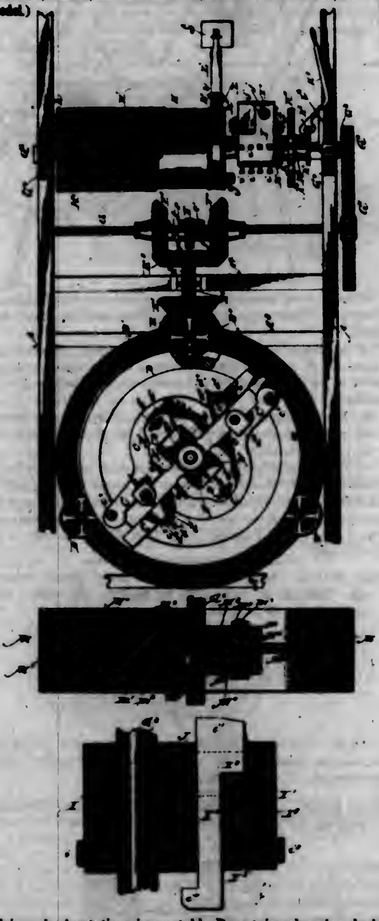
6. The combination, with a car having an opening in its top and a casting around said opening, of a hinged portion of the run-board, and a depending flange carried by said hinged portion and constructed to embrace said casting, substantially as shown and described.

382,686. BAND-CUTTER. JAMES BOSMAN, Indianapolis, Ind. Filed June 4, 1887. Serial No. 240,260. (No model.)

Claim.—In a band-cutter for thrashing-machines, the combination, with the revolving cutter-shaft A, of the removable short-armed iron spiders B B, the wooden guard-bars C C, the removable wooden knife-holders D D, and the thin detachable metal knife-blades N N, all arranged as described, and for the purpose specified.

382,687. TABLE ATTACHMENT FOR CHAIRS. ABNER A. BUSLER, Jamestown, N. Y. Filed Aug. 12, 1886. Serial No. 174,177. (No model.)

Claim.—1. The combination of the arms and spindles of a chair, a table adapted to rest upon said arms, and a leg, B, immovably secured to said table, and having a recessed arm, *c*, open on one side to receive one of the spindles of the chair, with a leg, E, pivotally secured to said table, and having a recessed arm, *c'*, open on one side to receive one of the spindles of the chair, substantially as and for the purpose described.



2. The combination of the arms and spindles of a chair, a table resting upon said arms, and a leg, B, secured to said table, and having a recessed arm, *c*, open on one side to receive one of the spindles of the chair, with a leg, E, pivotally secured to said table, and having a recessed arm, *c'*, open on one side to receive one of the spindles of the chair, and the locking-bar D, pivoted to the table and adapted to bear against the side of the leg E, substantially as and for the purpose described.

382,688. VETERINARY DRENCHING-TUBE. GEORGE W. GADY, Chicago, Ill. Filed Aug. 1, 1887. Serial No. 245,598. (No model.)

Claim.—An apparatus for the purpose described, consisting of a T-shaped tube, A, provided with an opening, *a*, and with cups *c* to both ends, all as shown and described.

382,689. APPARATUS FOR SINKING WELLS. MATTHEW T. CHAPMAN, Aurora, Ill. Filed Oct. 20, 1885. Serial No. 181,266. (No model.)

Claim.—1. A rotating ring or table, B, carrying clamping devices consisting of two arms, each carrying a support having cone-shaped clamps, substantially as and for the purpose specified.

2. The arms C C' C', plates D, cones D', and shafts D², for forming clamping-jaws, substantially as and for the purpose specified.

3. The arms C C' C', plates D, cones D', and shafts D², in combination with drawing and tightening bolts operating the arms for clamping the cones onto the article to be held, substantially as specified.

4. The combination, with a rotating ring, B, of the arms C C' C', plates D, cones D', shafts D², and tightening-bolts *e*², substantially as and for the purpose specified.

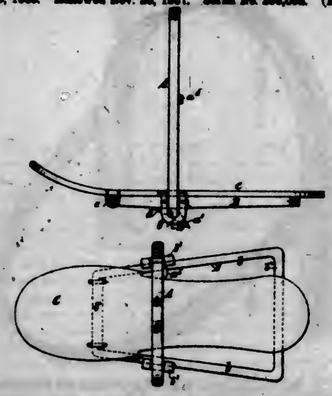
5. The combination, with pivoted arms, of a plate carrying the clamping-cones, drawing-bolts, and tightening-wedges for readily opening and closing the arms for clamping purposes, substantially as specified.

6. A loose winding-drum provided with a stationary stop, in combination with a rotating head carrying a sliding latch, and a cushioning device for the latch, substantially as and for the purpose specified.

7. A loose winding-drum provided with a catch or stop, in combination with a rotating head provided with a catch or stop, and a cushioning device for the catch or stop for preventing injurious effects from the engagement of the rotating head with the drum, substantially as specified.

8. The head I, having an extension, I', carrying a sliding latch, I', cushion J, and cam-disk K, for operating the head as a clutch, substantially as and for the purpose specified.

9. The combination of a rotating head, I, having an extension, I', carrying a sliding latch, I', bumpers or cushions J, cam-disk K, stop-plate K', and a loose winding-drum for engaging and disengaging the rotary head, substantially as specified.



10. The combination, with a power-shaft, of a cushioning-wheel consisting of a rim and a yielding ring or center connected with the rim by spokes, substantially as and for the purpose specified.

11. The rim M, spokes M', and ring M², in combination with the plate M³, center M⁴, plate M⁵, yielding sleeves *m'*, and bolts *m*², for cushioning the shock, substantially as specified.

12. A rotary clamp adapted to grasp a round article and rotate with the endwise movement of the article clamped independent of the rotary movement which carries said article around, and having jaws of a circular form provided with sharp angles, substantially as described.

13. A rotary clamp having jaws of a circular form, with sharp angles adapted to grasp a round article to rotate with the endwise movement of the article independent of the rotary movement which carries said article around, in combination with a rotary ring for carrying said clamp, and gearing for driving said ring, substantially as described.

382,690. STIRRUP. THOMAS CRADY, New York, N. Y. Filed Oct. 5, 1889. Renewed Nov. 25, 1887. Serial No. 256,092. (No model.)

Claim.—1. In the stirrup herein described, the combination of a hanger or main frame and an open frame hinged or pivotally connected to the former and adapted to hang down below it, substantially as specified.

2. In a stirrup, the combination of the hanger or main frame A, the frame B, hinged or pivotally connected thereto, and the lugs *a*² *a*² on the hanger or main frame, substantially as specified.

3. In the stirrup herein described, the combination of a hanger or main frame, a secondary frame hinged or pivotally connected thereto, and a foot-piece hinged or pivotally connected to the secondary frame, substantially as specified.

4. In a stirrup, the combination of a hanger or main frame, A, a secondary frame, B, hinged or pivotally connected thereto, and a foot-piece, C, hinged or pivotally connected to the frame B, substantially as specified.

5. In a stirrup, the combination of a hanger or main frame, A, provided with a lug, a^3, a secondary frame B, hinged or pivotally connected to the hanger or main frame A, and a foot-piece, C, hinged or pivotally connected to the frame B, substantially as specified.

382,691. NAPKIN-SUPPORTER. FREDERICK W. OTIS, Malden, Ill. Filed Aug. 2, 1887. Serial No. 245,889. (No model.)

Claim.—1. The napkin-support herein described, comprising napkin-supporting arms provided with table-embracing portions at their lower ends, substantially as specified.

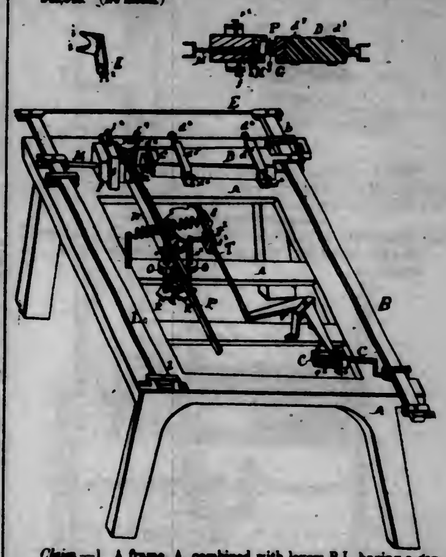
2. The napkin-support herein described, comprising napkin-supporting arms provided with napkin-retaining devices at their upper ends and table-embracing portions at their lower ends, substantially as specified.

3. A napkin-holder comprising napkin-supporting arms formed of wire, having at their lower ends wooden clamps bifurcated or grooved to receive the end of a table, substantially as specified.

4. A napkin-holder comprising a spring-arm having a napkin-retaining coil at its upper end and a bifurcated table-clamping block at its lower end, said arm passing through said block and bent to form a spring-tongue, substantially as specified.

5. The combination of the blocks A, grooved as at A', with the arms B, coiled as at B^2, connected to the blocks, as at B' B^2, and bent to form the spring-tongue B^3, substantially as specified.

382,692. HALTER. JAMES G. OVERIZ, West Troy, N. Y. Filed Jan. 18, 1888. Serial No. 261,088. (No model.)



Claim.—1. The combination, with a halter, substantially as shown and described, and a web throat-latch secured permanently to one side of the upper portion of the halter, of a skeleton frame, as C, through which the free end of the latch is woven, and constructed with an eye at the end nearest the side of the halter opposite to that to which the latch is permanently secured, and a device secured to said nearest side of the halter with which the eye is adapted to engage.

2. The combination, with a halter, substantially as shown and described, and a hook secured to one side of the upper portion thereof, and having a prong constructed with a recess in one side and a lug on the other side and opposite the recess, of a throat-latch connecting-frame, as C, having an eye at one end adapted to be fitted over the said prong by hand and arranged to be secured against accidental dislodgment by the said lug.

3. The combination, with a halter, of a metallic hook, for the purpose described, consisting of a body portion having a hole at one end for the attachment of the hook to the halter and terminating at the other end in a prong running toward said hole, the prong having a recess in one side of it and a lug on the other side opposite the recess, whereby an eye may be fitted over the prong by the hand and is prevented from accidental dislodgment.

382,693. MACHINE FOR MAKING BARBS FOR BOX-BOARD RIPPER. JOHN H. BENNINGER and HIRAM J. PARKER, Springfield, Mo.; said Benninger assignor to said Parker. Filed Sept. 2, 1887. Serial No. 248,646. (No model.)

Claim.—1. A frame, A, combined with levers B L, having a connecting-rod, E, and a punch and dies, substantially as shown and described.

2. A plunger, D, composed of a block hinged to lever B, placed in guides d^3 d^3, provided with set-screws, said plunger having a projection, d^3, spring-scraper d^4, and a die, G, substantially as shown and described.

3. The combination of levers B and L, having a connecting-rod, E, with plunger D, dies G H, and a punch, M, all substantially as and for the purpose specified.

4. The combination, with a frame, A, and levers B L, having a connecting-rod, E, of dies G H, plunger D, punch M, operating simultaneously with and through said dies, feed-rollers O O, operated by cog-wheels R R, ratchet-wheel S, ratchet-rod T, V-shaped motion-shifter V, and rod C, connected with lever B, substantially as shown and described.

382,694. HEEL-PLATE. CHARLES DOBEY, Ottawa, Ontario, Canada. Filed Jan. 30, 1888. Serial No. 261,693. (No model.) Patented in Canada Dec. 22, 1887, No. 26,268.

Claim.—The improved heel-plate herein described, having a sharp rim along its edges and sharp calks between the rims, the calks being approximately of the same height as the rims.

382,695. GAS-BURNER. ANDREW J. BOYLSTON, Cincinnati, Ohio. Filed Jan. 31, 1887. Serial No. 226,028. (No model.)

Claim.—The combination of the tip A, of refractory material, and the flaring casing B, the tip resting rigidly at the bottom of the flare by the enlargement or shoulder *a*, and narrowed above to form an annular chamber immediately surrounding the burner within the casing and provided with radial plungers *b*, opening into said annular chamber from the gas-supply, substantially as set forth.

382,696. APPARATUS FOR SUPPLYING HALAT CLOSING RECEPTACLES FOR CORKS, &c. TRESVAL EVERETT, London, England. Filed Dec. 27, 1886. Serial No. 222,503. (No model.) Patented in Germany June 13, 1886, No. 36,319.

Claim.—1. A mouth-piece for a bag or other receptacle, provided with a frame having a slot in its side, combined with a lock, and a tongue or flap having a key-slot and pivoted to said frame and co-operating with the slot therein, substantially as set forth.

2. The mouth-piece *b* and frame *c*, provided with a slot in its side, combined with a lock whose tumblers are slotted at *j*, and a tongue or flap pivoted to frame *c* and provided with a key-slot and with a pin or bolt, *k*, substantially as set forth.

3. A hopper or like device, *a*, provided with a fixed key, *c*, in combination with mouth-piece *b*, slotted frame *c*, and a pivoted tongue and a lock, substantially as set forth.

4. The hopper *a*, provided with a fixed key and with a bracket and pins *q d'*, in combination with a mouth-piece, slotted frame *c*, and pivoted tongue *e*, and a lock, substantially as set forth.

382,697. DRIVE-WELL POINT. FREDERICK E. PERKINS, Waterloo, N. Y. Filed Nov. 9, 1887. Serial No. 254,973. (No model.)

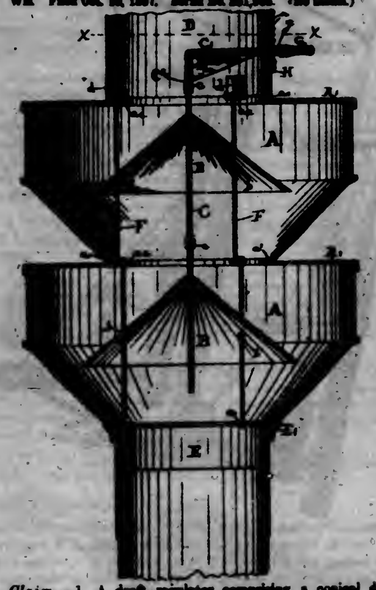
Claim.—1. As an improved article of manufacture, a drive-well point consisting of the tapering portion *a*, having thereon the vertical central stud, *d*, the annular part or hoop *b*, and one or more vertical arms or bars, *c c*, supporting the part *b* above the part *a* without inclosing the space between them, substantially and for the purposes specified.

2. The combination, in a drive-well, of the tube B, the collar *f*, removably applied to the said tube, the ring or hoop *b*, the tapering or pointed part *a*, and one or more arms or hoop-supports, *c c*, all arranged, substantially as described, with relation to each other, for the purposes specified.

3. The point A, consisting of the tapering part *a*, the stud *d*, one or more supports, *c c*, and the hoop *b*, in combination with the tube B, having a collar at or near its lower end, substantially as and for the purposes specified.

382,698. IRONBOARD. HENRY H. GARLAND, Somerville, Mass. Filed Feb. 28, 1888. Serial No. 265,916. (No model.)

Claim.—1. In an ironstand of the character described, the body A, having the curb E, well D, reservoir *m*, and slot *i*, in combination with a fountain, as B, provided with a duct for the ink and a vent-hole for air, substantially as set forth.



2. In an ironstand of the character described, the cover C, having the grooves *d* and provided with the shoulder *a*, adapted to engage the corners *p p'* of the curb E, and thereby prevent said cover from being accidentally upset, in combination with the body A and fountain B, substantially as specified.

3. The improved ironstand herein described, the same consisting of the body A, having the curb E, well D, reservoirs *m f*, slots *i* 60, and ledges *i v z*, the cover C, provided with the cavity *y*, shoulder *a*, and groove *d*, the cover J, fitted to slide on the ledge *z*, the cover N, fitted to slide on the ledge *i*, and the fountain B, provided with the stopple F, having the ducts *l A*, all being constructed, combined, and arranged to operate substantially as set forth.

4. In an ironstand of the character described, a fountain adapted to be inverted and supported in the well thereof, said fountain being provided with an opening through which air may enter the body of the fountain and an opening through which the ink may pass from the body of the fountain, the mouth of the air-opening being higher than the mouth of ink-opening when the fountain is inverted and in position for use in the ironstand, substantially as set forth.

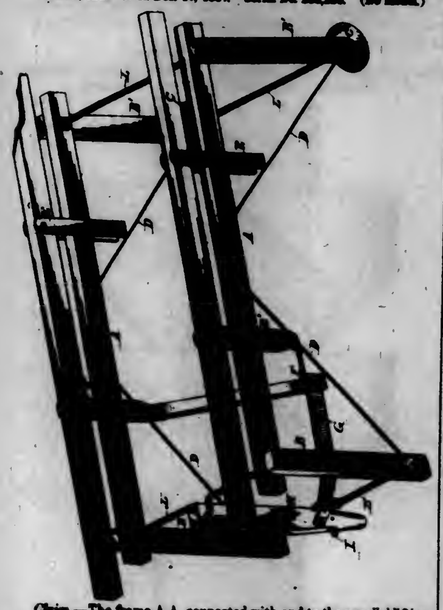
5. In an ironstand of the character described, the body A, having the well D, and an overflow-reservoir, *f*, separated from the main reservoir *m* by the partition 62, said partition being provided with the slot 60, in combination with the fountain B, supported in an inverted position in said well and provided with an ink-duct and vent-hole, substantially as set forth.

382,699. DRAFT-REGULATOR. GARDELL B. GRAY, Waukesha, Wis. Filed Oct. 10, 1887. Serial No. 251,933. (No model.)

Claim.—1. A draft-regulator comprising a conical damper adapted to be raised and lowered, a damper-chamber thereabout having annular top and bottom plates provided with lugs projecting laterally from their inner circumferences, and bolts passing through the lugs of the top and bottom plates, whereby they are bound together, substantially as and for the purpose set forth.

2. A draft-regulator comprising a conical damper adapted to be raised and lowered, a damper-chamber thereabout whose sides are expanded laterally toward the top and whose top and bottom are annular plates provided with lugs projecting laterally from their inner circumferences, and bolts passing through said lugs, whereby the top and bottom plates are bound together and the sides secured between them, substantially as and for the purpose set forth.

3. In a draft-regulator, in combination, a damper-chamber having annular top and bottom plates provided with lugs projecting laterally from their inner circumferences, a conical damper therein adapted to be raised and lowered, and bolts connecting the lugs of the top and bottom plates passing through apertures in the damper and serving as guides therefor, substantially as and for the purpose set forth.



4. In a draft-regulator, in combination, a conical damper adapted to be raised and lowered, a damper-chamber thereabout expanded laterally toward the top and having an annular top plate provided with lugs projecting laterally from its inner circumference, which lugs serve as stops for the damper when raised, substantially as and for the purpose set forth.

5. In a draft-regulator, in combination, a damper-chamber having annular top and bottom plates provided with lugs projecting laterally from their inner circumferences, a conical damper therein adapted to be raised and lowered, and bolts, connecting the lugs of the top and bottom plates, passing through apertures in the damper and serving

as guides therefor, the lugs on the upper plate serving as stops for the damper when raised, substantially as and for the purpose set forth.

6. In a draft-regulator, in combination with a damper-chamber expanded laterally toward the top and having annular top and bottom plates provided with lugs projecting laterally from their inner circumferences, a pipe above and secured to the damper-chamber, a conical damper within the chamber, bolts passing through the lugs, by which the top and bottom plates are bound together, and through apertures in the damper, whereby they serve as guides for it, and a damper-support extending upward and passing through the wall of the pipe, and having a lifting-handle outside the pipe whose stem engages in a notched plate, substantially as and for the purpose set forth.

382,700. WAGON AND CARRIAGE LIFTER. DAVID B. HAMLEY, Bristol, Ind. Filed Dec. 17, 1887. Serial No. 258,288. (No model.)

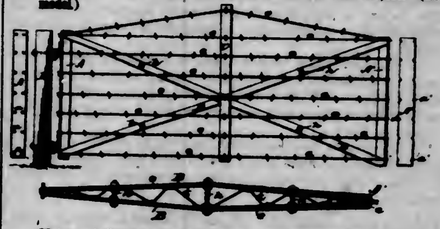
Claim.—The frame A A, connected with and to the parallel lifting-bars J J by the adjustable parallel couplings E E and E' E', supported by the folding legs B B and B' B', with the rollers C C on legs B' B', pivot F at the union of couplings E and E', attached to hand-lever H by connecting-rod G, all combined substantially as herein described and set forth.

382,701. COMBINED CONCENTRATOR AND AMALGAMATOR. WILLIAM H. HARTMAN, Denver, Colo. Filed July 1, 1887. Serial No. 243,101. (No model.)

Claim.—1. The combination of the main supporting-frame, a series of tiers of hanging shelves supported therein, each tier being in vertical and horizontal planes different from such planes of any other tier, so that the tiers are arranged in step fashion, a series of amalgamating-pans supported thereon, and means for imparting a reciprocating movement to the shelves and pans, substantially as set forth.

2. An amalgamating-pan having sides flaring from the base to the rim, an aperture at each base with grooved ways upon two of its sides, a mercury-pan taking in such grooved ways and closing the aperture, and a strap passing beneath the mercury-pan and additionally securing it in position, substantially as set forth.

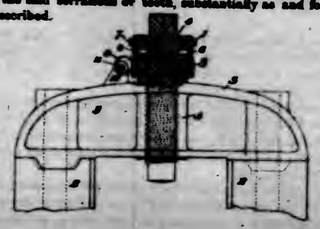
3. The combination of a main supporting-frame, two or more shelves suspended therein in different vertical and horizontal planes, a series of flaring pans carried thereon and having removable dished bottoms or mercury-pans held thereon in grooved ways, and means for imparting a reciprocating motion to the shelves and pans, substantially as set forth.



4. The combination of the main supporting-frame, two or more shelves supported therein in different vertical and horizontal planes, flaring-sided pans supported upon the shelves and arranged to discharge from a higher into a lower series, and means for imparting a reciprocating motion to the pans and shelves, substantially as set forth.

382,702. SWEAT-PAD. GEORGE P. HOWE, Streator, Ill. Filed Feb. 11, 1888. Serial No. 263,603. (No model.)

Claim.—As an improved article of manufacture, the sweat-pad herein described and shown, constructed with the front roll, *a*, extending the entire length of the pad, and the rear enlargement, *c*, the two parts brought together and stitched in rear of the roll, as at *b*, and also stitched through the body, as at *d*, the outer face forming a concave gradually curved toward the front roll and the rear forming a convex surface, as shown, and for the purpose set forth.

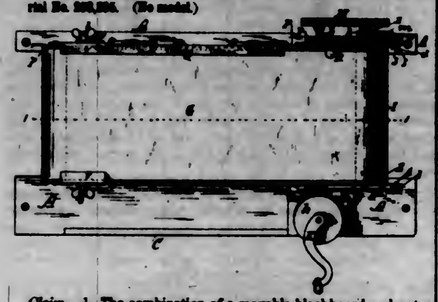


382,703. FARM-GATE. VIRGIL D. JOHNSON and VIRGIL GUTTLE, Mount Pleasant, Iowa. Filed May 14, 1887. Serial No. 238,152. (No model.)

Claim.—A farm-gate composed of upright metal bars A A', and double upright bars C, and double diagonal bars B, with the center of said bars B and C sprung outward or pressed apart at their center by a stud, A, and stayed by zigzag braces *i*, as a supporting frame-work, in combination with horizontal wires *e*, substantially as shown, for the purpose specified.

382,704. APPLIANCE FOR ROLLS. WILLIAM R. JOHN, Braddock, Pa. Filed Mar. 31, 1888. Serial No. 268,668. (No model.)

Claim.—1. An improvement in appliances for rolls, which consists in the combination, with the adjusting-screw, which is provided with serrations or teeth, of a pivoted look which is movable on its pivot to engage the said serrations or teeth, substantially as and for the purpose described.



382,704.

2. An improvement in appliances for rolls, which consists in the combination, with the adjusting-screw, which is provided with serrations or teeth, of a pivoted look which is movable on its pivot to engage the said serrations or teeth, said look being also serrated, substantially as and for the purpose described.

382,705. BLACKBOARD AND WIPING AND DUST-COLLECTING APPARATUS. JOHN KANE, Green Isle, Minn. Filed Oct. 31, 1887. Serial No. 255,256. (No model.)

Claim.—1. The combination of a movable blackboard and automatically-rotating wiper, for the purpose herein set forth.

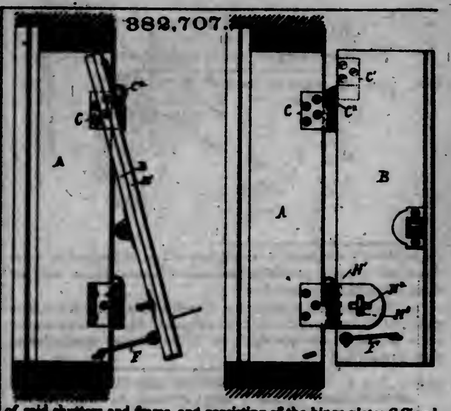
2. The combination of a movable endless belt blackboard or blackboard-surface and an automatically-rotating wiper, for the purpose herein specified.

3. A movable blackboard and a wiper therefor located in a close chamber, the said chamber being provided with a covered discharge-opening for the accumulated chalk-dust.

4. The combination of a movable endless belt blackboard, a revolving wiper, a turning handle or crank for driving the said rollers, belt, and wiper located in an oblique position, and gearing connecting the said handle, wiper, and endless belt, substantially as herein specified.

5. The pivoted hook-bearings P P, in combination with the revolving wiper N and the revolving rollers E I, substantially as and for the purpose herein specified.

6. In combination with the endless belt blackboard and fixed back board, the lip or flange Q and spring-plate R, whereby the upper edge of the endless belt is held straight and in position, substantially as and for the purpose herein specified.



382,706. CORN-HUSKING IMPLEMENT. PETER KAUFMAN, Bloomington, Ill. Filed Oct. 26, 1887. Serial No. 253,493. (No model.)

Claim.—The herein-described corn-husking implement, constructed from a single piece of wire or other suitable material, bent to form the loop B, for the reception of the fingers, the angular portion D, projecting over and beyond the forefinger, and the shank H, to bear against the side palm of the hand, substantially as and for the purpose set forth.

382,707. ADJUSTABLE SHUTTER. CHARLES J. KRAUSE, Beverly, N. J., assignor of one-half to James A. Moody, Philadelphia, Pa. Filed Dec. 31, 1887. Serial No. 258,491. (No model.)

Claim.—1. In combination with a window-frame and a pair of adjustable shutters, the double-acting hinge consisting of the hinge-plate C, having a socket-bearing secured to the inside of the frame at right angles to the shutter, a similar hinge-plate, C', secured to the outside of the shutter, and a hinge-bolt, C², in the form of a right angle, playing in the socket-bearing of both hinge-plates, substantially as described.

2. The combination, with a window-frame and a pair of adjustable shutters, of a double-acting hinge located at the upper end of each of said shutters and frame, and consisting of the hinge-plates C C' and the angular hinge-bolt C², playing in the socket-bearings of said hinge-plates, and of adjustable hinges located at the lower end of each of said shutters and frame, and consisting of the hinge-plate H', secured at one side thereof to the frame, the other side being slotted at H², and a turn-bolt, H³, secured to the shutter and adapted to be inserted in said slot, the said parts being constructed, arranged, and operating substantially as and for the purpose set forth.

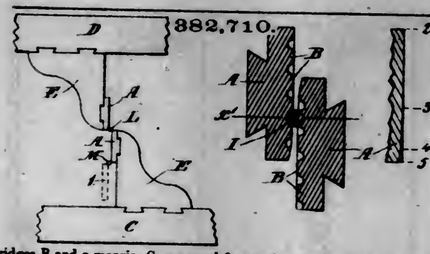
382,708. IMPLEMENT FOR EXTERMINATING ROBERTS. EMMA P. KINNEY, Lignite, Ind. Filed Oct. 11, 1887. Serial No. 252,042. (No model.)

Claim.—The herein-described implement for exterminating rodents, consisting of the handle B, having secured at one end the head A, said head being provided with inflexible sharpened teeth *c*, arranged in pairs thereon, and each pair being crossed or lapped together, as shown and described.

382,709. TRACE-CARRIER. OLIVER I. LADEWIGSEN, Bertrandville, Kans. Filed Feb. 14, 1888. Serial No. 263,862. (No model.)

Claim.—1. The combination, with the lower plate having a series of posts or studs, the upper plate provided with coincident grooves or recesses, and the straps secured between said plates, of a pad secured at one end to one of said straps and adapted to rest against the face of the lower plate, substantially as set forth.

2. As an improvement in harness attachments, the lower plate having studs or posts projecting therefrom, and the upper plate provided with coincident grooves or perforations adapted to receive the ends of said studs or posts, said upper plates being provided with inclined hooks projecting therefrom, substantially as set forth.

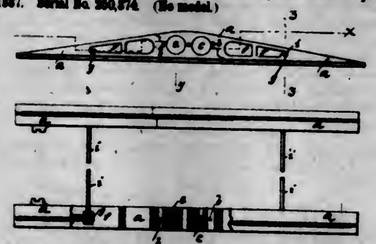


382,710. DIE FOR MAKING AUGERS. ANDREW LAMBERT, Otto St. Post Gaston, Canada, assignor of one-half to Henry Harrison Warren, Manassas, N. Y. Filed Feb. 6, 1888. Serial No. 263,126. (No model.)

Claim.—1. The combination of the dies A, each having diagonal parallel ridges B, arranged face to face, and caused to reciprocate and to act in parallel planes upon the metal placed between them, substantially as described.

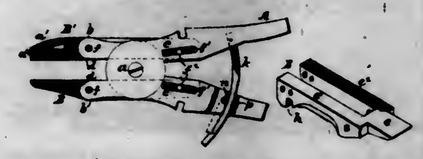
2. The combination of the dies A, each having diagonal parallel ridges B and a margin, F, arranged face to face, and caused to reciprocate and to act in parallel planes upon the metal placed between them, substantially as described.

3. The combination of the dies A, each having diagonal parallel



382,710.

ridges B and a margin, G, arranged face to face, and caused to reciprocate and to act in parallel planes upon the metal placed between them, substantially as described.

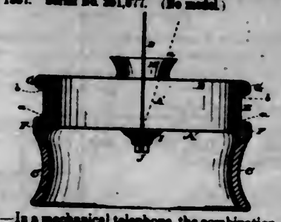


4. The combination of the dies A, each having ridges B and margins F and G, arranged face to face, and caused to reciprocate and to act in parallel planes upon the metal placed between them, substantially as described.

382,711. DEVICE FOR CARRYING CARS OVER TEMPORARY OBSTRUCTIONS. CHARLES H. LITTLE, Pittsburg, Pa. Filed Sept. 27, 1887. Serial No. 250,574. (No model.)

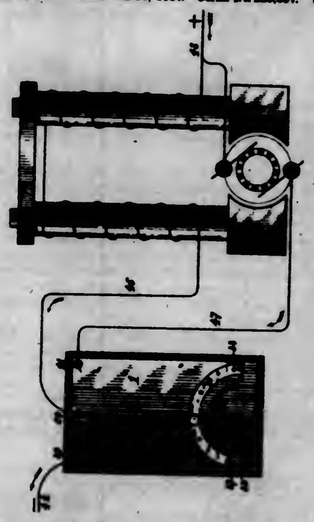
Claim.—In a device such as described, the combination consisting of the two sections *a* for each rail of the track, one or more circular openings, *c*, extending through the same, a portion of each of said openings *c* being formed in each of the two sections *a*, the projecting pins *b* for securing the sections together, the two rods *i*, extending across the track detachably secured to the device, whereby each portion of the device is held rigidly and securely in position, and the base and top of the sections *a* corresponding to shape of the rail *d*, on which the device is placed, substantially as and for the purpose set forth.

382,712. PLIERS. WILLIAM C. HARR, Orawa, Iowa. Filed Aug. 11, 1887. Serial No. 246,717. (No model.)



Claim.—1. The combination, with the pliers-handles A A', pivoted together and having the holes and slots, as set forth, of two bifurcated jaws, each provided with one pivotal hole through its front portion and a plurality of pivotal holes through its rear portion, and removably connected with the handles by means of the removable pins at *f f'*, substantially as and for the purposes described.

2. In pliers, a removable jaw, B', provided with a conic point, a^3, having a longitudinal groove, a^4, and a cross-groove, a^5, in combination with the removable nose *a'*, provided with a socket to fit over the conic point, and having a pin, a^6, adapted to extend into the grooves of the point, the said conic point having its inner gripping-surface flush with the inner face of the jaw, and being adapted to be used separately from the removable nose as a round-nosed jaw of pliers, substantially as described, for the purposes set forth.



3. The combination, with the handles A A', pivoted together and provided with the slots *c*, and having a wire-cutting groove, *h'*, of the bifurcated jaws B B', provided with a wire-cutting groove, *h*, each jaw having its forward portion pivoted to one of the handles by a pin inserted through perforations at *f*, and the same jaw having its rear portion connected with the other handle by a pin inserted through perforations in the jaw at *f'* and through slot *c* in the handle, in which construction and arrangement of the parts in the cutting operation the jaw and handle having the wire-cutting grooves approach a straightened position, substantially as and for the purpose described.

382,713. MECHANICAL TELEPHONE. PETER L. MARIE, West Salem, assignor of one-half to Henry B. West, Cleveland, Ohio. Filed Oct. 7, 1887. Serial No. 251,677. (No model.)

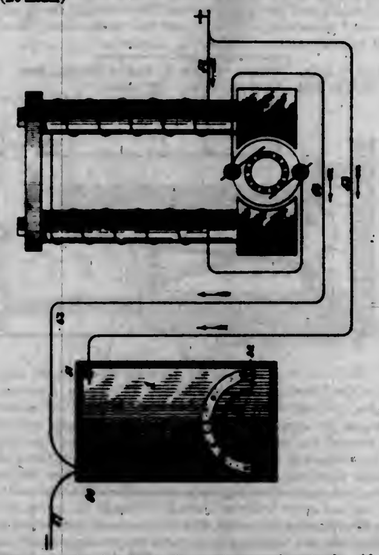
Claim.—In a mechanical telephone, the combination, with a drum, A', having two diaphragms, prepared, as described, with albumen or glutinous coating, attached to the hoop E, with a mouth-piece connected to one end of the drum, and a ring, G, at the other over the diaphragm-lap, of a guard, H, head I, and wire-line connection with said head, arranged in the manner and for the purpose substantially as set forth.

382,714. SWITCH FOR ELECTRIC MOTORS. RICHARD H. MATHER, Windsor, Conn. Filed Jan. 20, 1887. Serial No. 225,227. (No model.)

Claim.—1. An electric circuit a portion of which is divided into two branches forming a constantly-closed loop, and a shunt-wound electro-dynamic motor having its armature in one of said branches and its field-magnet helices in the other of said branches, in combination with a rheostat and a switch which is adapted to introduce, operate, and cut out said rheostat as a portion of said first-mentioned branch, and also to open and close an electrical connection between said loop and the remaining portion of said circuit, substantially as and for the purpose specified.

2. An electric circuit a portion of which is divided into two branches forming a closed loop, and an electric motor having its armature in one of said branches, and having field-magnet helices in the other of said branches, in combination with a rheostat and a switch which is adapted to manipulate said rheostat and to open and close the circuit-connection of said loop, substantially as and for the purpose specified.

3. An electric circuit having two branches, an electric motor having an armature in one of said branches and field-magnet helices in the other of said branches, and a rheostat which is connected with said armature-branch and is provided with a number of contact-points, in combination with an electric switch having a contact-plate which is connected with said circuit, and a movable conductor which is connected with said field-magnet branch, and is adapted to make sliding contacts with said contact-points and contact-plate, substantially as and for the purpose specified.



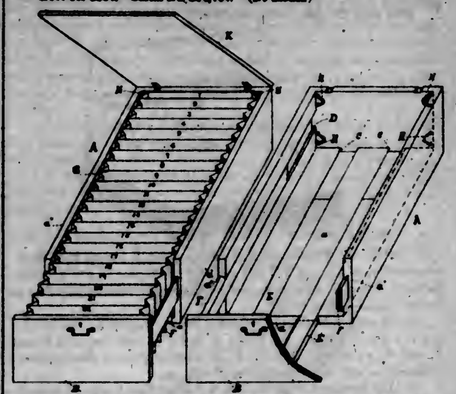
4. An electric switch having three terminals, in combination with a rheostat which is connected with one of said terminals, and a movable conductor which is connected with another of said terminals and is adapted to operate said rheostat, and also to make and break an electrical connection with the remaining terminal of said switch, substantially as and for the purpose specified.

5. An electric generator, a shunt-wound electric motor, and a rheostat which is connected with the armature-circuit of said motor, in combination with a movable conductor which is connected with the field-magnet circuit of said motor, and is adapted to operate said rheostat and to open and close an electrical connection between said movable conductor and said generator, substantially as and for the purpose specified.

6. An electric circuit having two branches, and an electric motor having an armature in one of said branches and field-magnet helices in the other of said branches, in combination with a rheostat which is connected with the armature-branch of said motor, a movable conductor which is connected with the field-magnet branch of said motor, and is adapted to connect said branches as a constantly-closed loop through a variable portion of said rheostat, and also to connect and disconnect said loop with the main circuit at a point between said branches, substantially as and for the purpose specified.

7. An electric circuit having two branches, a shunt-wound electric motor having its armature and field-magnet helices arranged in said branches, respectively, a rheostat which has a constant connection with the armature-branch of said motor, in combination with an electric switch which is provided with an insulated rest, a contact-plate, and a movable conductor connecting said branches through a variable portion of said rheostat and making and breaking contact with said plate, substantially as and for the purpose specified.

382,715. SWITCHING DEVICE FOR ELECTRIC MOTORS. RICHARD H. MATHER, Windsor, Conn. Filed Feb. 10, 1887. Serial No. 226,991. (No model.)



Claim.—1. An electric circuit, a series-wound motor in said circuit, a rheostat which is provided with a series of contact-points and is connected with said circuit at one side of said motor, a conductive plate which is connected with said circuit at the other side of said motor, a switch-finger which is adapted to make successive contacts with said contact-points and to make and break contact with said plate, in combination with an automatic cut-out which is arranged as a shunt about said rheostat and motor, substantially as and for the purpose specified.

2. An electric motor, an automatic cut-out, a rheostat, and a manual switch which is adapted to manipulate said rheostat, in combination with spring mechanism which is carried by the switch-arm and is adapted to open said cut-out whenever said arm is carried to a predetermined position, substantially as and for the purpose specified.

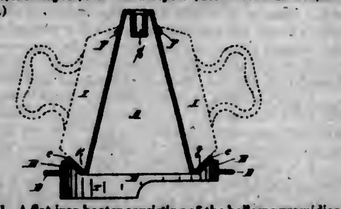
3. An electric motor and a rheostat, in combination with a manual switch which has a movable switch-arm and is adapted to operate said rheostat, a spring-seated stop-pin which is carried by said arm, an automatic cut-out which is provided with spring-contact, and an intermediate stop whereby motion is communicated from said stop-pin to said spring-contact, substantially as and for the purpose specified.

882,716. BILL-FILE. ROWE L. MATHEWS, Ada, Miss. Filed Nov. 10, 1887. Serial No. 254,767. (No model.)

Claim.—1. The combination, with an extensible bill-file case consisting, essentially, of a pair of telescoping parts, of a removable bellows bill-file detachably connected at its opposite ends to the end walls of the telescoping parts of said case, substantially as described.

2. In combination, the box-like body A, having its front end removed and provided with the grooves C D, the end B, provided with the slides E and F, working in said grooves, and the bellows-file G, attached at one end to the relatively fixed part A and at the other to the relatively movable part B, as and for the purpose set forth.

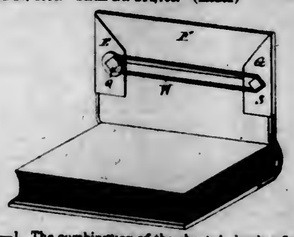
3. In combination with a bill-file case, a bellows bill-file adapted to fit the same and having end boards provided with projecting outer edges, and hook-shaped lugs secured in the ends of said case in pairs with their hook-shaped portions facing each other and adapted to detachably secure the ends of the bellows-file to the ends of the case, as and for the purpose set forth.



4. The extensible bill-file case and expansible bill-file described, consisting of the box-like body A, having one end removed and provided with the grooves C and D, the movable end B, provided with the slides E and F, working in said grooves, the lid K, pivotally secured to the rear end of the body A, and the bellows-file G, having its opposite ends secured by the lugs H, one end to the relatively fixed part A and the other to the movable part B, substantially as and for the purpose set forth.

382,717. WOLFRAM PROJECTILE. ARMAND MIES, Leipsic, Saxony, and HUGO BUSSMEY, Durlach, Baveria, Germany. Filed June 30, 1884. Serial No. 136,889. (No model.) Patented in Germany Nov. 20, 1883, No. 28,691; in Belgium Mar. 13, 1883, No. 60,734; in England Apr. 13, 1883, No. 1,949; in Austria-Hungary July 13, 1883, No. 16,606 and No. 20,606; in Italy June 30, 1884, XVIII, 14,606, and XXXIII, 200, and in France July 19, 1884, No. 163,269.

Claim.—As a new article of manufacture, a projectile made of metallic tungsten or wolfram, substantially as described.

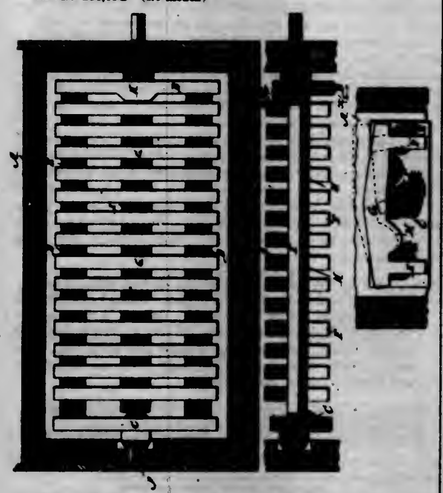


382,718. FLAT-IRON HEATER. ARMENIUS MOONEY and ASBURY LIECHARDT, Indianapolis, Ind. Filed Sept. 30, 1887. Serial No. 251,147. (No model.)

Claim.—1. A flat-iron heater consisting of the hollow pyramidical iron-holder A, having an imperforate top, the annular base B, the outward-projecting rim D, and the downward-extending flange *r*, all arranged as described, and for the purpose specified.

2. A flat-iron heater consisting of the hollow pyramidical iron-holder A, having an imperforate top, the base B, constructed as described, and the socket S, for receiving a curling-iron or the stove-lid lifter, as specified.

382,719. BOOK-COVER. CHARLES F. MORGAN, Cleveland, Ohio. Filed Sept. 27, 1886. Serial No. 214,708. (Model.)



Claim.—1. The combination of the sheet A, having flaps freed, respectively, at *a b*, *c d*, *e f*, and *g h*, and the slots *c m* and *g n*, with fasteners K and L, all constructed and arranged substantially as and for the purposes described.

2. The combination of the sheet A, having flaps freed, respectively, at *a b*, *c d*, *e f*, and *g h*, the slots *c m* and *g n*, with fasteners K and L, and the catches Q, R, S, and T, all constructed and arranged substantially as and for purposes described.

3. The combination of the sheet A, having flaps freed, respectively, at *a b*, *c d*, *e f*, and *g h*, the slots *c m* and *g n*, with fasteners K and L, the catches Q, R, S, and T, and the binder W, all constructed and arranged substantially as and for the purposes described.

382,720. GRATE. ABNER C. MORTON, Chicago, Ill., assignor of one-fourth to Samuel C. Morton, same place. Filed Oct. 19, 1886. Serial No. 216,694. (No model.)

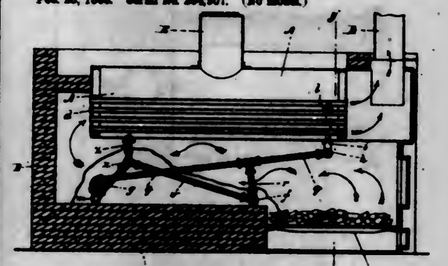
Claim.—1. The grate-frame composed of side and end bars, said side bars being provided with a series of perforations, in combination with a series of grate-bars having lugs projecting into said perforations, whereby said grate-bars may be bodily elevated or have either end elevated without disconnection from the frame or displacement relative to each other, and any grate-bar be removable from the frame without disturbing the others, substantially as described.

2. A grate-frame, in combination with a series of removable grate-bars and a separate rock-bar underlying said grate-bars at their centers, said bars being weighted at a point between the rock-bar and one end thereof, substantially as and for the purpose described.

3. A grate-frame composed of side and end bars, the side bars being provided with a series of perforations, a series of grate-bars supported by said frame, and lugs on said bars engaging the perforations in said side bars, in combination with a rock-bar underlying and engaging said grate-bars about the center of length thereof, and weights secured to said grate-bars intermediate the center and one end thereof, substantially as described.

382,721. FEED-TROUGH. ELI P. EDWARDS and JOHN MANAFFA, Beloit, Kans. Filed Dec. 20, 1887. Serial No. 258,472. (No model.)

Claim.—1. The herein-described trough attachment for cribs, boxes, &c., having an open end, and provided with an inclined chute that projects from said end to enter an opening in the side of the crib or box to which the device may be applied, substantially as specified.



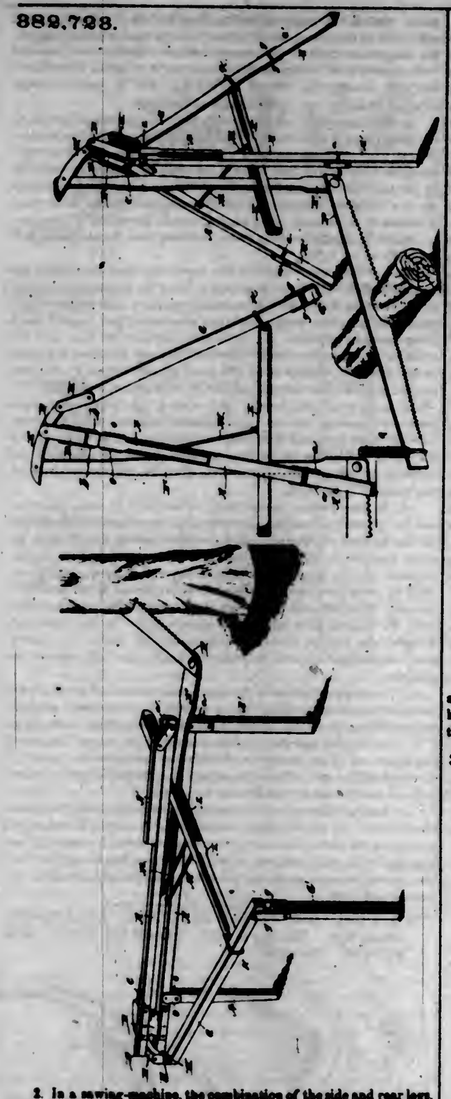
2. The combination, with the shallow trough having one end open and provided with an inclined chute, of the top having a feed-opening, the ear extending from the rear end of the top, and the cut-off adapted to be held in place by the bolt passing through the ear, substantially as described.

3. The herein shown and described attachment, composed of the shallow trough open at one end and having flaring sides and provided with ears, and an inclined chute at the open end, the top provided with a feed-opening and having an ear at its rear end, and the cut-off having a slotted extension, substantially as and for the purpose described.

4. The combination, with the box or crib having an opening in its side, of the trough having an open end, which end is secured to the side of the crib or box, and is provided with an inclined chute that extends through the said opening into the box or crib, substantially as described.

5. The combination, with the box or crib having an opening in its side, and the trough having an open end and provided with an inclined chute that extends through the said opening, and with the lug F, of the slotted cut-off placed between the box or crib and the trough, and the bolt *f*, for securing the trough to the box and for holding the cut-off in an adjusted position, substantially as specified.

382,722. BOILER. GEORGE F. ELLIOTT, Belmont, Mass. Filed Feb. 23, 1888. Serial No. 264,907. (No model.)



Claim.—1. In a boiler of the character described, the combination of the following instrumentalities, to wit: a body, a vertical pipe tapping said body at the rear on the under side thereof, a transversely-arranged pipe connected centrally with said vertical pipe and extending through the boiler-casing, a transversely-arranged pipe disposed on the bridge-wall near the fire-box and extending through the casing, inclined pipes connecting the ends of said transverse pipes outside the casing, a transversely-arranged pipe disposed on said bridge-wall under the rear end of the boiler and extending through the casing, the ends of said pipe being connected with the transverse pipe which is connected with said vertical pipe, a transversely-arranged pipe passing through the casing near the forward end of the boiler, inclined pipes connecting said pipe with the transverse pipe at the rear of the bridge-wall, and vertical pipes connecting the ends of the transverse pipes and the body of the boiler below the water-line, all being arranged to operate substantially as set forth.

2. In a boiler, the body or boiler proper, A, having the flues *d* and dome E, the vertical pipes *x r i*, transverse pipes *s m f* A, inclined pipes *q v g*, bridge-wall H, and casing D, combined and arranged to operate substantially as set forth.

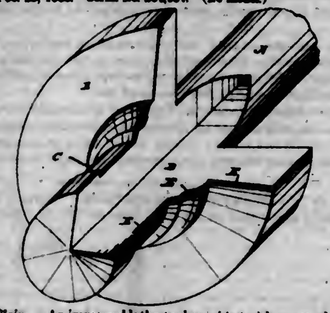
382,723. WOOD-SAWING MACHINE. FRANK W. GLEE, Hamlin, Mich. Filed Jan. 23, 1888. Serial No. 261,594. (No model.)

Claim.—1. In a sawing-machine, the combination of the side and rear legs, having extensions connected to their lower ends and adapted to assume positions at right angles to the legs when the machine is in the horizontal position, substantially as specified, the short leg mounted on one of the legs and the sawing device mounted on the said legs, all constructed and arranged substantially as and for the purpose specified.

382,723.

2. In a sawing-machine, the combination of the side and rear legs, A A and G, connected together at their upper ends, the extensions A' A' and G' at the lower ends of the said legs, respectively, and the side links, *a a* and *g*, connecting the upper ends of the extensions to the lower ends of the legs, the swinging arm F, and the saw attached to the lower end thereof, substantially as specified.

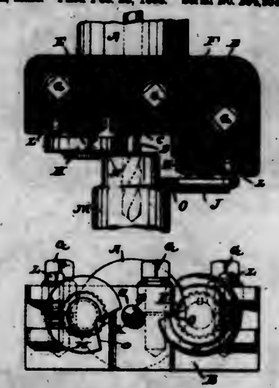
3. In a sawing-machine, the combination of the side legs, A A, and the rear leg, G, connected together at their upper ends, the guide-bar having a longitudinal slot therein, the loop on the rear end of the guide-bar embracing and sliding on the rear leg, the connecting-rods between an intermediate point of the guide-bar and the side legs, and the swinging arm pivoted at its upper end and operating in the said guide-slot, and having the saw attached at one end thereto, substantially as specified.



4. In a sawing-machine, the combination of the block B, the side legs mounted on the block, the lever B, mounted on the block, the rear leg connected to one end of the lever, and the swinging arm connected to the other end of the lever and having the saw attached thereto, substantially as specified.

5. In a sawing-machine, the combination, with a suitable stand, of the lever pivoted thereto, the leg connected to one end of the lever, and the swinging arm connected to the other end and having the saw attached thereto, substantially as specified.

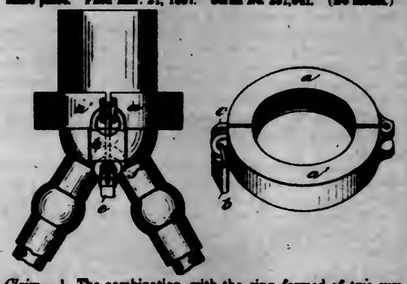
6. In a sawing-machine, the combination of the block B, having the depending ears *b b* and the vertical ears D D, the legs A A, mounted at their upper ends between the ears *b b*, the lever E, mounted between the ears D D, the rear leg, G, connected at its upper end to the rear end of the lever by means of the pivoted links H H, the guide-bar connected to the legs, and the swinging arm operating in a slot in the said guide-bar and having the saw attached to its lower end, substantially as specified.



7. In a sawing-machine, the combination of the block B, the side legs mounted at their upper ends, thereon, the depending tongue or stop C between the legs to limit the outward swing of the latter, the lever mounted on the block, the rear leg connected to one end of the lever, and the swinging arm connected to the other end thereof and having the saw attached thereto, as set forth.

382,724. LATHE-TOOL. ANDREW PATTERSON, McKeesport, Pa., assignor to the National Tube Works Company, Boston, Mass. Filed Feb. 23, 1888. Serial No. 264,957. (No model.)

Claim.—An improved lathe-tool provided with an attaching-shank and with a cutting stem and flange fluted to form a cutting-edge, and having the cutting-faces of flange and stem formed spirally, substantially as and for the purpose set forth.

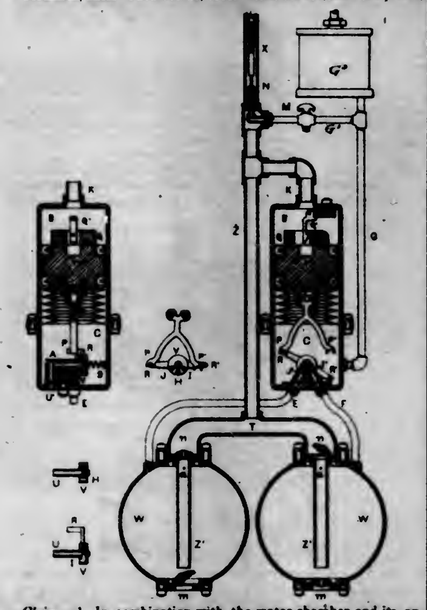


382,725. MACHINE FOR TURNING AXLE-ENDS. ANDREW PATTERSON, McKeesport, Pa., assignor to the National Tube Works Company, Boston, Mass. Filed Feb. 23, 1888. Serial No. 264,958. (No model.)

Claim.—1. In a lathe-tool, the combination, substantially as set forth, of an attaching-shank, a block upon the forward end thereof, an axial socket therein, one or more sockets parallel thereto, pinching-screws for the sockets, a bit secured in the axial socket, and disk tools provided with shanks engaging the other sockets.

2. In a lathe-tool, the combination, substantially as set forth, of an attaching-shank, a block upon the forward end thereof, an axial socket therein adapted to receive a boring bit or drill, one or more outer sockets in the block parallel to said axial socket, pinching-screws for the sockets, a worm-wheel disposed before each of said outer sockets, a worm journaled in said block at each of said worm-wheels and engaging the same, and a disk cutter for each of said outer sockets provided with a shank engaging said worm-wheel and socket.

382,726. LOCKING DEVICE FOR CABLE-SPLICES. WILLIAM B. PATTERSON, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Mar. 21, 1887. Serial No. 231,641. (No model.)



Claim.—1. The combination, with the ring formed of two symmetrical pieces hinged together, of the flanges at the joint of a cable-splice clasped thereby, and a padlock for holding the ring in place, as described.

2. The combination, with the ring formed of two symmetrical pieces hinged together, the hinges being integral with the said pieces, of the flanges at the joint of a cable-splice clasped thereby, and a padlock for holding the ring in place, as described.

3. The combination, with the Y-splice of the pipe of a telegraph-cable provided with a separate chamber or recess for receiving the test-wires, of said test-wires, a locking device, and a plug secured by said locking device, whereby the test-wires are made accessible, as described.

382,727. PNEUMATIC WATER-ELEVATOR. THOMAS O. PERRY, Tecumseh, Mich. Filed Oct. 26, 1886. Serial No. 217,104. (No model.)

Claim.—1. In combination with the water-chamber and its upwardly-extending discharge-pipe, a chamber supplied with compressed air, a pipe leading from such air-chamber into the water-discharge pipe, and a float and a valve operated thereby to control the discharge of air from such air-pipe into the water in the water-discharge pipe, substantially as set forth.

2. In combination with the water-discharge pipe and the air-pipe terminating within the same in a nozzle upwardly extended, a float terminating downwardly in a long and slender tapering extension, which protrudes into the mouth of the air-pipe nozzle to act as a regulating-valve, substantially as set forth.

3. In combination with two water-chambers, a third chamber from which compressed air is supplied to the water-chambers, a valve which controls the supply admitting air to but one chamber at a time, said valve having two arms, by which it is operated, a plunger or piston reciprocating within the compressed-air chamber and provided with suitable arms to engage the valve-arms at its stroke in one direction only, whereby the valve is shifted only once for each full reciprocation of the plunger, substantially as set forth.

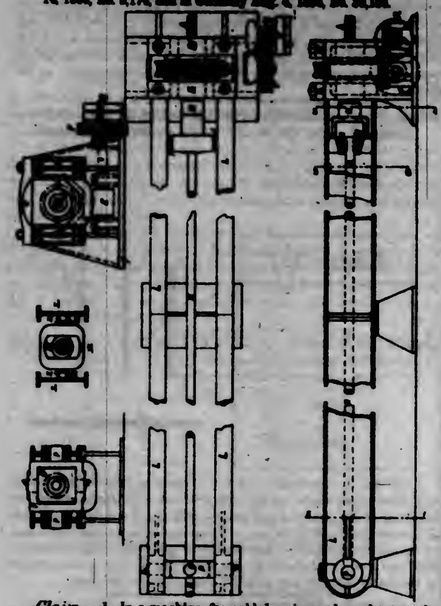
4. In combination with an oscillating valve, a plunger which reciprocates toward and from it, a pawl flexibly connected to the plunger, the valve having arms provided with two abutments located at opposite sides of the axis at such distance that only one can be encountered by the pawl at a time, and adapted when thus encountered to engage the pawl laterally, whereby the pawl is deflected laterally as the valve is rotated by it, said pawl being adapted—as by the action of gravity—to resume its original position when it recedes from the abutment, substantially as set forth.

5. In combination with the two water-chambers, the water-pipes communicating with them, respectively, near the bottom, and leading into a common discharge-pipe extending upward and constituting a stand-pipe, air-pipes leading into the water-chambers from a single compressed-air chamber, the valve which admits air from said air-chamber to the water-chambers, respectively, one at a time, a plunger in said chamber adapted to be lifted and upheld therein by the compressed air admitted thereto, and having connections, as the pawl P P', which engage and actuate the valve when it falls, whereby the compressed air passing into one water-chamber will first expel the water into the stand-pipe, and then follow it therefrom and partially expel it therefrom and lighten the column, and then permit the plunger to fall and shift the valve to admit compressed air to the other water-chamber, substantially as set forth.

6. In combination, substantially as set forth, a water-chamber, and its upwardly-extending discharge-pipe constituting a stand-pipe, the compressed-air chamber, and the air-pipe leading therefrom to the water-chamber, a valve which controls the escape of air from the air-chamber into the air-pipe, a plunger in the air-chamber actuated upward by compressed air, and connections therefrom, as the pawl P P', whereby it operates the valve when it falls, and a pipe communicating with the air-chamber above the plunger and with the stand-pipe, whereby the column of water in the stand-pipe above the point of such communication exerts its pressure equally upon both sides of the plunger.

7. In combination with the compressed-air chamber, the vertically-reciprocating plunger therein uplifted by compressed air, the valve which controls the escape of air, and connections, as the pawl P P', whereby the plunger actuates the valve, the weight hinged to the upper end of the plunger, and a latch connected to the upper end of the chamber and adapted to engage the hinged weight, substantially as and for the purpose set forth.

8. In a pneumatic water-elevator, in combination with the water-chambers and the air-chamber communicating therewith, the eduction-pipes from the water-chambers protruding into them, respectively, and provided with perforations *a*; whereby the compressed air may leak into the water-pipes to charge the water, substantially as and for the purpose set forth.



382,728. LOCK FOR BAGS OR SATCHELS. ALBERT PETERSON, Detroit, Mich. Filed May 13, 1887. Renewed Feb. 27, 1888. Serial No. 265,453. (No model.)

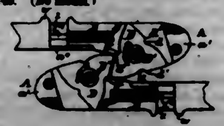
Claim.—1. In a lock for bags, satchels, or purses, the combination of a plate secured to the outer bow and a locking-lever pivotally secured between its ends in a slot therein, and having an outer arm formed complementary to the said plate and an inner arm constructed to engage a catch, substantially as and for the purpose described.

2. In a corner-lock for traveling-bags or satchels, a curved corner-plate secured to the face of the outer bow, a locking-lever pivotally secured between its ends in a slot therein and provided with an outer arm formed complementary to said plate and an inner arm forming a hook, and a catch formed on the inner bow, all arranged to operate substantially as described.

382,729. MACHINE FOR DRAWING RODS AND TUBES. CARL MARIA PERRETTEGUX, London, County of Middlesex, England. Filed Sept. 8, 1887. Serial No. 248,578. (No model.) Patented in England July 14, 1886, No. 9,174, and in Germany Aug. 4, 1886, No. 39,168.

Claim.—1. In a machine for cold-drawing rods and tubes, the combination of a screw-shaft carrying a cross-head and gripping-jaws, means for reciprocating said screw-shaft, longitudinal frames supporting the cross-head, and a self-centering drawing-die mounted between the extremities of the frames, substantially as described.

2. In a machine for cold-drawing rods and tubes, the combination of a hollow screw-shaft carrying a cross-head and gripping-jaws, means for reciprocating said screw-shaft, longitudinal side frames supporting the cross-head, and a die secured between the extremities of the side frames, substantially as described.



3. In a machine for cold-drawing rods and tubes, the combination of a screw-shaft provided with a cross-head and gripping-jaws, and means for reciprocating said shaft, side frames provided with lateral guiding-surfaces arranged to support the cross-head, and a self-centering drawing-die mounted between the extremities of the side frames, substantially as described.

4. In a machine for cold-drawing rods and tubes, a self-centering die in a support comprising a horizontally-pivoted frame, a die-holding plate or seat vertically pivoted within the frame, and a die-plate supported within the plate or seat, substantially as described.

5. In a machine for cold-drawing rods and tubes, a self-centering die in a support comprising the horizontally-pivoted frame P, the die-holding plate or seat O, vertically pivoted within the frame P, and a die-plate, Q, supported within the plate or seat O, longitudinal side frames between the extremities of which the frame P is pivotally supported, and a cross-head and gripper arranged to be reciprocated between the side frames, substantially as described.

6. In a machine for cold-drawing rods and tubes, the combination of a screw-shaft, a rotating nut on said screw, a worm-wheel engaging said nut, a counter-shaft carrying a worm-pinion engaging the worm-wheel, and suitable driving-pulleys on the counter-shaft, a cross-head and gripping-jaws on the screw-shaft, longitudinal frame-pieces provided with guides for the cross-head, and a drawing-die supported between the extremities of the frame-pieces, substantially as described.

382,730. CAR-COUPLING. JOHN RADENAH, Cincinnati, Ohio, assignor of one-half to John S. Patterson, same place. Filed May 2, 1887. Serial No. 236,769. (No model.)

Claim.—1. The draw bar and head and the revolving triangular block D, each face of which is provided with a groove, *d*, and shoulder *d'*, having an abrupt face forming one wall of the groove *d*, in combination with sliding block B, having projection b^3 adapted to fit in the groove *d* and against the shoulder *d'*, substantially as and for the purpose specified.

2. The draw-bar and head and the revolving triangular block D, each face of which is provided with a groove, *d*, and shoulder *d'*, having an abrupt face forming one wall of the groove *d*, in combination with sliding block B, having projection b^3 adapted to fit in the groove *d*, and means for locking the block B against the block D, substantially as and for the purpose specified.

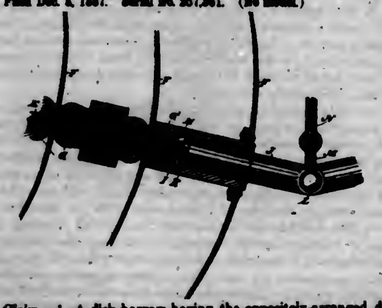
3. The draw bar and head and the combination of the revolving triangular block D, each face of which is provided with a groove, *d*, and shoulder *d'*, having an abrupt face forming one wall of the groove *d*, sliding block B, having projection b^3 adapted to fit in the groove *d* and against the shoulder *d'*, and lever E, provided with tooth *e* for insertion between block B and a projection or shoulder of the draw-head, substantially as and for the purpose specified.

4. The draw bar and head and the combination of the revolving triangular block D, each face of which is provided with a groove, *d*, and shoulder *d'*, having an abrupt face forming one wall of the groove *d*, and sliding block B, having shoulder b^3 projecting to the line of strain and adapted to fit in the groove *d* and against the shoulder *d'*, substantially as and for the purpose specified.

5. The draw bar and head and the combination of revolving triangular block D, having faces provided with grooves *d* and shoulder *d'*, and a sliding block, B, having shoulder b^3, shaped substantially as set forth, and lever E, provided with tooth *e*, and slotted lever F, substantially as set forth.

6. The combination of the draw bar and head and triangular coupling-block D, sliding block B, spring S, and a wedge or plug to intervene between the sliding block and a fixed point on the draw-bar to lock the sliding block in position, substantially as specified.

7. The combination of the draw bar and head, triangular block D, each face of which is provided with groove *d* and shoulder *d'*, sliding block B, provided with shoulder b^3, spring S, and a wedge or plug to intervene between the sliding block and a fixed point on the draw-bar to lock the sliding block in position, substantially as specified.



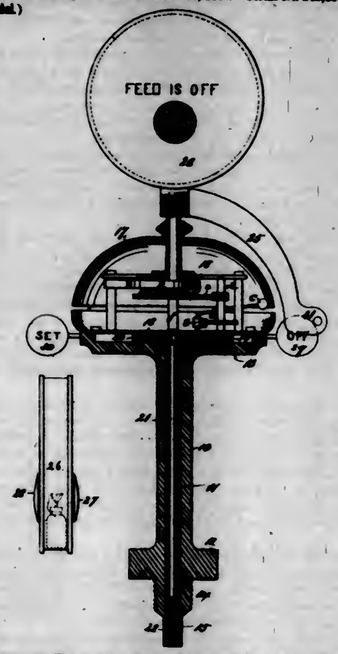
8. The combination of the draw-head A, provided with transverse open space in which the triangular block D is pivoted, the triangular block D, having in each face grooves *d* and shoulder *d'*, and sliding block B, provided with lip b^4 and shoulder b^3, substantially as set forth.

9. The combination of the draw-head A, provided with transverse open space in which the triangular block D is pivoted, the triangular block D, having in each face a groove, *d*, and shoulder *d'*, and sliding block B, and lip a^4, projecting from the draw-head, substantially as set forth.

10. The combination of the draw-head A, provided with transverse open space in which the triangular block D is pivoted, the triangular block D, having in each face a groove, *d*, and shoulder *d'*, and sliding block B, provided with lip b^4 and shoulder b^3 and lip a^4, projecting from the draw-head, substantially as set forth.

11. In a car-coupler, the combination of revolving triangular block D, having grooves *d*, respectively provided with shoulders *d'*, sliding block B, having shoulder b^3, provided with lip b^4 and tongue *b*, draw-head provided with spaces *a'*, lug a^4, shoulder or abutment *w*, lip a^4, and groove C, tooth *e*, connected with lever E, and slotted bar F, substantially as set forth.

382,731. DISK HARROW. LOVELL A. RICHARDS, Grayson, Cal. Filed Dec. 3, 1887. Serial No. 257,261. (No model.)



Claim.—1. A disk harrow having the oppositely-arranged disk-gangs with the inner ends of their shafts abutting or adjacent to each other, and the short shafts J extending into holes or openings in the

inner ends of the disk-shaft sleeves, and having internal wearing-plates, K, substantially as and for the purpose herein described.

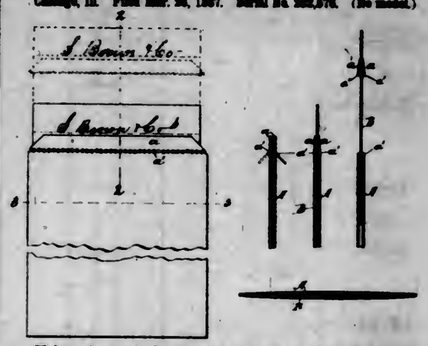
2. In a harrow, the short shafts J, having their meeting ends hinged together and their outer ends entering holes in the adjacent meeting ends of the disk-shafts or sleeves thereon, in combination with the lever O, and the connecting-rod N, by which this lever is united with the joint of the shafts J, substantially as and for the purpose herein described.

3. The disk harrow with the angularly-supported divergent shafts, the adjacent meeting ends having sleeves bored to receive short shafts J, the meeting ends of which are hinged together, in combination with wearing-plates upon the ends within the sleeves G', to act as thrust-bearings, and oil-holes whereby the chambers within the sleeves may be supplied with a lubricant, substantially as herein described.

382,782. INDICATOR FOR BOILER-FEEDS. William H. Reggan, Whitestone, N. Y. Filed June 10, 1887. Serial No. 240,897. (No model.)

Claim.—1. The combination, with a signaling apparatus, of a rotary shaft connected with the signaling apparatus and a fusible plug for locking the said shaft, substantially as described.

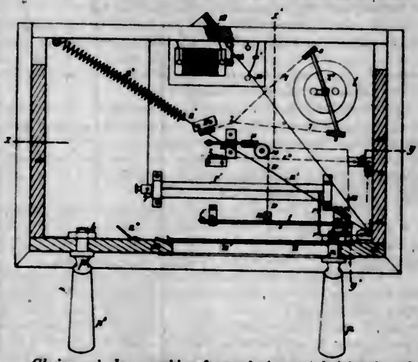
2. The combination, with a signaling apparatus, of a rotary shaft connected with the signaling apparatus, a tube surrounding the said shaft, and a fusible plug for locking the shaft to the tube, substantially as described.



3. The combination, with a signaling apparatus, of a rotary shaft formed with a recessed lower end and arranged in connection with the signaling apparatus, a tube surrounding the shaft and arranged to enter the feed-pipe of a boiler, and a fusible plug fitted within the recess at the lower end of the shaft and arranged to lock the shaft to the inclosing-tube, substantially as described.

4. The combination, with a signaling apparatus, of a rotary shaft, 21, connections between the shaft 21 and the signaling apparatus, a tube arranged in connection with the shaft and formed with exceedingly thin walls at its lower end and bottom, and a plug of fusible metal fitted within the lower end of the shaft and arranged to prevent the said shaft from turning, which thin-walled portion is arranged for connection with the feed-pipe of a boiler, substantially as described.

5. The combination, with a visual and audible signaling apparatus, of a rotary shaft, 21, connected to said apparatus, a thin-walled tube within which the lower end of the shaft rides, said tube being rigidly connected to the case of the signaling apparatus, and a fusible plug fitted within a recess formed at the lower end of the shaft and arranged to prevent the shaft from turning in the said tube, which tube is arranged for connection with the feed-pipe of a boiler, substantially as described.



6. The combination, with a visual and audible signal, of a post or standard, 10, upon which the signaling apparatus is mounted, a threaded projection, 14, formed in connection with the post and arranged for connection with the feed-pipe of a boiler, a contracted extension, 15, extending downward from the threaded portion 14, a shaft, 21, connected to the signaling apparatus and formed with a recess in its lower end, and a fusible plug, 22, fitted within said recess and against the inner face and bottom of the thin-walled tube, substantially as described.

382,783. RECEPTACLE FOR CHECK-SLIPS, &c. Henry W. Roth, Chicago, Ill. Filed Mar. 26, 1887. Serial No. 232,576. (No model.)

Claim.—A receptacle or pocket, of paper or other suitable material, closed at all edges but one and provided with gummed flaps on each side of its mouth, in combination with a card or other like device of greater length than the depth of the receptacle, whereby a portion of the matter on the card may be securely concealed within the receptacle and a portion exposed on the end of the card projecting outside of the latter, substantially as and for the purposes specified.

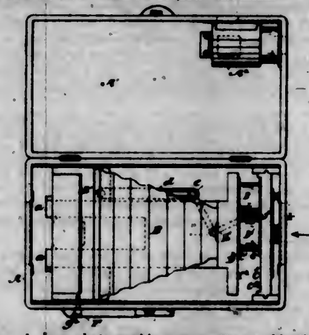
382,784. COIN-OPERATED ELECTRICAL APPARATUS. Herman W. Rau, London, England. Filed Jan. 3, 1888. Serial No. 259,668. (No model.) Patented in England July 17, 1886, No. 9,310; in France Apr. 19, 1887, No. 182,971, and in Belgium Apr. 30, 1887, No. 77,190.

Claim.—1. In a machine for producing or administering electricity, the combination of a movable coin-receptacle and a treadle operated by the recipient of the electric current and serving by the agency of a coin deposited in the receptacle to complete the electric circuit, substantially as shown and described.

2. In a machine for producing and administering electricity on depositing a coin therein, the combination of treadle *c*, a battery, coil, and connections operated thereby, and a sliding coin-receptacle, *e*, serving when slid to complete a circuit by the agency of the coin and to give the shock, substantially as set forth.

3. In a machine for producing and administering electricity on the deposit of a coin therein, the combination of the following devices, namely: the coin-receptacle *e*, having the self-closing hinged bottom *f*, spring-arm *g*, and side slots *j j*, slide *d'*, and its spring d^3, fixed pin *h*, lever *k*, treadle *c*, and its described connections, substantially as and for the purposes set forth.

4. In a machine for producing and administering electricity on the deposition of a coin therein, the means described and shown for increasing and diminishing the force of the current, consisting, essentially, of the combination of sliding handle *p*, slot *n*, slide *n'*, wire *r*, trough *r'*, and electrical connection from a coil, *m*, to the water in the trough, substantially as set forth.



5. In a machine for producing and administering electricity on the deposit of a coin therein, the combination, with the movable handle *p*, of the wire *r*, attached thereto, water-trough regulator *r'*, and an electrical connection from the coil to the trough, substantially as set forth.

6. In a machine for producing and administering electricity on the deposition of a coin therein, the rack *s*, and pawl *p'* on handle *p*, in combination with the sliding cover *t*, all substantially as hereinbefore set forth.

7. In a machine for producing and administering electricity on the deposition of a coin therein, the means described for bringing the element into the excitant, consisting of the combination of a battery, cord 7 7, cross-head z^2, rod z', guide-pulleys 8 8, chain z^3, and treadle, substantially as set forth.

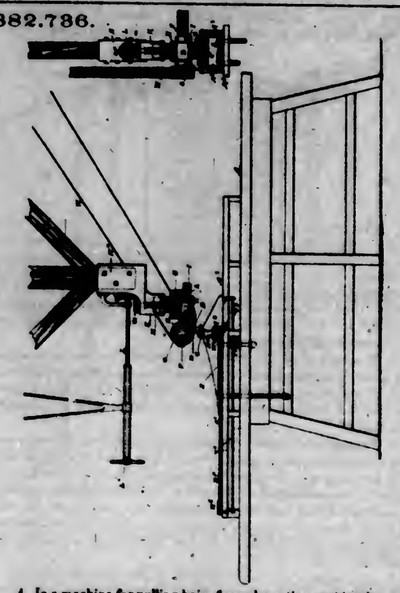
8. In a machine for producing and administering electricity on the deposition of a coin therein, the means employed for indicating on a dial the proportional increase of current administered to the recipient, consisting of the combination of dial *w*, pointer *w'*, wheel w^2, stop-pin w^3, arm w^4, pins $w^{4\times}$, and spring w^5, acted on by cord 18, all substantially as herein set forth.

382,785. PHOTOGRAPHIC CAMERA. Theodore S. Rue, Meriden, Conn., assignor to The Scovill Manufacturing Company, New York, N. Y. Filed Mar. 10, 1888. Serial No. 267,217. (No model.)

Claim.—1. In a photographic camera, the combination, with a box or case, of a movable back, two lens-tubes provided with lenses, and an adjusting device to adjust the lens-tubes during the movement of the movable back, substantially as specified.

2. In a photographic camera, the combination, with a box or case, of a movable back, two lens-tubes provided with lenses, and an adjusting device to adjust the lens-tubes during the movement of the movable back, said adjusting devices being capable of a limited range of movement without affecting the movement of the lens-tubes, substantially as specified.

3. In a photographic camera, the combination, with a box or case, of a movable back, two lens-tubes provided with lenses, a rod connected to the movable back and provided with a slot, a bell-crank lever having a loose connection with said rod, and a rod or projection on said lever extending between said lens-tubes, and a lever for causing the adjustment of the movable back and the lens-tube, substantially as specified.



382,786. MACHINE FOR PULLING HAIR FROM SKINS OF FUR ANIMALS. Bell Sherwood, San Francisco, Cal. Filed Aug. 27, 1887. Serial No. 248,009. (No model.)

Claim.—1. A machine for pulling hair from skins, consisting, essentially, of a fixed plate presenting a nose or beak for turning up and separating the ends of the hairs from the fur, a revolving stripper with a flexible gripping-edge adapted to impinge and run over the nose of the fixed plate, and a bed-roller for supporting and presenting the skin to the stripping device arranged beneath the fixed plate, substantially as described, for operation as set forth.

2. In a machine for pulling hairs from skins, the combination of the fixed plate presenting a nose or beak for turning up the ends of the hairs, a revolving stripper with a flexible gripping-edge, and a bed-roller capable of vertical adjustment toward and from the fixed plate.

3. In a machine for pulling hairs from skins, the combination, with the bed-roller, of the fixed plate and the revolving stripper mounted on the vertically-adjustable head-block, which is movable in the part K, and the screw *d*, as a means for setting up the head-block, up or down, to regulate the position of these parts with respect to the bed-roller, as and for the purpose set forth.

382,786.

4. In a machine for pulling hairs from skins, the combination, with a bed-roller or support for the skin, of a stripping device operating above said roller and a heater below said roller, substantially as described, for operation as set forth.

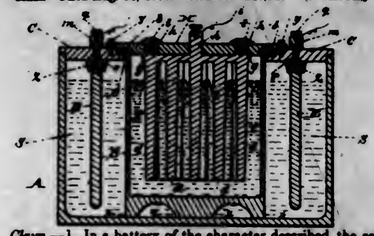
5. The combination, with the fixed plate presenting a nose or beak to turn the ends of the hairs from the fur, of the revolving stripper having a flexible gripping-edge.

6. The combination of the fixed plate having a roller which forms a lower grip and the revolving stripper having a flexible gripping-edge set to impinge against said roller, for operation as set forth.

7. In a machine for pulling hairs from skins, the combination, with the stripping-plate, of the bed-roller mounted beneath said plate and capable of being set at an angle with respect to the said plate, as described, to operate as set forth.

8. In a machine for pulling hairs from skins, a revolving stripper having a flexible edge and mounted over a stationary stripping plate or surface, with a rounded nose or edge, substantially as described, for operation as set forth.

9. In a machine for pulling hairs from skins, a revolving stripper consisting of a stripper-block mounted on a revolving shaft and a yielding jaw carrying a flexible stripping-edge, substantially as described.

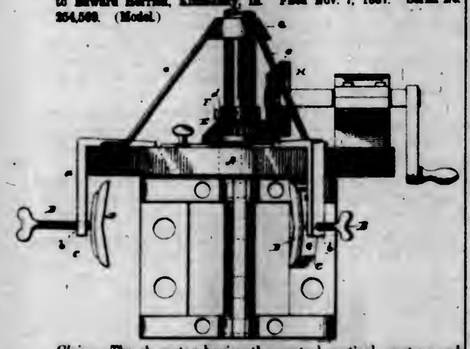


382,787. ROLLING COLTER. William H. Sutton, Canton, Ohio. Filed Mar. 12, 1888. Serial No. 266,957. (No model.)

Claim.—1. The frame A, provided with the parallel arms *c c*, in combination with the disk-bar B, having the serrated disks C, the connecting-arm D, having disk E, and the colter-arms F, substantially as and for the purpose specified.

2. The frame A, provided with the parallel arms *c c*, having the grooves *c' c'*, in combination with the disk-bar B, having the serrated disks C, the connecting-arm D, having disk E, and the colter-arms F, substantially as and for the purpose specified.

382,738. GALVANIC BATTERY. GEORGE H. BLAKE, Boston, Mass. Filed Aug. 31, 1887. Serial No. 248,345. (No model.)



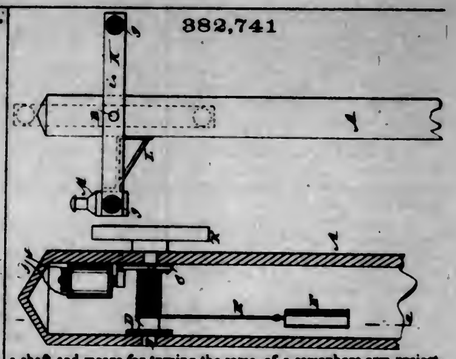
Claim.—1. In a battery of the character described, the cells A B and cover C, in combination with the carbon or negative plate E, provided with the lead ring *z*, and with the screw *v*, extending through said cover, and the screw-cap *m*, applied to said screw outside said cover, substantially as described.

2. In a battery of the character described, the zinc or positive plate *d*, cast integral with the supporting-plate *g*, and provided with lugs *h*, in combination with the cover H, screws *t*, cells A B, and cover C, the cover H being secured to the cover C by screws *y*, substantially as set forth.

3. The improved battery-jar herein described, the same consisting of the outer or containing cell, A, provided with the cover C, the porous cell B, provided with the cover H, overlapping the cover C and secured thereto by the screws *y*, the carbon E E, provided with the screws *v* and encircled by the lead ring *z*, the plate *g*, provided with the zinc rods *d* and secured to the cover H, the screw-caps *m*, and packing-ring *b*, constructed, combined, and arranged substantially as and for the purpose described.

4. In a battery, the combination of an outer cell, an inner cell, a cover for the outer cell, provided with an opening opposite the inner cell, a cover for the inner cell, which shuts over the opening in the cover for the outer cell, said covers being rabbeted, and a packing in the rabbet of the outer cover, the upper edge of the inner cell extending between said packing and the shoulder of the rabbeted cover of the inner cell, substantially as described.

382,739. CHURN. THOMAS J. SMITH, Omega, assignor of one-half to Edward Herrick, Kinmundy, Ill. Filed Nov. 7, 1887. Serial No. 254,569. (Model.)



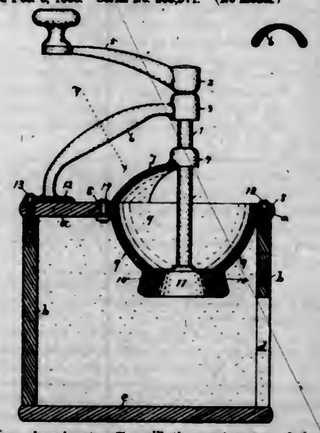
Claim.—The churn-top having the central vertical aperture and the aperture closed by a door, in combination with the angle-irons having their vertical branches provided with threaded eyes, the threaded rods bearing in said threaded eyes and having plates swiveled on their ends, the guide for the dasher-shaft secured by the braces, as shown, the dasher-shaft, the horizontal gear on the dasher-shaft, having a tubular sleeve, the set-screw for securing the gear to the dasher, and suitable means for rotating the same, substantially as specified.

382,740. WALL-COVERING COMPOSITION. CARL STRAUB, Syracuse, N. Y. Filed Feb. 8, 1887. Serial No. 226,946. (No specimens.)

Claim.—1. The covering composition consisting of wood fiber, cement, and a hardening-acid, substantially as set forth.

2. The covering composition consisting of wood fiber, sawdust, mineral cement, and muriatic and sulphuric acid, substantially as described.

382,741. RAILWAY-SIGNAL. CHARLES D. TEBBALS, Boston, Mass., assignor to himself and John D. Gould, same place. Filed May 27, 1887. Serial No. 239,531. (No model.)



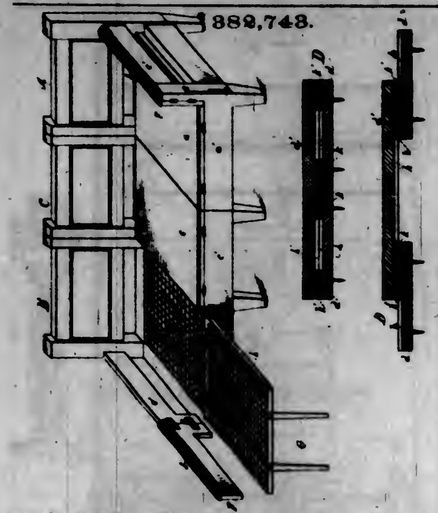
Claim.—1. In a semaphore signal device, the combination, with a shaft and means for turning the same, of a semaphore-arm projecting equally in opposite directions from the said shaft, and an escapement connected directly with the semaphore-shaft and arranged to limit the rotary movements of the shaft to a quarter of a revolution, substantially as described.

2. In a semaphore signal device, the combination of a hollow post, a weight-operated shaft journaled therein, a scape-wheel carried by the shaft, electro-magnetically-operated pallets arranged to engage and release the scape-wheel, a semaphore-arm attached to the shaft projecting equally in opposite directions from the shaft, and provided with windows in opposite ends thereof, and a lantern supported opposite the path of the windows of the semaphore-arm, substantially as described.

3. In a semaphore signal device, the combination, with the hollow post A, of the shaft B, provided with the drum D and two-toothed scape-wheel C, the cord E and weight F, the angled lever G, provided with the pallets *c d*, the armature H, attached to the said lever G, the electro-magnet J, adapted to operate the armature H, the semaphore-arm K, attached to the shaft B and provided with the colored windows *h*, and the lantern M, supported opposite the path of the windows *h*, substantially as described.

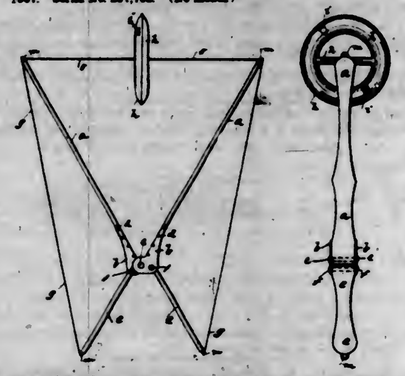
4. In a semaphore signal device, the combination, with the shaft B, scape-wheel C, drum D, cord E, and weight F, of the pin *b*, placed at an angle of ninety degrees with the semaphore-arm K, substantially as described.

382,742. COFFEE-MILL. JOHN M. WADDEL, Greenfield, Ohio. Filed Feb. 8, 1883. Serial No. 263,371. (No model.)



Claim.—In a hand coffee-mill, the combination of the grinding-shaft 1, having a hand-crank, 5, the hopper-cover 7, having a bearing, 4, the mill-box *a b c*, and the handle 6, having the shaft-bearing 3 at its upper end and an extension at its lower end for securing it to the box, substantially as set forth.

382,743. COMBINED EXTENSIBLE SOFA AND BED. CHARLES P. WALSH, Cincinnati, Ohio. Filed Nov. 3, 1887. Serial No. 254,392. (No model.)



Claim.—In combination, the end sections, A and B, provided with the pivoted seat *a* and *b* and the pivoted arm-rests P *f*, the extension-

382,743.

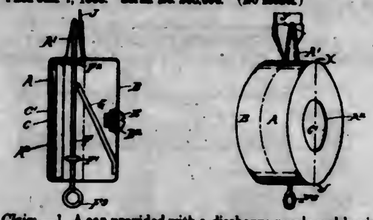
sides D, adjustably connecting said sections, the removable central section, C, provided with the pivoted seat *c*, adapted to fit over the slides and between said end sections, the folding legs G, pivotally attached to the free ends of said pivoted seats and adapted to assume a vertical position and support the same when opened outward into a bed-bottom, and the mattress-wire E, covering the under side of the pivoted seats and the seat-frames, substantially as and for the purpose set forth.

382,744. TOY. FRANK WEBER, Pittsburg, Pa. Filed Dec. 12, 1887. Serial No. 257,702. (No model.)

Claim.—In a musical toy such as described, the combination consisting of the hand-levers *c* and the upper levers, *a*, hinged together by a suitably-constructed hinge, *b*, the side cords, *g*, attached to the extremities of the levers *a* and *c*, the wheel *h*, having a hollow perforated rim, and a means for securing the ends of two double cords, *o*, to the center of the wheel *h* and to the upper extremities of the levers *a*, substantially as and for the purpose set forth.

382,745. BERRY-HARVESTER. GEORGE WILKIE, Dundee, N. Y. Filed June 16, 1887. Serial No. 241,592. (No model.)

Claim.—1. In a berry-harvester, a suitable frame mounted upon wheels in front and provided with handles, in combination with a pair of hoppers located in said frame one above the other, and provided with screen-bottoms, said hoppers having their free ends resting in the forward part of said frame and their rear ends independently hinged or pivoted to the rear part of said frame, whereby the front ends of the hoppers may be independently raised and the hoppers emptied of their contents, substantially as described.



2. In a berry-harvester, the combination of a suitable frame provided with handles and mounted upon wheels in front, a pair of hoppers provided with screen-bottoms and hinged at their rear ends one

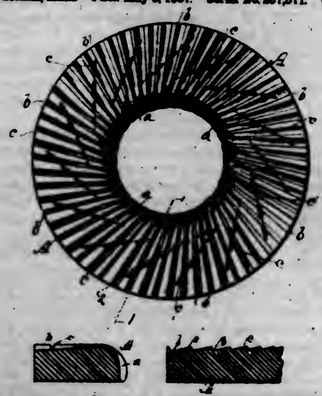
382,745.

above the other in said frame, so that their free ends can open upward, guiding-strips *m n*, located in one of said hoppers, and a parting-strip located at the hinged ends of said hoppers, for the purpose as described.

382,746. MUCILAGE-CAN. JOHN E. WEBSTER, Reading, Pa. Filed Jan. 7, 1888. Serial No. 260,094. (No model.)

Claim.—1. A can provided with a discharge-nozzle and having an open face with flexible interior lining, said lining having secured thereto an inflexible disk, substantially as set forth.

2. The combination, with a can having a flexible side and a discharge-nozzle, of a valve having a straight stem extended through the wall of the can opposite said nozzle and its point adapted to close and extend slightly beyond the nozzle, substantially as set forth.



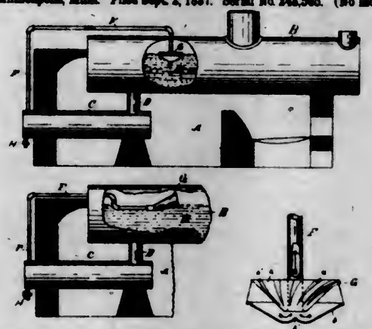
3. The combination, with the can having a flexible side, a discharge-nozzle, and a valve adapted to close said nozzle and having a straight stem extended through the wall of the can, of a spring adapted to press upon said stem and adapted to hold said valve open or shut as desired, substantially as and for the purpose set forth.

4. The combination, with a can having a discharge-nozzle and a valve adapted to close and extend beyond said nozzle, of a brush secured to said nozzle and adapted to receive and distribute the contents of said can, substantially as set forth.

5. The combination, with a can having a discharge-nozzle and a valve adapted to close and extend beyond said nozzle, of a brush or brushes adapted to be removably secured to said nozzle, substantially as and for the purpose set forth.

6. In combination with a can having a discharge-nozzle, a brush consisting of a flexible material secured to a sheet-metal back integral with a sheath and adapted to be removably secured to said nozzle, substantially as set forth.

382,747. MILLSTONE OR MILL-PLATE DRESS. DAVID J. ASHE, Owatonna, Minn. Filed May 9, 1887. Serial No. 237,571. (No model.)



Claim.—1. A disk or plate for cotton-seed and grain hulling and reducing machines having grooves or furrows tangential to a small

circle around the center thereof, commencing at about the outer margin of the curved portion around the eye and regularly increasing in depth from the inner ends to the periphery of the disk or plate, and other grooves or furrows tangential to a larger circle than the first-named grooves or furrows and crossing the same obliquely, extending from near the outer margin of the said curved portion around the eye nearly to the periphery of the disk or plate and increasing in depth from the inner to the outer ends, substantially as herein set forth.

2. A disk or plate for cotton-seed and grain hulling and reducing machines having deep-cut grooves in the curved portion around the eye, in combination with finer grooves or furrows tangential to a small circle around the center thereof, the said finer grooves or furrows commencing at about the outer terminations of the deep grooves and regularly increasing in depth from the inner ends to the periphery of the disk or plate, and other grooves or furrows tangential to a larger circle than the said finer grooves or furrows and crossing the same obliquely, extending from points near the outer margins of curved portions around the eye nearly to the periphery of the disk or plate and increasing in depth from the inner to the outer ends, substantially as herein set forth.

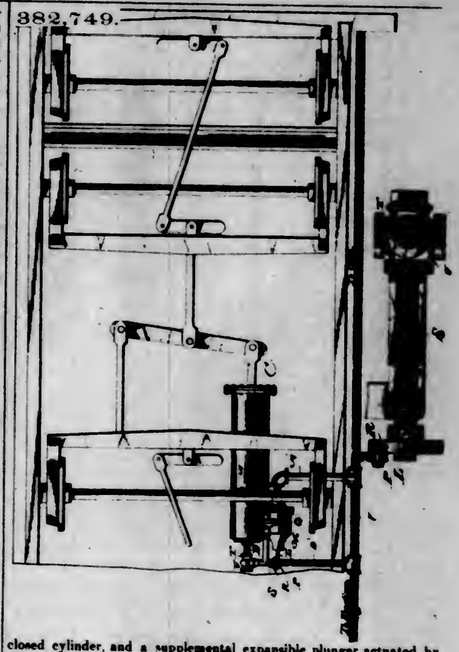
382,748. **SCALE-PREVENTER FOR BOILERS.** CHARLES F. BAKER, Minneapolis, Minn. Filed Sept. 2, 1887. Serial No. 248,566. (No model.)

Claim.—1. In scale-preventers for boilers, a mouth-piece for the outflow-pipe, consisting of a truncated cone provided with spiral corrugations on its water-receiving and directing surface, and having its small end coterminous with the end of said outflow-pipe, as and for the purpose set forth.

2. In scale-preventers for boilers, a mouth-piece for the outflow-pipe, consisting of a truncated cone provided with spiral corrugations on its outer surface extending from its larger to its smaller end, supported vertically with its small end below and its large end above the water-level, and having its small end coterminous with the end of said outflow-pipe.

3. In scale-preventers for boilers, a mouth-piece for the outflow-pipe, consisting of a spirally-corrugated truncated cone supported vertically with its small end below and its large end above the water-level, in combination with a disk or cone-shaped deflector or guide rigidly attached to said corrugated cone and supported directly under the same, and having its large end just below the water-level, as and for the purpose set forth.

4. In combination, boiler B, mud-drum C, drum-leg D, connecting the top of the latter to the bottom of the former, the outflow-pipe F, extending from the interior of the boiler to the mud-drum, and the mouth-piece G *a a' b b'*, as described, attached to the end of the pipe F, within the boiler, as and for the purpose set forth.



5. In scale-preventers for boilers, a mouth-piece for the outflow-pipe, consisting of a truncated cone supported vertically with its small end below and its large end above the water-level and a disk or cone-shaped deflector supported below and rigidly connected to said truncated cone, and having its larger end near to but slightly below the water-level, substantially as described.

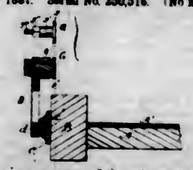
382,749. **AIR-BRAKE.** ALFRED R. BOLDER, Norwood, Ohio. Filed July 19, 1887. Serial No. 244,772. (No model.)

Claim.—1. In an atmospheric railroad-car brake, the combination, with the cylinder A, provided with hollow expansible plungers and a brake-rod, of the air-supply pipe D, connected to the head of an end plunger, a two-way oscillating valve at the junction of pipes B' and D, and a supplemental expansible plunger applied in a cylinder communicating with the main supply-pipe V, and provided with a recoil-spring and a rod adapted to oscillate said valve, all substantially as described.

2. The combination, in an atmospheric brake, of expansible plungers communicating by means of a branch pipe with a main supply-pipe, a cut-off valve in said branch pipe, said plungers arranged in a

382,749.

closed cylinder, and a supplemental expansible plunger actuated by the pressure of air and a recoil-spring, and suitably connected to the stem of the said cut-off valve, substantially as described.

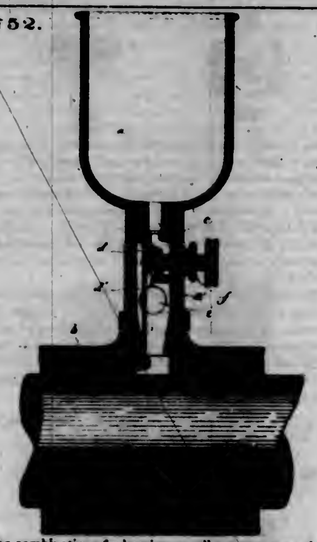


3. The combination of the closed cylinder, expansible plungers therein, a brake-rod, a supply branch pipe, D, the main supply-pipe V, the branches A' B', the cut-off valve at the junction of pipes D B', an expansible plunger, and a recoil-spring for oscillating said valve, substantially as described.

382,750. **SEWING-TOOL.** CHARLES K. BRADFORD, Lynnfield, assignor to George H. P. Flagg and George A. Fullerton, both of Boston, Mass. Filed June 7, 1886. Serial No. 204,335. (No model.)

Claim.—The improved tool herein described, made up of a needle, *a*, its handle *b*, having a longitudinal thread-passage, *b'*, and the clamp *d*, the clamp being pivoted at its end nearest the butt of the handle to shut into the thread-passage and clamp the thread therein, substantially as and for the purpose set forth.

382,751. **WASH-BOARD.** HENRY S. BERWINGTON, Baltimore, Md. Filed Sept. 23, 1887. Serial No. 250,516. (No model.)



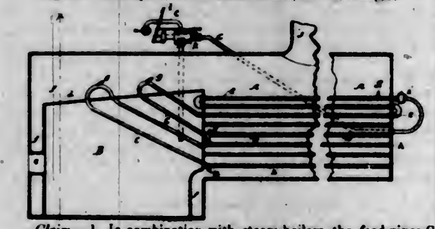
Claim.—In an improvement for wash-boards, the combination of the roller F, sustained in the arms *e e*, the handle E, the brackets D, having dovetail slides *d*, and the grooved plates C, attached to the sides of a wash-board, as described.

382,752. **LUBRICATOR.** GILMAN W. BROWN, West Newbury, Mass. Filed Dec. 19, 1887. Serial No. 258,330. (No model.)

Claim.—1. An oil cup or receptacle having a thermostatic or compound arm or bar regulating the discharge of oil therefrom and adapted to be operated by variations of temperature of the bearing to which the oil-cup is applied, as set forth.

382,752.

2. The combination of a bearing, an oil cup or receptacle adapted to supply oil thereto, and a thermostatic or compound arm or bar regulating the flow of oil from the cup and arranged to be operated by variations of temperature of the bearing, as set forth.



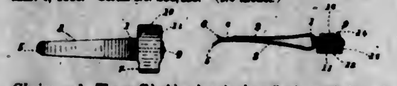
3. An oil cup or receptacle having a neck or shank provided with an oil-conduit combined with a valve, and a thermostatic arm or bar supporting said valve and arranged to be bent to displace the valve by an increase in the temperature of the bearing.

4. An oil cup or receptacle having a neck or shank provided with an oil-conduit and a sight-aperture, combined with a valve in said aperture, and a thermostatic arm or bar supporting said valve, as set forth.

5. An oil cup or receptacle having a neck or shank provided with an oil-conduit, composed in part of an adjustable tubular screw and a sight-aperture into which said screw projects, combined with the valve arranged to act on the delivering end of said conduit, and the thermostatic bar supporting said valve, as set forth.

6. An oil cup or receptacle provided with an oil-conduit composed in part of an adjustable screw, combined with a valve at the delivering end of the screw, and stop devices, substantially as described, whereby the rotation of the screw may be arrested both in the valve-opening and valve-closing positions of said screw, as set forth.

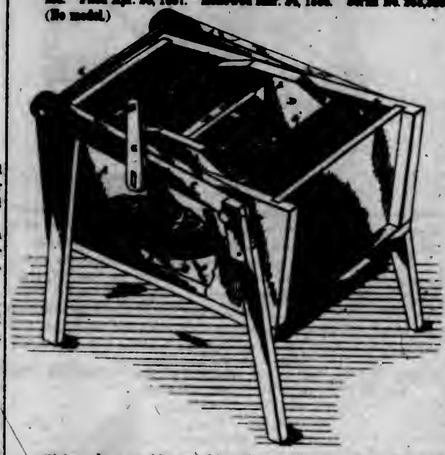
382,753. **FEED-PIPE FOR BOILERS.** SAMUEL R. BRYAR, Pittsburg, Pa. Filed Apr. 6, 1887. Serial No. 233,946. (No model.)



Claim.—1. In combination with steam-boilers, the feed-pipes C, extending through tubes or flues *h*, and inclined longitudinally through fire-box or furnace B, their upper curls entering crown-sheet D, and within water-space F, where it is provided with feeding-ducts G, as described, and for the purpose specified.

2. The combination, with a steam-boiler and feed or supply pipe C in a continuous coil or circuit through tubes or flues L passing within and exposed to fire, of fire-box or furnace B, having feeding-ducts G adjusted thereon within water-space of boiler, as shown.

3. In steam-boilers, the combination or arrangement of continuous, inclined longitudinal feed or supply pipes C, extending parallel through tubes or flues *h*, upward and downward through fire-box or furnace B, through openings in crown-sheet D at top of furnace, provided with feeding-ducts G within water-space F, and having discharging end N at rear end and bottom of boiler, substantially as described.



382,754. **CUFF-HOLDER.** JOSEPH H. CARSON, Buffalo, N. Y. Filed Mar. 7, 1888. Serial No. 266,488. (No model.)

Claim.—1. The cuff-holder herein described, consisting of two spring-arms formed in one piece, so that its free ends will spring together, between which the cuff is held so that it may be adjusted back and forth, in combination with a swiveled spring-clasp mounted on a pin rigidly secured to the rear end of said springs, substantially as and for the purposes described.

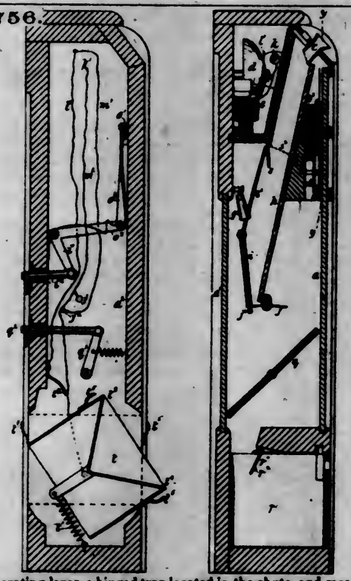
2. A cuff-holder consisting of two spring-arms formed in one piece bent over so as to spring together, one of them having its end projecting forward of the other, and the other spring provided with a bent portion, 4, at the end, a pin, 9, rigidly secured to the rear end of the springs, and a spring-clasp mounted upon said pin so that it may be turned in either direction or be opened and closed thereon, substantially as and for the purposes described.

382,755. **WASHING-MACHINE.** NORMAN R. CLARAGUE, Frederick, Md. Filed Apr. 30, 1887. Renewed Mar. 24, 1888. Serial No. 268,269. (No model.)

Claim.—In a washing-machine, the combination, with a tub and stationary rubbers, of a reciprocating frame carrying swinging rubbers, said swinging rubbers consisting of a body portion having pivots H H and legs G G, substantially as described.

382,756. **FARE-BOX.** WALTER A. CROWDUS, Dallas, Tex. Filed Aug. 3, 1887. Serial No. 246,002. (No model.)

Claim.—1. In a fare-box, in combination, a chute down which the fares are dropped, an electro-magnetic bell, balanced fingers at the bottom of the chute provided with electrical connections for closing the bell-circuit, a pivoted plate for holding the fares on the fingers, provided with an operating-lever, a fare-register, and mechanism connecting the lever of the pivoted plate to the register, substantially as and for the purpose set forth.

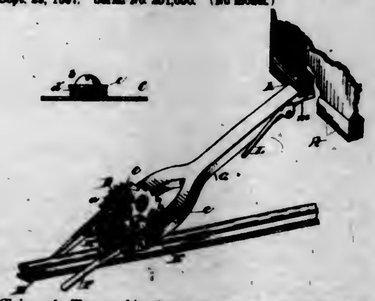


2. The combination, with a fare-box provided with an opening extending through it, of a trough pivoted centrally in the opening and normally closing both sides of the same, adapted to be moved so as to open only one side at a time, and a spring connected to the trough to normally hold it in central position.

3. In a fare-box, in combination, a trough pivoted therein and adapted to be moved so as to project through openings in two opposite sides of the box, a spring connected to the trough to cause it to normally close both openings, an electro-magnetic bell, a contact-spring, and lines connecting the trough, contact-spring, and electro-magnetic bell in an electric circuit, substantially as set forth.

4. In a fare-box, in combination, a chute down which the fares are dropped, a pivoted plate normally closing the lower side of the chute, a hinged trap located in the upper part of the chute normally open, and an arm projecting from the pivoted plate, whereby the trap is positively operated to close the chute when the pivoted plate is actuated to drop the fares from the lower end of the chute.

5. In a fare-box, in combination, a chute down which the fares are dropped, an electro-magnetic bell, balanced fingers at the bottom of the chute provided with electrical connections for closing the bell-circuit, a pivoted plate for holding the fares on the fingers, provided



382,756.

with an operating-lever, a hinged trap located in the chute, and means, substantially as described, for causing the trap to close the chute when the pivoted plate is actuated to drop the lower end of the chute.

6. In a fare-box, in combination, a pivoted fare-retaining plate, a fare-register, a chute for directing the fares to the retaining-plate, which normally closes the lower end of the chute, a hinged trap in the upper end of the chute normally open, and means, substantially as described, whereby the fare-register is operated and the hinged trap positively closed when the retaining-plate is actuated to drop a fare.

382,757. CAR-MOVER. GEORGE S. CURRIER, Garnett, Kans. Filed Sept. 29, 1887. Serial No. 251,050. (No model.)

Claim.—1. The combination, in a car-mover, of the cylinder D, the wheels C, bolted to said cylinder and having teeth *a* on their peripheries, the levers F, the pawls H, pivoted to said levers, and the notched push-bar G, substantially as described.

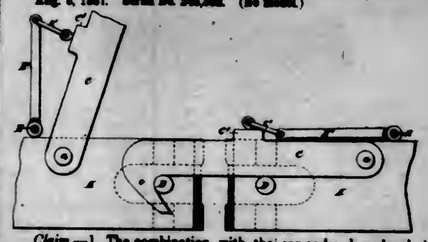
2. The combination, in a car-mover, of a cylinder, notched or toothed wheels, bolts for securing said wheels to the ends of said cylinder, springs surrounding said bolts, levers and pawls for rotating said wheels, and a push-bar, substantially as described.

3. The combination, in a car-mover, of a cylinder, toothed wheels, bolts for securing said disks to the ends of said cylinder, springs interposed between the ends of said bolts and the wheels, a central shaft passed through said disks and cylinder, levers having lateral projections pivoted to said shaft, pawls pivoted to the levers, a push-bar mounted on said shaft, and a cam-lever pivoted to said push-bar and carrying a hook, substantially as described.

382,758. INITIAL FINGER-RING. WILLIAM B. DUTEMPLE, Providence, R. I. Filed Nov. 15, 1887. Serial No. 255,189. (No model.)

Claim.—1. A finger-ring or other article of jewelry hereinbefore described, having a removable front portion provided with an eye or

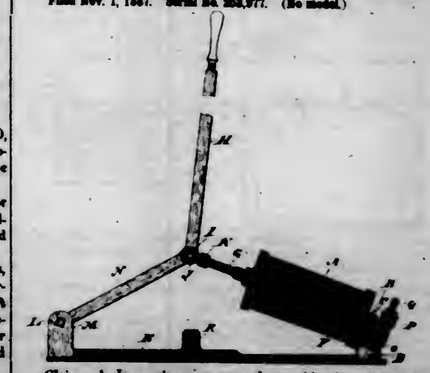
382,758.



staple, and a hook or latch permanently mounted in the fixed apertured front or head, arranged to engage said removable front portion, substantially as described, and for the purpose set forth.

2. In a finger-ring, the combination, with an apertured front or head having a pivoted latch or hook mounted thereon, and a spring arranged to hold the latch in a fixed position, of a removable front portion having an initial or other setting secured thereto, and having an eye or staple secured to its under side adapted to receive the free end of said hook.

3. The combination, in a finger-ring, with the apertured front or head having a spring-holding latch arranged to vibrate thereon, of the removable front portion *a*, having a staple secured to its under side arranged to pass through an opening, b^3, formed in the head to receive the end of said latch, and an opening formed in the back of the head through which the latch may be operated, substantially as shown and described.

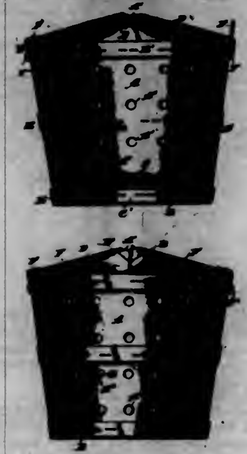


382,759. CAR-COUPLING. CHRISTIE ROY, Rhinelander, Wis. Filed Aug. 6, 1887. Serial No. 246,302. (No model.)

Claim.—1. The combination, with the car and a draw-head, A, provided with hooked arms C C and pins D D, of a horizontal longitudinally-movable rock-shaft, E, provided with a rigid arm connected with the hooked arms C C, and with an arm or hand-lever provided with a finger, c^1, and an eye or socket upon the car adapted for engagement with said finger, substantially as described.

2. The combination, with the car and draw-head A, provided with hooked arms C C and pins D D, of a horizontal longitudinally-movable rock-shaft, E, provided with a rigid arm connected with the hooked arms C C, with an arm or hand-lever provided with a finger, c^1, and with a rigid arm, E^2, and an eye or socket upon the car adapted to engage the said finger c^1, a rod, G, engaged with said arm E^2, and an eye, H, upon the car, affording a sliding bearing for said rod G, substantially as described.

382,760. AIR-COMPRESSOR. JAMES B. ERWIN, Milwaukee, Wis. Filed Nov. 1, 1887. Serial No. 253,977. (No model.)



Claim.—1. In an air-compressor, the combination of an oscillating cylinder pivoted at a fixed point to a supporting-bracket and provided with inlet and outlet air-controlling valves, a piston and a piston-rod, a two-armed lever pivoted at one end to the cylinder-supporting bracket, and at an intermediate point between its ends to the protruding end of said piston-rod, the pivotal point of said rod and lever being

adapted with each downward stroke of the piston to be brought in line with the fixed pivotal points of said lever and cylinder, substantially as and for the purpose specified.

2. In an air-compressor, the combination of the base or bracket K, provided at its respective ends with upward-projecting lugs D D and M M, and at or near its center with a stop, R, air-compressing cylinder A, provided with air-controlling valves O and P, piston P, and piston-rod G, pivotal lugs B B, affixed to the lower end of said cylinder and pivoted to said lugs D D by pivotal bolt C, pivotal bolt C, and operating-lever H, pivoted at its lower end to said lugs M M and at an intermediate point between its ends to the protruding end of said piston-rod G, all substantially as and for the purpose specified.

382,761. FRUIT-BASKET. GEORGE H. GILLETTE, Newark, N. J. Filed Feb. 11, 1888. Serial No. 263,653. (No model.)

Claim.—1. A basket of the character described, having the conical integrally-flanged radially-seamed bottom formed of a single piece of material, substantially as specified.

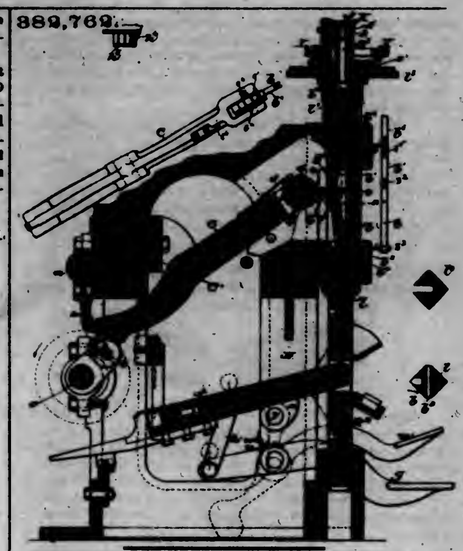
2. A basket of the class described, having the conical integrally-flanged radially-seamed bottom, the conical radially-seamed cover, and flat metal cover-retaining clamps, substantially as specified.

3. A basket of the class described, having the conical, tapered, and integrally-flanged bottom, a tapered body, and a hoop, the flange, body, and hoop being secured together by staples passing therethrough, substantially as specified.

4. A bottom for a basket of the character described, consisting of a disk having a portion removed and overlapped on radial lines to form a seam and having an integral flange, substantially as specified.

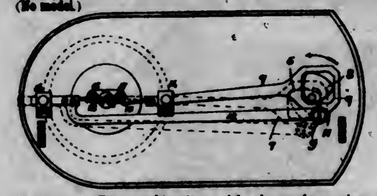
5. In a basket of the class described, the body A, the conical cover D, resting upon the upper edge of the body, an exterior hoop, E, projecting above the body, and the cover-retaining clamp F, secured between the hoop and the body and adapted to be bent down upon the cover, substantially as specified.

6. In a basket of the class described, the body A, cover D, the exterior hoop, E, and a malleable cover-retaining device arranged between the hoop and body, with its lower end passing through and clinched to the latter and its upper end adapted to be bent down upon the cover, substantially as specified.



7. The clamp F, having the clinching end F', the bend or shoulder F^2, and the cover-retaining end F^3, substantially as shown and described.

382,762. NAILING-MACHINE. CHARLES W. GLIDDEN, Lynn, assignor to James W. Brooks, trustee, Cambridge, Mass. Filed Oct. 21, 1887. Serial No. 252,985. (No model.)

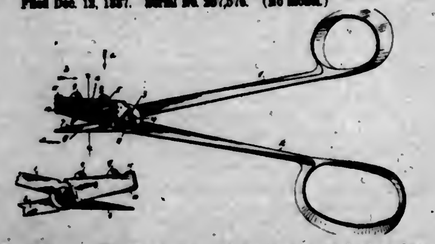


Claim.—1. In a nailing-machine, a vertically-reciprocated nail-box to contain the nails to be driven into the heel, and a driver-plate, combined with means to actuate the driver-plate to drive the nails from the nail-box into the heel, and with a secondary lifter to thereafter impart an additional movement to the nail-box only to compress the heel upon the nails previously driven into the body of the heel to attach it to the sole, substantially as described.

2. The die-bed spindle, the driver-plate moved by it, and the nail-box supported by a spring above the driver-plate, combined with the secondary lifting devices and cam to operate them, substantially as described.

382,762.

382,763. BUTTON-HOLE SEWING-MACHINE. THOMAS F. HASSETT, San Francisco, Cal. Filed Aug. 30, 1886. Serial No. 211,902. (No model.)



Claim.—1. The combination, with the reciprocating needle, needle-bar, frame which carries the needle-bar, and means to operate the said parts, of the vertical shaft 1, eccentric 2, strap 4, rod 5, thumb-screw *c*, eccentric 6, strap 9, link 12, eccentric 6, forked lever 7, swiveled boxes 14 and 15, looper-points 10 and 13, and detainer-points 16 and 17, substantially as and for the purpose herein set forth.

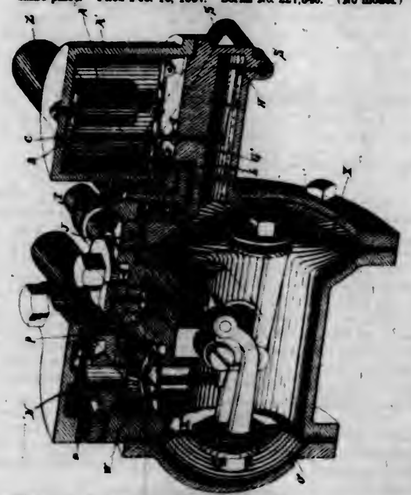
2. The combination, in a button-hole machine, of the needle-bar, its pivot-carrying frame, and the looping and feed mechanism, with means for operating said parts, as described, consisting of the vertical shaft 1, having the eccentrics 6 and 8 arranged beneath the bed-plate, and the eccentric 2 at the upper part of said shaft, the strap-levers 4, 9, and 7, the rod 5, the link 12, and the detainer-points 16 and 17, all arranged for co-operation, substantially as herein set forth.

3. The combination, with the reciprocating needle, needle-bar, and means for operating the same, of the vertical shaft 1, eccentric 8, strap 9, lever 12, pivoted boxes 14 and 15, looper-points 10 and 13, and detainers 16 and 17, substantially as and for the purpose herein set forth.

382,764. FRUIT-PICKER. HENRY HARMOUR, Charlton, Mass. Filed Dec. 12, 1887. Serial No. 257,576. (No model.)

Claim.—1. The combination, with the jaws 5 and 6, pivoted together and provided with the handles for operating the same, of a knife-blade upon one of said jaws, a spring-actuated holding-jaw ex-

tending between said jaws 5 and 6 and forming a yielding surface for one of said jaws, a spring interposed between said movable jaw and the jaw it extends over, and a lug integral with the movable jaw and embracing the jaw over which said movable jaw extends on the side opposite from said spring, for the purpose stated, substantially as shown and described.



2. In a fruit-cutter, the combination, with jaws pivoted together and provided with handles for operating the same, one of said jaws having a knife-blade thereon, of a spring-actuated holding-jaw extending between said jaws and forming a yielding surface for one of said jaws, said holding-jaw being loosely secured at its rear end upon the pivot-pin of said jaws, and provided with an oblong slot therein to permit of the rear end of said holding-jaw moving on said pivot-pin, for the purpose stated, substantially as set forth.

382,765. SHAFT-COUPLING. GEORGE H. MACKAY, Salem, N. H., assignor of one-half to Orlando Woodbury, same place. Filed June 17, 1887. Serial No. 241,632. (No model.)

Claim.—The combination, with a divided shaft having abutting ends, each of such abutting ends being offset or cut away, as at *a b*, the construction and arrangement being such that the two ends will match or register when brought together, of the clamping-shells *d d*, adapted to be placed over the shaft at the meeting ends, and the clamping-thimbles *c c'*, the latter provided with a male screw and the former with a female screw, substantially as and for the purposes set forth.

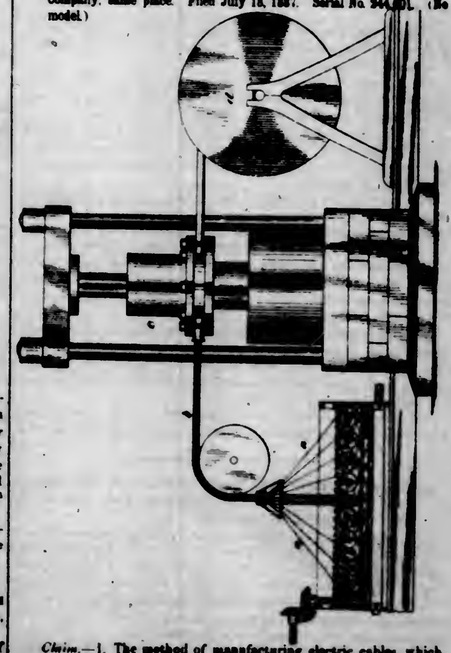
382,766. ELECTRO-MAGNETIC CAR-BRAKE. ALBERT P. MASSEY, Watertown, N. Y., assignor to the Eames Vacuum Brake Company, same place. Filed Feb. 16, 1887. Serial No. 227,846. (No model.)

Claim.—1. In a fluid-pressure brake in which the valves are actuated by a variation of pressure in a given space, a chamber of such capacity that the air contained will, when opened to the space for actuating the main valves, vary the pressure in said space sufficiently to cause the fluid pressure to actuate the main valves controlling the application of the brakes, a valve between said chamber and said space, a valve between said chamber and the atmosphere, and an electro-magnet for actuating the valves, substantially as set forth.

2. In a fluid-pressure brake, the auxiliary chamber A', in combination with valves B, G, and H, and suitable passages connecting same with the chamber outside of diaphragm X.

382,767. MANUFACTURE OF TELEGRAPH-CABLES. WILLIAM R. PATTERSON, Chicago, Ill., assignor to the Western Electric Company, same place. Filed July 18, 1887. Serial No. 244,508. (No model.)

Claim.—1. In an electric cable, the combination, with the core of insulated conductors, of a water-proof pipe inclosing the same, and a serving between the interior of the pipe and the conductors, said serving being in bunches, the bunches being compressed by the pipe, whereby



382,767.

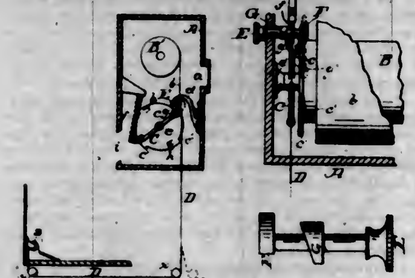
air-spaces are formed and the compression of the covering of the conductors at said air-spaces prevented, substantially as described.

2. In an electric cable, the core, the serving wound thereon and bunched at points *d*, and lead pipe surrounding the core and compressing the serving at points *d*, as described.

382,768. METHOD OF MANUFACTURING ELECTRIC CABLES. WILLIAM R. PATTERSON, Chicago, Ill., assignor to the Western Electric Company, same place. Filed July 18, 1887. Serial No. 244,601. (No model.)

Claim.—1. The method of manufacturing electric cables, which consists in loosely twisting the insulated conductors together and then covering the core with a jacket or tubing of lead, whereby the serving heretofore used is dispensed with and hurtful compression of the

insulating-covering of the conductors avoided, thereby lowering the electrostatic capacity of the cable, as described.



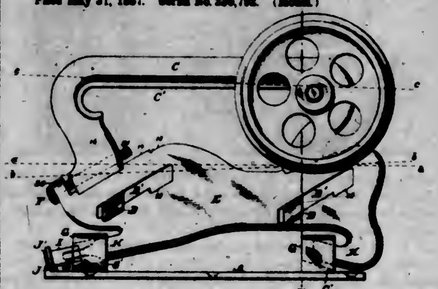
2. The method of manufacturing electric cables, which consists in loosely twisting the insulated conductors together and then loosely covering the core with a jacket or tubing of lead, whereby the serving heretofore used is dispensed with and hurtful compression of the insulating-covering of the conductors avoided, thereby lowering the electrostatic capacity of the cable, as described.

3. The method of manufacturing electric cables, which consists in twisting the insulated conductors loosely together to form the core, passing the core thus formed through a press, and forming a jacket or tubing of lead over the same, whereby objectionable compression of the insulating-covering is avoided, substantially as and for the purpose specified.

4. The method of manufacturing electric cables, which consists in loosely forming the conductors into a core, loosely covering the core with a flexible metallic jacket or tubing, and forcing melted insulating material into the tubing among the conductors, substantially as described.

5. The combination, with the spools, each carrying a different wire and mounted on a revolving carriage, of the press for forming the pipe over the core, as described.

382,769. STREET-INDICATOR FOR CARS. GEORGE A. FISCHER, Englewood, Ill. Filed May 24, 1887. Serial No. 239,177. (No model.)



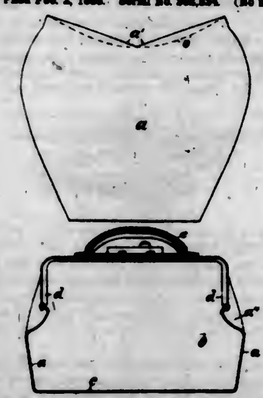
Claim.—1. In a street-car indicator having a rectangular case with opening in front, the combination, with two rollers thereof parallel to and placed one above the other, and a web of paper, having the names of streets thereon, so wound on said rollers as to roll from one onto the other, of plate *c* on the end of the lower roller, having serrations in its edges and depressions *c'* in its face, lever C, journaled on the central projecting stud of said plate, spring-actuated pawl journaled on the end of said lever and engaging depressions *c'*, spring *f*, depressing the end of lever C opposite said spring-actuated pawl, wire D, attached to the end of said lever contiguous to pawl *g*, and pawl *d*, engaging the serrated periphery of said plate.

2. In a street-car indicator, the combination, with spring-roller B', roller B, parallel with and immediately under the same, and a web of paper having the names of streets thereon and adapted to be wound from one of said rollers onto the other, of spindle-plate *c*, secured to one end of roller B, having its periphery serrated and provided with depressions *c'* in its face, lever C, journaled on the spindle of said plate, spring-actuated pawl *g*, journaled on the end of lever C, spring *f*, depressing the opposite end of lever, wire D, attached to the end of said lever contiguous to pawl *g*, and pawl *d*, engaging the periphery of plate *c*.

3. In a street-car indicator, the combination, with spring-roller B', roller B, parallel with and immediately under the same, and a web of paper having the names of streets thereon and adapted to be wound from one of said rollers onto the other, of spindle-plate *c*, having its periphery serrated and provided with depressions *c'* in its face, lever C, journaled on the spindle of said plate, spring-actuated pawl *g*, journaled on the end of lever C, spring *f*, depressing the opposite end of said lever, wire D, attached to the end of the lever contiguous to pawl *g*, pawl *d*, engaging the periphery of plate *c*, sheaves *x*, *y*, and *z*, the former two under the car and the latter journaled next the dash-board thereof, around which said wire travels, and a treadle to which the end of said wire is attached, substantially as and for the purpose set forth.

4. In a street-car indicator, the combination, with spring-roller B', roller B, parallel with and immediately under the same, and a web of paper having the names of streets thereon and adapted to be wound from one of said rollers onto the other, spindle-plate *c*, having its periphery serrated and provided with depressions *c'* in its face, lever C, journaled on the spindle of said plate, spring-actuated pawl *g*, journaled on the end of lever C, spring *f*, depressing the opposite end of said lever, wire D, attached to the end of the lever contiguous to pawl *g*, and pawl *d*, engaging the periphery of plate *c*, said pawl *g* having an extension opposite its engaging-point, in combination with tumbler E, having projections *h* and *i* so arranged and constructed with reference to pawls *g* and *d* that when it is turned it disengages said pawls from plate *c*, as and for the purposes set forth.

382,770. DOOR-HANGER. WILLIAM I. POWELL, Kansas City, Mo. Filed May 31, 1887. Serial No. 239,702. (Model.)



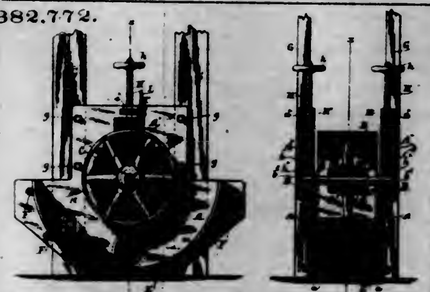
Claim.—1. A door-hanger constructed with a pair of inclined arms, both of which incline in the same direction, and provided with another pair of inclined arms, which are inclined in a direction that is opposite each other, substantially as and for the purpose set forth.

2. In a door-hanger, the combination of the hanger proper constructed with oppositely-inclined arms, as described, and a door-plate provided with inclined passages for engaging said arms, substantially as described.

3. In a door-hanger, the combination of an upper section provided with a rider-bar engaging the axle of the supporting-wheels, a lower section or door-plate provided with oppositely-inclined passages, and a main section located between the upper and lower sections and provided with a pair of inclined slots, which incline in the same direction, and also provided with oppositely-inclined arms for engaging the inclined passages in the lower section, substantially as described.

4. In a door-hanger, the combination of a lower section to be attached to the door and provided with oppositely-inclined passages, an upper section which is provided with a rider-bar for the axle of the supporting-wheels, and with lugs, as described, and a main section located between said upper and lower sections and provided with inclined slots which are engaged by the hooks on the upper section and also provided with oppositely-inclined arms for engaging the passages in the lower section, and adjusting-screws, substantially as described.

382,771. TRAVELING-BAG. FERDINAND C. SCHMIDT, Newark, N. J. Filed Feb. 2, 1888. Serial No. 262,834. (No model.)



Claim.—The combination, with the bag-frame and suitable bottom and side pieces, of end pieces or gussets having their top edges cut before their insertion in the bag inwardly and downwardly from the upper corners toward the middle of the gusset, as and for the purpose set forth.

382,772. ELEVATOR-BOOT. MARSHALL F. SMILEY, Fremont, Nebr. Filed Nov. 6, 1886. Serial No. 218,201. (No model.)

Claim.—1. The combination, with a pulley and pulley-shaft, of a casing or boot comprising side walls, A A, of cast metal, provided with

382,772.

vertical guide-grooves A'-A' upon their inner faces and forming part of said side walls, and bearing-boxes B B for the pulley-shaft contained within the boot, fitted to and sliding in said guide-grooves, substantially as described.

2. The combination, with a pulley and pulley-shaft and vertically-movable bearings for the shaft, of a boot or casing comprising cast-metal side walls, A A, provided with vertical guides for said bearings and having horizontal recesses a' a' over the said guides, nuts H' H', inserted in said recesses a', and screw-shafts H H, engaged with the said nuts and connected with the said bearings, substantially as described.

3. An elevator-boot comprising continuous side walls, A, of cast metal, provided with vertical grooves or recesses A' upon their inner faces, and having horizontal recesses a' located vertically over the grooves A' A', of a pulley-shaft, bearings B B, constructed to slide in said grooves, nuts H' H', fitted within the recess a', and vertical shafts H H, engaging said nuts H' H' and connected at their lower ends with said bearing B, substantially as described.

4. The combination, with a pulley and pulley-shaft, of a casing or boot comprising continuous side walls, A A, of cast metal, provided with vertical guide-grooves A' A' upon their inner faces, and bearing-boxes B B for the pulley-shaft, sliding in said guide-grooves and provided with apertures b^2 b^2, extending through the boxes, said pulley-shaft being without shoulders at its ends and extending to the outer surface of the box, whereby the inner surfaces of the said guide-grooves A' A' serve as end bearings for the shaft, substantially as described.

5. The combination, with a pulley and pulley-shaft, of a casing or boot comprising continuous side walls, A A, of cast metal, provided with vertical guide-grooves A' A' upon their inner faces, bearing-boxes B B for the pulley-shaft, sliding in said guide-grooves, and oil-tubes connected with the said bearing-boxes, extending upwardly through the said guide-grooves, the upper part of the said side walls, A A, being provided with guide-apertures for the said oil-tubes, substantially as described.

382,773. KNOT-TYING MECHANISM FOR GRAIN-BINDERS. JAMES R. SEVERANCE, Fremont, Ohio, assignor of two-thirds to William D. Baldwin, Montclair, N. J., and John C. Adsit, Hornellsville, N. Y. Filed Feb. 20, 1886. Serial No. 192,646. (No model.)

Claim.—1. In a knotter, the combination of two parallel spiral arms of unequal length independently mounted upon tubular shanks fitting one within the other and supported on a fixed axis, the longer spiral being extended as a screw-thread upon the exterior of the outer shank, and a stationary block acting against said portion of the longer spiral, whereby the spirals when rotated are caused to move longitudinally upon their axis, substantially as and for the purposes set forth.

2. In a knotter, the combination of a pair of parallel spirals supported upon independent tubular shanks, one within the other, mounted loosely upon a fixed axis, and suitable mechanism adapted to give them a reciprocating longitudinal and rotary motion, substantially as described.

3. In a knotter, the combination of two parallel spirals of unequal length, each attached to a tubular shank, one of which runs within the other, a fixed axis upon which the inner shank is loosely mounted, a spring connecting the shanks, a fixed block acting against one of the spirals, and means for giving a rotary motion to the shanks, substantially as and for the purposes set forth.

4. In a knotter, the combination of two parallel spirals independently mounted upon tubular shanks fitting one within the other, the outer ends of the spirals being formed with a cord-holding hook and recess, respectively, a spring connecting the rear ends of the shanks and acting to hold the hook into the cord-holding recess, a fixed axis upon which the inner tubular shank is loosely mounted, means for positively rotating the inner shank, a stationary block acting against the convolutions of one of the spirals for imparting longitudinal motion thereto, a stud or projection on the exterior shank, and a fixed stop adapted to engage the stud and arrest the movement of the outer shank while the other shank completes its movement and opens the cord-holding jaws, substantially as and for the purposes described.

5. In a knotter, the combination of two parallel spirals, their concentric tubular spring-connected shanks loosely mounted on a fixed axis, the screw-thread extension of one of the spirals upon the surface of the exterior shank, the cam-shell partially enveloping the extended spiral, the stationary block adapted to act against said extension, and means for imparting to the cam-shell a reciprocating rotary motion, substantially as and for the purposes described.

6. In a knotter, the combination of a spiral cord-looping device mounted loosely upon a fixed shaft by means of a tubular shank, a screw-thread upon the surface of the shank having the same pitch as the spiral, a stationary block adapted to act against the spiral to cause it to move longitudinally when rotated, and means for giving to the shank reciprocating rotary motion, substantially as and for the purpose described.

7. In a knotter, the combination of a spiral cord-looping device, a suitable rotary cord-holder, and means for imparting a reciprocating longitudinal and rotary motion to the cord-looping device and an intermittent rotary motion in one direction to the cord-holder, all suitably arranged and adapted to co-operate with each other in the formation of a fish-net knot, substantially as and for the purpose set forth.

8. In a cord-holder, the combination of a fixed segmental clamping-surface, a revolving clamping-plate so mounted concentrically with the segment as on its rotation to pass close to the surface of the segment and press the cord against it with a yielding pressure, and a horn projecting spirally outward from the plate and adapted to hook over and engage the needle end of the cord at the beginning of the revolution of the plate, and by its continued revolution in the same direction to conduct the cord into position to be caught and clamped between the yielding plate and the fixed segment, substantially as and for the purposes described.

9. In a cord-holder, the combination of the fixed segmental clamping-surface, the rotating spiral horn-carrying plate adapted to perform by a single forward revolution all the operations of presenting the cord to the knotter and releasing, engaging, guiding, and clamping it as described, the mutilated pinion, upon the hub of which the horn-bearing plate is mounted so as to revolve about the axis of the segment, and the segmental gear fixed upon the binder-shaft and adapted to give to the pinion a single rotation at each revolution of the binder-shaft, substantially as described.

10. In a cord-holder, the combination of a fixed segmental clamping-surface, its supporting-post, a pinion mounted to revolve thereon, the plate K', secured to the pinion and extending across the periphery of the segment, and provided with a spirally-extending horn adapted on the rotation of the pinion to engage the cord outside of the orbit of the plate and move it laterally into the orbit of the plate, between which and the segment it is clamped by the continued rotation of the pinion, substantially as described.

11. In a knotter adapted for the formation of a fish-net knot, the combination of the double spiral, constructed as described, the cam for actuating the same, the pinions and driving-wheels for imparting rotary motion thereto, the rotating cord-holder, its driving-wheel mounted on the binder-shaft, and the vibrating knife, also actuated thereby, substantially as and for the purpose described.

12. In a knotter, the combination, with suitable supporting framework, of the casing A, the axis a^4, secured at its rear end to said casing and supported at its forward end by a depending bracket, and the double-spiral cord-looper mounted loosely upon said axis by its tubular shank, substantially as and for the purpose described.

13. In a knotter, the cord-holder consisting, essentially, of the segmental circular clamping-surface h^2 and the intermittently-rotating pinion I, to the hub of which is attached the cylindrical clamping-plate K', provided with the spiral projecting horn K, substantially as described.

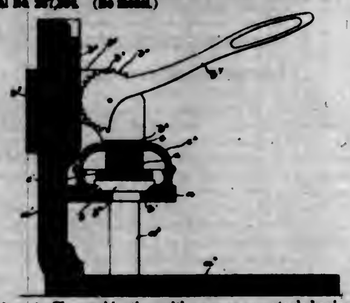
14. The combination, with the segmental circular clamping-surface h^2, of the revolving elastic clamping-plate K' and the spiral projecting horn K, formed in one piece with the clamping-plate, substantially as described.

15. The combination, with the cord-looping jaws, of the cord-holder consisting of a rotating spiral horn and a fixed segment against which the cord is clamped by the projecting base or heel of the horn, continued rotation of which carries the cord into the open looping-jaws as it passes off the segment and is released by the holder, substantially as described.

16. The combination, with the knotter-casing formed with the lip or guard A, of the rotating cord-holder having the spiral cord-guiding horn K, adapted to pass beneath and be protected or shielded by the lower edge of the said lip, substantially as shown and described.

17. The combination, with the stud h', hub H', having recess h^3, and the circular segmental clamping-surface h^2, of the pinion I, having clamping-plate K', provided with spiral projecting horn K attached thereto, substantially as and for the purposes set forth.

18. The combination, with the knotter-casing formed with the lip or guard A, of a vibrating knife and a bracket attached to the casing and adapted to support said knife, with its blade behind and protected by the lip h', substantially as shown and described.



19. The combination of the knotter-casing formed with a lip or guard, A, with the rotating cord-holder having the spiral cord-guiding horn K, adapted to rest behind and be protected by the lip A, and the vibrating knife mounted as described and located behind the guard and adapted to move during its cutting-stroke between the convolution of the spiral horn, as shown and described.

20. The combination of a knotter and a cord-holder consisting of a fixed segment and a rotating plate provided with an extending spiral cord-guiding horn, with a vibrating knife mounted as described and adapted to move during its cutting-stroke between the convolutions of the spiral horn, as set forth.

21. In combination with the cord-looping devices of a knot-tyer, a cord-holder consisting, essentially, of a circular segmental clamping-surface and a revolving clamping-plate provided with a spiral projecting horn or cord-hook arranged to revolve about an axis at or nearly at right angles with the plane of the vibration of the binder-arm, whereby the engagement of the cord by the rotation of the hook is secured, substantially as and for the purposes set forth.

22. The combination, in a cord-holder, of the cylindrical segmental clamping-surface h^2, having its outer edge beveled, as at h^4, and the revolving clamping-plate K', provided with spiral projecting cord-hook K, substantially as described.

382,774. LEMON-SAUERBIER. ALBERT SEELA, Boston, Mass., assignor of one-half to Francis A. Shea, same place. Filed Mar. 16, 1888. Serial No. 267,304. (No model.)

Claim.—1. The combination, with a cup or receptacle having perforations in its bottom, of an upright or standard, a rack-bar, a toothed sector having a handle, a plunger or press connected to the said toothed sector, a knife, and a cover movable on said plunger or press, substantially as described.

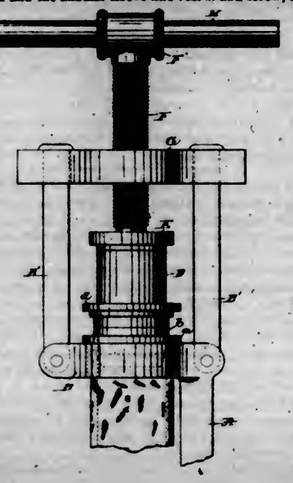
2. The combination, with a cup or receptacle having perforations b and slot b' in its bottom, of a knife, b^3, an upright or standard, a', a rack-bar, b^5, a plunger or press having arms b^6, extended beyond the said standard, a cross-bar joining said arms, a cover on said plunger or press, and a toothed sector pivoted in said arms and provided with a handle, substantially as described.

382,775. LINT COLLECTING AND COMPACTING APPARATUS. JOHN W. SEELS, Bruning Shade, Ark. Filed July 5, 1887. Serial No. 243,266. (No model.)

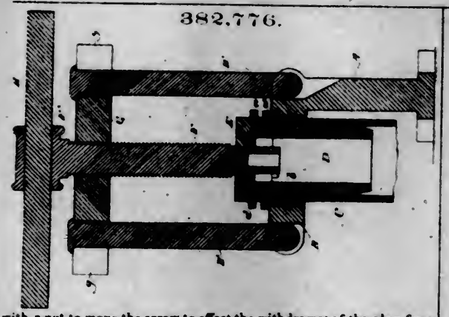
Brief.—The lint-receiver rolls upon a track and is provided with a foraminous door at one end and a sliding door at the end adjacent to the gin. The receiver is filled from the gin-flue and then rolled back to the press. The foraminous door is removed and the sliding door drawn through the receiver, compressing the cotton into the press, of which the sliding door is adapted to form one side, several sliding doors being used. The receiver is then pushed back to be filled again, the foraminous door and another sliding door being put in position.

Claim.—1. The combination of the track, as described, with the lint-room A, consisting of the cross-beams a^6, sills b b^2, having between them a slot, as shown, the uprights and braces, lining b^3, beams d^3, curtains b^4 b^5, wire-gauze lining b', the roof and the floor, wire-gauze door F, and sliding door D, having the casters d^9 d^{14} d^4, all substantially as shown and described, and for the purposes set forth.

382,775.



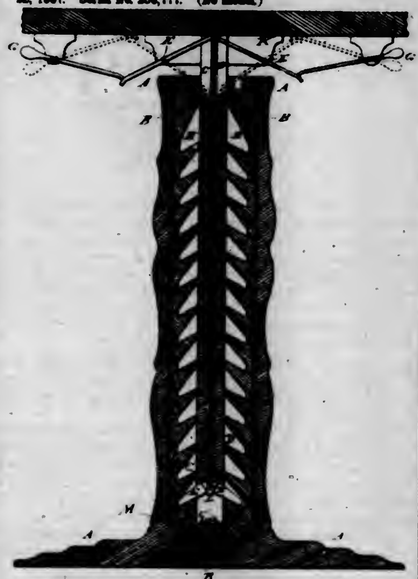
2. The combination of the room A, constructed as described, and having the sliding door D, having the cross-pieces d d', casters d^9 d^{14} d^4, and beam d^4, having the eye d^7, with the driving-beam E, having the notch d^8 and casters e, side rods, f, attached to said driving-beams, hooks and stretcher f', secured to said side rods, tackle-block f^3, attached to said hooks and stretcher, ropes f^2, the beam f^6, the winding-beam C, rope f^5, tackle-block f^7, and the press B, said tackle-block f^7 hooked in the eye d^7 of the beam d^4, all substantially as shown and described, and for the purposes set forth.



382,776. TOOL FOR APPLYING COUPLINGS TO HOSE. EDWIN R. EMLEY and CHARLES ALLEN, Chelsea, Mass., assignors to the American Fire Hose Manufacturing Company, same place. Filed Dec. 3, 1887. Serial No. 256,260. (No model.)

Claim.—1. The binder-holder to hold the outer ring or binder and the plug, a follower resting thereon, and a cap to act upon both the plug and the follower, combined with means, substantially as described, to cause the cap to force the plug into the hose and cause the follower to at the same time act upon the wedge-ring and force it into the hose surrounding the plug, substantially as described.

2. The binder-holder to hold the outer ring or binder and the plug having a head and the annular sleeve-like rest m and screw, combined



382,776.

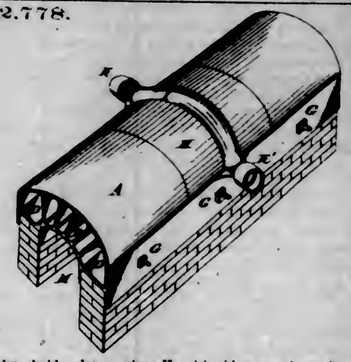
with a nut to move the screw to effect the withdrawal of the plug from the hose end and the outer ring, substantially as described.

382,777. STOOL. HERMAN C. SETTE, Normal Park, Ill. Filed Dec. 22, 1887. Serial No. 258,777. (No model.)

Claim.—1. The combination, in a stool-seat, K, of a revolving cylinder, B, with indentations H, the post C, with the chamber C C', the rod D, the plugs E E, the wedged bottom L M, and the levers F and G, substantially as specified.

2. The rod D, having plugs E E attached, in combination with a revolving cylinder, B, with indentations H, the post C having the chamber C C', with a wedge-shaped bottom, L M, substantially as shown, for the purpose specified.

382,778. UNDERGROUND CONDUIT FOR ELECTRIC WIRES. WALTER F. SMITH, Philadelphia, Pa. Filed Jan. 24, 1888. Serial No. 261,754. (No model.)

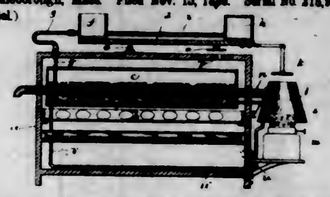


Claim.—1. A sectional conduit for electric wires, composed of double arch A B, fins C, attached to one of the arches and forming long chambers D D to receive the wires, substantially as described.

2. A sectional conduit for electric wires, composed of double arch A B, fins C, attached to one of the arches and forming long chambers D D to receive the wires, said conduit being provided with spaces J J at intervals between the upper edges of the fins and the roofing or arch A, and side openings, K, whereby a wire from any one chamber in the conduit may be carried or led out of the side opening, substantially as described.

3. A subway for electric wires, composed of double arch A B, fins C, attached to one of the arches to strengthen the same, brace-rod G, with its screw and nut to truss and strengthen the double arch, substantially as described.

4. A sectional conduit for electric wires, composed of double arch



382,778.

A B, detachable plate-sections H, with side-tapered nozzles K, and rings O, adapted to be driven onto the tapered nozzle and tighten the joint, substantially as described.

5. A sectional conduit for electric wires, provided with removable plates H, side-tapering nozzles K, and rings O, to secure the parts together, substantially as described.

382,779. TEMPERATURE-REGULATOR FOR INCUBATORS. GEO. B. TALBOT, Tyngsborough, assignor of one-half to Lyman A. Thomas, Middleborough, Mass. Filed Nov. 15, 1886. Serial No. 218,972. (No model.)

Claim.—1. The combination of a casing or apartment, means for artificially heating it, a chamber within said apartment containing a fluid, a lever without said apartment having an open and closed receptacle, a communication from both receptacles to said chamber independent of said lever, and heat-controlling devices connected with and operated by said receptacles, substantially as set forth.

2. The combination of a casing or apartment, a chamber within said casing containing a fluid, the heating-pipe extending therethrough and connected with the source of supply of heat, an external tilting lever, a receptacle at one end of said lever and having a communication with said chamber independent of said lever, and a counterpoise for the receptacle on said lever, and heat-regulating devices connected with and operated by said lever, substantially as set forth.

3. The combination of a casing or apartment, means for heating it externally, a chamber, *c*, containing a fluid, an external tilting lever, and two receptacles, *f h*, at opposite ends of said lever, said receptacles having a tubular connection with each other, and with the chamber independent of the lever, substantially as set forth.

4. The combination of the casing, the sealed chamber *c* within the casing, an external heater, a funnel or passage over the same, a flue, *n*, adapted to conduct heated air through the casing, the tilting lever *d* outside of the casing, having the valve *k*, adapted to either divert the heated air into the flue *n* or permit it to pass directly through said funnel or passage, the receptacle *f* on said lever, connected, as described, with the chamber *c*, and a counterpoise on said lever for the receptacle *f*, as set forth.

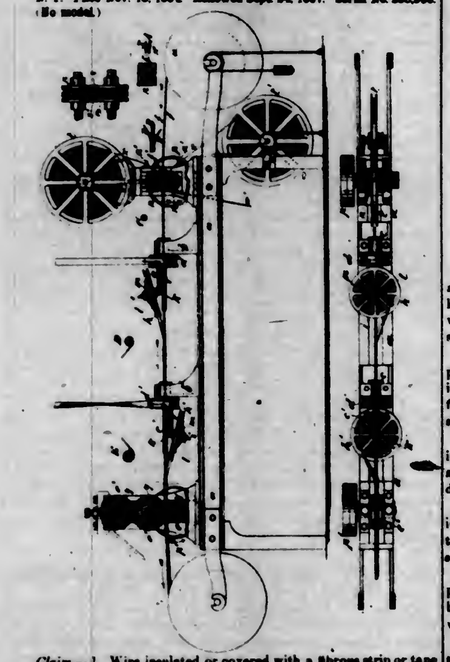
5. The combination of the casing, the chamber *c* therein, the external funnel, *l*, the flue from said funnel extending through the chamber *c*, the lever *d*, having the valve or damper *k*, the receptacle *f* on said lever, connected, as described, with the chamber *c*, and a counterpoise on the lever for said receptacle, as set forth.

6. The combination of the casing, the chamber *c* therein, means for heating said casing, the tilting lever *d*, the open receptacle *f*, and the sealed receptacle *h* on said lever, connections, substantially as described, between said receptacles and between the receptacle *f* and chamber *c*, and heat-regulating devices operated by the lever *d*, as set forth.

382,780. WEATHER-STRIP. OLIVER TATHAM and JOHN BYAR, Augusta, Ky. Filed Jan. 5, 1888. Serial No. 259,888. (No model.)

Claim.—1. The combination, with a door, of the hood C, attached to the bottom thereof, the strip mounted in bearings at the ends of

382,780.



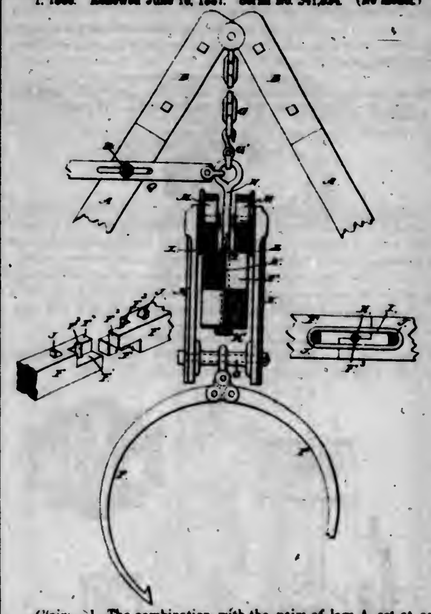
the hood, the lever G, mounted in a recess at the free edge of the door and having the detents H, adapted to strike at its upper end against the jamb when the door is closed, and the connecting-link B, between the lower end of the lever and the strip, substantially as specified.

2. The combination, with a door having a groove in its lower edge, of the weighted strip mounted therein, the shoulder L, having the padding or cushion M thereon, the upwardly and rearwardly extending arm D on the strip, and the lever connected to the said arm and adapted to engage the jamb of the door, substantially as specified.

3. The combination, with a door having a groove, B, in its lower edge and a recess, E, in its free edge, of the hood C over the groove B, the weighted strip mounted therein, the plate F over the recess E and having a slot, *f*, therein, and the lever G, mounted in the recess E and connected to the strip and having a detent, H, on its upper end projecting through the slot *f*, substantially as and for the purpose specified.

382,781. INSULATED WIRE. JOSEPH D. THOMAS, New York, N. Y. Filed Nov. 13, 1884. Renewed Sept. 24, 1887. Serial No. 250,586. (No model.)

Claim.—1. Wire insulated or covered with a fibrous strip or tape coated with soft unvulcanized rubber wound spirally about the wire and subsequently vulcanized thereon.



2. Wire insulated or covered with two successive tapes wound successively about the wire, the first tape being provided with adherent insulating material to adhere to the wire, while the second tape is prepared with a dry and non-adherent exterior.

3. Wire insulated or covered with two tapes or strips wound successively thereon, the first tape being of insulating and adherent material, while the outer tape is non-inflammable with a dry and non-adherent exterior, substantially as herein set forth.

4. Wire insulated or covered with two longitudinal strips of soft insulating material united diametrically about the wire, in combination with two overlying strips or tapes wound spirally thereon in successive layers and in opposite directions, substantially as herein shown and described.

5. The method of covering wire with a triple coating herein described, consisting in first applying a soft rubber coat to the naked wire, and thence winding over said coat two successive spiral windings of tape, each wound in opposite directions, substantially as herein set forth.

382,782. SUSPENDED TRAMWAY. CHARLES H. THOMPSON, Bartow, Fla., assignor to Alexander H. Brown, Cleveland, Ohio. Filed Sept. 1, 1886. Renewed June 16, 1887. Serial No. 241,894. (No model.)

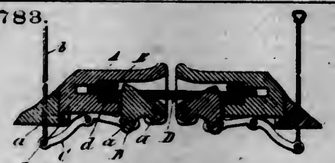
Claim.—1. The combination, with the pairs of legs A, set at an angle with each other, of the track-bed suspended freely between the legs, so as to be capable of sidewise movement, and an adjusting device for aligning the track-bed, substantially as herein shown and described.

2. In combination with the suspended track-bed, the series of pairs of supporting-legs straddling the same, the legs of each pair being set at an angle with each other, and the braces D E, extending from one leg to the succeeding one on each side of the track-bed, substantially as herein shown and described.

3. In a suspended tramway, the combination, with the supporting-legs, of a track-bed carried thereby formed of stringers connected at their adjoining ends by pivots, substantially as herein shown and described.

4. In a suspended tramway, the combination, with the supporting-legs, of a track-bed carried thereby formed of stringers jointed together and connected by links at their ends, substantially as herein shown and described.

5. In a suspended tramway, the combination, with the series of pairs of legs A and braces E D, of the track-bed suspended by flexible connections from the legs, and a laterally-projecting bar connected with the track-bed and adjustable on the legs, substantially as specified.



6. In a suspended tramway, the combination, with the legs or supports A, of the stringers F, flexibly suspended therefrom and having the adjacent ends oppositely mortised and apertured to receive the pivoting-bolt and connected by a link, substantially as specified.

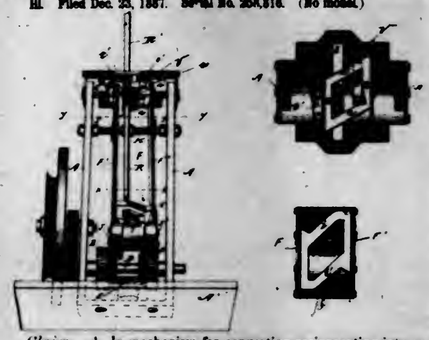
7. In a tramway, the combination of the suspended stringers F, the parallel rails L on each side of the same, the V-shaped frame N, the wheels M, journaled in the same, and the tongs P, suspended from the frame N, substantially as specified.

382,783. CAR-COUPLING. WILLIAM L. UHLEMHART, Astoria, Oreg. Filed Nov. 8, 1886. Serial No. 218,264. (No model.)

Claim.—1. In a car-coupling, the combination of the coupling-pin B, lever C, and spring *c*, substantially as set forth.

382,783.

2. In a car-coupling, the combination of the several parts, coupling-pin B, lever C, fender-plate E, spring *d*, lever-spring *e*, and hand-hold *b*, all substantially as set forth.



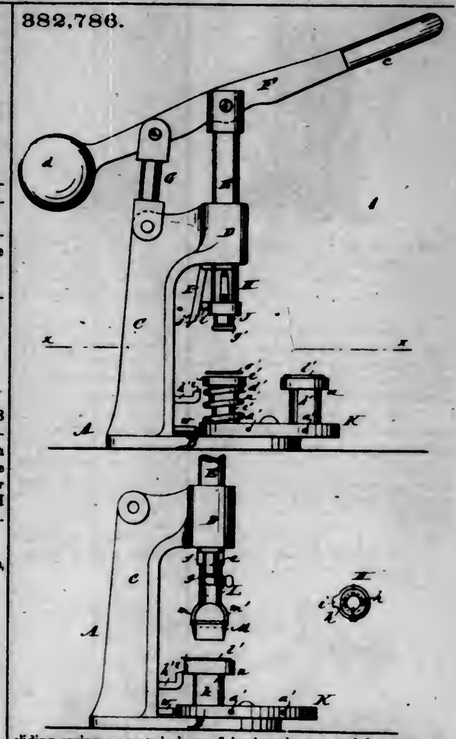
3. In a car-coupling, the combination of the several parts, lever-pin B, lever C, fender-plate E, spring *d*, lever-spring *e*, and lever-handle F, all substantially as set forth.

382,784. WINDOW-SHADE FIXTURE. DANIEL W. WEBB, Chicago, Ill. Filed Nov. 20, 1886. Serial No. 219,452. (No model.)

Claim.—In a window-shade fixture, the combination of shade B and roller C, having button K^3, with two shade-supports, J J, one provided with an aperture, K', and a pin, L, and both having arms with perforations to receive the rods H H and an aperture above to receive the end of the cord, rods H H, pulley-brackets having pulleys over which the curtain-cords pass, and each a hole into which one rod H is received, plates G G, lock-nuts I I, the compound cord N, and lock-pulley O, all as and for the purpose set forth.

382,785. MECHANICAL MOVEMENT. JULIUS WITT, Chicago, Ill. Filed Dec. 23, 1887. Serial No. 258,816. (No model.)

Claim.—1. In mechanism for converting reciprocating into rotary movement, the combination, with a series of co-operating wheels, substantially as described, to receive alternating movement and change it to continuous rotary movement, of a frame provided at one end with a toothed segment or segments, and carrying at its opposite end anti-friction rollers, said frame being mounted loosely on a supporting-shaft and provided with oblique cam-plates, a lever having its fulcrum coincident with the pivotal support of the frame and adapted to engage with the cam-plates of the frame, and guide-bars provided with detents that prevent a return-stroke of the frame until the latter is shifted.



2. In a mechanical movement, the combination, with the series of wheels B, C, and E, of the frame F, mounted loosely and adapted to slide upon a fulcrum-support and provided toward its ends, respectively, with cam-plates, substantially as described, also with segments J J' at its lower end and anti-friction rollers *l l'* at its upper end, a shaft, H, on which frame F is supported, lever R, mounted on said shaft, and guide-bars *e e'*, having détents *u u*, substantially as described.

3. In a mechanical movement, the combination, with a series of wheels, B, C, and E, of the frame F, pivotally mounted and laterally movable, and provided with cam-plates *a* and *a'* and *i* and *i'*, a shaft, H, a pivotal lever, R, mounted on said shaft, anti-friction rollers *n n* and *n' n'*, guide-bars *e* and *e'*, detent-springs *u u*, and rollers *l l'*, substantially as set forth.

382,786. BUTTON-MACHINE. ALBERT WITTE, New York, N. Y. Filed Aug. 12, 1887. Serial No. 246,781. (No model.)

Claim.—1. In a button-machine, the combination, with the sliding rod E, provided with the guide *c*, of the follower H, the movable magnetized cylindrical block J, and the die formed of the standard *c'* and

382,786.

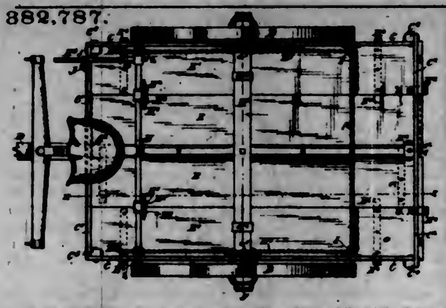
sliding spring-supported sleeve *d'*, having the recessed flange *e'*, substantially as specified.

2. In a button-machine, the combination of the rod E, provided with the guide *c*, the movable follower H, having the beveled projection *i* and concaved sliding cylindrical block J, the spring-actuated detent-lever I, the die formed of the standard *c'* and sliding spring-supported sleeve *d'*, having the recessed flange *e'*, and the disengaging-arm *h'*, provided with the beveled end *i'*, adapted to engage the detent-lever, substantially as specified.

3. In a button-machine, the combination, with the follower E and revoluble plate K, of the hollow punch M, secured to the follower E, and the punching-block *u*, carried by the plate K and provided with the rawhide disk *l'*, substantially as specified.

4. In a button-machine, the combination, with the sliding rod E and revoluble plate K, of the punch M, fitted to the said rod E, and the punching-block *u*, carried by the plate K, substantially as specified.

5. In a button-machine, the combination of the sliding spindle E, provided with the guide *c*, the follower H, fitted to the guide *c*, the concaved magnetized cylindrical block J, carried by the follower H the detent-lever I, releasing-arm *h'*, and the die formed of the standard *c'* and spring-supported sleeve *d'*, having the recessed flange *e'*, substantially as specified.



382,787. DUMPING-WAGON. ALEXANDER M. WOOLPOLE, Chicago, Ill. Filed Sept. 14, 1887. Serial No. 249,643. (No model.)

Claim.—1. A dump cart or wagon body provided in its bottom with longitudinally-arranged flaps extending from end to end of the body and hinged to the body at their side edges, and with a transversely-arranged axle passing through the sides of the wagon-body at a point between the ends of the latter over and free from the flaps.

2. A dump cart or wagon body provided with a central longitudinal beam or support extending from front to rear of the wagon-bed, and flaps hinged to said central beam and to the sides of the body, and a horizontal axle passing through the wagon-body above the flaps and attached to the said beam, substantially as described.

3. The combination, with the body of a dump-cart provided with longitudinally-arranged hinged flaps in its bottom extending from end to end of the body, of a transversely-arranged axle passing horizontally through said body at a point between its ends and above the flaps, and a centrally-arranged tongue extending through the front

382,787.

wall of the body and attached to the axle at the middle of the latter, substantially as described.

4. The combination, with the body of a dump-cart and an axle passing through the said body, of a tongue extending into the body and attached to the axle at its rear end, a longitudinal beam located beneath the axle and extending from end to end of the body, said beam being secured to the axle, substantially as described.

5. The combination, with the body of a dump-cart and an axle passing horizontally through said body, of a tongue extending into the body and attached to the axle, a longitudinal beam located beneath the axle and extending from end to end of the body, said beam being secured to the axle, and flaps hinged to the central beam and to the sides of the body and extending beneath the axle, substantially as described.

6. The combination, with the wheels and axle, of a dump-cart body comprising side walls sustained upon the said axle and extending below the latter, front and rear end walls connected with said side walls, a central longitudinal beam attached at its ends to the end walls of the body and secured to said axle, and flaps hinged to the said side walls and to the said longitudinal beam beneath the axle and forming the bottom of the body, substantially as described.

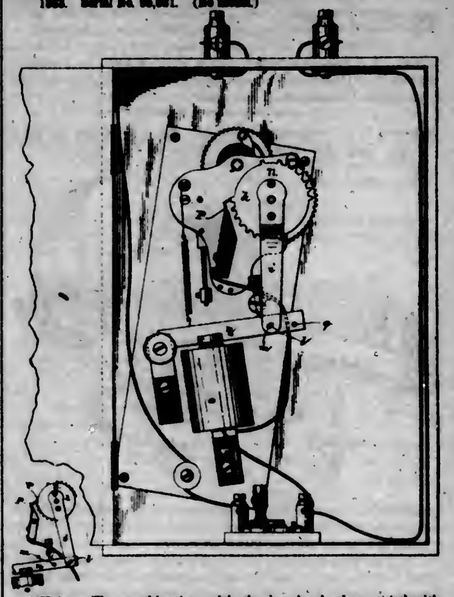
7. The combination, with a cart or wagon body and longitudinally-arranged hinged flaps forming the bottom of said body, of a rock-shaft mounted transversely at the front end of the body and provided with rigid arms, lifting-chains attached to said arms and extending downwardly to the front ends of the flaps, other lifting-chains extending from said arms to the rear ends of said flaps, and guides or pulleys upon the sides of the body near the rear end of the latter for said chains last mentioned, substantially as described.

8. The combination, with a cart or wagon body provided with hinged flaps forming the bottom thereof, and lifting-chains attached to said flaps, of a transverse rock-shaft having bearings upon the sides of the body, said rock-shaft consisting of a square bar of iron having cylindric bearings formed thereon, cast-metal arms provided with square apertures for the passage of the rock-shaft, and with set-screws for securing said arms upon the shaft, said arms consisting of two parallel parts or prongs, and having a pin extending through the extremities of said arms for the attachment of said lifting-chains, and a hand-lever attached to said shaft, substantially as described.

9. The combination, with the body of a cart or wagon provided with an outwardly-opening tail-board hinged at its top edge to the body, of longitudinal flaps hinged to the body, said flaps being provided with prongs or fingers adapted to engage the tail-board, and means for lifting and holding closed the said flaps, substantially as described.

10. The combination, with the body of a cart or wagon provided with an outwardly-opening tail-board hinged at its top edge to the body, of longitudinal flaps hinged to the body and provided with prongs or fingers adapted to engage the tail-board, the edges of the side-boards of said body being outwardly or rearwardly inclined in their parts against which the tail-board rests, whereby the said tail-board will close tight against the side-boards by gravity, substantially as described.

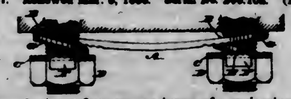
11. The combination, with the body of a cart or wagon and longitudinally-arranged hinged flaps, of lifting-chains extending from the front end of the wagon to each of said flaps, other lifting-chains extending from the rear ends of the alternate flaps, and prongs or fingers upon the rear ends of said flaps, to which the said chains last mentioned are connected, said fingers being adapted to extend beneath the free edges of the adjacent flaps, substantially as described.



12. The combination, with a cart or wagon body, two flaps hinged at the center of said body, and two other flaps hinged at the sides of the body, of a rock-shaft mounted at the front end of the body, lifting-chains extending from said shaft to the forward ends of all of said flaps, other lifting-chains extending from the said rock-shaft to the rear ends of the outer flaps, guides upon the sides of the body for said chains last mentioned, and prongs or fingers upon said outer flaps engaging and supporting the free edges of the inner flaps, substantially as described.

13. The combination, with a cart or wagon body provided with a central longitudinal beam, of flaps hinged to said beam, and hinges for the flaps consisting of straps secured against opposite faces of said beam, a pivot-pin inserted and held in the lower bend of the strap, and straps attached to the opposite flaps and engaging opposite ends of said pin, substantially as described.

14. The combination, with the body of a cart or wagon and an axle passing through said body, of metal shells or thimbles embracing the axle and attached to the sides of the body, said shells or thimbles forming recesses to receive the wheel-hubs, whereby the wheels may be placed close to the body.



15. The combination, with the body of a cart or wagon and an axle passing through said body, of metal shells or thimbles embracing the axle and attached to the sides of the body, said shell or thimbles consisting of two separable flanged parts, substantially as described.

382,788. AUTOMATIC FIRE-ALARM. JOHN YOUNG, Chicago, Ill., assignor to the Western Electric Company, same place. Filed May 21, 1883. Serial No. 99,021. (No model.)

Claim.—The combination, with the break-wheel provided with the characters for indicating a given signal twice, of the clock-work, the circuit-closer *p*, the arm *i*, provided with the stop *l*, the armature-lever *n*, provided with stops *m q*, the fire-alarm circuit, the electro-magnet *o*, included in said circuit, and registering apparatus, substantially as shown and described.

382,789. NUT-LOCK. LOUIS J. BENTON, Alpine, N. Y. Filed Apr. 6, 1887. Renewed Mar. 3, 1888. Serial No. 266,102. (No model.)

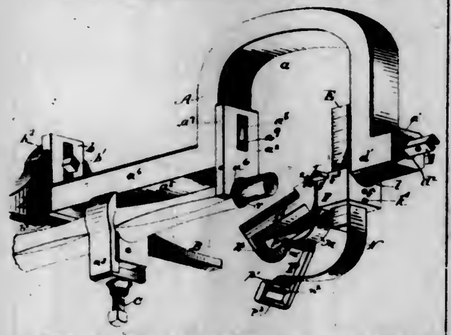
Claim.—1. A nut-fastener consisting of a spring-bar having eyes with toothed ends, a corrugated washer with lips at its periphery, and a nut, substantially as described.

2. A nut-fastener consisting of a bar with helical eyes at the ends thereof, and serrated washers interposed between the nuts and eyes, the coils of the eyes interlocking with the serrations of the washers, said bar extending diagonally from eye to eye and bowed outwardly, substantially as described.

382,790. PROCESS OF PRODUCING RECORDS OF SOUND. EMILE BERLINER, Washington, D. C. Filed Mar. 17, 1886. Serial No. 267,868. (No model.)

Claim.—1. The method or process of producing a record of sound-waves in solid resisting material for reproduction of the re-

corded sounds, which consists in covering the surface of such material with a film of etching-ground that offers no perceptible mechanical resistance, then making a phonautographic record upon and through the etching-ground, and then exposing the record to the action of a suitable etching agent, substantially as described.



2. The method or process of producing a record of sound-waves in solid resisting material for reproduction of the recorded sounds, which consists in depositing upon the surface of such material a film of wax from a solution of the same in a suitable menstruum, then making a phonautographic record upon and through the wax film, and then exposing the record to the action of a suitable etching agent, substantially as described.

3. The method or process of producing a record of sound-waves in solid-resisting material for reproduction of the recorded sounds, which consists in depositing upon the surface of such material a film of wax from a solution of the same in benzine, then making a phonautographic record upon and through the wax film, and then exposing the record to the action of a suitable etching agent, substantially as described.

4. The method or process of preparing solid surfaces for the reception of a phonautographic record, which consists in depositing upon said surfaces a film of tracing or etching ground and then moistening such film with an adhering fluid, substantially as described.

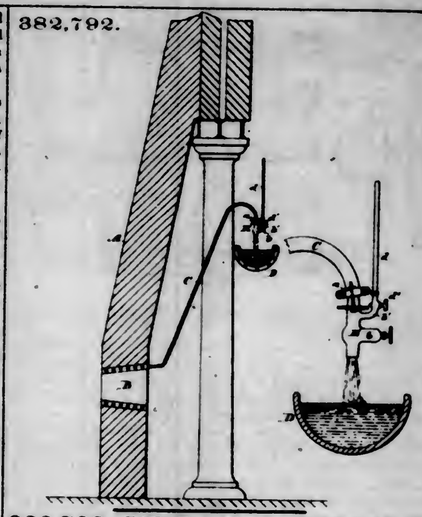
5. The method or process of preparing solid surfaces for the reception of a phonautographic record, which consists in depositing upon said surfaces a film of wax and then moistening the wax film with alcohol, substantially as described.

382,791. **TENONING-MACHINE.** George C. Berlin, Del Norte, Colo. Filed Mar. 30, 1887. Serial No. 232,962. (No model.)

Claim.—1. In a spoke-tenoning machine, the supporting-frame, in combination with the cutter-head hinged lengthwise of the frame and held adjustably thereto, as set forth.

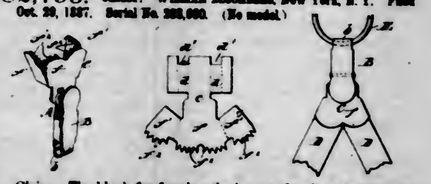
2. In a spoke-tenoning machine, the supporting-frame, in combination with the cutter-head hinged lengthwise of the frame to said frame, and provided with the spring or springs arranged lengthwise of the cutter-head, as set forth.

3. The combination, with the supporting-frame, of the cutter-head H, springs M N, and the yoke P, the cutter-head being hinged to the frame, and the springs connected by the yoke and interposed between the cutter-head and the frame, as set forth.



382,792. **APPARATUS FOR DETECTING LEAKAGE IN FURNACE-BLOCKS.** Joseph Bird, Saxton, Pa. Filed Aug. 17, 1887. Serial No. 247,176. (No model.)

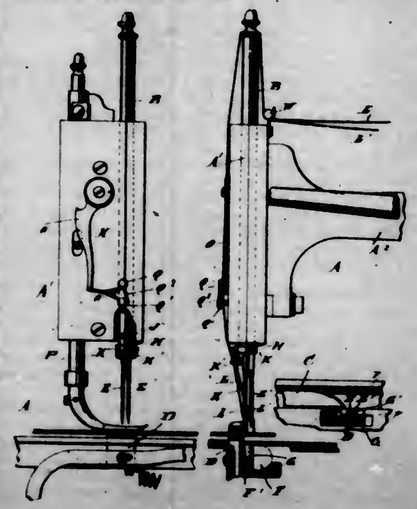
Claim.—1. The combination, with the discharge-pipe of a furnace-block, of a stop-valve, a gage-glass closed at its upper end, and a stop-cock between the pipe and gage, substantially as set forth.



2. A device for detecting the leakage of blocks in furnaces, consisting of a faucet provided with a valve near the lower end, an upwardly-extending branch near the opposite end, a gage attached to the end of said branch, a stop-cock in said branch and closed at its upper end below the gage, and means for attaching the faucet to the water-discharge pipe of a furnace, substantially as shown and described.

3. The combination, with the water-blocks of a furnace and the discharge-pipe leading out therefrom, of a faucet detachably connected to said discharge-pipe, provided with a valve near the lower end, an upwardly-extending branch above said valve, a glass tube supported by said branch and closed at its upper end, a stop-cock below said tube, and the sectional collar *e*, attaching the faucet to the discharge-pipe, substantially as described.

382,792.



382,793. **CLASP.** William Rogers, New York, N. Y. Filed Oct. 29, 1887. Serial No. 253,660. (No model.)

Claim.—The blank for forming the jaw A of a clasp formed with the main center piece, *c*, side pieces *d*, fan-shaped piece *f*, side pieces *f'*, and teeth *f²*, substantially as described.

382,794. **SEWING-MACHINE.** Charles P. Bentley, Milton, assignor to himself, John F. Merkley, Watsontown, and Charles H. Dougal, Milton, Pa. Filed Mar. 29, 1887. Serial No. 232,698. (No model.)

Brief.—Two needles placed so as to make an angle to the path of the shuttle are brought into line, so as to be engaged by the same shuttle, by means of an inclined wall in the side of the race, which deflects one needle into line with the other. A needle-clamping device is also included in the invention.

382,794.

Claim.—1. The combination, in a sewing-machine, with the needle-bar, a race, a shuttle, and an operating mechanism, of two needles carried by the needle-bar and at an angle to the width of and both entering the same race, and mechanism for bringing the points of the needles into position within the race for the single shuttle to take both loops, substantially as set forth.

2. The combination, in a sewing-machine, with the needle-bar, the shuttle, the race, a slot having vertical walls, a slot having an inclined wall, the slots being at their bottoms in a plane parallel with the inner wall of the race, below the needle-bar, and an operating mechanism, of the two needles carried by the needle-bar and set at an angle to the width of the race, whereby the inclined wall of the slot will throw the point of one entering needle into line with the other needle and the race, substantially as set forth.

3. In a sewing-machine, a socket-piece provided with a slot and a transverse set-screw entering the slot, the needle-carrying frame within the slot and having a needle-receiving recess in the path of the set-screw, and means for securing the said needle-frame within the slotted socket-piece, substantially as set forth.

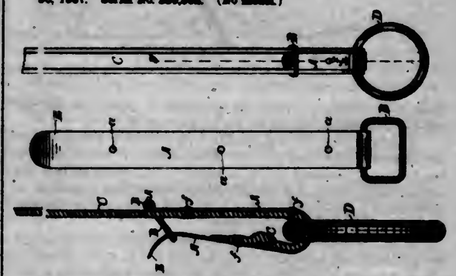
4. In a sewing-machine, the slotted socket-piece having a transverse set-screw entering the slot and recesses at opposite sides of the upper end of the slot, the needle-carrying frame having a recess in its upper end to form prongs which enter the said recesses in the socket-piece and a needle-receiving recess in the path of the set-screw, and the ring surrounding the lower end of the socket-piece and frame, substantially as set forth.

5. In a sewing-machine, the slotted socket-piece, its needle-clamping set-screw, and the needle-carrying frame within said slot and having a needle-receiving recess in line with the set-screw, the ring surrounding the lower end of the socket-piece and frame, substantially as set forth.

6. The combination, with the needle-bar of a sewing-machine having a socket in its lower end and a set-screw, and the operating mechanism, of the socket-piece having a reduced upper end entering said socket and provided with a vertical slot and a transverse set-screw, the needle-carrying frame having a vertical needle-receiving recess in line with said transverse set-screw, and the ring surrounding the lower end of the socket-piece and frame, substantially as set forth.

7. In a sewing-machine, the take-up N, consisting of the spring-lever O, pivoted at its upper end to the front of the head and operated from the presser-bar, the two eyes, O' O², placed alongside of each other at the lower end of said lever, the pins Q Q' on the head, one above the other at opposite sides of the eyes, and the spring Q², extending from one pin to the other, substantially as set forth.

382,795. **POCKET-BOOK FASTENING.** Robert L. Boyd, New York, N. Y. Filed Mar. 17, 1883. Serial No. 267,490. (No model.)



Claim.—1. A pocket-book provided with a fastening consisting of a base-plate attached to the body of the pocket-book and formed with a hook-shaped jaw and an elevated seat, a plate attached to the flap of the pocket-book and formed with a hook-shaped jaw adapted to engage that on the body base-plate, and a locking-button mounted to slide lengthwise on the said elevated seat over the engaging-jaws, substantially as described.

2. The combination, with the body and flap of a pocket-book, of a base-plate attached to the body and formed with a transverse jaw and an elevated seat, a button mounted to slide on said seat over the jaw and having a front cam end, and a fastener attached to the flap having a transverse jaw adapted to engage that on the base-plate, and formed with converging cam-ridges to receive and guide the cam-ended button, substantially as described.

3. The herein-described fastening for pocket-books, consisting of a body base-plate provided with attaching-claws and formed with a jaw extending entirely across the tip of the oval and having an inner face inclined sharply forward and downward, and with a flat seat just behind and elevated above the jaw, a button mounted to slide on said seat over the jaw, and a flap-fastener formed of a plate folded upon itself to embrace the flap and having a curved ridge on its outer face to engage the button, and a transverse hook-shaped jaw projecting from the face opposite the ridge, substantially as described.

382,796. **SAFETY REIN-FASTENER.** Elmer E. Brown, Portland, Me., assignor of one-half to John S. Williams, Boston, Mass. Filed Dec. 30, 1887. Serial No. 259,262. (No model.)

Claim.—1. The combination of the driving-rein with the U-shaped elastic metal hook having a pivoted loop, substantially as described.

2. A driving-rein provided with the U-shaped elastic hook having a curved point and a pivoted loop located at about equal distances from the bend of the hook, substantially as described.

3. The combination of the rein C, U-shaped elastic plate or hook A, with curved end E and pivoted loop B, and the ring D, substantially as described.

382,797. **CURTAIN-FIXTURE.** Ephas F. Bryant, Malden, assignor of one-half to William H. Part, Boston, Mass. Filed Apr. 27, 1885. Serial No. 163,686. (No model.)

Claim.—1. In combination with a curtain-roller, A, having slots *g* and *i* and peripheral groove A, and a spindle, C, a spiral spring, B, fastened at its inner end to the spindle and fastened at its outer end to the roller A by extending through said slots and groove, substantially as set forth.

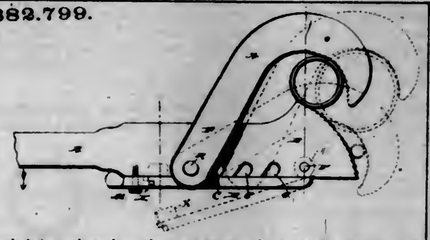
2. In combination with a curtain-roller, A, provided with slots *g* and *i* and groove A, to receive the end of the spring-wire, a cap, E, extending over the periphery of said roller, so as to cover said groove and spring-wire therein, substantially as specified.

3. In combination with a curtain-roller, A, a cap, E, of one piece of metal, extending over a portion of the periphery of said roller and turned back upon itself at its outer end, whereby the cap may be struck up out of sheet metal and be recessed or countersunk at its end to form a chamber for the pawls *j*, substantially as specified.

4. In combination with a curtain-roller, A, cap E, and pawls *j*, pins *k*, which extend through the end of said cap and into the roller and form pivots for the pawls, substantially as set forth.

5. In a curtain-roller, in combination with a ratchet or notched hub, a spindle formed of a central wire or core doubled or enlarged within the ratchet or notched hub, and a wire wound around the central wire or core and bent to form the rectangular end, substantially as specified.

6. In combination with a curtain-roller, a spindle therein formed of a central core having a wire wound thereon, substantially as described, and for the purposes set forth.



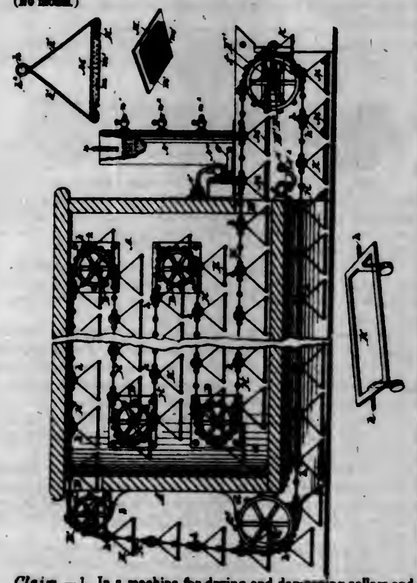
382,798. **MANUFACTURE OF FELT HATS, CAPS, &c.** Frederic W. Cheesman, Hyde, County of Chester, England. Filed Mar. 31, 1887. Serial No. 233,210. (No specimens.)

Claim.—The herein-described improvement in the method of manufacturing felt hats or head-coverings, which consists in first forming the complete body or form according to whether it is to be soft or stiff, then working or felting a covering or veneer of fine short staple wool or fur upon said coarser body or form, and, finally, finishing the body or form, substantially as set forth.

382,799. **PIPE-WRENCH.** Robert Copland, Baroda, Col. Filed Jan. 18, 1888. Serial No. 261,111. (No model.)

Claim.—1. In a wrench, the combination of the shank A, having the jaw B provided with sockets C C and the recess I, the swinging jaw having a transverse pin, R, engaging any one of the sockets, and the latch pivoted at its front or outer end to the jaw B, and having a detent on its other end fitting in the said recess I in the jaw, the said

382,799.

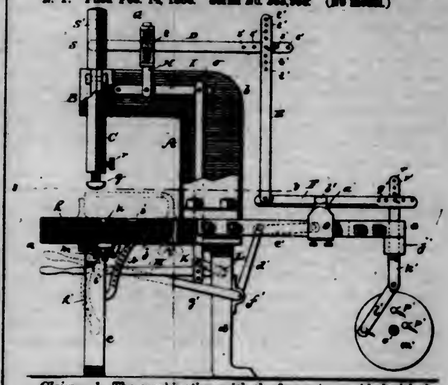


latch being adapted to close the open ends or mouths of the said sockets, substantially as and for the purpose specified.

2. In a wrench, the combination, with the shank having a rigid jaw attached thereto and provided with sockets C C, of the movable jaw having a transverse pin, R, mounted in one of the sockets, the pivoted latch closing over the said sockets and having a shoulder on its free end, and the catch having a shoulder to engage the shoulder on the latch, substantially as specified.

3. In a wrench, the combination, with the shank having a rigid jaw provided with sockets C, of the movable jaw having a transverse pin, R, mounted in one of the sockets, the pivoted latch having a beveled end provided with a shoulder, G, and the pivoted catch having a thumb-hold, N, and a beveled outer end provided with a shoulder to engage the shoulder G, substantially as and for the purpose specified.

382,800. COLLAR AND CUFF DRIER AND DAMPENER. JOHN G. DIXON, New York, N. Y. Filed Feb. 15, 1887. Serial No. 227,679. (No model.)



Claim.—1. In a machine for drying and dampening collars and cuffs, the combination, with a heated chamber, of an endless chain traveling in and out of the chamber, carriers suspended from the endless chain, and atomizers arranged outside of the chamber and above and below the endless chain, substantially as herein shown and described.

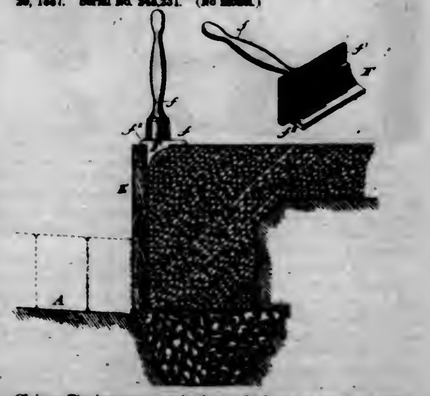
2. In a machine for drying and dampening collars and cuffs, the combination, with a heated chamber, A, having the extension E and provided with an inlet, D, and outlet E, a series of atomizers attached above and below the said outlet, and endless chain belts H, traversing said chamber, of carriers K, journaled in and suspended from said chain, and perforated trays M, supported upon said carriers, adapted to hold collars and cuffs, substantially as shown and described, whereby the collars and cuffs in said trays have both surfaces presented equally to the heat and also to the spray of the atomizers, as set forth.

3. In a machine for drying and dampening collars and cuffs, the combination, with a heated chamber, A, having an inlet, D, and outlet E, and provided with the extension E', endless chain belts H, traversing said chamber, carriers K, journaled in said chain and supported therefrom in a horizontal position, and perforated trays supported by said carriers adapted to hold collars and cuffs, of a series of atomizers, N' N², held above and below said outlet, and a tank, N, adapted to supply water to said atomizers, provided with overflow-cocks n', n², and n³, substantially as shown and described, whereby the spray is regulated, to be thrown upon the collars and cuffs after passing through the outlet E, as set forth.

382,801. EMBOSSING-MACHINE. MICHAEL T. DUNKIN, Brooklyn, N. Y. Filed Feb. 14, 1888. Serial No. 263,902. (No model.)

Claim.—1. The combination, with the frame A, provided with the bed-plate *a* and right-angled arm *b*, of the follower C, the lever D, provided with an adjustable yielding fulcrum, and means for oscillating the lever D, substantially as described.

2. In an embossing-press, the combination of the frame A, provided with the notched bed-plate *a*, the adjustable frame A, the circular die *i*, fitted to the frame *h*, the bolt *k*, the cross-bar *l*, and the reciprocating follower C, carrying the die *q*, substantially as described.

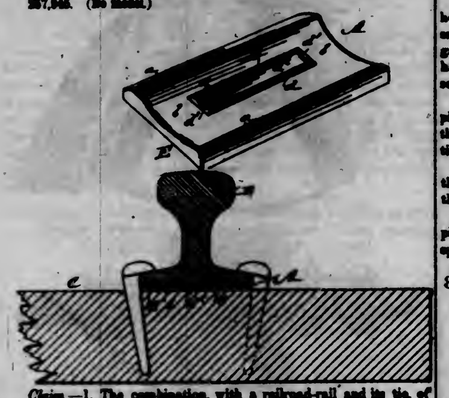


3. The combination of the follower C, the lever D, having a yielding fulcrum, the connecting-rod E, the lever F, the sliding block O, provided with convex surfaces *o' o'*, the reciprocating bar *k'*, pivoted to the lever F, and the crank-wheel *m'*, substantially as described.

4. The combination, with the follower C and lever D, of the frame G, provided with the rods *u*, the spiral springs *v*, the movable fulcrum *t*, the lever I, connecting-rod J, the shaft L, the arm K, and the hand-lever M, substantially as described.

5. The combination, with the circular die *i*, of the stake *p*, substantially as described.

6. The combination, with the frame A and reciprocating follower C, carrying the die *q*, of the right-angled stake *r'*, substantially as described.

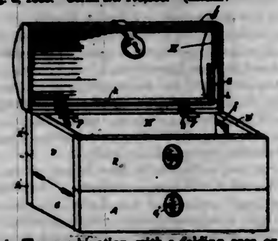


382,802. METHOD OF CONSTRUCTING STREET-CURBING OF ARTIFICIAL STONE. CHARLES J. EVERETT, Tuxedo, N. J. Filed Aug 20, 1887. Serial No. 248,231. (No model.)

Claim.—The improvement in the method of constructing street-curbing of artificial stone, consisting in first building the curb of stone

composition and providing a guard and guide plank or plate at the edge of the curbing, and in then forming an ornamental molding and consolidating the surface at the upper and outer corner of the plastic curbing by the combined pressing and rubbing action of a pressing and rubbing tool, guiding the tool meanwhile upon the upper edge of the guard plank or plate, substantially as herein described.

382,803. RAILWAY-RAIL PAD. HARRY J. PASSMORE HALL and LEWIS WALLACE, Philadelphia, Pa. Filed Dec. 15, 1887. Serial No. 257,945. (No model.)

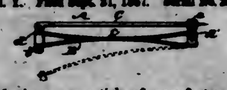


Claim.—1. The combination, with a railroad-rail and its tie, of an intervening elastic pad provided with a flat under face, a concave upper face, and a central longitudinal rib, as and for the purpose herein set forth.

2. The combination, with a railroad-rail and its tie, of an intervening elastic pad provided with a flat under face, a concave upper face, beveled longitudinal edges, and a central longitudinal rib having a concave face, the side edges whereof are of a height equal to the side edges of the body, substantially as shown and described.

3. As an improved article of manufacture, an elastic pad for railway-rails, consisting of a block provided with a flat under surface, beveled upper longitudinal edges, a concave upper face, and a central longitudinal rib having a concave upper face the side edges whereof are equal in height to the side edges of the block proper, substantially as and for the purpose herein set forth.

382,804. FOLDING CASE. HENRY C. FAY, Worcester, Mass. Filed Aug. 3, 1883. Serial No. 173,202. (Model.)



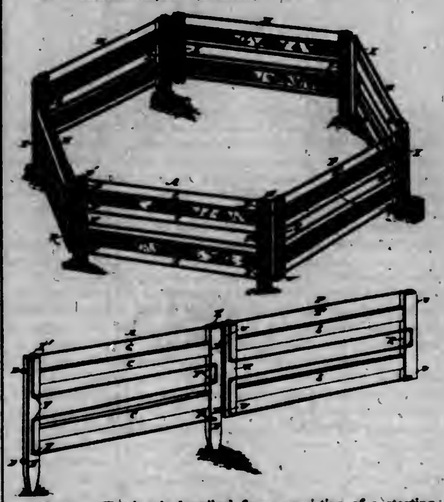
Claim.—1. The combination, with a folding case or box whose sides are provided with dovetailed grooves, of a detachable lid, and hinges attached to said lid provided with leaves adapted to be inserted in said dovetailed grooves, whereby the lid is attached to said case or box, substantially as described.

2. In a folding case or box, the combination of a rigid and a folding section, substantially as described, each of said sections being provided with dovetailed grooves, and a lid having hinges provided with leaves adapted to be inserted in said dovetailed grooves, substantially as described.

3. In a box or case, the sides provided with dovetailed grooves to receive the leaves of the lid-hinges, a detachable lid having hinges, each of which is provided with a leaf which is adapted to enter one of said grooves, and a pin passing through said leaves into the box, whereby the lid is attached to the box or case, substantially as described.

4. In a folding case, the sides A A' and C C', attached to the bottom of the case, folding sides B B', folding ends D D', the edges of the sides A' and B' being provided with grooves, as described, and a detachable lid having hinges whose leaves are adapted to enter and be held in said grooves, and an elastic packing between said lid and the sides of said box or case, substantially as described.

382,805. HANDKERCHIEF-HOLDER. STEPHEN M. SEAVERS, Brooklyn, N. Y. Filed Sept. 21, 1887. Serial No. 250,304. (Model.)



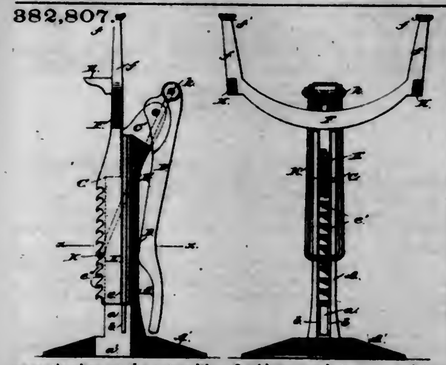
Claim.—1. As a new article of manufacture, a handkerchief-holder constructed substantially as herein shown and described, the same consisting of a main frame, a pin for fastening the same to a garment, and a clasping-bar hinged to the main frame for clasping a handkerchief between said bar and the main frame, substantially as set forth.

2. The main frame A, formed of spaced side bars, *c c*, and end pieces, *d d'*, in combination with the pin C, clasping-bar B, hinged to the main frame, and a fastening device for the clasping-bar, substantially as described.

3. The main frame A, provided with a pin, C, in combination with the clasping-bar B, hinged to the main frame and bent inward toward the main frame to form a spring, substantially as described.

4. The main frame A, composed of the spaced side bars, *c c*, end pieces, *d d'*, pin C, and hinged clasping-bar, made narrower than the space between the bars *c c*, substantially as described.

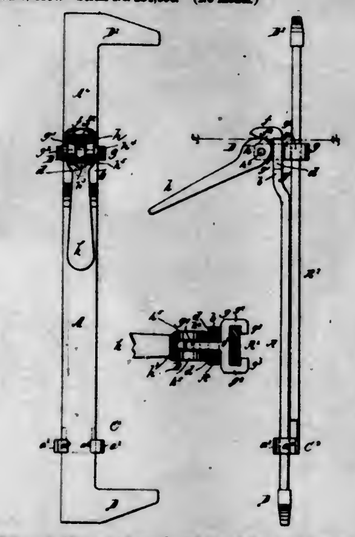
382,806. FENCE. JAMES HARRIS, Columbia, Mo. Filed Sept. 12, 1887. Serial No. 249,489. (No model.)



Claim.—The herein-described fence, consisting of a starting-panel having posts at each end pointed at their lower ends for insertion in the ground, and a number of similar panels having but one end post similarly pointed, the said panels being connected by hooks and staples at their meeting edges, and each panel composed of the mortised end posts and tenoned rails fitted to each other without bolt or pin, and the continuous wire having one end secured to the top of one of the end posts at E, running thence through the staple E' on top of the other posts, and over the pins F, secured in the side of the posts, and having its lower end secured to the first end post vertically below its upper end, the strands of wire adjacent to each rail being at equal distances above and below the latter, substantially as specified.

382,807. WAGON-JACK. RUSSELL HARRIS, Hackensack, N. J. Filed Nov. 4, 1887. Serial No. 254,266. (No model.)

Claim.—1. In a wagon-jack, the combination, with the carrying-bar, of a curved arm attached centrally thereto, upwardly-extending supporting-bars integral with the extremities of said arm, and steps secured upon one side of the arm beneath said supporting-bars, substantially as and for the purpose herein set forth.



2. In a wagon-jack, the combination, with the recessed standard, a friction-roller journaled in said standard projecting in said recess, a lever pivoted in the standard, and a U-shaped lifting-loop pivoted to the lever, of a carrying-bar sliding in the recess of the standard, provided with notches to receive the lifting-loop, a curved arm attached centrally at the top of the carrying-bar, upwardly-extending vertical

382,807.

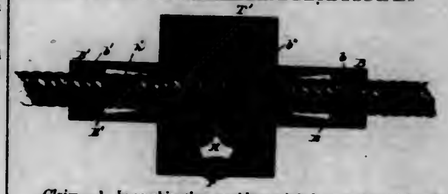
supporting-bars at the extremities of said arm, and stops secured beneath said supporting-bars, substantially as shown and described, and for the purpose herein set forth.

382,808. CLAMP. HENRY B. HATHAWAY, Merrill, Wis. Filed Oct. 7, 1887. Serial No. 251,602. (No model.)

Claim.—1. The combination, with two sliding jaw-bars, of a clasp separate from and independent of both bars, embracing one of said bars and provided with a stud extended to the outer side of the other bar, and a pivoted cam hung upon said stud, substantially as and for the purpose described.

2. The combination, with two sliding jaw-bars, A A^3, one, A, of which is provided with an inclined projection, of a clasp separate from and independent of both bars embracing the other bar, A^3, and provided with a stud extended to the outer side of said bar A, and a pivoted cam hung upon said stud, substantially as and for the purpose described.

3. The combination, with two sliding jaw-bars, one of which is provided with a slot, of a clasp separate from and independent of both bars embracing the other of said bars, and provided with a stud extended through said slotted bar, and a pivoted cam hung upon said stud, substantially as and for the purpose described.



4. The combination, with two sliding jaw-bars, one of which is provided with an inclined projection, *f*, and a slot, *d*, of a clasp, *g*, embracing the other of said bars, provided with a stud, *g'*, extended through said slotted bar, and a pivoted cam, D, hung upon said stud, substantially as and for the purpose described.

5. The combination, with two sliding jaw-bars, A A^3, one, A, of which is provided with an inclined projection, *f*, and a slot, *d*, and the other, A^3, with a clasp, a^3, of a clasp, *g*, embracing said bar A^3, provided with a stud, *g'*, extending through said slotted bar, and a grooved pivoted cam, D, hung upon said stud, all substantially as and for the purpose described.

382,809. WITHDRAWN.

382,810. CABLE CONDUIT AND TRUCK. WILLIAM HEMMING, Yonkers, N. Y., assignor to Benj. Butterworth, trustee, Cincinnati, Ohio. Filed Feb. 13, 1883. Serial No. 269,902. (No model.)

Claim.—1. In combination, a cable-conduit for traction-cable railroads having an upper and a lower pair of rails, the cable-truck supported by wheels running normally upon the lower set of rails and having its wheels inclined one toward the other, so that the axial line of each passes through the rail upon which the other runs, substantially as described.

2. A cable-truck for traction-cable railroads having its wheels so inclined one to the other that the axial line of each wheel passes through the tread of the other, substantially as described.

3. A cable-conduit of trapezoidal cross-section having, in combination, the double bracket, the inclined side pieces supported by the brackets and separated by a central overhead slot, and the floor-piece held in place by the overlapping side pieces, substantially as described.

4. A cable-truck for traction-cable railways having three separate and independent points of support upon the cable, substantially as described.

5. In a cable-truck for traction-cable railways, the truck-frame centered on a ball of soft metal and having tubular bell-mouthed extensions surrounding the cable, in combination with the two auxiliary buttons, one at each end of the truck-frame, each centered upon its ball of soft metal, the bearing-surfaces of the buttons, and truck-extension forming portions of the surface of a sphere whose center coincides with that of the truck-frame, substantially as described.

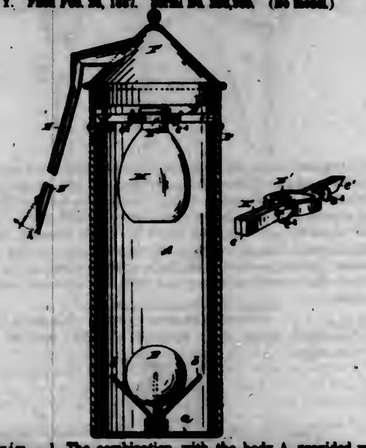
6. A cable-truck frame having the central cavity connected with inclined journal-bearings, in combination with the plugged oil-hole leading to the same, substantially as described.

7. An organization of parts designed to secure a button upon a cable, consisting of the following combination: the cable-center, the two-part egg-shaped mass of soft metal surrounding the cable-center and provided with spiral corrugations, the surrounding cable-strands fitting into the said corrugations, and the secondary mass of soft metal surrounding and separating the strands, substantially as described.

8. In a cable road, the conduit having inclined sides and inclined rails forming a track for a cable-truck, in combination with a truck having its wheels and axles inclined one toward another and provided with an upward projection for engaging with the sprocket on a chain-grip, substantially as described.

9. A cable-truck having its wheels inclined one toward the other, substantially as described.

382,811. ELECTRO-MEDICAL APPARATUS. PETER HENRY, Sioux City, Iowa. Filed Oct. 5, 1887. Serial No. 251,514. (No model.)



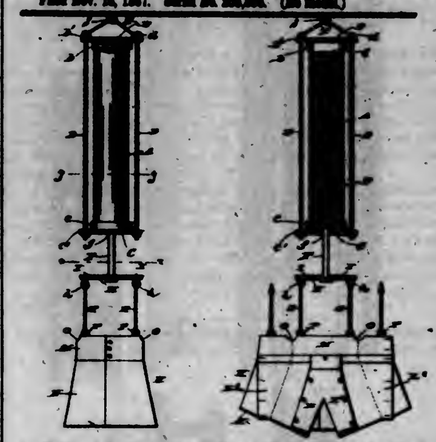
Claim.—1. In a medical apparatus, the combination, with a grooved hard-rubber disk, of a small metallic disk held centrally on the bottom of said rubber disk, a screw screwing in said rubber disk and resting with its head against said small metallic disk, a handle held on said screw, a large metallic disk held on the top of said rubber disk, and against which also rests the inner end of said handle, and metallic pins held in said rubber disk, their inner ends contacting with the inside of said large metallic disk, substantially as shown and described.

382,811.

2. In a medical apparatus, the combination, with a grooved hard-rubber disk, of a small metallic disk held centrally on the bottom of said rubber disk, a screw screwing in said rubber disk and resting with its head against said small metallic disk, a handle held on said screw, a large metallic disk held on the top of said rubber disk, and against which also rests the inner end of said handle, metallic pins held in said rubber disk, their inner ends contacting with the inside of said large metallic disk, and a collector for frictional electricity held between said large metallic disk and the top of said rubber disk, substantially as shown and described.

382,812. AUTOMATIC FIRE-EXTINGUISHER FOR STOVES AND HEATERS. FRANCOIS L. HOUSMAN and FRANK A. RAIT, Brooklyn, N. Y. Filed Feb. 28, 1887. Serial No. 229,205. (No model.)

Claim.—1. The combination, with the body A, provided with brackets D D' near the top, the oppositely-inclined rods *b* at the bottom, and the conical cap F, provided with an outlet-tube, H, of an acid bottle suspended by a detachable split yoke, E, from said brackets D D', and a ball, B, loosely seated upon the said inclined rods *b*, substantially as shown and described, and for the purpose herein set forth.



2. The combination, with a stove or heater, of a fire-extinguisher consisting of a body, A, a split yoke, E, detachably held in said body near the top, an acid bottle suspended from the yoke, a series of oppositely-inclined rods, *b*, attached centrally to the bottom of the body, a metal ball supported by said rods beneath the bottle, a detachable conical cap, F, and outlet-tube H, connecting the body with the interior of the stove, substantially as shown and described

382,813. GUMMED PAPER-FASTENER. JOSEPH M. JONES, Paris, Ky. Filed Oct. 26, 1887. Serial No. 253,252. (No model.)

Claim.—In gummed paper-fasteners, the strip A, divided transversely at suitable distances apart by rows of perforations *b*, and having the gum or adhesive material applied to both of its sides in sections or patches extending across the rows of perforations, leaving blank or ungummed portions or surfaces *c* on both sides of the strip and intermediate of the rows of perforations therein, substantially as and for the purposes specified.

382,814. BABY-JUMPER. MARY P. JONES, Mineral City, Tex. Filed Nov. 14, 1887. Serial No. 255,393. (No model.)

Claim.—1. In a baby-jumper, the combination, with the vertically-resilient supporting-rod F, having a frame, H, entwined on its lower end, of the supporting-garment adapted to be fastened around the infant and comprising the waist M, to be buttoned around the body, the pants depending from the waist and having the front flap, L', and the side flaps, L², adapted to be buttoned together in front of the infant, and the skirt N, attached to the waist at the top of the pants and hanging around the said pants, the upper edge of the waist being attached to the lower ends of cords R, which are attached to the said frame H, substantially as and for the purpose hereinbefore specified.

2. In a baby-jumper, the combination of the cylinder A, suitably supported and having an aperture, *f*, in its lower end, the spring coiled within the cylinder, the rod F, mounted in the aperture *f*, and having a plunger, G, on its upper end, fitting in the cylinder and bearing on the upper end of the spring, and the support K, attached to the lower end of the rod F, substantially as and for the purpose specified.

3. In a baby-jumper, the combination of the cylinder A, the cap B on the upper end, having the depending flange *b* surrounding the end of the cylinder, and the lateral flange *b'*, provided with perforations, the cap C, having the central opening, *f*, the vertical flange *e*, and the lateral flange *e'*, which is provided with perforations to align with the perforations in the flange *b'*, the rods D D, passing through the aligned perforations, and having the rings *d d* on the upper ends above the cap B, the spring E in the cylinder, the supporting-rod F, connected at the upper end to the spring and operating in the opening *f*, the support K, attached to the lower end of the rod F, the eyebolt S, secured to a suitable support, and the cords or chains T T between the said bolt and the eyes *d d* on the upper end of the cylinder, substantially as specified.

4. In a baby-jumper, the combination of the cylinder A, the cap B, having the depending flange *b* to embrace the end of the cylinder and the lateral perforated flange *b'*, the cap C, having the vertical flange *e*, to embrace the lower end of the cylinder, and the lateral perforated flange *e'*, the bolts D D, passing through aligned perforations in the said perforated flanges, the spring E within the cylinder, and the supporting-rod F, connected to the spring, and having the support K attached to the lower end to sustain the child, substantially as specified.

382,815. RAIL-JOINT. JOHN V. KERR, North Yakima, Wash. Filed Jan. 31, 1888. Serial No. 262,668. (No model.)

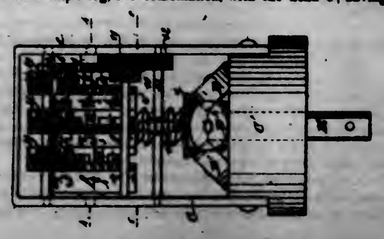
Claim.—1. An expansible rail-joint consisting of a chair having a fixed rail and sliding rail-sections, with intervening spring-joints, and located in a groove in the chair adjacent to the fixed rail, the latter having its ends overlapping the inner ends of the end sections, one of which is fixed, and the grooved chair extending beyond the end sections, substantially as shown and described.

2. An expansible rail-joint consisting of a chair grooved from end to end, rail-sections located at intervals apart and adapted to slide in said groove and connected by pins and resting-springs, end rail-sec-

882,815.

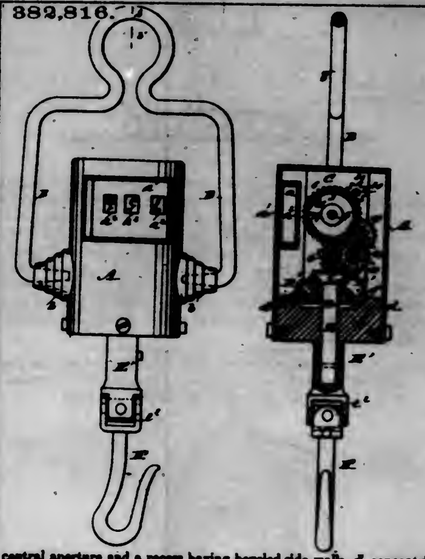
tions, one of which is fixed, overlapping the ends of the fixed rail, and the grooved chair extending beyond the end sections, substantially as described.

3. An expansible rail-joint consisting of a chair having a groove throughout its length, sliding rail-sections located in said groove and connected at intervals apart by spring-joints, and a fixed rail at one side of said groove, the intervening sliding rail-sections being less in height than the fixed rail, and the end rail-sections forming with the fixed rail a continuous rail shorter than the grooved chair, substantially as shown and described.



4. An expansible rail-joint consisting of chair 1, having groove 10, and fixed rail 2, having shoulders 18 20, groove 4, tongue 5, and lips 12 and 15, in combination with sliding rail-sections 9 9 8 8, and fixed section 19, connected by pins 23, springs 24, with ends in recesses 25, transverse slots 26, and pins 27, the end section, 9, having a shoulder, 17, and pin 21, engaging slot 22 in chair 1, and the sections engaging the lips of groove 10, substantially as described.

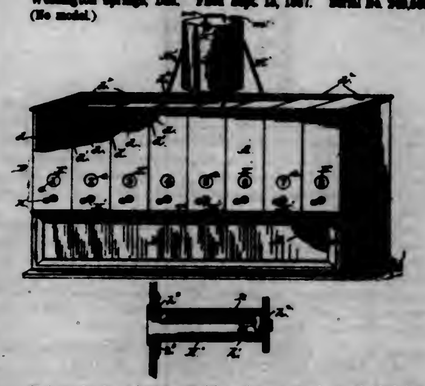
882,816. SHIP'S LOG. OSCAR KNUTH, San Francisco, Cal. Filed Aug. 15, 1887. Serial No. 246,975. (No model.)



Claim.—1. In a ship's log, the combination, with the apertured head having a beveled face or track on its inner face, of the main shaft extending through the said aperture and having a disk or projection having its under face beveled parallel with the beveled face or track on the said head, and friction-rollers of even diameter between said beveled surfaces and having their axes parallel therewith, substantially as set forth.

2. In a ship's log, the combination, with the apertured head having a beveled surface or track on the inner face concentric with the aperture, of the shaft extending through said aperture and having a disk or projection beveled parallel with the said beveled surface on the head, a loose wheel or disk upon the shaft, and rollers journaled thereon and of even diameter, the axes of the rollers being parallel with the two beveled surfaces, substantially as set forth.

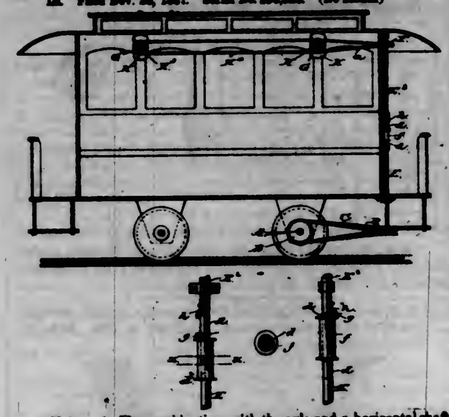
3. In a ship's log, the combination, with the head C, having a



882,816.

central aperture and a recess having beveled side walls, *d'*, concentric with the aperture, of the shaft E, extending through the aperture and provided with the projection or disk *e*, having its lower surface beveled parallel with the surface *d'*, the loose beveled wheel D on the shaft within the recess, and the rollers D', of even diameter, journaled on the beveled face of the wheel between the two beveled surfaces between the shaft and the head, the axes of the wheels being parallel with the said beveled surfaces on the shaft and head, substantially as set forth.

882,817. POWDER AND SHOT CARRIER. AUGUSTINE LA POINT, Wessington Springs, Dak. Filed Sept. 12, 1887. Serial No. 249,599 (No model.)

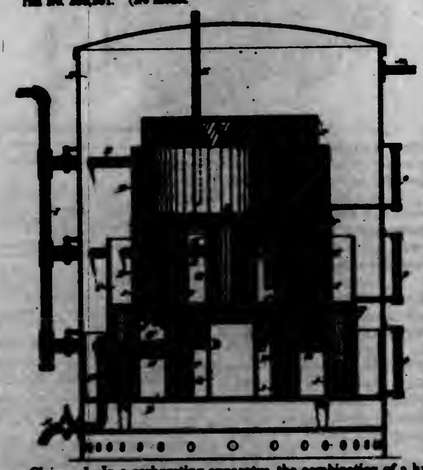


Claim.—1. A cabinet comprising the receptacle A, divided into compartments B and D by a horizontal partition, *c*, a series of vertical partitions, *d'*, subdividing the compartment D into lockers *d*, adapted to contain shot, each locker provided with an inlet and a glass plate indicating the size, and a glass door, E', covering the compartment B, and means, substantially as shown and described, for withdrawing the shot from the several lockers.

2. The combination, with the receptacle A, divided into compartments B and D by a horizontal partition, *c*, and a series of vertical partitions, *d'*, subdividing the compartment D into lockers *d*, adapted to contain shot, each locker provided with an inlet, of a revolvable faucet attached to each locker, consisting of an apertured tube, H, a similarly-apertured revolvable casing, H', provided with a milled disk, *h*, and collar *h'*, all combined to operate substantially as herein set forth.

3. The combination, with the receptacle having an opening in one wall, of the tube H, registering with said opening and provided with an aperture, A, the tube H' upon the tube H, and provided at its outer end with a head, *h'*, an aperture, *h'*, to register with aperture A, and a flange or projection at its inner end, and the loose collar *h'* upon the tube H, and secured to the outer wall of the receptacle to allow the rotation of the tube H', but prevent longitudinal movement, substantially as set forth.

882,818. FAN FOR CARS. JEAN H. V. LE BEAU, New Orleans, La. Filed Nov. 26, 1887. Serial No. 256,332. (No model.)

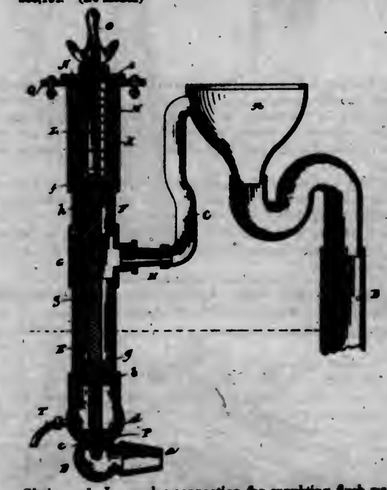


Claim.—1. The combination, with the axle and a horizontal shaft in a vehicle-chamber carrying a fan, of a two-part vertical shaft, a clutch-connection between said parts, said connections, such as described, between said axle and shafts, substantially as and for the purpose described.

2. The combination, with the axle of a vehicle provided with a pulley, B, and a fan-shaft in the car-chamber having a pulley, H, of the vertical shafts E E', having squared ends, the sleeve *f*, adjustable on said squared ends, the pulleys D F on said shafts, and the belts C *c*, substantially as and for the purpose described.

3. The combination, with the axle A of a vehicle provided with a pulley, B, and a fan-shaft in the vehicle-chamber having a pulley, H, of the vertical shafts E E', having squared ends, the sleeve *f*, provided with the eye *g*, adjustable on said squared ends, the hook *h* on the shaft E', and the belts C *c*, substantially as shown and described.

882,819. CARBURETOR. LOUIS HASEL, San Francisco, Cal., assignor, by direct and mesne assignments, of two-thirds to G. Schleuniger and George Barthorst, both of same place. Filed Nov. 28, 1887. Serial No. 256,591. (No model.)



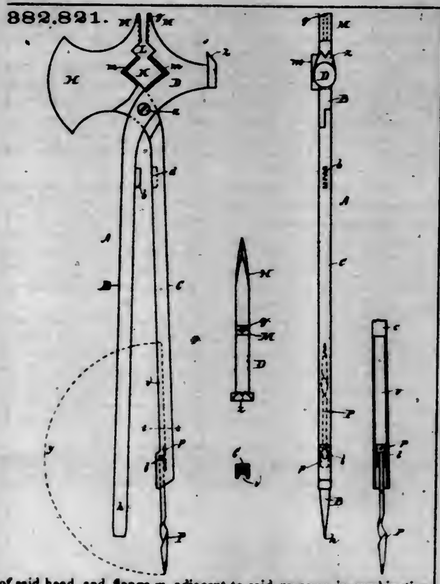
Claim.—1. In a carbureting apparatus, the combination of a hydrocarbon-gas generator, consisting of an exterior tank, the interior superposed shallow vessels of decreasing diameter from the bottom upward, a supply-pipe, overflow-pipes in each vessel, an internal chamber within the vessels containing air under pressure, and the perforated discharge-pipes uniting said chambers and provided with a porous or fibrous covering, substantially as described.

2. In a carbureting apparatus, the gas-generator consisting of the exterior tank, the interior superposed shallow vessels with the supply and overflow pipes and air-chambers, in combination with perforated or foraminous cylinders *f* and the horizontal perforated pipes by which they are connected, said cylinders and pipes being inclosed in fibrous or porous material and receiving air from the central chamber, substantially as herein described.

3. In a carbureting apparatus, the vessels or pans for containing the hydrocarbon placed in a series within an exterior inclosing-tank, having the central chambers receiving air under pressure, a series of vertical cylinders or chambers surrounding the central one and having an interior packing of sponge or porous material, and pipes by which they are united, said pipes having the receiving and discharge ends in different planes and covered with fibrous or porous material, substantially as herein described.

4. In a carbureting apparatus, the superposed hydrocarbon-containing pans within an outer inclosing-tank, the central air-chamber and the surrounding perforated cylinders, one of which is connected with the central air-chamber, while the others are connected with the first and each other successively by intermediate perforated pipes, the same being covered with fibrous or porous material, and the fibrous or porous disks covering and surrounding the same, substantially as herein described.

882,820. VALVE-CONNECTION FOR HOPPER WATER-CLOSETS. GEORGE F. MARSHALL, Brooklyn, N. Y. Filed Apr. 13, 1887. Serial No. 235,161. (No model.)

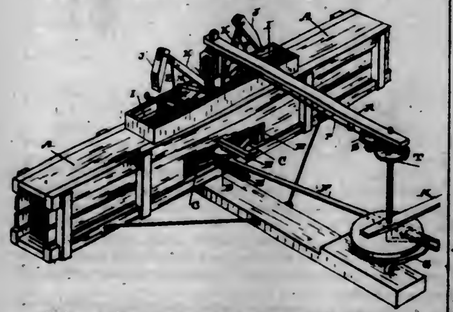


Claim.—1. In a valve-connection for supplying flush-water to hopper water-closets, the combination of the seat-plate Q, having the screw-threaded central aperture, the cylindrical casing K, having the screw-threaded flange *e*, screwed into the aperture of the plate, the cap N, screwed into the upper end of the casing, the valve-rod sliding through the cap, and the rocking cam-lever bearing against the cap and pivoted in the upper end of the valve-rod, as shown, and for the purpose specified.

2. In a valve-connection for the flush-water in hopper water-closets, the seat-plate Q, the guide-cap N, the upper casing, K, and the lower casing, E, their intermediate couplings, F and G, the latter having the hopper-connecting pipe H, and the supply-coupling D at the lower end of the lower casing, having the seat-forming constriction *c* of curved walls, forming the valve-seat centrally in line with the guideway in the cap, and having the drain-pipe T above said constriction and the supply branch *a* below said constriction, in combination with the elongated valve P, having curved walls, and its connecting-rod, whereby the said cap forms the guide for the valve-rod and the said curved constriction forms a centering guide and seat for the valve, as set forth.

882,821. COMBINATION-TOOL. JOSEPH B. MARSTON, Boston, Mass. Filed Sept. 8, 1887. Serial No. 248,978. (No model.)

Claim.—1. The improved combination-tool herein described, the same consisting of the handle B, provided with the blade *b*, the head D, claw *z* on said head, the projection M, the recesses in the lower side

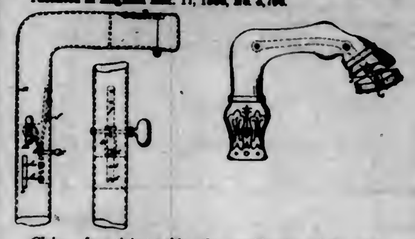


382,821.

of said head, and flange *m*, adjacent to said recesses, in combination with the handle C, pivoted at *x* to the handle B, provided with the hatchet-blade H, the recesses at the top of said blade, the flange *m* adjacent to the said recesses, the slot *d*, the projection M, and the gimlet P, pivoted in the lower end of said handle, substantially as described.

2. In a tool of the character described, the handle C, grooved longitudinally on its inner side and provided with the pivoted gimlet P, adapted to be folded into said groove, in combination with the handle B, pivoted to the handle C, and adapted to assist in keeping said gimlet properly extended when said handles are closed, substantially as set forth.

382,822. HAY-PRESS. PIRRO MCKINNEY, San Diego, Cal. Filed Feb. 16, 1888. Serial No. 264,280. (No model.)



Claim.—1. The press-boxes standing horizontally in line with each other, having their inner ends separated, as shown, in combination with the upper and lower transverse guides standing between the inner ends of the press-boxes, a slide traveling between said guides, a pitman having a slotted head, a crank-shaft connected therewith and to which power is applied, and plungers or followers connected with said slide by knee-levers between the slide and plungers, whereby a double reciprocation of the followers takes place with each complete rotation of the driving-crank, substantially as herein described.

2. The combination of the press-boxes, the reciprocating followers, the compressors, and means for operating the compressors and the followers, the flanged pulley and the cords P, by which the compressors are forced downward, a pinion fixed to the pulley on its shaft, and a mutilated gear-wheel fixed to the main crank-shaft and operating to rotate the pulley intermittently, substantially as herein described.

3. The horizontal press-boxes with their reciprocating followers, the rising and falling compressors acting in the feed-boxes and having their lever-arms connected with the followers by cords, in combination with the second cords connected with the opposite ends of the lever-arms, the flanged pulley around which the cord passes, and the mutilated gear secured to the crank-shaft and operated thereby, substantially as herein described.

382,823. HOLDER FOR TICKETS, &c. RUDOLF MEYER, Dresden, Saxony, Germany. Filed Apr. 4, 1888. Serial No. 269,612. (No model.) Patented in England Mar. 17, 1888, No. 3,766.

Claim.—In a ticket-holder, the combination of the stick *a* with the handle *d*, tappet *c*, spring *f*, the slot *b*, pins or pegs *s*, and the knob *e*, substantially as and for the purpose set forth.

382,824. MANUFACTURE OF ARTIFICIAL-STONE COFFINS. LEBRECHT MUHDT, Berlin, Germany. Filed Nov. 12, 1886. Serial No. 218,733. (No model.)

Claim.—The construction of coffins in the mold F, consisting of a substance composed of gypsum, oxide of iron, glycerine, dextrine, alum, glue, and water, in combination with linen strips *b b'* and wood laths *c d*, and a wire skeleton or frame, *e f f e*, substantially as described.

382,825. GUNPOWDER-MILL. PAUL A. OLIVER, Oliver's Mills, Pa. Filed June 14, 1887. Serial No. 241,269. (No model.)

Claim.—1. In a gunpowder-mill, the combination of the side frames provided with deep slots, the subordinate frames removably secured within the said slots, and the adjustable rolls for the powder journaled in the said subordinate frames.

2. In a gunpowder-mill, the combination of the side frames provided with deep slots arranged alternately, with their open ends at opposite sides of the side frames, the subordinate frames removably secured within the said slots, and the adjustable rolls for the powder journaled in the said subordinate frames.

3. In a gunpowder-mill, the combination, with the adjustable roll D, of the hollow roll D', driven at a much greater speed, pipes for circulating water within the hollow roll D', and a scraper for preventing accumulations upon the surface of the said hollow roll.

4. In a gunpowder-mill, the combination of the adjustable rolls D and the hollow rolls D', arranged zigzag in pairs, one above the other, the rolls D' being driven at a much greater speed than the rolls D, gather-boards for guiding the material between each pair of rolls, pipes for circulating water within the hollow rolls, and the scrapers for cleaning the said hollow rolls.

5. In a gunpowder-mill, the combination of the side frames, the rolls moving with unequal speed and journaled in the frames in pairs, one above the other, toothed gearing connecting each similar roll so that each pair is driven at the same relative speed, and a pair of distributing-rollers journaled above the top pair of rolls, also driven with unequal speed, but at a much less velocity than the said rolls, whereby the feed of material to the said rolls is rendered perfectly uniform.

6. In a gunpowder-mill, the combination of the side frames, the rolls moving with unequal speed and journaled in the side frames in pairs, one above the other, the teeth-geared wheels M and M' on opposite sides of the machine connecting each similar roll, so that each pair is driven at the same relative speed, the toothed wheels L^2 and L^3 for operating the wheels M', the toothed wheels L' and L^2 for operating the wheels M, and a driving-shaft passing across the machine journaled in the side frames, and having said wheels L' and L^2 and driving-belt pulleys secured upon it.

7. A gunpowder-mill comprising a series of revolvable rolls arranged in pairs, one above the other, and driven at unequal speed, a pair of slow-moving distributing-rollers journaled above the top pair of rolls, a roller for the feed-conveyer belt journaled above the distributing-rollers, a roller for the delivery conveyer-belt journaled below the lowest pair of rolls, a shaft provided with driving-pulleys and extending across the machine, and intermediate gearing connecting all the rolls and rollers with the said driving-shaft, the whole supported by side frames and mounted upon a common base-plate, substantially as set forth.

8. In a gunpowder-mill, the combination of the side frames, A, provided with deep slots arranged alternately with their open ends at opposite sides of the side frames, the slotted subordinate frames G, provided with flanges, the bolts R, passing through said flanges and securing the subordinate frames in position in the deep slots of frames A, the rolls D and D', arranged zigzag in pairs, one pair above the other, and carried by the subordinate frames G, the separate sliding journal-blocks for the rolls D, and the adjusting-screws F for regulating the position of said rolls D, substantially as set forth.

382,826. ALLOY. HERMANN GUTEMANN and AXEL PRIP, Geneva, Switzerland. Filed Feb. 16, 1888. Serial No. 264,362. (No specimens.)

Claim.—An alloy composed of platinum, fifty to sixty parts; copper, ten to twenty parts; nickel, twenty to thirty parts; wolfram one to two parts; cobalt, one to two parts, and cadmium one to one and one-half part, substantially as described, and for the purpose specified.

382,827. ALLOY. HERMANN GUTEMANN and ALEX PRIP, Geneva, Switzerland. Filed Feb. 16, 1888. Serial No. 264,363. (No specimens.)

Claim.—1. An alloy composed of platinum, nickel, copper, wolfram, cobalt, and cadmium, for the purpose specified.

2. An alloy composed of platinum, sixty to seventy parts; nickel, ten to twenty parts; copper, ten to twenty parts; wolfram, one to two parts; cobalt, one to two parts, and cadmium, one to one and one-half part, substantially as described, and for the purpose specified.

382,828. THILL-COUPLING. JOHN S. PARSONS, New Troy, Mich. Filed Sept. 6, 1887. Serial No. 248,896. (No model.)

Claim.—1. In a thill-coupling, the combination, with a clip adapted to a vehicle-axle, of a hook on the clip adapted to receive a thill or pole stud, and a clamp-head connected elastically and pivotally to the clip and adapted to lock against the thill or pole stud in the hook, substantially as described, for the purposes set forth.

2. In a thill-coupling, the combination, with a clip adapted to a vehicle-axle, of a hook on the clip, a spring pivoted to the clip, and a clamp-head pivoted to the spring and adapted to a thill or pole stud slipped into the hook, substantially as herein set forth.

3. In a thill-coupling, the combination, with a clip adapted to a vehicle-axle, of a hook, D *d*, on the clip, a spring, F, pivoted to the clip, and a clamp-head, G, pivoted to the spring and provided with an elastic block, H, adapted to bear on a thill or pole stud slipped into the hook, substantially as herein set forth.

4. In a thill-coupling, the combination, with a clip adapted to a vehicle-axle, of a hook, D *d*, on the clip, a spring, F, pivoted to the clip, and a clamp-head pivoted to the spring and adapted to a thill or pole stud slipped into the hook, and studs J at the joint between the spring and clamp-head, substantially as herein set forth.

5. In a thill-coupling, the combination, with a clip adapted to a vehicle-axle, of a hook, D *d*, on the clip, a spring, F, pivoted at *f* to the clip, and a clamp-head pivoted at *f'* to the spring and adapted to a thill or pole stud, E, slipped into the hook, and said pivot *f'* being arranged below a line drawn through the centers of the stud E and pivot *f* when the coupling is in use, substantially as herein set forth.

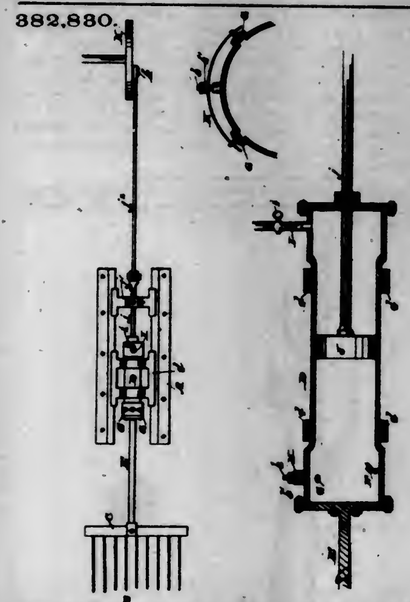
6. In a thill-coupling, the following elements in combination: a clip, A, a hook, D *d*, thereon, a spring, F, pivoted at *f* to the clip, a clamp-head, G, pivoted to the spring at *f'*, and an elastic block, H, in the clamp-head and adapted to bear on a thill or pole stud, E, slipped into the hook, and said pivot *f'* being arranged below a line drawn through the center of the stud E and pivot *f* when the coupling is in use, substantially as herein set forth.

382,829. TELEGRAPH-CABLE. WILLIAM R. PATTERSON, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Feb. 2, 1883. Serial No. 199,051. (No model.)

Claim.—1. A telegraph-cable covered with a winding of lead tape with overlapping edges, shellacked as described, wound upon a bed or covering of dry-paper tape, a covering of paper tape outside the lead tape, and an outer serving of yarn, substantially as shown and described.

2. A telegraph-cable consisting of a flexible core of one or more conductors, a winding of lead tape with overlapping edges, the overlapping portions of the lead tape being cemented together by a water-proof cement like shellac, a winding of paper tape outside the lead, and an outer serving of yarn wound upon the paper, the lead tape being separated and protected from the yarn by said paper tape, substantially as and for the purpose specified.

3. The combination, in a telegraph-cable, of a winding of lead tape with shellacked and overlapping edges, a bed or winding of paper tape under the lead tape for absorbing the excess of shellac, the core of conductors, and an outer serving, substantially as and for the purpose specified.



382,830. CARTRIDGE-LOADING APPARATUS. JAMES H. READ, San Francisco, Cal. Filed Oct. 22, 1887. Serial No. 253,153. (No model.)

Claim.—1. In a cartridge-loading or powder-packing apparatus, the connection between the plunger or rammer of the apparatus and the source of power, which consists of a sliding cylinder connected with the plunger or rammer and a reciprocating piston connected with the source of power and operating within the cylinder to move it back with itself in one direction and forward through the interposition of the air in front of the piston, substantially as herein described.

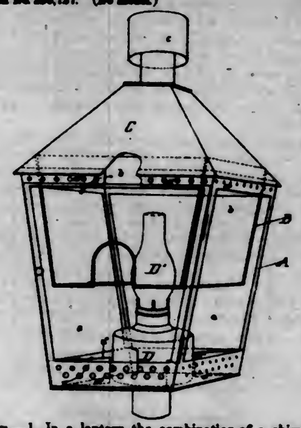
2. In a cartridge-loading or powder-packing apparatus, the pneumatic connection for applying power, consisting of a sliding cylinder, a reciprocating piston working therein and moving the cylinder with itself in one direction and in the other direction by the compression of air, and a relief-port in the cylinder controlled by an adjustable pressure-valve, whereby the limit of motion of the cylinder in the latter direction is defined by regulating the pressure of the valve, substantially as herein described.

3. In a cartridge-loading and powder-packing apparatus, the connection between the plunger or rammer of the apparatus and the

382,880.

source of power, which consists of a sliding cylinder connected with the plunger or rammer, a reciprocating piston connected with the source of power and operating within the cylinder to move it back with itself in one direction and forward by compressing the air in front, a valve-controlled inlet-port for the air in front, and a valve-controlled relief-port for defining the forward limit of the cylinder's movement, substantially as herein described.

4. In a cartridge-loading or powder-packing apparatus, the connection between the plunger or rammer of the apparatus and the source of power, which consists of a sliding cylinder connected with the plunger or rammer, a reciprocating piston connected with the source of power and operating within the cylinder to move it back with itself in one direction and forward by compressing the air in front, a valve-controlled inlet-port for the air in front of the piston, and a relief-port controlled by an adjustable pressure-valve for defining the forward limit of movement of the cylinder, substantially as herein described.



5. In a cartridge-loading and powder-packing apparatus, the connection between the plunger or rammer of the apparatus and the source of power, consisting of a sliding cylinder connected with the plunger or rammer, a reciprocating piston connected with the source of power and operating within the cylinder to move it back with itself in one direction and forward by compressing the air in front, a valve-controlled inlet-port for the air in front of the piston, a relief-port with a controlling-valve, and an adjustable spring for applying different pressures to said valves, whereby the forward limit of the cylinder's motion is defined, substantially as herein described.

6. In a cartridge-loading or powder-packing apparatus, the connection between the plunger or rammer of the apparatus and the source of power, consisting of a sliding cylinder connected with the plunger or rammer, a reciprocating piston connected with the source of power and operating within the cylinder to draw it back with itself in one direction and to force it forward by compressing the air in front, and a cushion in the rear end of the cylinder, against which the piston comes in contact when drawing said cylinder back, substantially as herein described.

7. In a cartridge-loading or powder-packing apparatus, the connection between the plunger or rammer of the apparatus and the source of power, consisting of a sliding cylinder connected with the plunger or rammer, a reciprocating piston connected with the source of power and operating within the cylinder to draw it back by itself in one direction and to force it forward by compressing the air in front, a valve-controlled inlet-port for admitting the air in front of the piston, a relief-port controlled by an adjustable pressure-valve for defining the forward movement of said cylinder and a cushion in the rear end of the cylinder, against which the piston comes in contact when drawing said cylinder back, substantially as herein described.

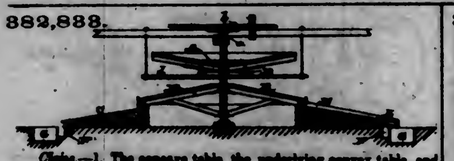
8. In a cartridge-loading or powder-packing apparatus, the connection between the plunger or rammer of the apparatus and the source of power, consisting of a sliding cylinder connected with the plunger or rammer, a reciprocating piston connected with the source of power, and operating within the cylinder to move it back with itself in one direction and forward by compressing the air in front, a valve-controlled inlet-port for the admission of air in front of the piston, a relief-port controlled by an adjustable pressure-valve for defining the forward movement of the cylinder, and an exit-pipe from the rear of the cylinder controlled by a cock or valve, whereby a cushion is provided behind the piston, substantially as herein described.

382,881. LANTERN. FRANK REBER, Morton, Conn., assignor of one-half to Edward Miller & Company, same place. Filed May 21, 1887. Serial No. 239,737. (No model.)

Claim.—1. In a lantern, the combination of a chimney-bearing lamp, a translucent chimney resting in conjunction with said lamp, an outer translucent lantern-wall, an opening for the admission or emission of air at the upper edge of said outer wall, and an inner translucent lantern-wall separated from the outer wall by an air-space and extending downward to a point below the top of the lamp-chimney and above the lower edge of the outer wall, substantially as described.

2. In a lantern, the combination of a chimney-bearing lamp, a translucent chimney resting in conjunction with said lamp, an outer translucent lantern-wall, an opening for the admission or emission of air at the upper edge of said outer wall, an inner translucent lantern-wall separated from the outer wall by an air-space, and a lantern roof or top from which said inner wall depends, substantially as described.

3. In a lantern, the combination of a chimney-bearing lamp, a translucent chimney resting in conjunction with said lamp, an outer translucent lantern-wall, an opening for the admission or emission of air at the upper edge of said outer wall, an inner translucent lantern-wall separated from the outer wall by an air-space, and a lantern roof or top from which inner wall depends, said roof being formed with a covered or protected opening, substantially as described.

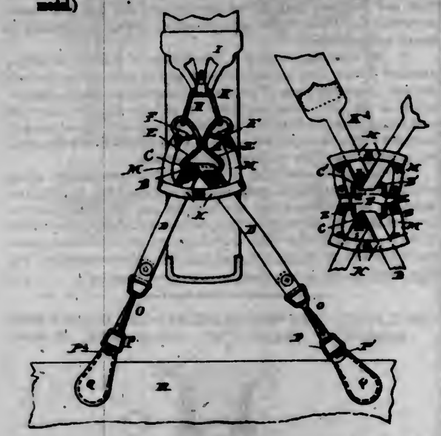


382,882. PRODUCTION OF YELLOW COLORING-MATTER. CHRISTIAN RUDOLPH, Offenbach, near Frankfort-on-the-Main, Germany, assignor to K. Oehler, same place. Filed Sept. 27, 1887. Serial No. 250,251. (No specimens.)

Claim.—1. The method of producing a yellow dye-stuff from benzaldehyde and tolaylen or phenylen-diamine by first condensing benzaldehyde with the said diamines, as described, next heating the tetra-amines thus formed with bodies capable of separating ammonia, and then converting the products of this reaction (the hydrophenylacridines) by oxidizing agents—such as chloride of iron, &c.—into the new yellow dye-stuff herein described as benzoflavine.

2. The yellow dye-stuff herein described as benzoflavine, consisting of an orange-colored powder difficultly soluble in water, somewhat more easily soluble in alcohol, capable of being precipitated from its watery solution by the addition of muriatic acid, showing in alcoholic solution an intense greenish-yellow fluorescence, which disappears on the addition of diluted acids, showing when in solution in concentrated sulphuric acid a yellow tint with greenish fluorescence, and from an aqueous solution of which the coloring-matter is, by the addition of caustic soda, precipitated in the shape of yellowish-white flakes insoluble in water, but soluble in alcohol and ether, as herein described.

382,883. GAS-CONDENSATOR. CHARLES C. BURRIS, Anaconda, Mont. Filed May 21, 1887. Serial No. 239,033. (No model.)



382,888.

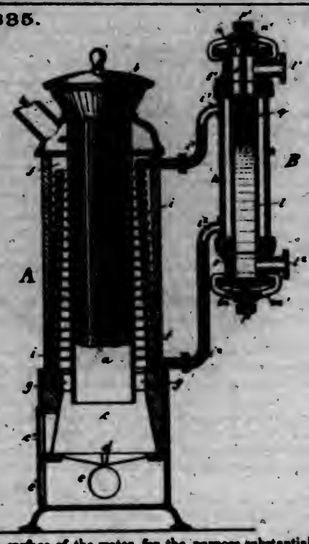
Claim.—1. The concave table, the underlying convex table, and means for rotating said tables, in combination with the stationary receiver D and the stationary cone C, substantially as herein described.

2. A revolving concave upper table and a revolving convex lower table, in combination with a convex stationary cone onto which the ore-pulp is fed by the tables, substantially as described.

382,884. SUSPENDER ATTACHMENT. CHARLES H. STALLS, Toronto, Ontario, Canada. Filed Dec. 30, 1887. Serial No. 259,507. (No model.)

Claim.—1. The suspender-buckle A, formed of a single piece of wire bent upon itself, thereby forming an axis, B, adapted to receive the friction-roller C, said ends contracted above said axis and extended and bent to receive the end of the suspender, substantially as shown and described.

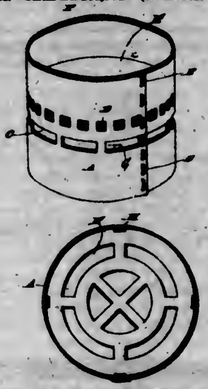
2. In a suspender-buckle, the combination, herein described, with a skeleton body having a transverse friction-roller axis, upward-projecting members, and outward-projecting arms, of a pair of oblong guide-loops rigidly connected end to end, and rigid branches on the loops connecting them to the outward-projecting arms of the body, substantially as described.



3. The combination, with the buckle A, formed of a single piece of wire, formed with a transverse axis, B, provided with a friction-roller, C, and its ends extended and projected and adapted to receive the suspender-end, as shown, of the skeleton plate M, connected to the outward projection of the buckle A, and provided with guide-loops N N, arranged exterior to the said buckle, substantially as and for the purpose specified.

382,885. STEAM-GENERATOR. WILHELM SIEMENS, Halberstadt, Prussia, Germany. Filed Oct. 17, 1887. Serial No. 252,617. (No model.) Patented in Germany May 5, 1886, No. 37,987.

Claim.—1. A steam-generator consisting of two tubes, *l* and *h*, of different diameters, being shut off from one another, and of which the one *l* is inserted in the other, *h*, and is provided with a steam-outlet port, *l'*, and water-inlet port *P*, and of which the other one, *h*, is connected to the boiler by means of the pipe *P'* at the top and by the pipe *P* at the bottom, in combination with a directly-heated system of tubes, *i*, the steam of which is conducted into tube *h* by a pipe, *i'*, and the condensed steam is guided back into the system of tubes *i* through pipe *P'*, for the purpose substantially as described.

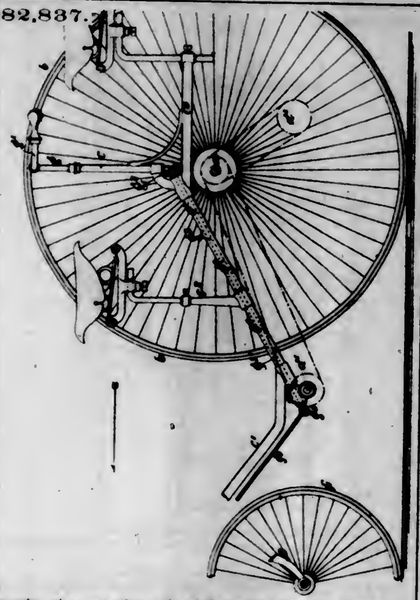


2. In steam-generators consisting of two tubes, *l* and *h*, of different diameters, being shut off from one another, and of which the one *l* is inserted in the other, *h*, and is provided with a steam-outlet port, *l'*, and water-inlet port *P*, and of which the other one, *h*, is provided with similar ports, *l'* and *P*, in combination with a directly-heated system of tubes, *i*, the steam of which is conducted into tube *h* by a pipe, *i'*, and the condensed steam is guided back into the system of tubes *i* through pipe *P*, and with a piston, *g*, arranged inside the boiler *l*

382,885.

above the surface of the water, for the purpose substantially as described.

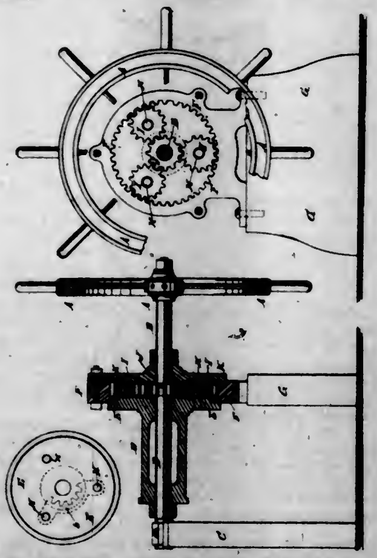
382,886. VAPORIZER. ROBERT S. SKINKLEY, Galesburg, Ill. Filed Jan. 20, 1888. Serial No. 261,674. (No model.)



Claim.—1. The vessel for heating and administering the catarrh remedy, said vessel comprising the cylinder having the pan F in its upper end, the perforated plate or diaphragm G below the said pan and adapted to rest upon the upper end of a lamp-chimney, that portion of the cylinder between the bottom of the pan and the plate or diaphragm G being perforated to admit the escape of the products of combustion, substantially as described.

2. The device for administering catarrh remedy, comprising the cylinder having the openings C D, the diaphragm B, arranged in the upper end of the cylinder above the openings D, and the plate or diaphragm G, arranged in the cylinder below the openings C, said plate or diaphragm being perforated for the purpose set forth, and having the lugs or ears secured to the cylinder, substantially as described.

382,887. VELOCIPEDE. SAMUEL GOODE and RICHARD H. LEA, Coventry, County of Warwick, England. Filed July 22, 1887. Serial No. 244,962. (No model.) Patented in England Mar. 27, 1886, No. 4,346.



Claim.—The combination, in a two-cast tricycle, with the driving-wheels and front steering-wheel and fork, and the frame having an inclined tube connecting the forward and back portions, of a handle-bar between the two ends, an inclined rod connected to said handle-bar and passing through and below the inclined tube of the frame, a crum-head upon the lower end of this rod, a crum-head upon the upper end of the steering-wheel forks, and two parallel rods or links

382,837.

connecting the respective ends of the cross-heads, substantially as specified.

382,838. STEERING APPARATUS FOR VESSELS. JOHN H. SHELLENS, Peru, N. Y. Filed Mar. 12, 1888. Serial No. 266,055. (No model.)

Claim.—In a steering apparatus, the combination of the combined standard and internally-toothed rim F with the wheel-shaft and its gear J, the drum and its gears I, mounted loose on studs fixed in the flange of said drum, the cap-plate K, in which the shaft has its front bearing, and bolts for securing said plate to the standard, as shown and described.

382,839. TWO-WHEELED VEHICLE. CHARLES C. SPENCER, Cortland, N. Y. Filed Dec. 2, 1887. Serial No. 256,773. (No model.)

382,839.

Claim.—1. The combination, with a vehicle-body and a semi-elliptic spring attached to said body, of longitudinal side springs having their forward ends attached at the front of said body and their rear ends curved upward, provided with a U-shaped bend, and secured to the said semi-elliptic spring, substantially as herein shown and described.

2. The combination, with a vehicle-body, a semi-elliptic spring attached to said body, and the axle, of longitudinal side springs secured to the axle, having their forward ends linked to the body at its front and their rear ends curved upward, provided with a U-shaped extremity and linked to the said semi-elliptic spring, substantially as shown and described.

3. The combination, with a vehicle-body, a semi-elliptic spring attached to said body beneath the seat, and an axle having its body dropped below the plane of its ends, of longitudinal side springs attached to the axle within and below its ends, having their forward ends linked to the body at its front and their rear ends curved upward, provided with a U-shaped extremity and linked to the said semi-elliptic spring, substantially as shown and described.

4. The combination, with a vehicle-body, a semi-elliptic spring attached to the seat of the body, the axle, and side bars, of springs attached to said side bars and the body, longitudinal side springs secured to the axle, having their forward ends linked to the front sides of the body and their rear ends curved upward, provided with a downwardly-inclined U-shaped end, and linked to the extremities of the semi-elliptic spring, substantially as shown and described.

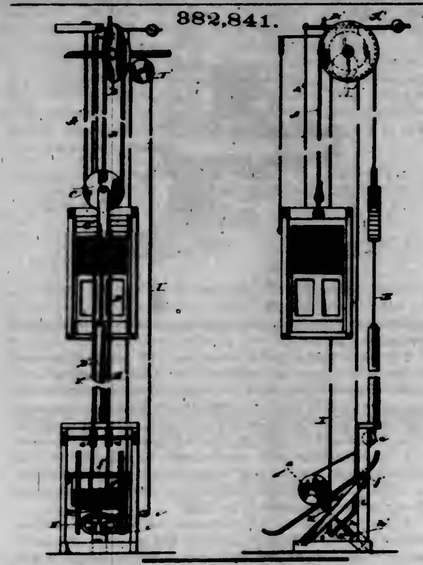
382,840. DRAW-GEAR FOR RAILWAY-CARS. CHARLES H. STARR, Logansport, Ind. Filed July 13, 1887. Serial No. 244,193. (No model.)

Claim.—1. As a new article of manufacture, a channel-bar having outwardly-extending flanges, the flanges and sides of which are provided with transverse gains or slots, substantially as described.

2. An improved channel-bar having outwardly-extending flanges and provided with transverse slots in the sides and flanges, the said slots being of a sufficient depth to allow the head of a bolt to drop down behind the said flanges when a bolt is inserted in the said slots, substantially as herein shown and described.

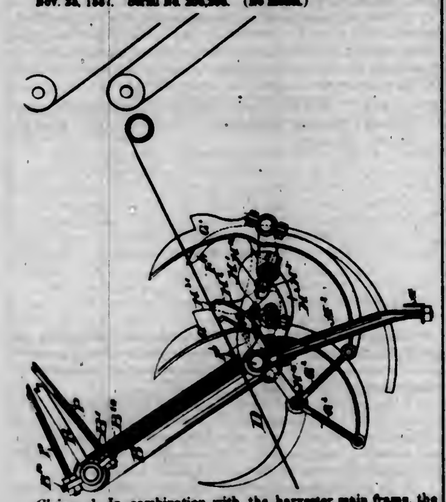
3. The combination, with channel-bars with outwardly-extending flanges and a means of connecting said bars with the draft-sill of the car, of bolts passing through transverse gains or slots formed in the flanges and sides of the channel-bars and bolster-bearings, being held to place by bolts and the lower flanges on the channel-bars, substantially as described.

4. The combination, with channel-bars 13, a means for connecting said bars to the draft-sills of a car, of bolts 3, which pass through gains or slots 2, formed in the flanges and sides of channel-bars 13, substantially as described.



5. The combination, with the spring-cage 15, provided with apertured plates or flanges 16, of the channel-irons 13, having outwardly-extending flanges and provided with slots 2 in the sides and flanges, and the bolts 3, substantially as herein shown and described.

382,841. ELEVATOR. EDWARD J. STELLWAGEN, Washington, D. C. Filed Jan. 4, 1888. Serial No. 259,771. (No model.)



Claim.—1. The combination of an elevator-car, its hoisting mechanism, an adjustable track or inclined plane, and a car-elevating weight connected with the hoisting mechanism and traveling on the adjustable track, as set forth, whereby the car may be elevated or permitted to descend.

2. The combination of an elevator-car, its hoisting mechanism, a pivoted adjustable track or inclined plane, a car-elevating weight connected with the hoisting mechanism and traveling upon said track, and a track-inclination adjusting-rope passing through the car, whereby by manipulation of the rope in the car the inclination of the track may be varied and the car elevated by the draft of the weight or permitted to descend, as set forth.

382,841.

382,842. GRAIN-BINDER. JOHN F. STEWARD, Chicago, Ill. Filed Nov. 23, 1887. Serial No. 256,206. (No model.)

Claim.—1. In combination with the harvester main frame, the binder-frame, the needle rock-shaft journaled in said binder-frame, and a post or bracket, as A^1, supported on the main frame and having a bearing for the needle rock-shaft, whereby the binder-frame receives support through the needle rock-shaft, substantially as set forth.

2. In combination with the harvester main frame and the binder-frame comprising a rigid arm; as B^2, the needle rock-shaft journaled in said arm and protruding from the end of it, and a rigid post or bracket, as A^1, on the main frame, having a bearing in which the protruding end of the needle rock-shaft is journaled, substantially as and for the purpose set forth.

3. In combination with the binder-frame having a rigid arm, as B^2, the needle rock-shaft journaled in said arm and having the needle at one end of said arm, the packer crank-shaft having its cranks located one on each side of the vertical plane of the needle, and the bracket H^3, secured to the arm B^2 and having a journal-bearing for the packer crank-shaft between the cranks, substantially as set forth.

4. In combination with the binder-frame and the packer crank-shaft, a bracket, as H^3, secured to the binder-frame and having a bearing for the packer crank-shaft between its cranks, and having also a bearing for the trip-shaft, substantially as set forth.

5. In combination with the binder-frame, the needle rock-shaft journaled in an arm thereon, a rigid bracket secured to the said arm and hung on said rock-shaft, and having a bearing for the packer crank-shaft, substantially as set forth.

6. In combination with the binder-frame and the needle rock-shaft journaled in an arm thereof and carrying the needle located at the end of such arm, and protruding beyond said needle, a bracket, as $H' H^3$, having a journal-bearing for the packer crank-shaft and extended from such bearing in two arms, one on each side of the vertical plane of the needle, one of them being secured to the binder-frame arm and the other supported on the protruding end of the needle rock-shaft beyond the needle, substantially as set forth.

7. In combination, substantially as set forth, the binder-frame, needle rock-shaft, packer crank-shaft, and the bracket composed of the parts H' and H^3, each part having a portion of a journal-box for the packer-shaft, one part, H', being supported on the needle rock-shaft and the other part, H^3, being secured to the binder-frame, substantially as set forth.

8. In combination with the binder-frame, the bracket H^3, secured to the lower arm of said frame, the trip-shaft and the packer-shaft each having bearings therein, the packer, and the packer guide-link having the trip-shaft as its pivot, substantially as set forth.

9. In combination with the binder-frame, the packer crank-shaft and the trip-shaft having their bearings rigid therewith, the packer journaled on the crank-shaft wrist, and the packer guide-link pivoted to the packer and having its other pivot on the trip-shaft, substantially as set forth.

10. In combination with the binder-frame, the bracket H^3, secured to the lower arm of said frame, having the tucker-cam integral with it, and having the bearing for the packer-shaft, substantially as set forth.

11. In combination with the binder-frame, the bracket H^3, secured to the lower arm of said frame, having the tucker-cam integral with it, and having the bearing for the trip-shaft, substantially as set forth.

12. In combination with the binder-frame, the bracket H^3, secured to the lower arm of said frame and having the tucker-cam integral with it, and having the bearings for the packer-shaft and the trip-shaft, substantially as set forth.

13. In combination with the binder-frame, the needle rock-shaft journaled in its lower arm, the brackets H' and H^3, rigidly joined, one of them being secured to the binder-frame arm and the other being hung upon the needle rock-shaft, and the trip-shaft having a bearing in one of said brackets, substantially as set forth.

14. In combination with the binder-frame, the needle rock-shaft journaled in its lower arm, the brackets H' and H^3, rigidly joined, one of them being secured to the binder-frame arm and the other being hung upon the needle rock-shaft, the packer crank-shaft journaled in one of said brackets, the packers pivoted on the cranks of said shaft, and the packer guide-links having one end pivoted to the packers, respectively, and the other end pivoted to said brackets H' and H^3, respectively, substantially as set forth.

15. In combination with the binder-frame arm B', the braces P P, secured to said arm and extended thence inward and rigidly secured at approximately the same point to the bar N, said bar terminating free of support at both ends, and the grain-check fingers M M M, secured to said bar, substantially as set forth.

16. In combination with the binder-frame arm B', the binder-shaft O, journaled therein, the knotter-frame K, supported on the protruding portion of said shaft, the breast-plate secured to the lower part of the knotter-frame and extending inward, the braces P P, secured to the arm B' and extending thence inward and rigidly connected with the inward part of the breast-plate, and the bar N, rigidly secured both to the breast-plate and to both said braces and terminating free of other support at both ends, substantially as set forth.

17. In combination with the binder-frame arm B', the braces P P, rigidly secured to the said arm, one on the upper and the other on the lower side thereof, and extended thence inward and bent at their inner ends to form a foot on each, and the bar N, rigidly secured to such feet and extending both ways therefrom and terminating free of other support at both ends, and the grain-check fingers secured to said bar, substantially as set forth.

18. In combination with the binder-frame arm B', the braces P P, rigidly secured to said arm, one on the upper and the other on the lower side thereof, and extended thence inward and bent at their inner portion to form feet at an angle with their remaining portion, the bar N, rigidly secured to said feet and terminating free of other support at both ends, the binder-shaft journaled in the arm B', the knotter-frame hung upon its protruding portion, and the breast-plate secured to the knotter-frame and to the bar N, substantially as set forth.

382,843. STOCK-CAR. LUTHER R. STILES, Chicago, Ill. Filed Oct. 3, 1888. Serial No. 170,232. (No model.)

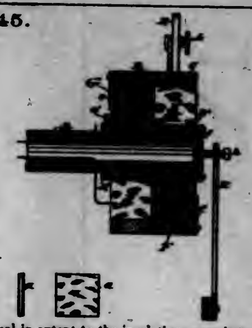
382,843.

Claim.—1. An upper and removable deck for a stock-car, composed of planks the ends of which are sustained by the side walls of the car, and each plank provided with two cleats extending out laterally from each of its edges so as to support and receive support under pressure from adjacent planks, substantially as described.

2. As a component part of an upper and removable deck for a stock-car, the plank D, provided with two cleats, *c*, one of which is fastened upon each side edge of the same and extends out laterally therefrom, the two cleats being placed on opposite sides to each other of the plank and also of the short axis of the plank, adapted to afford support to and receive support from adjacent planks and to render the same interchangeable, substantially as described.

3. In combination with a stock-car having a removable upper deck, the described receptacle for holding the removable deck when not in use, located immediately under the lower deck of the car and supported in position by any suitable means, substantially as described.

382,844. GATE ROLLER AND HINGE. JAMES J. SWARTHOUT, Stone's Prairie, Ill. Filed Mar. 12, 1888. Serial No. 267,012. (No model.)



Claim.—1. A gate roller and hinge device consisting of a ball having two oppositely-extending arms adapted for connection to two posts, between which the gate may slide and swing, and a roller fitted loosely on the ball and adapted to support the gate, substantially as herein set forth.

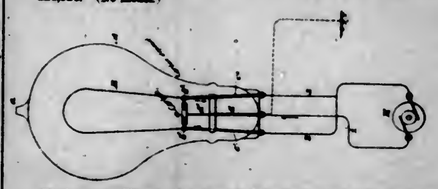
2. In a gate, the combination, with two diagonally-set posts, F G, of a ball-bearing, B, having arms C D fixed to said posts, a roller, A, fitted loosely onto the ball B, and said gate provided with rails or ways supporting it to slide on the roller and swing with the roller on the ball, substantially as herein set forth.

382,845. COMMUTATOR FOR DYNAMO-ELECTRIC MACHINES. NIKOLA TESLA, New York, N. Y., assignor of one-half to Charles F. Peck, Englewood, N. J. Filed Apr. 30, 1887. Serial No. 236,711. (No model.)

Claim.—1. In a dynamo-electric machine, the combination, with a commutator formed with conducting terminals or segments with intervening insulating-spaces, of a collector adapted to bear upon the surface of the commutator and formed with conducting terminals or

382,845.

segments equal in extent to the insulating-space between the commutator-segments, as set forth.



2. The combination, with a commutator built or formed of alternate blocks or segments of conducting and insulating material, of a collector adapted to bear upon the surface of the commutator and formed of conducting blocks or segments of a width or extent equal to that of the insulating-segments of the commutator and separated by interposed blocks or segments of insulating material, as described.

3. The combination, with a commutator formed as a disk with alternate terminals or segments of conducting and insulating material, of a collector similarly formed and mounted with its face in contact with that of the commutator, as set forth.

4. The combination, with a commutator having a bearing-surface formed of alternate sections of conducting and insulating material, of a collector with a similar and symmetrically-formed bearing-surface and means for applying spring-pressure to force the two bearing-surfaces together, as set forth.

5. The combination, with a commutator and a collector the bearing-surfaces of which are identical in respect to the disposition of the conducting and insulating parts, of means for applying spring-pressure to maintain the two bearing-surfaces in contact and means for holding the collector against rotary movement, as set forth.

382,846. MANUFACTURE OF INCANDESCENT ELECTRIC LAMPS. EDWARD P. THOMPSON, Elizabeth, N. J. Filed Feb. 4, 1887. Serial No. 226,596. (No model.)

Claim.—1. The hereinbefore-described method of heating the joints of incandescent electric lamps, which consists in forming electric arcs between the same and an independent conductor in a chemically-inert atmosphere, substantially as described.

2. In an incandescent electric lamp, the combination, with the leading-in wires, the filament and the joints between the same, of an independent conductor, and a carbon plate supported upon the latter and extending into proximity to the respective joints, all contained in a chemically-inert atmosphere, substantially as described.

3. In an incandescent electric lamp, the combination, with the leading-in wires, the filament, and the joints between the same, of a plate or strip of carbon extending between the joints, and a source of electricity for passing an electric current from said plate to the respective joints, substantially as described.

4. The hereinbefore-described method of building up the joints of incandescent-electric-lamp filaments, which consists in causing a deposit of carbon to be made upon the joints in a chemically-inert atmosphere by means of an electric current forming arcs between an independent electrode of carbon and said joints.

5. In an incandescent electric lamp, discharge-points of carbon between the respective joints of the filament and an independent conductor supporting the same, substantially as described.

6. The hereinbefore-described process of manufacturing incandescent electric lamps, which consists in exhausting the atmosphere from the lamps and simultaneously heating the joints of the filaments to incandescence, and strengthening the same by electrically depositing carbon thereon.

7. In an incandescent electric lamp, the combination, with the

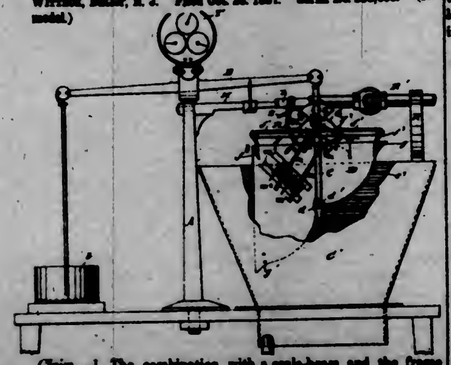
leading-in wires of the filament, of an independent conductor consisting of a plate of carbon between the joints of the filament and a flexible support carrying the same, substantially as described.

8. The hereinbefore-described process of strengthening the joints of the filaments of an incandescent electric lamp, with its leading-in wires, which consists in forming an arc between an electrode and the joints and causing a deposit of carbon obtained from said electrode to be made upon the joints by the discharge of the current in an attenuated atmosphere.

382,847. SPRING-TOOTH. PHILIP F. WELLS, Milford, Mich., assignor of one-half to D. S. Wells, same place. Filed Sept. 22, 1887. Serial No. 250,631. (No model.)

Claim.—The herein-described spring-tooth, consisting, essentially, of the curved-spring standard provided with a slot near its lower end, the reversible point having its edges turned abruptly rearwardly to snugly engage the opposite edges of the spring-standard and having an extended bearing therewith in the direction of the length of the point, and the single draw-bolt extending through the elongated slot to lock the point to the spring-standard, substantially as set forth.

382,848. DOG-GUARD FOR EYEGLASSES. WALTER S. WELLS, New York, N. Y. Filed Apr. 25, 1887. Serial No. 236,067. (No model.)



Claim.—1. The combination, in eyeglasses or spectacles, with the glasses or lenses, of arms extending substantially horizontally from and beyond the posts which connect the bow-spring with the glasses or lenses, and nose-pads secured one upon each arm by a universal joint, and of which said arms constitute the sole support, substantially as herein described.

2. The combination, in eyeglasses or spectacles, with a bow-spring the end portions of which are prolonged in a substantially horizontal plane beyond the posts which connect the spring with the glasses or lenses, of nose-pads, each having a universal-joint connection with the end of the bow-spring, whereby the pad is solely supported, substantially as herein described.

3. The combination, in eyeglasses or spectacles, with the glasses or lenses, of arms projecting from and beyond the posts which connect the bow-spring with the glasses or lenses, and terminating in balls *c*, and the nose-pads C, each consisting of a wire or strip of metal bent into ring-like form and having its ends separated and shaped in the form of rings or cups *c'* to embrace the ball and form a joint therewith, and provided with an adjusting-screw, *d*, substantially as herein described.

4. The combination, in eyeglasses or spectacles, of a bow-spring having its end portions projecting in a substantially horizontal plane beyond the posts which connect it with the glasses or lenses, and each forming the sole support for a nose-pad, and the posts adjustable along the bow-spring to vary the distance of the glasses or lenses apart, substantially as herein described.

382,849. AUTOMATIC WEIGHING-SCALE FOR LIQUIDS. PAUL WITZKE, Butler, N. J. Filed Oct. 20, 1887. Serial No. 253,003. (No model.)

Claim.—1. The combination, with a scale-beam and the frame suspended therefrom, of the divided scoop pivoted thereto, a transverse bar secured to the frame, angular catches pivoted at their angles to the ends of the said bar and engaging the opposite ends of the scoop alternately with their vertical arms, pins on the horizontal or trip arms of the catches, and a releasing device in the path of the said pins when the frame and scoop are depressed, substantially as set forth.

2. The combination, with the scale-beam, the frame suspended therefrom, and the scoop pivoted in said frame and having a partition, of the tilting table pivoted above the scoop and provided with flanges at its sides and at its ends, the end flanges being inclined inward and having downward and outward extending lips, and connections between the table and scoop, substantially as set forth.

3. The combination, with the scale-beam, the frame suspended therefrom, and the scoop pivoted to the frame, of the tilting table above the scoop, connections between said table and scoop, and an adjustable stop limiting the throw of the table, substantially as set forth.

4. The combination, with the scale-beam, the frame suspended therefrom, and the scoop pivoted in the frame, of a tilting table above the scoop, a yoke connected with the table, and an adjustable stop on the scoop and with which said yoke engages, substantially as set forth.

5. The combination, with a scale-beam, a frame suspended from one end and a weight from the other, a scoop divided into compartments by a central partition and provided with a central adjustable projection upon one outer face, and a receiving-receptacle beneath said scoop, of a flanged tilting table pivoted above the uppermost compartment of the scoop, a yoke secured to the axis of said table, the arms whereof extend downward at each side of the said adjustable projection, and a supply-pipe having an outlet centrally above the table, substantially as and for the purposes herein set forth.

6. The combination, with a scale-beam, a frame suspended from one end and a weight from the other, a scoop divided into two compartments by a central partition and provided with a central adjustable projection, a cross-bar attached to the front of said frame, retaining-arms pivoted at the ends of said bar, provided with catches at their outer extremities adapted to engage pins secured upon the scoop, and a receiving-receptacle below said scoop, of a flanged tilting table pivoted above the uppermost compartment of the scoop, a yoke secured to the axis of the table, the arms whereof engage the said adjustable projection, a curved tripping-bar secured to the table-support projecting under the inner ends of the retaining-arms, and a supply-pipe having an outlet centrally above the table, substantially as and for the purposes herein set forth.

7. The combination, with a scale-beam, a frame suspended from one end and a weight from the other, a scoop divided into two compartments by a central partition and having a curved bottom, and provided with a central adjustable projection, a cross-bar attached to the front of said frame, retaining-arms pivoted at the ends of said bar, provided with catches at their outer extremities adapted to engage pins secured upon the scoop, and a receiving-receptacle below said scoop, of a flanged tilting table pivoted above the uppermost compartment of the scoop having beveled end lips, a yoke secured to the axis of said table, the arms whereof engage said sliding projection, a tripping-bar secured to the table-support projecting under the inner ends of the retaining-arms, and means, substantially as described, for supplying material to the table, as and for the purposes set forth.

382,850. COUGH-MIXTURE. JAMES WEST, Crawford, Colo. Filed June 16, 1887. Serial No. 241,869. (No specimens.)

Claim.—The herein-described compound or composition of matter to be used as a remedy for coughs and colds, consisting of the extract of bloodroot, essence of anise, essence of sassafras, essence of lobelia, tincture of Cayenne pepper or capsicum, and tincture of myrrh, in or about the proportions specified.

382,851. STOVE OR RANGE. EDGAR W. ANTHONY, Brooklyn, Mass. Filed Oct. 7, 1886. Serial No. 215,892. (No model.)

382,851.

Claim.—1. In a cooking stove or range having an entrance to a compartment under the hearth-plate, a movable hearth-plate hinged to the base-plate or end of the stove, and a latch or lock for holding it to the end of the stove in a perpendicular position, substantially as described.

2. In a stove or range having an entrance to a compartment under the hearth-plate, the combination of the hinged hearth-plate A, the said compartment, and an ash-pan, D, adapted to be held in said compartment, and having the front plate, *d*, which forms the front plate of the base of the stove, and its handle *b'*, as and for the purposes specified.

3. In a stove or range, the combination of the base-plate *b*, or end of the stove or range, the hearth-plate A, and a latch adapted to automatically hold the plate when lifted to a perpendicular position, substantially as described.

382,852. BOARD FOR PICTURE AND MIRROR BACKS. JACOB APELL, Chicago, Ill., assignor to Duncan & Johnston, same place. Filed Sept. 14, 1887. Serial No. 249,615. (No model.)

Claim.—1. The improved manufacture described, consisting of a thin wood board, A, scored lengthwise of the grain at short intervals, and a sheet, B, adhesively attached to the surface of the board, substantially as described.

2. The improved manufacture described, consisting of a thin wood board, A, scored lengthwise of the grain in alternate lines on opposite sides, and a sheet, B, adhesively attached to the surface of the board, substantially as described.

382,853. DEVICE FOR MAKING POST-HOLES. JOSIAH W. BAILEY, Mansfield, Pa. Filed Sept. 12, 1887. Serial No. 249,494. (No model.)

Claim.—The herein-described device for making post-holes, consisting of the steel bar A, having the cylindrical part *a*, the point a^2, and the part a' between said point and the cylindrical part, which part a' is larger in diameter than the cylindrical part *a* and is rectangular in cross-section, and the cast-iron portion C, which has its sides aligned with the point B of the stem A, and is held on said stem by its contraction from a molten state upon the shoulders a^3 a^4 of the stem A, substantially as specified.

382,854. SLIP AND SHRINKAGE GAGE. HENRY C. RAILSBACK, Harrisburg, Pa. Filed May 21, 1887. Serial No. 239,023. (No model.)

Claim.—1. In a slip-gage, the combination of the tube A, having one end threadless and formed with tongues *m*, having slots N between them, the long round plug B, having terminal *c* and sleeved snugly in said tube, the flared ring L, adapted to be slid inward on said tongues for clamping said plug therein, the corresponding shorter plug, E, having the terminal *c'* and pin Q inserted in the exteriorly-threaded end of said tube, with said pin projected through the slot O' therein, the spring G, contained in said threaded end and exerted against the inner end of the plug, and the nut C on the threaded end of the tube and engaging said pin, substantially as and for the purposes set forth.

2. In a slip-gage, the combination, with the tube A, formed at one end with the taper tongues *m*, duly spaced apart, and with the partition A' fixed therein, of the round plug B, sleeved in said tube and having the point *c*, of the slip-ring L, adapted to inclose said tongues and compress them onto said plug to hold it in place therein by sliding the ring over the tongues, of the plug E, provided with the pin Q, projecting through the slot O' in said tube, of the nut C, driven upon the threaded end O of said tube and having its inner end in contact with said pin, and of the spring G, interposed between said plug E and said partition in said tube, as and for the purposes set forth.

3. In a slip-gage, the combination, with the tube A, having one of its ends provided with the taper tongues *m*, the ring N, slipped thereon and with the long plug B adjustably held therein by said means, of the doubly-threaded ring or nut C, driven on the threaded end O of said tube, of the round plug E, provided with the fixed pin Q, projected through the slot O' and engaged by the inner end of said nut, of the spring G, inserted between the partition A' and the butt-end of said plug in said tube, and of the sprung pin J, provided with the point X, all arranged and adapted substantially as and for the purposes set forth.

4. In a slip-gage, the combination, with the tube A, having the long-pointed plug B adjustably clamped therein, and having sleeved in its opposite end the plug E, provided with the pin Q, of the ring or nut C, driven on said tube and jammed interiorly against the end thereof, of the outer nut, D, driven on said other nut and provided with the circle of graduation-marks *d*, of the spring G, supported in said tube and exerted to hold said pin in contact with said nuts, and of the sprung indicator J, inserted in the plug E and having its point X extended over said marks, so as to be adjustable to any of them, substantially as and for the purposes herein set forth.

382,855. METALLIC RAILROAD-TIE. FRANK RARETY, Schenectady, N. Y. Filed Feb. 26, 1887. Serial No. 228,969. (No model.)

Claim.—1. A railroad-tie consisting of an upper and a lower section and springs intermediate between the two sections, said upper section being normally held at a point between the extreme limits of expansion and contraction of said springs, thereby compressing the latter to sustain without contraction a given load, while at the same time permitting of further contraction to compensate for heavier loads, substantially as described.

2. A railroad-tie consisting of an upper and a lower section and springs intermediate between the two, the sections being provided with stops to prevent separation of the sections from each other, and retaining the springs in a normally-compressed condition corresponding to a given load, substantially as described.

3. A railroad-tie consisting of an upper and a lower section and compressed springs intermediate between the two, one of said sections being provided with slots and the other with cross-bolts engaging within said slots, substantially as described.

4. A metallic railroad-tie consisting of a U-shaped base having side flanges and cross-bolts, a U-shaped upper section fitting within said flanges and having slots, springs intermediate between the base and upper section, and end caps, substantially as described.

382,856. REPEATING INDUCTION-COIL. JOHN A. BARRETT, Brooklyn, N. Y. Filed Jan. 14, 1888. Serial No. 260,742. (No model.)

Claim.—1. A repeating-coil consisting of two insulated wires of approximately equal length and size, and a magnetic core, said wires being each wound into two or more helices, each of which is placed in close inductive relation to a helix or helices of the other wire, and both wires as a whole being equally near to the core, whereby each wire is equally exposed to reciprocal inductive action, and to magneto-electric induction from the magnetic core, substantially as described.

382,856

2. A repeating-coil having two wires of approximately equal length and size, and a spool divided longitudinally into sections, said wires being each wound into two or more separate helices disposed in the sections of said spool in such manner that each helix is adjacent to one in the other circuit, substantially as described.

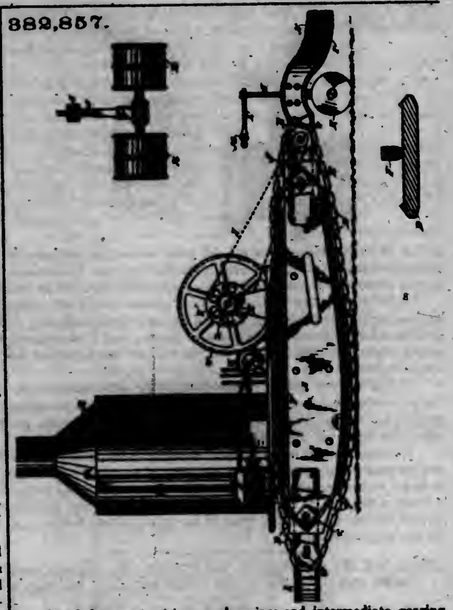
3. A repeating-coil for telephone-circuits, comprising a soft-iron core, and two separate insulated conducting-wires wound thereon, equal portions of both of the said wires being wound in a helix next to the core, and the remaining portions of each being wound externally to and surrounding that portion of the other which immediately surrounds the said core, whereby both are equally exposed to magnetic induction from the said core, and whereby each is enabled to act inductively with equal power upon the other.

4. A repeating-coil for telephone-circuits, comprising a soft-iron core, and two separate and independent insulated conducting-wires of equal size and approximately equal length and resistance surrounding the same, equal portions of both of said wires being wound in separate helices next to the core, each being wound to an equal thickness from one end to the center of the said core, and the remaining portions of each being wound externally to and surrounding that portion of the other which immediately surrounds the said core, whereby both are alike exposed to the inductive action of the core, and whereby each is enabled to reciprocally induce currents in the other.

5. In a repeating induction-coil, a containing reel or spool divided at its longitudinal center into two equal portions or compartments, an inside helix of insulated wire wound in each compartment of the said reel and filling up one-half of the depth of the wire-spaces, each inside helix being of substantially equal length and resistance, an external helix of insulated wire wound in each reel-compartment surrounding the inner helix thereof, and filling the remaining wire-space of the reel, the external wires also being of uniform length and resistance, one end of each external helix being united to one end of the internal helix of the other compartment, so that two separate circuits are constituted in the complete repeating-coil, each formed, respectively, of one inside and one outside helix, the outer helix of each surrounding the inner helix of the other, and a soft-iron core passing through the center of the reel and surrounded by the said helices, substantially as and for the purposes described.

6. In a repeating induction-coil, the combination, substantially as hereinbefore described, of a soft-iron core, a wire-spool surrounding the same and divided into longitudinal compartments, two helices of insulated wire of uniform size wound in each compartment, the inner helix being wound to fill one-half the depth of the wire-space, the outer helix wound thereover until the remaining wire-space is filled up, and the inner helix of each compartment being connected with the outer helix of the next, whereby each of the two circuits of the repeating-coil are caused to consist of an inner helix and an outer helix in series, the outer helix surrounding the inner helix of the other circuit, and terminal screws or connections for each of the said circuits, whereby they may be united with independent telephone-circuits, for the purpose specified.

382,857. TRACTION-ENGINE. FRANK BAXTER, Slide, Cal. Filed Feb. 11, 1888. Serial No. 263,731. (No model.)



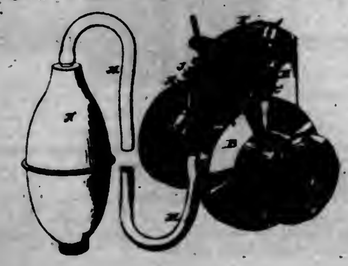
Claim.—1. The traction-engine consisting of parallel frames united together and having two independent endless belts formed of blocks or sections hinged together, pulleys or drums in the ends of the frames, around which the belts pass and through which they are propelled, in combination with a series of alternately flanged and plain rollers journaled to the lower part of the engine-frame, and an intermediate endless belt composed of links resting upon the central portions of the shoes and upon the upper edges of which the rollers travel, substantially as and for the purpose herein described.

2. The traction-engine composed of parallel frames with the semi-circular channel-iron end pieces by which they are united, the endless belts composed of blocks hinged together, having their greatest length transversely to the machine, so as to form shoes upon which the latter is supported, a second belt composed of narrower links united together and resting upon the upper surfaces of the shoes, alternately flanged and plain rollers journaled in the power part of the frames and traveling upon the upper edges of the intermediate links and out of contact with the shoes, in combination with the two sets of steering-drums mounted in pairs on horizontal shafts, vertical shafts, tillers, and connecting rod or bar by which they are turned simultaneously, a divided driving-shaft and clutch-couplings by which either one or both traveling belts may be driven, and engines and intermediate gearing by which power may be applied to the same, substantially as herein described.

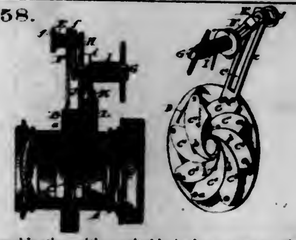
3. The steering-drums mounted in pairs on horizontal shafts which pass through journal-boxes, said boxes being hinged to vertical steering-shafts, whereby the tread of the drums may conform to the irregularities of the surface without strain upon the vertical shafts, substantially as herein described.

4. In a traction-engine, the parallel frames united together, having the supporting-shoes, the intermediate link belt and the rollers traveling upon the same, together with the engines and driving-shaft, in combination with the draft-bar extending rearwardly from a transverse shaft P, to which said draft-bar is connected, and the screw or mechanism by which the bar may be shifted to one side or the other of the center when it is desired to turn the machine around, substantially as herein described.

382,857.



5. The traction-engine having the independent endless traveling belts forming shoes upon which it is carried, and engines and driving mechanism, as described, in combination with the draft-bar N, the transverse shaft P, to which said draft-bar is connected, and the screw or mechanism by which the bar may be shifted to one side or the other of the center when it is desired to turn the machine around, substantially as herein described.



382,858. DIAPHRAGM AND SHUTTER FOR PHOTOGRAPHIC AND OTHER LENSES. EDWARD BAUSCH, Rochester, N. Y. Filed Dec. 24, 1887. Serial No. 258,883. (No model.)

Claim.—1. In combination with a suitable body or support having an opening therethrough, the series of pivoted blades grouped around said opening and each engaging directly with and actuating the next, substantially as described and shown.

2. In combination with a suitable body or support, the pivoted overlapping blades grouped around said opening, and each provided with a stud or projection to act directly on the next, in combination with a springe tending to move said blades in one direction on their pivots.

382,858.

3. In combination with a suitable body or support, the series of pivoted overlapping blades directly connected by studs and slots, as shown, whereby they are caused to move inward and outward in unison.

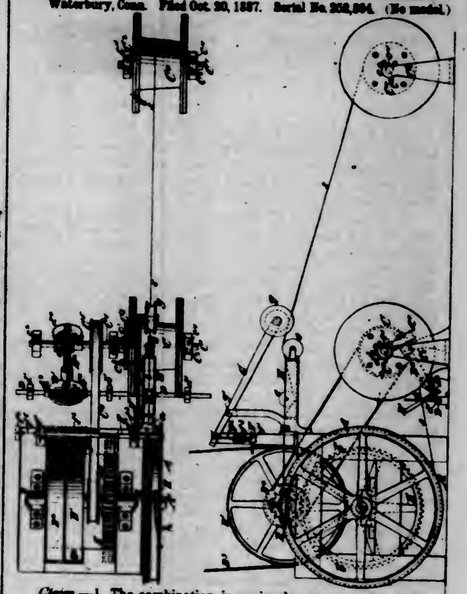
4. In combination with a series of pivoted connected blades adapted to swing inward and outward across a central opening, an arm extended from one of said plates, a crank acting on said arm, a spring to turn the crank, and a detent to hold the crank against the stress of the spring.

5. The series of pivoted blades grouped around a central opening and acting each to move the next, in combination with the spring tending to close the blades, the slotted arm *c*, the slotted crank, the adjustable crank-pin, the crank-actuating spring, and the detent-lever.

6. In combination with a series of movable blades pivoted around the periphery of a central opening and adapted to swing inward and outward across the same, an arm arranged to operate the said blades, a crank acting on said arm, a spring to turn the crank, and a detent to hold the crank against the stress of the spring, substantially as and for the purposes described.

382,859. COBK-HOLDER FOR BOTTLES. WILLIAM BRADSLEY, Buncon, Iowa. Filed Mar. 26, 1888. Serial No. 268,480. (No model.)

Claim.—The within-described compensating cork holder or retainer for bottles of different sizes, the same consisting of a flexible strip or cap-piece, A, having strap-like clinching-extensions *c c*, and of a flexible neck band or strip, B, adapted to encircle the neck of the bottle and provided with a series of cross-slots, *f*, at or near its one end, a clinching extension or tongue, *d*, at or near its opposite end, and longitudinal intermediate slots, *e e*, of greater length than the width of the clinching end portions of the cap-piece or strip, essentially as and for the purposes herein set forth.

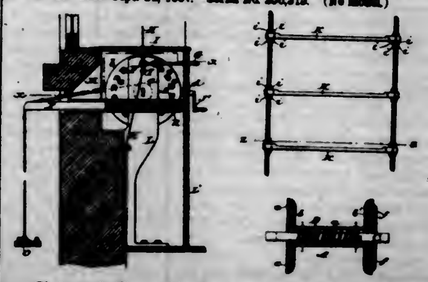


382,860. HINGE. CHARLES H. BEER, New York, N. Y. Filed Mar. 2, 1888. Serial No. 265,904. (No model.)

Claim.—1. A hinge having the under bearing-surface of the leaves inclined in opposite directions from an approximate central point, as and for the purpose specified.

2. A hinge having the under bearing-surface of the leaves inclined in opposite directions from an approximate central point and a longitudinal shoulder at the termination of the inner incline, substantially as and for the purpose herein specified.

382,861. WIRE-DRAWING MACHINE. GEORGE C. BLAKESLEE, Waterbury, Conn. Filed Oct. 20, 1887. Serial No. 252,994. (No model.)



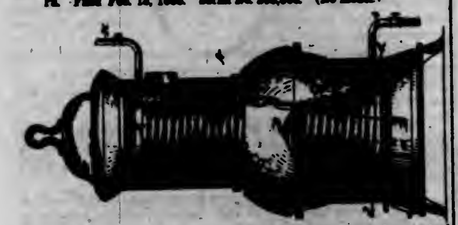
Claim.—1. The combination, in a wire-drawing machine, of a delivery reel or drum, C', from which the wire is taken, and a take-up reel or drum, C, bearings wherein said reels or drums are interchangeably supported, so that they may be changed one for another at each drawing operation, a die through which the wire is drawn, a winding-drum, A, whereby the wire is drawn through the die and from which the wire is taken by the take-up reel or drum, and a slipping driving device for the said take-up reel or drum, substantially as herein described.

2. The combination, in a wire-drawing machine, of a reel or drum from which the wire is taken, a die through which the wire is drawn, a winding-drum, a take-up drum or reel for the wire, and a traverse-guide, and mechanism, substantially as described, for reciprocating said guide, substantially as herein set forth.

3. The combination, in a wire-drawing machine, of a reel or drum from which the wire is taken, a die through which the wire is drawn, a winding drum or reel, a take-up drum or reel and slipping driving mechanism for operating it, a shifting driving device for the winding-drum, a shipper operating automatically when released to shift the driving device, a catch for holding the shipper retracted, and a bearer riding on the wire and connected with the catch to withdraw the latter when the bearer falls, substantially as herein described.

4. The combination of the delivery drum or reel C, the box E for lubricant, and its guiding-pulleys, the winding-drum A and gearing for driving the same, the reciprocating traverse-bar D, the take-up drum C, the belt-shipper F and its actuating-spring or equivalent weight, the catch *f*', and the stop-motion lever G, supported by the wire and connected with the catch, substantially as herein described.

382,862. LADDER FIRE-ESCAPE. FRANK L. ROSS, New York N. Y. Filed Sept. 21, 1887. Serial No. 250,315. (No model.)



Claim.—1. The combination, in a fire-escape, of the drum, the flexible ladder winding up thereon, a block attached to the free end of the ladder and adapted to close an opening in the house-wall through which the ladder is carried, connected parallel bars extending at right angles to said block, each moving into a case fitted longitudinally into and through the house-wall, and springs compressed by each bar when the block is in place and operating automatically to force said block out of its seat, substantially in the manner and for the purpose herein set forth.

2. The combination, with a block closing an opening in the house-wall, a flexible fire-escape ladder attached to said block and extending inward through said opening, a drum upon which the ladder is wound, spring-actuated bars operating automatically to force out the block and ladder, of an auxiliary spring attached to the drum and operating automatically to revolve it so as to unwind the ladder, substantially in the manner and for the purpose herein set forth.

3. The combination of a block closing an opening in the house-wall, a flexible fire-escape ladder attached to said block and extending inward through said opening, a drum upon which the ladder is wound, spring-actuated bars operating automatically to force out the block and ladder, an auxiliary spring attached to the drum, and operating automatically to revolve it so as to unwind the ladder, a beveled gear-wheel carried by a crank-shaft mounted to rotate and to move longitudinally in bearings at a right angle to the axis of said wheel, and a beveled pinion upon the shaft adapted to be thrown in and out of gear by the longitudinal movement of the shaft, substantially in the manner and for the purpose herein set forth.

4. The flexible ladder herein described, having sides constructed of wire strands, which at regular intervals are laid flat and parallel to each other to permit of a ready attachment of the rounds thereto and are twisted together between the rounds, in combination with rounds made fast to said flat intervals, substantially in the manner and for the purpose herein set forth.

382,863. STEAM-GENERATOR. JOSEPH S. BUNDLE, Middletown, Pa. Filed Feb. 13, 1888. Serial No. 263,993. (No model.)

Claim.—1. In a steam-generator, the combination of a conical coiled water-pipe supported above the grate, a rotary grate upon which the fuel rests, an annular fire-chamber, and an air-supplying chamber in the bottom of the furnace leading up into the chamber formed by the coil and through the spaces between the coils into the fuel-chamber, substantially as described.

2. In a steam-generator, the combination of a conical coiled water-pipe with an opening at both ends, a cover for the upper opening, an inner and an annular fuel-chamber, a rotary grate, and air-feeding passages between the coils, substantially as described.

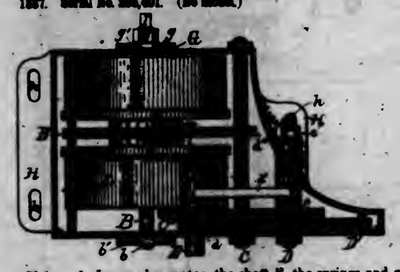
3. In a steam-generator, an inner and an annular fuel-chamber, a rotary grate, a conical coiled water-pipe supported above the grate, a metallic cover for the upper end of the coil provided with a conical top, and a magazine, all combined and operating substantially as described.

4. In a steam-generator, a conical coiled water-pipe supported above a rotary grate and forming an annular fuel-chamber, in combination with a superheating-coil supported in the combustion-chamber, substantially as described.

5. In a steam-generator, a conical water-pipe forming an annular fuel-chamber, in combination with a superheating-coil arranged to perform the function of a magazine to discharge fuel into said fuel-chamber, substantially as described.

382,864. CISTERN-CLEANER. JOHN H. BARNES, Minneapolis, Minn. Filed Dec. 22, 1887. Serial No. 259,268. (No model.)

Claim.—1. The combination of a hollow body provided with a bottom having an aperture, a tube open at both ends and extending upward from said aperture within said body and terminating below the top thereof, and a tubular handle connected to the top of said body, substantially as described.



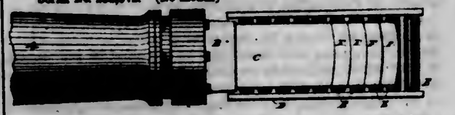
2. The combination of a hollow body provided with a bottom having an aperture, an extensible tube open at both ends and extending upward from said aperture within said body and terminating below the top thereof, and a tubular handle connected to the top of said body, substantially as described.

3. The combination of a hollow body provided with a bottom having an aperture, a tube open at both ends and extending upward from said aperture within said body and terminating below the top thereof, a tubular handle connected to the top of said body, and a closing device for said handle, substantially as described.

4. The combination of a hollow body provided with a bottom having an aperture, an extensible tube open at both ends and extending upward from said aperture within said body and terminating below the top thereof, a tubular handle connected to the top of said body, and a closing-plug for said handle, substantially as described.

5. The combination of a hollow body provided with a bottom having an aperture, a tube open at both ends and extending upward from said aperture within said body and terminating below the top thereof, a detachable cover for said body, a hollow handle secured to said cover, and a closing-plug for said handle, substantially as described.

382,865. MOTOR. JOHN M. BROWN, Atlanta, Ga. Filed Dec. 19, 1887. Serial No. 258,691. (No model.)



Claim.—1. In a spring-motor, the shaft E, the springs and gearing to drive said shaft, and a second shaft provided with a wheel, in combination with the speed-regulating mechanism consisting of the pipe P, the friction-plate *p*, bearing on said wheel, the spring *s*', and the rod R, provided with the stirrup S, for the purpose set forth.

2. In a spring-motor, the combination of the shaft E, the sleeve G, said shaft and sleeve provided, respectively, with the seats I and J for the winding-key, the ratchets *b* and *g*, pawls *b*' and *g*', the springs L and M, the ratchets *l* and *m*, the pawls *l*' and *m*', and the brakes by which the action of the springs may be stopped, substantially as shown and described.

3. In a spring-motor, the shaft E and the mechanism for driving the same, in combination with the arm *d*', journaled on the shaft D and adapted to permit the variation of the height of shaft E, the nut *e*, and the slotted casing for allowing the adjustment of said shaft E, substantially as set forth.

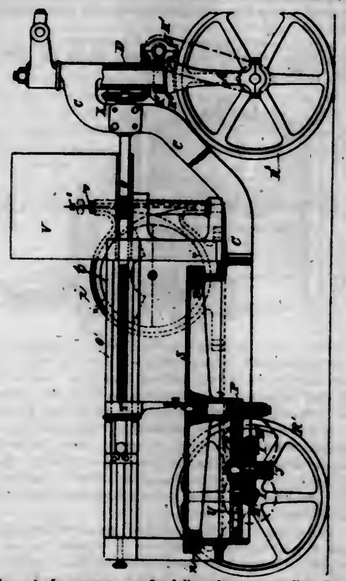
4. In a sewing-machine motor, the combination of the spring-driven gearing, the arm *d*', the pinion-shaft E, the socket-coupling connecting the pinion-shaft and the sewing-machine shaft, and the casing having slots *h* and screws *h*', for the purpose specified.

382,866. METHOD OF MANUFACTURING BRICK. JAMES F. CLARK, Morenci, Mich. Filed July 19, 1886. Renewed Oct. 14, 1887. Serial No. 252,572. (No model.)

Claim.—An improvement in the art of making brick, which consists in cutting the brick from a column of clay as it emerges from the machine in a curved direction, so as to form one side convex and the other concave, and then straightening the sides of the brick by subsequently drying and burning the same, as set forth.

382,867. AUTOMATIC LOCKING ATTACHMENT FOR FARE-BOXES. JAMES H. CLANEY, Atlanta, Ga. Filed July 26, 1888. Serial No. 282,176. (No model.)

Claim.—1. In a cash-box for street-cars, the combination, with the spring-lock provided with the locking-hooks 11 and the guide-pin *a*,



382,867.

of the key 12, said pin being so placed as to guide the key when it enters the lock and retain it in its proper position to act on both locking-bolts simultaneously, as set forth.

2. In a cash-box for street-cars, the combination of the key 12 hollow piston 13, spring 17, and slotted incasing-tube 14, all arranged and adapted to rotate the key when the piston is forced backward upon the spring, as set forth.

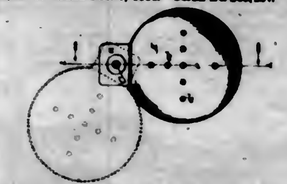
382,868. APPARATUS FOR RECORDING THE DIRECTION AND GRADIENTS OF A ROAD. ADOLPHE R. D. F. DE VILLEPOIX, Paris, France. Filed Feb. 20, 1887. Serial No. 228,947. (No model.)

Claim.—1. In an apparatus for delineating or recording the direction of a road, the combination, with a rotating table, S, of a double sector, K, the axis thereof, a fixed rack gearing with the sector, the pinion I, the slide J, carrying said pinion and sector, and the shafts E E', rotated independently by the two hind wheels of the vehicle and gearing with pinion I, all arranged so that the pinion I and sector K shall receive a movement of translation when the shafts E E' revolve at different speeds, substantially as herein described.

2. In an apparatus for delineating or recording the direction of a road, the combination of a rotating table, S, pinion P, sector K, gearing with said pinion, rack U, gearing with the sector, and means, as described, for moving the sector, the pencil-carrier T, the screw-shaft O, for moving said carrier, the leading wheel B^2, and gearing X X' $H^{\times}$ y H H', and a chain connecting H H' for moving the screw-shaft O from the wheel B^2, substantially as specified.

3. In an apparatus for recording or delineating the gradients of a road, the combination, with a drum, V, receiving continuous rotary motion from the traveling wheel, as described, of a casing, i, mercury in the casing, a drum, t, within the casing and immersed in the mercury, a pencil-carrier, r, and bands connecting the carrier r with the drum t, the pencil-carrier receiving vertical motion in consequence of the relative motion of the mercury and drum and of the casing containing the same, substantially as specified.

4. In an apparatus for recording or delineating the direction and gradients of a road, the tables S, the double sector K, gearing therewith, the fixed rack U, slide J, carrying the double sector, the pinion I, and independent worms operated by different wheels gearing with pinion I, in combination with the pencil-carrier T, the worm-shaft O, operating the same, and means for operating said shaft from the wheel B^2, substantially as described.

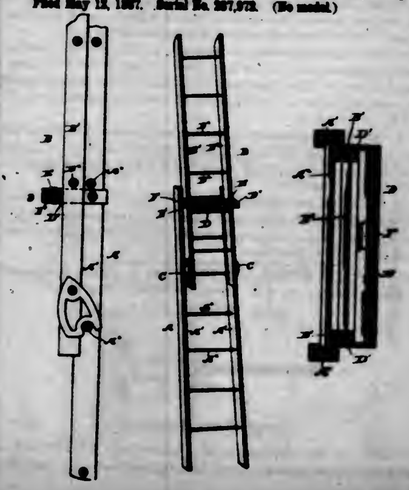


5. In an apparatus for recording or delineating the direction and gradients of a road, the combination of the table S and means, as described, for operating the same, the pencil-carrier T, screw-shaft O, for operating the same, drum V, casing i, containing mercury, drum t in the mercury, and pencil-carrier r, connected with the drum t, all arranged and operating substantially as described, and for the purposes set forth.

382,869. HOPPLE. CHARLES B. FALES, Guilford, Ohio. Filed Jan. 11, 1888. Serial No. 260,412. (No model.)

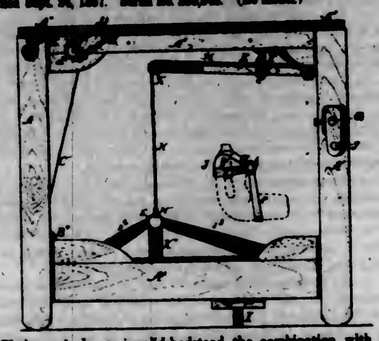
Claim.—In a serving and kicking hopple, the combination of the collar A, having attached thereto the breast-strap B, the free end of said breast-strap having the pulley a, the rope C, passing over said pulley a, the pulley-block d, fixed to said rope C, and adapted to embrace and confine the return portion of said rope C, the hopple composed of the strap G and the elastic strap H, the snap-hooks D and E, and the swivingle I, substantially as and for the purpose specified.

382,870. MEASURING UTENSIL. THOMAS B. FARRINGTON, New York, N. Y. Filed Feb. 6, 1888. Serial No. 263,127. (No model.)



Claim.—1. A measuring implement or vessel consisting of a cup-shaped disk and a second disk pivoted thereto and swinging on its pivot in position to cut or scrape off the contents of the cup which rise above its edges.

2. The combination of two saucer or cup shaped disks of unequal concavity, pivoted together with their concaved surfaces adjacent to each other, the pivot being arranged at right angles to the planes of the meeting edges of the cups.

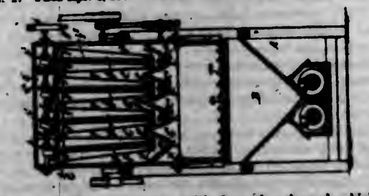


3. The combination of a cup-shaped disk and a second disk pivoted together, with their edges in contact with each other and adapted to swing in parallel planes, one of said disks having perforations, substantially as and for the purposes set forth.

382,871. EXTENSION-LADDER. JAMES C. GARDNER, Chicago, Ill. Filed May 12, 1887. Serial No. 237,972. (No model.)

Claim.—The combination of the sections A and B, the latter lying upon the rungs and between the side rails of the former, a yoke, D, extending transversely across said section B, and having its arms D' D' passing along the side rails of said section, and secured to the side rails of the section A, and jointed above each section B by a shaft, F, extending from one to the other, a roller loosely surrounding said shaft, and stirrups C C, to engage the rungs A^3, substantially as shown and described.

382,872. INVALID-BEDSTEAD. MORRIS F. HARDY, Bozeman, N. Y. Filed Sept. 24, 1887. Serial No. 250,045. (No model.)



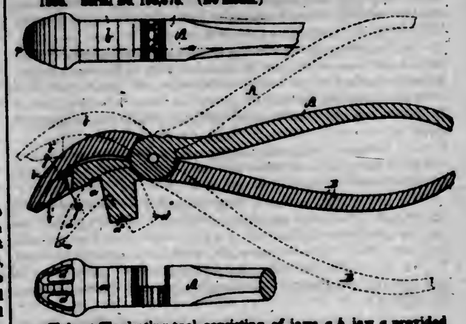
Claim.—1. In an invalid-bedstead, the combination, with the frame A A' A^3 A^3, of the crane-arm B, pivoted at e to the top portion of said frame midway between the rails A^3, hanger d, secured about midway of said arm B, curved trunk F, upon which the hanger e travels, extending transversely across the bedstead-frame and secured to the top rails, A^3, thereof, drum G, with crank-handle g and pawl and ratchet g' g^2, pulleys h h', and rope H, with hook H', all constructed and arranged substantially as described, for the purposes specified.

2. In an invalid-bedstead, the combination, with a suitable frame and means for elevating the patient, substantially such as described, of the sling or yoke composed of a broad band, J, adapted to fit around the back, loop j^3, upon which the patient sits, straps J', passing across the shoulders and united at the back to the strap J to form the openings j' for the arms, and ring j, uniting the ends of the straps and forming a means of suspension of the sling, as described, for the purposes specified.

3. In an invalid-bedstead, the combination, with a suitable frame and means for elevating the patient, substantially such as described, of the stretcher K, formed of flexible material, with the side bars, k, head or strap K', secured transversely about midway across the stretcher, head-straps k^2 and foot-straps k^3, extending at an angle from the outer ends of the strap K' to the head and foot, respectively, of the stretcher, and ring or eyes k', which unite the ends of the straps and form a means of attachment of the stretcher to the elevating devices.

4. In an invalid-bedstead, the combination, with the side rails, A^3, formed with a slotted guideway transversely across the bottom thereof, of the counter-support I, fitting within said slotted guideway and adapted to be adjusted upon either side of the bedstead, for the purposes specified.

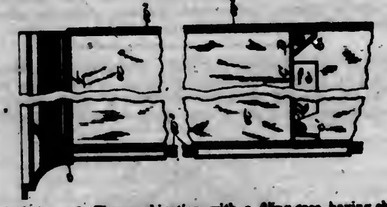
382,873. BEDCLOTHES-FURLIFTER. ANDREW HESSE, Silver Creek, N. Y. Filed Apr. 1, 1887. Serial No. 233,202. (No model.)



Claim.—1. The combination, with the casing through which the dust-laden air passes, of a diaphragm extending across said casing and composed of a series of dust-collecting troughs having the upper portions of their side walls perforated, and a series of dust-collecting chambers arranged in said casing above the said diaphragm, substantially as set forth.

2. The combination, with the casing through which the dust-laden air passes, of a diaphragm arranged across said casing and provided with inclined side walls having upright corrugations, and air-passages in the crown portions of said corrugations, and dust-collecting chambers arranged in said casing above said diaphragm, substantially as set forth.

3. The combination, with the casing through which the dust-laden air passes, of a dust-collecting chamber depending into said casing, open at its top, closed at its bottom, and having its sides covered with filter-cloth, a vertically-movable gate applied to the upper end of said dust-collecting chamber, and a cam whereby the gate is raised and then suddenly dropped, thereby shutting off the air-current and jarring the chamber, substantially as set forth.



4. The combination, with the shaking screen, of cleaning-cords arranged on the screen and secured at one end to the screen, and a support to which the opposite ends of the cords are secured, and which moves independent of the screen, whereby the cords are at intervals loosened to rest on the screen and tightened to be lifted clear of the screen, substantially as set forth.

382,874. LASTING-TOOL. CHARLES H. HILLS, Poughkeepsie, N. Y., assignor to George H. P. Flagg, trustee, Boston, Mass. Filed Feb. 3, 1888. Serial No. 263,673. (No model.)

Claim.—The lasting-tool consisting of jaws a b, jaw a provided with one or more longitudinal recesses, a', and jaw b with one or more longitudinal projections, b', which enter recesses a' when the jaws are closed, thereby seizing and crimping the material, substantially as and for the purpose set forth.

382,875. FILING CASE AND DRAWER. BERNARD J. HOFFMAN, Milwaukee, Wis. Filed Sept. 26, 1887. Serial No. 250,494. (No model.)

Claim.—1. The combination, with a filing-case having sheet-metal sides or partitions which are rolled or folded at their front edges into ribs or beads, of drawers having inwardly-turned side wings or flanges which fit closely against said ribs or beads when the drawers are closed, substantially as and for the purpose set forth.

2. The combination, in a filing-case having upright partitions, of transverse rods passing through said cases from side to side, and sheet-metal shelves bent at the sides into stiffening-flanges and inserted between said upright partitions and supported upon said transverse rods, substantially as and for the purpose set forth.

3. The combination, in a filing-case, of upright sheet-metal partitions, transverse tie-rods passing through said partitions and secured at the ends in the sides of the case, and sheet-metal shelves bent at the ends to engage said tie-rods, which support them and bind the sections of the case together, substantially as and for the purpose set forth.

4. The combination, in a filing-case, of transverse rods, upright partitions, and sheet-metal shelves bent at the sides into vertical stiffening-flanges, and looped or turned at the ends to receive or engage said transverse rods, upon which they are supported, substantially as and for the purpose set forth.

5. In a filing-case, a drawer the bottom and sides of which are composed of a single piece of sheet-metal folded at the sides to form on the bottom depending bearing-flanges, substantially as and for the purpose set forth.

6. In a filing-case, a drawer having a sheet-metal bottom folded

to form a longitudinal retaining-groove, in combination with a sliding support or compressor working in said groove, substantially as and for the purposes set forth.

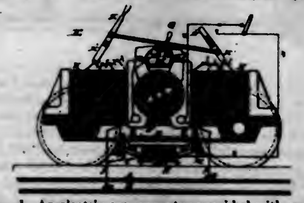
7. In a filing-case, a drawer having its sides and bottom formed of a single piece of sheet metal folded longitudinally to form a retaining-groove in the bottom for receiving and holding the compressor-foot, and depending bearing-flanges at the sides of the bottom, and a front piece bent rearwardly at the sides into stiffening flanges or wings, substantially as and for the purposes set forth.

8. In a filing-case, a drawer open at the rear end and provided with a bail attached thereto, in combination with a compressor working in a longitudinal groove in the bottom of said drawer, substantially as and for the purposes set forth.

9. In a filing-case, the combination, with a compartment in which the drawer slides, provided at the upper side of the front or open end with a ledge or projection, of a drawer working in said compartment and provided at its rear end, which is open, with an upright bail arranged to engage said ledge or projection when the drawer is open, and thus suspend the same, projecting horizontally from the case, substantially as and for the purposes set forth.

10. In a filing-case provided with drawer-compartments, the combination of drawers provided at their rear ends with upright suspension-bails, and a hook or hanger attached to said case, so as to hold a drawer projecting horizontally therefrom in a convenient position for manipulating its contents, substantially as and for the purposes set forth.

11. In combination with a filing-case, a filing-drawer having a metallic front bent at the sides into stiffening wings or flanges, substantially as and for the purposes set forth.



12. In combination with a filing-case, a drawer provided with a card pocket or holder on the front, and having a slit through the front piece or section for the insertion of a card from the rear or back side into said pocket or holder, substantially as and for the purposes set forth.

13. In combination with a filing-case, a drawer provided at its rear end with a suspension-bail, substantially as and for the purposes set forth.

14. In a filing-case, a drawer having its bottom and sides formed of a single piece of sheet metal folded longitudinally through the bottom into a groove having overhanging edges, and at the sides into depending bearing-flanges, substantially as and for the purposes set forth.

15. The combination, in a filing-case, of upright sheet-metal sides or partitions rolled at one or both edges over wire rods, which are riveted at the upper ends in the top section of the case, and rest at their lower ends upon the base and flanges turned upon the edges of said sides or partitions, and riveted to the inside of said base, substantially as and for the purposes set forth.

382,876. ELECTRIC RAILWAY. RUDOLPH M. HUNTER, Philadelphia, Pa., assignor to the Electric Car Company of America, same place. Original application filed Mar. 13, 1886, Serial No. 195,742. Dividing and this application filed Aug. 29, 1887. Serial No. 248,103. (No model.)

Claim.—1. An electric car or motor provided with an armature adapted to be attracted by the poles of the motor, and friction-brake mechanism actuated by said armature, substantially as and for the purpose specified.

2. In an electric car or motor, the field-magnets of the motor and means to increase or decrease their magnetic power, in combination with a brake-applying armature adapted to be attracted to the field-magnet poles upon increasing their strength above the normal to stop the car, substantially as and for the purpose specified.

3. In an electric car or motor, the field-magnet of the motor and means to increase or decrease the magnetic power, in combination with a brake-applying armature adapted to be attracted to the field-magnet poles upon increasing their strength above the normal to stop the car, a helix to magnetize the brake-armature, and a switch to open or close said helix with the electric supply, substantially as and for the purpose specified.

4. In an electric car or motor, the field-magnets of the motor and means to increase or decrease their magnetic power, in combination with a brake-applying armature adapted to be attracted to the field-magnet poles upon increasing their strength above the normal to stop the car, a helix to magnetize the brake-armature, and a switch to put said helix in a shunt around the motor, substantially as and for the purpose specified.

5. In an electric car or motor, the field-magnets of the motor and means to increase or decrease their magnetic power, in combination with a brake-applying armature adapted to be attracted to the field-magnet poles upon increasing their strength above the normal to stop the car, a helix to magnetize the brake-armature, and a switch to put said helix in or out of circuit upon increasing or decreasing the power of the field-magnets, substantially as and for the purpose specified.

6. The combination of the field-magnets H of the motor or car, the magnetic armature L of the friction-brake controlled by said field-magnets, brake-shoes M, actuated thereby, circuit *n*, and a switch to open or close said circuit, substantially as and for the purpose specified.

7. The combination of the field-magnets H of the motor or car made with a series of coils, switches to put any number of said coils into circuit to vary the power of the motor, the magnetic armature L of the friction-brake controlled by said field-magnets, brake-shoes M, actuated thereby, circuit *n*, and a switch to open or close said circuit, substantially as and for the purpose specified.

8. The combination of the field-magnets H of the motor or car made with a series of coils, switches to put any number of said coils into circuit to vary the power of the motor and actuate the switch of the brake-circuit *n*, the magnetic armature L of the friction-brake, shoes M, actuated thereby, circuit *n*, and a switch to open or close said circuit, substantially as and for the purpose specified.

9. An electric-railway motor having its field-magnets formed of a series of coils, those on each magnet connected in series, in combination with an electric circuit for supplying electricity to said magnets, and switches to simultaneously put in or out of circuit any number of coils of each field-magnet to vary the power or speed of the motor, substantially as and for the purpose specified, an electric signal, a signal-circuit, a switch in said circuit, and a connection between the signal-switch and switches for putting in or out of circuit the magnet-coils of the field-magnets.

10. An electric-railway motor having its field-magnets formed of a series of coils, and its armature arranged in multiple-arc or shunt connection with said field-magnets, in combination with working-conductors and connecting devices for supplying electricity to said magnets, and switches to simultaneously put in or out of circuit any number of coils of each field-magnet to vary the power or speed of the motor, and switch devices for reversing the direction of the current through the armature, substantially as and for the purpose specified, an electric signal, a signal-circuit, a switch in said circuit, and a connection between the signal-switch and switches for putting in or out of circuit the magnet-coils of the field-magnets.

11. In an electric railway, the working-conductors, in combination with a motor or car, connecting devices for conveying electric currents to the motor from the conductors, a slowing-down lever to control the power of the motor, an alarm or electric bell arranged in a branch circuit connecting the positive and negative working-conductors and interrupted to intermittently break said branch circuit, a switch to open or close said circuit, and a connection between said switch and slowing-down lever, substantially as and for the purpose specified.

12. In an electric railway, the working-conductors, in combination with a motor or car, connecting devices for conveying electric current to the motor from the conductors, a slowing-down lever to control the power of the motor, an alarm or electric bell arranged in a branch circuit connecting the positive and negative working-conductors, and a switch to open or close said circuit actuated by the slowing-down lever to sound the alarm when slowing down the motor, substantially as and for the purpose specified.

13. In an electric railway, a traveling electric vehicle, an electric motor on said vehicle, a source of electric energy, an electric brake, a brake-magnet having its coils made in sections, a brake-circuit including said magnet, switch devices to put one or more of said coils in circuit, a brake-armature, a helix on said armature, and an electric circuit to energize said armature, substantially as and for the purpose specified.

14. In an electric railway, a traveling vehicle, a source of electric energy, a mechanical or friction brake, a movable brake-actuating magnet, a stationary magnet independent of the wheels to actuate said brake-magnet, a connection between the brake-magnet and friction-brake, and means to energize the said movable brake-magnet, whereby it is attracted toward the stationary magnet.

15. In an electric railway, a traveling electric vehicle, an electric motor on said vehicle, a source of electric energy, an electric brake, a brake-magnet connected to the brake and capable of moving a stationary magnet, and means to energize both said movable and stationary magnets, substantially as and for the purpose specified.

16. In an electric railway, a traveling electric vehicle, an electric motor on said vehicle, a source of electric energy, an electric brake, a brake-magnet connected to the brake and capable of moving a stationary magnet, and means to energize both of said movable and stationary magnets, and means to vary the power of the stationary magnet, substantially as and for the purpose specified.

17. In an electric railway, a line-working conductor, a traveling electrically-propelled vehicle, an electric motor on said car, receiving electric current from said conductor, the field-magnets of said motor being formed of a number of coils or bobbins, and means for putting into or out of circuit one or more of said bobbins to vary the power of the field-magnets, an alarm or signal, a signal-circuit, a switch in said signal-circuit, and a connection between said signal-switch and the means for putting into or out of circuit the bobbins of the field-magnets.

18. In an electric railway, a line-working conductor, a traveling electrically-propelled vehicle, an electric motor on said car receiving electric current from said conductor, the field-magnets of said motor being formed of a number of coils or bobbins, means for putting into or out of circuit one or more of said bobbins to vary the power of the field-magnets, and means for reversing the current in the armature-circuit, an alarm or signal, a signal-circuit, a switch in said signal-circuit, and a connection between said signal-switch and the means for putting into or out of circuit the bobbins of the field-magnets.

382,877. ELECTRIC RAILWAY. RUDOLPH M. HUNTER, Philadelphia, Pa., assignor to the Electric Car Company of America, same place. Original application filed July 12, 1886, Serial No. 208,413. Divided and this application filed Sept. 6, 1887. Serial No. 248,760. (No model.)

Claim.—1. The combination of two lines of working-conductors made in sections, the sections of one line being connected together through resistances, and sections of the other lines being connected with the sections of the first-mentioned line, and a generator of electricity connecting with opposite ends of the respective lines, whereby motors upon the line may be coupled in series with each other, substantially as and for the purpose specified.

2. The combination of two lines of working-conductors made in sections of a length sufficient to accommodate two or more motors or trains, the sections of one line being connected together through resistances, and sections of the other line being connected with the sections of the first-mentioned line, a generator of electricity connecting with opposite ends of the respective lines, whereby motors upon the various sections of the line may be coupled in series with each other and those upon the corresponding sections may be coupled in multiple arc, substantially as and for the purpose specified.

3. The combination of two lines of working-conductors made in sections, the sections of one line being connected together through resistances, means to adjust said resistances, and sections of the other line being connected with the sections of the first-mentioned line, a generator of electricity connecting with opposite ends of the respective lines, whereby motors upon the line may be coupled in series with each other, substantially as and for the purpose specified.

4. The combination of two lines of working-conductors made in sections, the sections of one line being connected together through resistances, automatic devices controlled by the current in the line to adjust said resistances, sections of the other line being connected with the sections of the first-mentioned line, and a generator of electricity connecting with opposite ends of the respective lines, whereby motors upon the line may be coupled in series with each other, substantially as and for the purpose specified.

5. The combination of two lines of working-conductors made in sections, the sections of one line being connected together through resistances, automatic devices controlled by the current passing through the motors to adjust said resistances, and sections of the other line being connected with the sections of the first-mentioned line, and a generator of electricity connecting with opposite ends of the respective lines, whereby motors upon the lines may be coupled in series with each other, substantially as and for the purpose specified.

6. The combination of two lines of working-conductors made in sections, the sections of one line being connected together through resistances, automatic devices controlled by the current passing through both the line and the motors to adjust said resistances, and sections of the other line being connected with the sections of the first-mentioned line, and a generator of electricity connecting with opposite ends of the respective lines, whereby motors upon the line may be coupled in series with each other, substantially as and for the purpose specified.

7. The combination of two lines of working-conductors made in sections of a length sufficient to accommodate two or more motors or trains, the sections of the one line being connected together through resistances, automatic devices controlled by the current in the line to adjust said resistances, and sections of the other line being connected with the sections of the first-mentioned line, a generator of electricity connecting with opposite ends of the respective lines, whereby motors upon the various sections of the line may be coupled in series with each other, and those upon the corresponding sections may be coupled in multiple arc, substantially as and for the purpose specified.

8. The combination of two lines of working-conductors made in sections of a length sufficient to accommodate two or more motors or trains, the sections of one line being connected together through resistances, automatic devices controlled by the current passing through the motors to adjust said resistances, the sections of the other line being connected with the sections of the first-mentioned line, a generator of electricity connecting with opposite ends of the respective lines, whereby motors upon the various sections of the line may be coupled in series with each other, and those upon the corresponding sections may be coupled in multiple arc, substantially as and for the purpose specified.

9. The combination of two lines of working-conductors made in sections of a length sufficient to accommodate two or more motors or trains, the sections of the one line being connected together through resistances, automatic devices controlled by the current passing through both the line and the motors to adjust said resistances, sections of the other line being connected with the sections of the first-mentioned line, and a generator of electricity connecting with opposite ends of the respective lines, whereby motors upon the various sections of the line may be coupled in series with each other, and those upon the corresponding sections may be coupled in multiple arc, substantially as and for the purpose specified.

10. The combination of two lines of working-conductors made in sections, the sections of one line being connected together through resistances, sections of the other line being connected with the sections of the first-mentioned line, a generator of electricity connecting with opposite ends of the respective lines, whereby motors upon the line may be coupled in series with each other, and means to control the line-current, substantially as and for the purpose specified.

11. The combination of two lines of working-conductors made in sections of a length sufficient to accommodate two or more motors or trains, the sections of the one line being connected together through resistances, the sections of the other line being connected with the sections of the first-mentioned line, a generator of electricity connecting with opposite ends of the respective lines, whereby motors upon the various sections of the line may be coupled in series with each other, those upon the corresponding sections may be coupled in multiple arc, and means to control the line-current, substantially as and for the purpose specified.

12. The combination of two lines of working-conductors made in sections, the sections of one line being connected together through adjustable resistances, and the sections of the other line being connected by branches with the sections of the first-mentioned line, so as to connect motors on the respective sections of the line in series, a regulating device for varying said resistances, consisting of an electro-magnet in said branch, and a resistance-changer actuated by said magnet, substantially as and for the purpose specified.

13. The combination of two lines of working-conductors made in sections, the sections of one line being connected together through adjustable resistances, and the sections of the other line being connected by branches with the sections of the first-mentioned line, so as to connect motors on the respective sections of the line in series, a regulating device for varying said resistances, consisting of an electro-magnet in circuit with adjacent sections of the first-mentioned line, and an electro-magnet in said branch, and a resistance-changer actuated by said magnet, substantially as and for the purpose specified.

14. The combination of two lines of working-conductors made in

sections, the sections of one line being connected together through adjustable resistances, the sections of the other line being connected by branches with the section of the first-mentioned line, so as to connect motors on the respective sections of the lines in series, a regulating device for varying said resistances, consisting of an electro-magnet of high resistance in circuit with adjacent sections of the first-mentioned line, and an electro-magnet of low resistance in said branch, and a resistance-changer actuated by said magnets, substantially as and for the purpose specified.

15. The combination of two lines of working-conductors made in sections, the sections of one line being connected together through adjustable resistances, the sections of the other line being connected by branches with the sections of the first-mentioned line, so as to connect motors on the respective sections of the lines in series, a regulating device for varying said resistances, consisting of an electro-magnet in circuit with adjacent circuit-sections of the first-mentioned line, and a resistance-changer actuated by said magnet, substantially as and for the purpose specified.

16. The combination of two lines of working-conductors made in sections, the sections of one line being connected together through adjustable resistances, the sections of the other line being connected by branches with the sections of the first-mentioned line, so as to connect motors on the respective sections of the lines in series, a regulating device for varying said resistances, consisting of an electro-magnet in circuit with adjacent sections of the first-mentioned line, a resistance-changer actuated by said magnet, and a shunting device to put the magnet in a shunt-circuit when the resistance is cut out, substantially as and for the purpose specified.

17. The combination of two lines of working-conductors made in sections, the sections of one line being connected together through adjustable resistances, the sections of the other line being connected by branches with the section of the first-mentioned line, so as to connect motors on the respective sections of the lines in series, a regulating device for varying said resistances, consisting of an electro-magnet of high resistance in circuit with adjacent sections of the first-mentioned line, an electro-magnet of low resistance in said branch, a shunting device to put the high-resistance magnet in a shunt-circuit when the resistance between the sections of the first-mentioned line is cut out, and a resistance-changer actuated by said magnets, substantially as and for the purpose specified.

18. In an electric railway, two lines of working-conductors divided into sections and having their sections connected in pairs, including one section from each line, and such successive pairs of sections connected in series, so as to couple motors on the successive sections of the lines in series, and motors on the corresponding sections of each line in multiple arc, in combination with one or more electric motors, and a bridging-circuit to shunt more or less of the line-current around the motors on the said corresponding sections, whereby the current passing through the motors may be in accordance with the requirements, substantially as and for the purpose specified.

19. In an electric railway, two lines of working-conductors divided into sections and having their sections connected in pairs, including one section from each line, and such successive pairs of sections connected in series, so as to couple motors on the successive sections of the lines in series, and motors on the corresponding sections of each line in multiple arc, in combination with one or more electric motors, a bridging-circuit to shunt more or less of the line-current around the motors on the said corresponding sections, and an adjustable resistance device in said bridging or shunt circuit and governed by the current flowing through the motors, to the end that the current passing through the motors may be in accordance with the requirements, substantially as and for the purpose specified.

20. In an electric railway, two lines of working-conductors divided into sections and having their sections connected in pairs, including one section from each line, and such successive pairs of sections connected in series, so as to couple motors on the successive sections of the lines in series, and motors on the corresponding sections of each line in multiple arc, in combination with one or more electric motors, a bridging-circuit to shunt more or less of the line-current around the motors on the said corresponding sections, and an electrically-actuated adjustable resistance device in said bridge or shunt circuit and governed by the current flowing through the motors, to the end that the current passing through the motors may be in accordance with the requirements, substantially as and for the purpose specified.

21. In an electric railway, two lines of working-conductors divided into sections and having their sections connected in pairs, including one section from each line, and such successive pairs of sections connected in series, so as to couple motors on the successive sections of the lines in series, and motors on the corresponding sections of each line in multiple arc, in combination with one or more electric motors, a bridging-circuit to shunt more or less of the line-current around the motors on the said corresponding sections, an adjustable resistance-changer in said bridge or shunt circuit and in multiple-arc connection with the motors on the corresponding sections of the lines, and controlled by the motor-resistance, whereby the current passing through the motors may be in accordance with the requirements, substantially as and for the purpose specified.

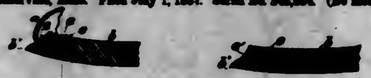
22. In an electric railway, two lines of working-conductors divided into sections and having their sections connected in pairs, including one section from each line, and such successive pairs of sections connected in series; so as to couple the motors on the successive sections of the lines in series, and motors on the corresponding sections of each line in multiple arc, in combination with one or more electric motors, a bridging-circuit, a resistance-changer in said bridging-circuit to shunt more or less of the line-current around the motors on the said corresponding sections, whereby the current passing through the motors may be in accordance with the requirements, and a regulator to control the current passing through all of the sections simultaneously, substantially as and for the purpose specified.

23. In an electric railway, two lines of working-conductors divided into sections and having their sections connected in pairs, including one section from each line, and each successive pairs of sections connected in series, so as to couple motors on the successive sections of the lines in series, and motors on the corresponding sections of each line in multiple arc, in combination with one or more electric motors, a bridging-circuit to shunt more or less of the line-current around the motors on the said corresponding sections, an electrically-actuated adjustable resistance device in said bridge or shunt circuit, and governed by the current flowing through the motors, to the end that the current passing through the motors may be in accordance with the requirements, and a regulator to control the current passing through all of the sections simultaneously, substantially as and for the purpose specified.

24. In an electric railway, two lines of working-conductors divided into sections and having their sections connected in pairs, including one section from each line, and each successive pairs of sections connected in series, so as to couple motors on the successive sections of the lines in series, and motors on the corresponding sections of each line in multiple arc, a bridging-circuit to shunt more or less of the line-current around the motors on the said corresponding sections, an electrically-actuated adjustable resistance device in said bridge or shunt circuit, and governed by the current flowing through the motors, to the end that the current passing through the motors may be in accordance with the requirements, and a regulator to control the current passing through all of the sections simultaneously, substantially as and for the purpose specified.

25. In an electric railway, a line-working conductor divided into sections arranged end to end in line, in combination with a bridging-conductor connecting the said sections end to end in the same line, and a resistance in said bridging-conductor, substantially as and for the purpose specified.

26. In an electric railway, a line-working conductor divided into sections, in combination with a bridging-conductor connecting the said sections end to end, and a variable resistance in said bridging-conductor, substantially as and for the purpose specified.



27. In an electric railway, a line-working conductor divided into sections, in combination with a bridging-conductor connecting the said sections end to end, a variable resistance in said bridging-conductor, and an automatic device to vary said resistance, substantially as and for the purpose specified.

28. In an electric railway, two lines of working-conductors made in sections, in combination with traveling electromotors receiving electricity therefrom, branch conductors connecting one section of one line with the next section of the other line, electrical connections between one of the poles of said generator and the nearest end of one of the line-conductors, and the other pole and the farthest end of the other line-conductor, whereby the resistance from the generator through a motor and return shall be practically uniform for all positions of the motor upon the line, substantially as and for the purpose specified.

29. The combination of two portions of a series multiple electric-railway circuit and an automatic variable-resistance shunting device, substantially as set out, between the two portions of the railway to shunt more or less current around the motors on one portion of the railway and deliver it to the other portion of the railway, with two generators having similar poles coupled to the same line-conductor, but on opposite ends thereof, and having the other and similar poles coupled to the other working-conductor at a distance from the terminals of the first-mentioned working-conductor, substantially as and for the purpose specified.
